change slightly as I go through it, because of the good presentations yesterday, your conversation this morning, when you presented your Committee work.

So I am representing Thorvin, Incorporated today, producers of certified organic kelp sold under the brand name of Thorvin Kelp, located in New Castle, Virginia.

Thorvin as a company would also like to thank you and recognize your hard work and commend you for taking on the difficult and complex issues that face the organic production and processing community.

Thorvin supports the work done on the definition of a nonagricultural substance and the use of a decision tree to provide assistance in defining a nonagricultural substance presented by the Joint Handling and Materials Committee.

These recommendations provide the opportunity to implement the full scope of
the Organic Foods Production Act that includes non-plant life and, as has been brought up, I know that you will have to deal with now this very good question, "How does it fit, non-plant, non-animal?" What else needs to be done in your recommendation to make this workable.

As a company, Thorvin, Inc., that produces an organic product that is not land-based, we have seen the environmental benefits that have resulted from our organic kelp production. We believe that it is important that non-plant/non-animal life should be considered agricultural, and that by doing so, have the opportunity and encouragement to be produced organically and contribute to a positive impact on the environment.

In 2004, Thorvin joined the 15-member coalition of companies to support the petition to consider yeast as an agricultural product. Our motivation to be
part of this coalition is based on our strong conviction that continuous improvement is one of the underlying principles of organic production.

Encouraging better methods as they become available was intentionally built into the organic regulations for just this type of situation. As gentler production methods that align more closely with organic principles are developed, it is essential that we encourage and adopt them.

This direction to change the definition of nonagricultural substance allows the National Organic Program rule to move more effectively and serve the growing and innovative organic industry by supporting organic production and handling of several products that had been previously considered outside of the requirements of organic certification.

So we strongly encourage you to continue this work on this recommendation,
to move in the direction that your recommendation has presented, and to expand opportunities for non-plant and non-animal living organisms to be considered organic.

Thank you.

Any questions?

CHAIRMAN O'RELL: Thank you, Katherine.

Any questions?

(No response.)

MS. DiMATTEO: All right, thank you very much.

CHAIRMAN O'RELL: Thank you.

Steffan, and on deck, Rebecca Goldburg.

MR. HAKE: Good afternoon and thank you for giving me the opportunity to give some comments. My name is Steffan. I work for GNT. We are a base producer of natural colors, and those are all the colors that are qualified as non-synthetic.

We thought we would take this
opportunity to give a little bit of an insight on how does a color manufacturer supplier look at this, because I think colors generally are misunderstood from a lot of different angles. So what I wanted to do is just give a very quick overview.

Basically, as I said, we are a base manufacturer. We would agree that non-synthetic coloring category is too broad. Because if you look at all the colors that are available under that category, it would include carmine, annatto, paprika, just to mention a few.

Then we have to look at the process. So then if we look at annatto, paprika, and carmine, they are traditionally processed using all kinds of different solvents to make them into form that it becomes functional to use in different food and beverage applications.

Then under non-synthetic food colorings, you would have fruit and
vegetable juice color. So these are derived colors from fruits and vegetables. They can be processed with water only, or by FDA definition, they only can be processed with water.

So that is where the differentiation would come in. So for a consumer, it is very confusing. If you see on a label "annatto," you don't know what is behind the process of annatto, whereas it is a little bit more clear what is behind the fruit and vegetable juice color process.

The FDA classification of color is very misleading because anything that is capable of importing color is classified as a color and, therefore, an additive. So, therefore, a strawberry puree added to an ice cream is a strawberry, but if I now used that same strawberry to standardize a cherry juice or to add to a cherry juice, this strawberry now becomes an additive and, therefore, is classified as a color.
So we would think that a true natural color really would be a food having coloring property. Because if we cook at home, there's all kinds of foods that can impart foods to other items, such as a strawberry imparts color to the ice cream. A chocolate imparts a color to the chocolate milk.

So how do we deal with the question of making colors available for organic products? One of the suggestions would be to look at the FDA regulation, the fruit juice and vegetable juice color. This provides a wide spectrum of different colors that are available from orange, red, yellow. They work in all different applications.

By definition, that process has to be organic. You are not allowed to use any chemical solvents. You are basically removing the water, which you would do if you are making, for example, a tomato puree at home. You are simply concentrating a
fruit and vegetable.

So where do the challenges lie? The challenges lie, there's not enough organic farmers that can cultivate organic fruits and vegetables for the coloring worldwide. So that is really where right now the challenge lies.

It is not that we cannot provide with a process to come up with an organic color, but it is to say, okay, now we need to grow these fruits and vegetables organically and make them available organically. That is a challenge because there are not enough farmers out there who can do this at this moment. Organic crops could be made available, however, over a given period of time.

Why do we keep mentioning fruit and vegetables as a broader category? Because the way we have to look at it is, if nature makes the color, we cannot modify due to process; we have to work with all
different batches from fruits and vegetables. We can take cherries, we can take elderberries, strawberries, and we can mix them, but in the end, with using this mixing knowhow, different fruits and vegetables can deliver standardized colors that are available for the industry.

So it would be very difficult if we were to say, well, let’s just put cherry on the list; let’s just put elderberry on the list. So a broader category that allows for fruits and vegetables will allow for better commercial availability because you could use the organic fruits and vegetables that are available and put them together.

So, in conclusion, our suggestion would be to take a more holistic approach, eliminating the usage of highly-processed colors --

CHAIRMAN O'RELL: We will let you make your conclusion.

MR. HAKE: Okay, thank you.
Allow non-synthetic color to meet certain requirements, organically-certified process; colors can be eaten with a spoon; colors from fruits and vegetables with no selective extraction. We believe this will motivate companies to produce organic materials by providing compliance timeframes.

CHAIRMAN O'RELL: Steffan, thank you very much.

Did you hand a copy of this in?

MR. HAKE: Yes.

CHAIRMAN O'RELL: You have it now? Okay. Because I think we would certainly like to have this, the information you presented.

Julie?

MS. WEISMAN: Before when you said that there are not enough organic farmers to provide for these colors on a worldwide basis, are you thinking in terms of conventional and organic or just for
organic foods?

MR. HAKE: Just for organics. So, for example, if you say, let's make an orange color from carrot, you would have to go to a farmer, and then we would provide the seeds, and then we say, "Please grow these carrots for us." Finding a farmer that has land available to now grow carrots, or just using carrots as an example, that is quite difficult, because it has not been done on a large scale up until now.

MS. WEISMAN: Are there specific varieties of, say, carrots that have to be grown in order to manufacture colors? Are these different than the carrots that we eat?

MR. HAKE: Yes. Yes, there are different varieties. But, more importantly, what has to happen is one has to work with the farmers, because the way the rows, what kind of light is available, the environment, where it is grown, and also it has to be
harvested at an optimal point, whereas, commercially-available, even organic, a lot of times it is not harvested at an optimal time because you grow carrots because of taste and different characteristics. Strawberries are grown, so that if you eat them in a hotel, they still look good, but they all taste like colored potatoes.

(Laughter.)

MS. WEISMAN: That's true.

MR. HAKE: Yes. So if you make strawberries for color, you would do it completely different, because you grow them; you want to get the optimal amount of color. It has to be processed really quickly because you have to harvest it, and then it has to be processed quickly.

MS. WEISMAN: Thank you very much.

CHAIRMAN O'RELL: Kevin?

MR. ENGELBERT: Do you have conventional farmers growing vegetables for
you for color?

MR. HAKE: Yes.

MR. ENGELBERT: And have you approached them about organic --

MR. HAKE: Exactly. So that is what we are looking into. We would say over the next couple of years it will become more and more available. It is doable, but it needs time. It is not something you can do overnight.

So I think a good timeline would be somewhere around five years. But, in the meantime, there could be some of fruits and vegetables that could be organic, but maybe not all of them. But to get the whole color spectrum and to make it commercially available, probably somewhere around the timeline of five years, and then it could be done.

MR. ENGELBERT: Thank you.

CHAIRMAN O'RELL: Joe?

MR. SMILLIE: Actually, he just
answered my question.

CHAIRMAN O'RELL: Okay. Any other questions?

(No response.)

Thank you.

MR. HAKE: Thank you.

CHAIRMAN O'RELL: Becky?

Marie Banda is on deck.

Becky, you're up. Sorry.

MS. GOLDBURG: All right. Well, thank you. This time it really is me. Becky Goldberg representing Becky Goldberg. I am, as many of you know, a former NOSB member. I am a senior scientist with Environmental Defense in our Oceans and Health Programs, and I am also a member of the Aquaculture Working Group working on aquaculture standards, where I am the lone representative of an environmental organization. My comments today represent me and Environmental Defense, not the Working Group at large.
I want to offer my own perspective, after listening and reading many of the excellent comments that have been received by the NOSB about aquaculture standards.

It is clear to me that there is really and truly broad support for promulgation of aquaculture standards. There's been no comment, to my knowledge, that has been in opposition to aquaculture standards, despite the really incredible diversity of the commenters.

But two areas are highly controversial. One is feed for carnivorous fish, especially the use of fishmeal and oil made from wild-caught fish.

The other area that is really controversial is the use of net pens or net cages to raise fish, open systems, in other words, that are placed in natural waters.

Now, to be upfront, outside the context of my work on the organic standards,
I have been among scientists and conservation organization staff who have raised some concerns in the past about the sustainability of feeds for carnivorous fish and the ecological impact of net pens. There is, in my view, a very real basis for many of the concerns expressed.

With that in mind, I want to suggest an option to the Livestock Committee as it moves forward. That is to move forward really expeditiously with organic standards for herbivorous and omnivorous fish raised in ponds and tanks and similar sorts of aquaculture, it would be really terrific, from my vantage point, to have USDA organic standards for such popular fish as shrimp and tilapia and catfish in the near term.

Such species are now the majority, by far, of U.S. aquaculture production. I know that there are producers keen to grow these fish in accordance with
USDA organic standards.

Then the Livestock Committee could put on a separate track the development of standards for carnivorous fish and fish raised in net pens. Of course, the issues with carnivorous fish and net pen raising of fish are intertwined because most of the carnivorous fish consumed in the United States are raised in net pens, and vice versa. They go together.

And as you have heard, the issues are difficult. They are complex. They are controversial. We need to get them right, even if it takes us more time.

Moreover, such an approach would be consistent with what the Aquaculture Working Group is now doing with mollusk production. There are a number of tricky issues around production of shellfish such as oysters and clams and mussels which live in the water column and filter out water.

Because we recognize that it
takes some time to consider all the associated issues, we are pursuing mollusks on a separate track and have not yet even completed a draft set of standards for organic mollusk production.

So, in other words, even once we get through a first set of aquaculture standards, there will, presumably, in the future be more coming.

So, from my perspective, it makes sense to take the difficult and tricky issues around farming of carnivores and net pens and give them more time and fast-track the non-controversial areas, which, as I said, represent the bulk of U.S. aquaculture production at this time.

That said, if you do choose this option, continued work on draft standards could, of course, be done by the Livestock Committee or could be done by the Aquaculture Working Group.

I would like to offer an
observation that it might be useful, if we do have a separate process looking at carnivores and net pens, that perhaps some of the critics of those types of operations be included in the deliberations, in the interest of making them really balanced.

Anyway, those are my thoughts, and I thank you for your time.

CHAIRMAN O'RELL: Thank you, Rebecca.

Any questions? Dan?

MR. GIACOMINI: Hi, Becky. I just want to say hello. We've talked and traded emails for months.

MS. GOLDBURG: Right, many emails.

(Laughter.)

MR. GIACOMINI: I just wanted to say hi.

MS. GOLDBURG: Hi.

MS. CAROE: I just wanted to thank you, Becky, for your participating on
all of those calls. I know it was really hard for you to schedule to be there, and your input was always very valuable, and it is appreciated, the work that you did on that Task Force.

MS. GOLDBURG: Well, thank you very much.

Nancy?

CHAIRMAN O'RELL: Nancy?

MS. OSTIGUY: I'm curious, you are suggesting that we possibly fast-track the herbivorous and omnivorous fish. Are there any questions about accommodating their innate behavior in a farm system?

MS. GOLDBURG: Well, that is a really great question. I haven't thought it through.

Many of the fish that are raised that are lower on the food chain naturally within, say, a relatively small section of river or a pond anyway, so there aren't -- perhaps the one area where there could be
some consideration is, what do we think about indoor systems for raising these fish? Is it the equivalent of access to pasture for fish or is a tank as good as a pond?

MS. OSTIGUY: Yes, do you have to have sunshine?

MS. GOLDBURG: Right. Do you have to have real sunshine?

MS. OSTIGUY: Or could you do lights?

MS. GOLDBURG: You could have a tank, though, that has real sunshine, too, but there could be some of those issues which the Committee could consider. I, frankly, think it will be really tough because so little is understood about perhaps the natural needs of fish.

MS. OSTIGUY: Yes, I agree.

CHAIRMAN O'RELL: It's tough to ask them.

MS. OSTIGUY: Well, it's also tough to ask a cow.
(Laughter.)

CHAIRMAN O'RELL: Dan?

MR. GIACOMINI: Becky, after hearing all the comments that have been made and all the wonderful participation you have done, in your recommendation to include the omnivorous fish sort of in a faster track mode, do you have any ideas at all on what we can possibly do regarding the chicken-and-the-egg issue of the fishmeal that we would need for those fish?

MS. GOLDBURG: Well, it is possible right now, actually, to raise some omnivores without fishmeal. For example, Bart Reid, who is part of the Aquaculture Task Force, is a shrimp producer in Texas and raises shrimp with no fishmeal and oil at the moment, even though shrimp are naturally omnivorous, but they are naturally tridivores, so they are not so selective.

Similarly, channel catfish are naturally omnivorous. Their diet at the
moment in conventional production is maybe a few percent fishmeal, and it may be possible to have a zero fishmeal diet or to consider a diet where fishmeal or fish oil is really used as a supplement in a way we are all really comfortable with, because it is only a couple of percent of the diet.

MR. GIACOMINI: Okay.

MS. GOLDBURG: The other issue, of course, is the use of slaughter byproducts, which I haven't directly addressed. But the use of organic slaughter byproducts in fish feeds would be a really good source of protein for omnivorous fish.

There are all sorts of questions about the acceptability of their use, even if they are from organic sources, but I happen to favor their use personally, as long as they are from organic sources. But it deserves more consideration by the NOSB, and maybe it makes sense to restrict the kind of slaughter byproducts, for example,
to poultry and not allow ruminants, since there is so much concern about ruminant byproducts.

CHAIRMAN O'RELL: Bea?

MS. JAMES: Do you believe that netted-off pen systems, if that became a part of, just hypothetically speaking, an organic system plan for aquaculture, that the geographic locations would be conducive for that anywhere, or would there have to be certain areas that maybe pollution levels or water levels would not be adequate for systems like that?

MS. GOLDBURG: Oh, siting of net pens is really critically important. I think anybody in aquaculture would say that today. They just can't go anywhere. They have to be sited carefully.

CHAIRMAN O'RELL: Thank you, Becky.

MS. GOLDBURG: Any more questions?
Thanks.

CHAIRMAN O'RELL: Maria Banda, and then Richard Theuer following.

MS. BANDA: Good afternoon, everyone. I am Maria Banda from the Small Planet Foods, a processor of a number of organic products, including organic cereal.

The comment I will be providing is in regards to the recommendation for bleached lecithin. I commend, and sincerely commend, the NOSB members for the thoughtful consideration given to manufacturers such as ourselves who at the current time have not found an appropriate substitute for de-oiled lecithin powder.

We know that our consumers would prefer we use an organic de-oiled lecithin and so continue to look for one. However, we also aim to meet their desire to have organic flake cereal, which requires that we use de-oiled lecithin powder.
We strongly support the recommendation made this morning to renew bleached lecithin on the National List while encouraging petitions to remove liquid bleached lecithin.

When an organic dry version becomes available, a petition can be made to remove bleached lecithin from the list.

Thank you for the opportunity to provide these comments and for your thoughtful consideration.

CHAIRMAN O'RELL: Thank you for the very direct recommendation.

MS. BANDA: I would like to have the notoriety of having the shortest comment in history.

(Laughter and applause.)

MR. MOYER: Kevin, I think Jennifer's right; that was a challenge to everybody else to try to beat.

(Laughter.)

MR. THEUER: My name is Rich
Theuer. I am here with two hats today. The first one is as a representative of OMRI. OMRI is the Organic Materials Review Institute. I am currently Chair of the Board.

(Pause due to technical difficulties.)

Well, I'm representing OMRI, which is the Organic Materials Review Institute, where I am serving as Chair of the Board. OMRI was created to facilitate the organic industry by reviewing inputs for organic agriculture and handling, and to make that available to the industry.

In the past year, as you heard yesterday, OMRI has created an accessible database for organic seed. We see that that is a close model for organic equivalence to items that are on 605 and 606.

So, at this moment, OMRI stands ready and willing to implement a similar accessible database for those particular
materials on 605, on 606, which are available in organic form, and to provide this source of information, to use your words, within about four months. So we think that that would be very useful to the industry for suppliers who make the organic form of something on 605 or 606, to be able to get that in a database that would be accessible to the world.

The second comment I would like to make is perhaps the only one in the room from the inaugural NOSB 12 to 14 years ago, and to, first of all, congratulate you on the quality of work -- it is very, very good -- and the dedication of all of you to making organic better.

I noticed in printing agricultural versus nonagricultural the comment that, quote, "The distinction between agricultural and nonagricultural originated with the NOSB," about 1994, and the NOSB adopted this distinction based on
its understanding of OFPA requirements.

I think it is important that, in reflecting back on the work that we did 14, 13, 12 years ago -- I only had a three-year term, one of those early people -- that we were doing the best we can, as you are trying to do. The NOSB in that time, we frequently did not get compliments.

(Laughter.)

We were not infallible.

I think one of the things I would like to congratulate you on is the fact that you have a reasoned skepticism about some of the work that was done a long time ago. Because, again, we were not infallible.

I think the take-home lesson that I have learned is that you are a good Board and you realize precedent does not mean prohibition, that something that happened a long time ago like creating something called "agricultural," it served its purpose perhaps then, but maybe no longer does so.
Thanks.

MS. CAROE: I have a comment.

CHAIRMAN O'RELL: Andrea?

MS. CAROE: Better late than never, I want to compliment the pioneers that were on the first Board and actually had the foresight to put in place a good path.

Yes, we are filling in the details of and we are negotiating our way through at this point, but I appreciate all the work that was done by those groups, and based on the fact that you had nothing for precedence, I think you did a fabulous job.

MR. THEUER: We used an axe and we went through the forest marking the trail.

(Laughter.)

CHAIRMAN O'RELL: Jeff?

MR. MOYER: I have a question for your, Rich. When you mentioned about your seed list database, how do seed companies go
about getting their seeds on your list? What is the process or the procedure?

MR. THEUER: Well, it has been made available. Dave DeCou, the Executive Director of OMRI, has been working with the seed manufacturers and the seed associations to make this database available.

People just get in touch with OMRI. There's a relatively low-cost $25 per company, $10 per seed listing in groups of five. So for $75, they can get their seeds listed in the database.

And it is up and running, I believe, for the last month or two, yes.

MR. MOYER: Thank you.

CHAIRMAN O'RELL: Julie?

MS. WEISMAN: Not to take up too much time, but piggybacking on Andrea's comment is that it really helps to have -- I mean our view is better because we are standing on your shoulders, and yours are particularly tall.
(Laughter.)

And I'm particularly short. So it really helps.

(Laughter.)

MR. THEUER: Thank you.

CHAIRMAN O'RELL: Thank you very much, Rich.

Lisa?

Leslie Zuck is up next.

MS. McCORY: Hi, everybody. I have a proxy, Pat Kane. So I am not going to use a full 10 minutes. I'll just want to take my time when I read my comments.

So thank you for the opportunity to comment. I appreciate all that the NOP and the NOSB are doing. I realize that there are a lot of thankless hours that go into this process.

My name is Lisa McCrory, and I work as a technical advisor for the Dairy and Livestock Technical Assistance Program of the Northeast Organic Farming Association
of Vermont. I have been working with certified and transitioning livestock and dairy producers for 15 years.

The program provides technical support to the 126 certified organic dairy farms and the 80 farmers who are currently transitioning to organic production.

NOFA-Vermont's Dairy and Livestock Technical Assistance Advisors are very concerned about the integrity of the organic milk market due to either decisions made or lack of final decisions by the NOP in the following areas pertaining to organic dairy production.

I am representing NOFA-Vermont today to share the following concerns:

NOFA-Vermont's Dairy and Livestock Technical Assistance Advisors are concerned with the fact that the NOP did not accept the following NOSB recommended substances for use in organic livestock production: synthetic activated charcoal,
calcium boro gluconate, calcium propianate, Kaolin pectin, mineral oil, and propylene glycol.

These substances are commonly used by producers and veterinarians. With a cow with milk fever, for example, there is no fast-acting intravenous alternative treatment to calcium boro gluconate, and prohibiting this product makes no sense to producers and veterinarians alike.

The NOP has rejected these substances not based on criteria set up by the OFPA, but, instead, because the FDA does not consider these substances to be animal drugs. However, the FDA does acknowledge that there are 3,000 medications that are allowed by discretion for livestock producers, and the NOSB has recommended only six identified as such in The Federal Register notice and noted above.

If organic producers and veterinarians are prohibited the use of
these products, they will be robbed of important tools to treat serious ailments, for no other reason than bureaucratic classification.

One example I have in what I have presented comes from the online version of the Merck Veterinary Manual and principles of treatment for hypocalcemia. The definitive treatment for hypocalcemia is to eliminate the underlying cause; supportive measures, including the following: "to restore normal calcemia, can be administered pending the diagnosis. Hypocalcemia tetany or convulsions are indications for the immediate IV administration of 10 percent calcium gluconate, which should be slowly infused over a 10-minute period."

And it goes on a little bit further, but just to clearly illustrate that the use of calcium boro gluconate is clearly recommended within a veterinary manual that, obviously, all veterinarians have access to.
It is a common product, and, again, just to illustrate that this is one example of a product that should be allowed for organic producers.

The second item that I would like to discuss is the pasture standard. The pasture standard has been under construction for more years than the NOP has been in place. As time goes on, consumer confidence for organic products, especially dairy, is starting to waier.

NOFA-Vermont realizes that the NOP has been incredibly busy, but if we want the organic milk market to succeed, we cannot wait any longer for a pasture standard to be finalized. This issue needs to be reconciled immediately, and it needs to be implemented in support of the NOSB's recommendations, which states that all ruminants over six months of age should harvest/graize 30 percent of their dry matter needs from pasture for a minimum of 120 days
per year.

The NOSB recommendation also clarifies the producer of an organic operation may provide temporary confinement for an animal because of the animal's stage of life, and that the producer of an organic operation must not prevent dairy animals from grazing pasture during lactation.

Third is origin of livestock. NOFA-Vermont believes that the allowance for conversion of non-organic dairy animals should be permitted only as a one-time whole-herd transition. After the transition, all certified operations must manage their animals organically, starting from the last third of gestation.

Currently, all of our 126 dairy farmers are abiding by this standard. The preamble to the rule clearly states that this was the intent of the law. If farms are permitted to buy in non-organic young stock or to continually transition in young
stock to organic, this allows animals under 12 months of age to potentially be fed GMO feed, feed treated with hormones and antibiotics, or fed slaughter byproducts. This is in direct contradiction to the NOP rule for livestock feed and healthcare.

To clarify that the NOP rule requires that animals brought onto a certified operation must be raised organically, starting from the last third of gestation, would provide consistency among producers and certifiers. It would not require a significant change in management, as it is currently the practice for a large majority of organic dairy producers.

Recent headline news has indicated that cloned livestock are making it into the conventional market undetected. Allowing a continuous flow of conventional livestock to transition into the organic market will undoubtedly allow some of these livestock to infiltrate the organic system,
which will, again, have an effect on consumer confidence and ultimately their purchasing power.

And, last but not least, the dairy animal acquisition document under the NOP regulations, issued on October 3rd, 2006, has created yet another outcry from producers and certifiers alike. Where did this come from? Why did it come to be?

Thanks for all your efforts, though.

(Laughter.)

But I understand that it is with all the best of intentions, but why did this come to be?

Because once a dairy farm has completed the one-time whole-herd conversion, those dairy animals should be certified organic, period. We should be moving forward from their official certification date, not looking back into the producer's precertification history.
This document is inconsistent and creates a system of organic standards which are difficult for organic certifiers to verify, not to mention all those producers out there.

It also allows two neighboring farms to have very different organic standards, creating yet another unlevel playing field.

The NOP's clarification that it is okay for some farms to continually raise non-organic young stock and then transition them to organic creates issues with consumer confidence and allows two farms to be certified by very different standards from each other.

The Dairy and Livestock Technical Assistance Advisors of NOFA-Vermont encourage the NOP to pull this document from the NOP site and allow us to follow the policy that most certifiers have been enforcing all along. Once a herd is
transitioned in, all livestock are certified organic.

I thank you very much for your time.

Any questions?

CHAIRMAN O'RELL: Thank you, Lisa.

Any questions?

MR. KARREMAN: I want to thank you, Lisa, for bringing up all those good points.

MS. McCORRY: Thank you, Hue.

CHAIRMAN O'RELL: Thank you.

Leslie?

Emily Brown Rosen on deck.

MS. ZUCK: Hello. I'm Leslie Zuck, Pennsylvania Certified Organic.

I just have to say I was really compelled to come before you for a few minutes at least to just express my feelings about the commercial availability of organic seed guidance statement.
I was really disappointed to read about the statement that said producers of non-organic seed should bear the cost of this requirement. It made me think that we should be asking, is the purpose of this policy to punish the farmers that are using non-organic seed or is the purpose of it to provide a better market for organic seed producers?

And if the purpose is to provide a better market or motivate that market, then why should the farmers bear the cost of that program? Remember, the rule allows them to use non-organic seed when organic is unavailable.

I know the farmers are out there looking for it. I know they are. They are seeking organic seed. They are asking us about it. They are trying to find out where they can get the seed. They are really trying to do it.

But many, many seeds are still
just non-existent organically. It is not a matter of how far away they have to be shipped or how much they can get or what variety. They are just not there.

So it really presents a problem for me as a certifier. The statement was, well, we would bill the farmer who is using the non-organic seeds to cover the cost of this requirement, and, you know, I'm going to send him a bill. That farmer is going to call me up and he is going to say, "You mean you're charging me because I use non-organic seeds?" And they are going to look at it as a penalty.

It really doesn't make any sense because farmers are already paying what I feel to be a disproportionate share of operating this program. I don't think they should be paying anything.

It really seems silly to make a farmer pay because the industry hasn't yet developed an organic sorghum-sudangrass
seed. I mean, what kind of sense does that make?

So that seed is unavailable at all anywhere, and he can't get it organically, or maybe he can, but I just picked that one. You all would know better than I would.

He looks in the rule, and he is allowed to use it because it doesn't exist organically. Then the certifier sends him a bill for using that.

So it just kind of was something I would like to bring up and ask you to rethink about it. Because if the purpose is really to promote the use of organic seed, it only seems logical to me and fair that the seed industry should bear that cost. Why couldn't they go and seek out a list of all the organic seeds that are available in the world, post it somewhere on a website, and they can pay for that?

Then all the certifier has to do
is look on the website and say, "Hey, this one's available, buddy. You'd better be using it or we are not going to approve your organic plan." That seems to be a little more logical than having all these certifiers collecting all this information and sending it who knows where, and then charging the farmers for doing that.

On the other hand, I felt really great when I got that hydroponic survey in my email box. I really, really appreciated the opportunity to contribute to your process at that point in the system. I think it just makes so much better sense to me than you all drafting a recommendation, posting it three weeks before the meeting, and then having to rely on public comment, us all coming up here, the day before you vote.

So if you could do more of that type of thing, I would really appreciate it, and we encourage it. I will have to say,
though, that some of the certifiers were a little reluctant to spill it out, thinking that maybe they would say something that might appear to be non-compliant, like, "Oh, what if I say I'm certifying hydroponics and they say we're not allowed to?"

So that may be something we can deal with if we are going to do more of this and figure out a way to handle that, but I think the information-gathering process is really great. I hope it works for you all, too. We will see how it pans out.

Did you get a lot of response? I'm not supposed to be asking questions. Sorry.

(Laughter.)

Now this one's for Hue. As happy as I was to see that hydroponics survey, I had a totally different reaction when I got the dairy animal acquisition chart and it landed on my desk.

(Laughter.)
I'm not going to comment on that today in detail, actually, because of time constraints, other than to say it caused me to go up in my attic and look for my old law school books on statutory interpretation. Okay? Statutory interpretation involves a series of canons that judges use when they have to figure out what a law or a regulation really means.

One of those canons is called "the canon of avoiding absurdity."

(Laughter.)

And the canon of avoiding absurdity says the legislature did not intend an absurd or manifestly unjust result.

So I submit that Congress would not have intended different lifetime privileges and penalties for producers who are all producing exactly the same commodity, which would be organic milk. It is the epitome of absurdity, and I bring
this up because I am worried that this could be considered rulemaking without notice and comment. I don't want to see the program have to defend another lawsuit. It is not going to be coming from me, you know.

(Laughter.)

I just want to say that I don't want to see that happen. It is a serious regulatory flaw. We have to fix it soon.

There is talk of an ANPR. I hope it is on a fast track, and the industry is willing to help in any way it can to make that happen.

CHAIRMAN O'RELL: Leslie, thanks. Thanks for your comments. We do appreciate the fact, recognizing that the survey idea, going out and getting information from certifiers beforehand is a good process. I am sure that the Board will look at that and make more use of that in the future.

MS. ZUCK: Great.

CHAIRMAN O'RELL: We don't want
the certifiers to feel like they are going to be self-incriminated if they fill the wrong thing out, though. So maybe we can put a disclaimer on it.

MS. ZUCK: Immunity from prosecution.

(Laughter.)

Can we grant immunity?

CHAIRMAN O'RELL: I believe we have a question. Gerald?

MR. DAVIS: Leslie, the document on the seed availability, that was just merely answering concerns that many of the certifiers voiced at the previous meeting. It was not any new guidance or anything.

It was just a discussion, a response, and it is just a suggestion that, if there are growers that continually use a lot of untreated seed, and it is clear that they are not trying, and they are putting a lot of work on you to collect all this information, and it is costing the certifier
money, that was a suggestion maybe that is a way that you could recoup that.

MS. ZUCK: Do you know what we do if they are not making good-faith effort to source organic seed? It is a non-compliance, and that is how we handle it. They go down the road.

(Laughter.)

MR. DAVIS: If there is a large grower, for example, if you are certifying a large grower and they have a lot of instances of stuff you have to do recordkeeping on to document all those exemptions, I know the certifiers might for some growers be spending a lot more time on it and don't have a way to get a fee out there.

MS. ZUCK: It is definitely an additional cost for our certification program because we don't collect all that information. We have the growers retain it, and we inspect it when we go to the farm.
We audit their records from sourcing organic seed. So we don't have all that. We don't collect it. We go and we make sure that they have it, and we audit their records.

CHAIRMAN O'RELL: Kevin?

MR. ENGELBERT: Just to expound on what Gerry said, Leslie, in the realm of gathering seed of all different varieties all over the country, we wanted to be sure that farmers are trying to source organic seed.

MS. ZUCK: Right.

MR. ENGELBERT: We are not saying you've got to send them a bill if they don't, but just the cost involved with using any conventional untreated, they've got to bear that cost. So they continually have some type of incentive to look hard for organic seed. That's all.

We aren't trying to punish them. We just want to continue the development of the organic seed investment --
MS. ZUCK: I think it would go a lot farther if the industry could come up with a way to just put a list somewhere of what's all available and we could use that. That way, it would be really simple: It's either on the list or it's not, and you can't use it. That crop that you grew without that, that we told you you couldn't use that seed, ain't going to be organic.

CHAIRMAN O'RELL: Gerald?

MR. DAVIS: The problem, Leslie, is there are elements of the seed business -- and this is especially in the hybrid vegetable realm -- there's a lot of big companies that really have no interest in going into organic seed production.

MS. ZUCK: Well, they probably won't ever.

MR. DAVIS: Right.

MS. ZUCK: Whether we want them to or not.

MR. DAVIS: It would be nice to
come up with a way to nudge the system without causing major disruptions. That is what we were all, I think, in general, trying to grapple with.

MS. ZUCK: Yes, and I don't really think it --

MR. DAVIS: How can we give a little bit of a push without hurting the --

MS. ZUCK: It's a great idea. I just don't think the certifiers and the farmers should be the ones that do it.

Thank you.

CHAIRMAN O'RELL: Thank you, Leslie.

Emily?

Erin James is next on deck.

MS. ROSEN: She's not here. I'll take her -- she had to leave, but I will try not to use it, though. Okay.

CHAIRMAN O'RELL: Okay.

MS. ROSEN: I really don't think I'll need it, but just in case.
CHAIRMAN O'RELL: She gets 10, yes. We're just clarifying the time. Go ahead. She's not going to take it all.

MS. ROSEN: Okay, we'll have a speed race.

Emily Brown Rosen, Pennsylvania Certified Organic.

I would just like to say double amen to everything Lisa McCrory said. We are facing all those problems with livestock. They are all really critical.

I know there's so much going on, so much to do, but, you know, it is just really important to get these issues settled.

For the Livestock Committee, the followup on the medications docket and whatever happens next, I hope you dedicate some time to that because I do think, I do hope NOP will see fit to come back and consult further with you on those withdrawal times and other annotations, and that we can
straighten all that out kind of somewhat promptly. That would be really helpful.

I have really just three issues, and the second one is a short one, too. I have new problems for you, okay? I'm sure you need them.

Peracetic acid just got added to the National List for use in washing flume water and sanitizing equipment. Unfortunately, all the formulations of peracetic acid that are on the market, you have to understand they are considered antimicrobials that are registered pesticides with EPA.

Sanitizers, there is a whole division of EPA for sanitizers. So they all have this List 4 inert ingredient in them, only some of the ones I'm aware of that are commonly out there.

So now we have the manufacturer sending letters around to our clients saying, "You can use this product on direct
food contact," and we're saying, "What about the List 4 inerts?" Because, unfortunately, we don't have a category on the National List in the processing section for List 4 inerts. I think that was an oversight.

I did bring it up about five years ago, but now it has hit the fan. So we need to know what to do about this. Otherwise, we are telling them they can't use peracetic acid in direct contact; they are going to have to rinse or something or they can use it on equipment, but this is a little bit of a setback.

So we really need this product for direct crop use for food safety issues. So I don't know if we need an expedited petition or something, but we need to get it on the list.

The other new problem is we seem to be getting a lot of complaints lately about brokers/handlers of livestock feed. These are agricultural commodities who all
seem to think that they don't need to be certified. They think that they are exempt or excluded. Some of them say they have called NOP and been told that.

These are third parties that buy grain, buy hay that's on trucks. They take it somewhere else. They may store it or they may take it directly to a farmer, but they are an intermediate party handling crops that are getting fed to organic animals.

They claim they don't need to be certified. They get their initial certificate from the grower, and then they make photocopies and hand it over to the farmer.

Now I am not sure who's -- you know, we wouldn't let this be done with our certified farmers, but inspectors keep turning this up and they keep arguing about it. So I think we need a little clarification on this.
We don't see that they are excluded, the definition that would allow an exclusion for a handler. It says it has to be, the product has to be packaged or otherwise enclosed in a container, and it has to remain in that same package. We don't see hay wrapped in twine as being enclosed in a container. We don't see truckloads of grain, particularly which can be unloaded and stored and then shipped somewhere else, as exempt.

So we would like a little clarification there, that this was not intent.

There is also a problem where 310(2)(a), 5.310(a), it says, any product, if it was exempt or excluded, that those products produced or handled on an exempt or excluded facility cannot display the seal, cannot be sold or represented as certified organic, cannot be used in multi-ingredient product.
So we think that pretty well knocks it out for livestock feed. So we would appreciate a little support from -- I don't know if you need to get involved, but if NOP should look at this, too, but that I think is potential for a huge amount of product that is going out that is not tracked as a complete whole audit trail or there's big potential for fraud and people shipping this stuff around.

So I think that was really all I needed. So I'm done.

Any questions?

CHAIRMAN O'ReLL: Thank you, Emily.

MR. KARREMAN: Yes.

CHAIRMAN O'RELL: Hue, and then Joe, and then Jeff.

MR. KARREMAN: This question, it is kind of for you, Emily, but also for Mark. Regarding the materials that came out on July 17th, what part of the -- it is for
Mark, actually -- what part of the process are we in there? Are we in what is called ex parte or can we or individuals still have some input, or can we help you, or is it what you would call ex parte? If that is the case, do you declare when that starts or not?

MR. BRADLEY: For the proposed rule that closed --

MR. KARREMAN: For the 12 materials that took four years to go through.

MR. BRADLEY: Oh, those?

(Laughter.)

MR. KARREMAN: On July 17th, that ANPR.

MR. BRADLEY: We would be in ex parte right now, but in ex parte you can discuss things that are -- we can't allude to what the final rule would be on that, but we can hear discussion as long as it is recorded, and this is.
MR. KARREMAN: Because in the AN--

MR. BRADLEY: At a public meeting.

MR. KARREMAN: In the ANPR, I think it said that the Secretary will engage in further discussion on various materials.

MR. BRADLEY: Like this.

MR. KARREMAN: Is that still happening now?

MR. BRADLEY: That's what this is.

MR. KARREMAN: Right now, okay.

Well, is there anything we can -- I mean, with all the public comment that we have put in as a group, is there anything that needs more clarification or enunciation regarding those non-NADA products that the Secretary doesn't want to add?

I mean, do you guys understand what the industry and some of the experts out here are saying about the non-NADAs?
And is that maybe going to be incorporated in your response?

MR. BRADLEY: We will consider that when we draft the final rule.

MS. ROSEN: Okay, can I ask another question? A followup on that would be, the restrictions, the withdrawal times, you know, you said you couldn't do that because FDA wouldn't let you do it. A lot of Board members signed a letter saying, okay, we really recommended restrictions; here's another way to do it.

Can you go back to them and see if they would approve whatever your new version is going to be, if there is one, on withholding time, like before the next proposed rule?

MR. BRADLEY: Let me look at that.

MS. ROSEN: Okay.

MR. BRADLEY: I'll see what we can do. We understand what your concerns
are.

CHAIRMAN O'RELL: I have Joe and then Jeff and then Gerald. Joe?

MR. SMILLIE: Without getting into a detailed discussion, which we don't have the time for, I hear your issue about brokering of trucked feed products and all that. It is really complicated. It is tricky. We don't have the clear lines like we do with canned or labeled, packaged products.

MS. ROSEN: Right.

MR. SMILLIE: I think there is the opportunity for fraud there. But, basically, primarily, if you use the word "broker," they don't have to be certified.

MS. ROSEN: Not the way I read the rule.

MR. SMILLIE: I know. I recognize that we are looking at it differently. So I would like to pursue that conversation.
MS. ROSEN: Okay, sure.

MR. SMILLIE: If I get a written statement as a certifier rep, I will certainly act on it.

MS. ROSEN: Okay, very good.

MR. SMILLIE: We will start to look at it in CAC.

CHAIRMAN O'RELL: Jeff?

MR. MOYER: Yes, my question was in the same vein. When you are talking about broker, are you talking about somebody who actually takes ownership of the product?

MS. ROSEN: Yes, yes.

MR. MOYER: Versus somebody who is just moving product for someone else?

MS. ROSEN: The definition of handler, let's see, says that, you know, someone who is handler, handlers are -- brokers are handlers. Anyone is a handler who sells, processes or packages, except it doesn't include to sell, transport delivery of crops or livestock by the producer to the
handler.

So if you are delivering your crops and livestock to the mill, that's not a problem. But someone else comes in and takes it and brings it over there, they are a handler and they are not excluded.

MR. MOYER: Even if they don't take ownership of it, if they're just a -- you're talking about an outside --

MS. ROSEN: Ownership is not really mentioned in the rule. But, I mean, it does say -- well, you know, we could go around about that. It is probably worth more discussion.

MR. MOYER: Yes.

MS. ROSEN: Yes.

MR. MOYER: It would be.

CHAIRMAN O'RELL: Kevin -- or, I'm sorry, Gerald and then Kevin. I had Gerald up.

MR. DAVIS: Emily, on peracetic acid, the List 4 inert, what is that?
MS. ROSEN: I'm trying to remember if it is on the label or not. I'm not going to answer unless I checked the label. I'm not sure if I am supposed to say that.

If you read the FDA center of identity for peracetic acid, they mention it there. So I guess it is probably public, but I am not sure that it is disclosed on the labels of the registered pesticides.

MR. DAVIS: So the people you have talked to claim that it is in all formulations of peracetic acid?

MS. ROSEN: I'm pretty sure it is because it is a stabilizer. Otherwise, peracetic acid is pretty -- you know, disassociates really rapid and wouldn't be as effective.

CHAIRMAN O'RELL: Kevin?

MR. ENGELBERT: Emily, I would like your opinion real quick on where you think milk falls into this category of
truck, because milk is transported farm to plant, plant to plant. It is transloaded from trailer to trailer. The trucking companies never take ownership, but it is --

MS. ROSEN: Could I defer that question to Leslie or maybe Jim Pierce wants to answer that? I'm not quite -- I haven't really thought about that angle.

MR. ENGELBERT: Okay.

MS. ROSEN: I know initially we used to worry about it, and there's some -- Jim, do you want to answer that?

MR. PIERCE: Jim Pierce, Organic Valley.

I think the solution to both the milk, and then wider to the feed and hay issue, is that that needs to be part of either the shipper or the receiver's handling plan.

In our case, we have a tanker affidavit on file for every milk-hauling company we are dealing with and livestock-
hauling affidavits to get those animals to the slaughterhouse, and in a lot of cases, trucking affidavits for feed companies, and whatnot.

Where it breaks is exactly where Emily said, when it is wrapped and contained in a package. Then it is common carrier, and you just make the contractual agreement.

But, in addition to a thousand certificates, we've got a few dozen trucking certificates that we maintain on file.

MS. JAMES: I just want to say real quick, otherwise, wouldn't we have to certify UPS?

(Laughter.)

I know, but I'm just trying to make a point that they are just a courier and --

MR. PIERCE: But anywhere where there's a chance for contamination, and milk-hauling is an excellent example -- they could either wash with the wrong materials
or haul without a clean truck. There's lots of potentials, and they are on file as understanding basic organic regs and signing off that they are going to follow them.

CHAIRMAN O'RELL: Any other questions or comments for Emily?

(No response.)

Thank you, Emily. We appreciate your comments.

I think I failed to announce who was on deck. Steffan Scheide and then Lisa Engelbert.

Steffan? Sorry about not giving you notice. We got a little distracted.

People want a break? Okay, we are going to give you a chance to get yourself together. We're going to take a little break. There's been a request for a bio break here.

(Whereupon, the foregoing matter went off the record at 5:35 p.m. and went back on the record at 5:53 p.m.)
CHAIRMAN O'RELL: Lisa Engelbert is on deck.

Okay, you have the Board members and you have their attention. We are fresh and ready to go. So this should be an advantage for you.

(Laughter.)

Bea is going to be a little bit late. So I am going to try to manipulate her little timepiece here.

MR. SCHEIDE: Thank you for the break, Mr. Chairman. Also, thank you to each and every member of this Board for steering all of us through the sunset process. It certainly has been exciting, and it has been fun. Sadly, I do have to comment on the sunset material.

My name is Steffan Scheide. I am affiliated with Summit Hill Flavors, and I am a food product developer.

I am speaking out today again for the retention of colors on the National List
under sunset. The removal of color, non-synthetic sources only, means the entire elimination of a class of ingredients as defined in 21 CFR Part 40.

Colors are entirely regulated by the FDA. It means, even though that we have organic certified turmeric, organic beet juice, organic carrot powders available commercially, they are now gone and they can no longer be used.

This means that if this Board decides that colors fail sunset, after October 2007, we will no longer have those organic food products which contain color. For example, organic hotdogs, organic beverages, organic candy, and I don't even want to think about the impact on organic clothing and organic cosmetics.

So, in other words, if color is already listed, then I would implore this Board to come up with some type of sunset process for the delisting of colors and also
for the type of use of colors in manufactured items up until October 2007.

Therefore, I implore you to please keep colors on the National list, where they currently are.

I think the impact is really going to be significant to the organic industry. We have heard a manufacturer of colors today, which I am kind of happy about, because there is a lot of progress being made for subcategories of colors.

Now even though I am aware of the petitioning process, not one manufacturer of organic certified colors has actually petitioned, and I am wondering why that is the case.

That really worries me. Why are manufacturers of conventional colors petitioning conventional colors under 606, whereas none of the manufacturers that I'm aware of have been involved in this process?

I think there's another issue
that we have to recognize as part of the petitioning process. Clearly, if you change the definition of agricultural/nonagricultural, you can petition colors onto 606, but it is only the FDA that makes a determination of what actually is a color.

Can this Board actually determine, for instance, if I use a barley malt that I use for a coloring material, to be a color? Or do I have to petition to the NOSB or the USDA an item with an annotation for color use only?

So I am a product developer, and I am concerned about the impact that that will have. If this Board decides to delist, I will have to ask our salespeople to basically inform our customers that, after 2007, we are no longer going to be able to manufacture products that contain food colors both within food ingredients or within the final food product.

So I thank you for your time.
CHAIRMAN O'RELL: Thank you, Steffan.

We certainly recognize the potential train wreck, for lack of a better term, but it is definitely an issue that this Board recognizes for colors.

The easy thing to do would be to pass colors. We have tried that, and we received some objections to procedure, that colors previously was not petitioned -- or was not recommended by the Board to be listed.

We are going through sunset now, which we have limitations in terms of what we can do. We can renew it or not. If we choose not to, this could be challenged, and somebody might have the false belief that they're okay, and then down the road we get in a situation where we're told colors procedurally is not accepted by OGC or the program, maybe a legal challenge.

We really want to have an answer
to this. Our answer back in April was petition, petition, petition. Get those materials on the list for consideration on 606 that are not available organically.

Obviously, if it is available organically, it continues to be used. That is not a problem.

We would welcome for that magic solution truly. We have talked with the program. We understand the list of petitions we have. We need to expedite those. We need to work in collaboration with the program to get those petitions that are currently in reviewed.

If there is information that still needs to be supplied by petitioners, to get those back in a quick manner and give the petitioners an opportunity to get those petitions corrected and back in place, so that at least the materials that have been petitioned, we can deal with in a timely manner before the June 2007 deadline.
But I understand it. It is a big challenge.

Any comments, questions?
Andrea?

MS. CAROE: I don't know that even renewing this material on the present list is going to help you. The reason I say that is because the colors that we are seeing are agricultural, and being agricultural, they're not allowed by -- they're on the list for nonagricultural colors.

So maybe a color that is coming from a mineral or something is allowed by the present listing, but a color from agriculture, it is not on the National List right now. It needs to be put on 606.

We have the petitions. All we can do is be cognizant of that and expedite that process as much as possible to best service.

MR. SCHEIDE: I would like to
add, I do thank you for finalizing or completing the sunset process, and for consistency for the industry, if you could come up with a vote about the future of colors, I think that would help us all, independent of how petitions proceed.

So thank you.

CHAIRMAN O'RELL: Thank you.

Any other questions?

(No response.)

Thank you for your comments.

Lisa Engelbert?

Liana Hoodes, up on deck.

MS. ENGELBERT: Good afternoon. My name is Lisa Engelbert. I am Co-Administrator with NOFA-New York Certified Organic in Binghamton, New York. I work primarily with the dairy farms in our agency.

First of all, a big thank you to all of you. As I said at the last meeting, I am seeing really firsthand how much time
you really put into this.

(Laughter.)

We really, really appreciate it from a certifier's point of view and from a producer's point of view.

The same goes to the NOP. We really appreciate all the effort you guys are putting forth.

I would like to thank Mark and Barbara, even though Barbara is not here, please pass that on to her, for clarifying where there's no proposed pasture rule in place yet.

I am sure you have all noticed that we are not swarming with dairy farmers at this meeting. Partly, pasture wasn't on the agenda, and it is busy harvest season. But I think the main reason is the producers really have faith that the NOP is going to get this done.

They are disappointed it hasn't been done yet, but they do have faith in the
program. So you can pass that along to Barbara, too.

I agree wholeheartedly, and NOFA-New York agrees wholeheartedly, with Lisa McCrory's comments on the origin of livestock. I know the chart was really meant to help, and we really appreciate that, but we've gone from a two-track system to a seven-track system.

Even in the seven-track system, there are some pretty serious questions that aren't answered yet. So, hopefully, we can revisit that.

I also would like to put forth to the NOP, on issues like this, I love the idea of what the NOSB is doing, putting forth questions to certifiers for input. I think most certifiers are really, really open to that from not only the NOSB, but from you as well, on issues like this, to get input from the people that are doing it.

It is very difficult out in the
field to have a farm side by side, two farms side by side, one that transitioned under the 80.20 and one that transitioned or became certified however else, and have to hold them to two different standards. It is just very, very difficult to explain that to them.

It just doesn't make any sense to think that the 80.20 people had a big financial advantage during transition when the pre-NOP people, once their land qualified as organic, they basically had a 90-day transition at 100 percent organic feed. So I just wanted to put that out there.

I also have to really question, can we legally treat two groups of producers producing the same commodity differently? Is it legal?

The intent of the rule is clear. Once a farm becomes certified to produce organic milk, they should be managing all
livestock, whether farm-raised or purchased, organically in the last third of gestation. This is a scale-neutral rule. It doesn't matter if they have five cows or 5,000 cows; they are following the same rule. And I think that is the true intent of the rule.

I would like to comment on the cost-share program. Barbara had mentioned that there's a lot of money left over each year. I don't know any of the details with that, but I do know that the majority of the farmers that we are working with -- and this is not only dairy; this is all producers -- are taking advantage of this cost-share program. It means a lot to them. It means a lot especially to new, small-scale people that are just starting up, that the certification fee may be a burden, the first few years especially. So I hope that program can continue.

We agree also that there needs to be standardized certificates in English,
please. We do see some in foreign languages, and we say we have to have this in English.

We agree that it should list all crops and products produced, including what labeling category a product falls in. It doesn't need to be so prescriptive that you get down to varieties within sweet corn, for example, or broccoli.

We also agree that there needs to be some sort of a date on certificates indicating either the last date of inspection or the last date of Committee approval for that farm. Out in the field, it is difficult for inspectors, when they see a certificate from 2002, to know for sure whether that certificate is still valid. So if there is some sort of a mechanism there -- I don't really think we need expiration dates. I think that could create a whole new nightmare, but some sort of an annual date would be really helpful.
Once again, I want to comment just on the broker issue. We are hearing things also in the field, especially with grain, that there are people calling themselves brokers that are basically taking possession of organic grain, offloading it at non-certified facilities and then reloading it and transporting it elsewhere. So that really is an issue.

CHAIRMAN O'ReLL: Thank you, Lisa.

MS. ENGELBERT: You're welcome.

CHAIRMAN O'RELL: We appreciate your comments.

Any questions for Lisa? Kevin, it is your opportunity to get a response on the record.

(Laughter.)

MS. ENGELBERT: He wouldn't dare.

(Laughter.)

MR. ENGELBERT: I would pay later.
(Laughter.)

CHAIRMAN O'RELL:  All right, we won't go there.

Thank you.

Lianna?

Julianne Mayo is up next.

MS. HOODES:  Hello, all.  I am Lianna Hoodes.  I am the Organic Policy Coordinator of the National Campaign for Sustainable Agriculture.

I am sorry I don't have a copy of my comments and I will get them to you, but they have now been changed. Really good stuff this afternoon. So I need to add some more things. But there is a copy of an attachment that I thought you would be interested in.

The National Campaign is a national network of organizations and individuals working to advance sustainable ag policy. We have environmental groups, consumer, health, animal welfare, food
security, and other interests that support ag policies.

We want to compliment the work of this Board and the National Organic Program in your ongoing work to support the premiere standard of sustainability in agriculture, organic agriculture. That is really important. That is what it means to us in sustainable ag, that high bar, and you're the ones that set and keep that high bar of organic integrity.

I am going to leave most of the docket questions for my written comments, but I want to spend some time talking about what some of the work of the National Campaign groups, the National Organic Coalition, and the Sustainable Ag Coalition, and others on Capital Hill do to advocate for organic programs.

We advocate for many agricultural programs that support the work of organic farmers, such as the Conservation Security
Program, ATTRA, SER, Organic Transitions Research Program, as well as the NOP budget and the National Organic Certification Cost-Share.

This advocacy is vital, because without it, programs for organic farmers and family farmers are easy targets, and with it, it works.

Unbelievably, ATTRA, for instance, for the past six years, in the President's budget has been zero, zeroed out. With advocacy from all of our groups, we have been able to bring it back, but it has gotten level-funded for six years, but at least it has something. Can you believe that they would zero out that really efficient program of ATTRA? With our advocacy, we can bring it back.

With regard to the National Organic Program, last year's FY 2006 funding was at $2 million. Proposals supported by the National Organic Coalition, as well as
virtually all others, including the President, House, and Senate, called for an increase in NOP budget to $3.13 million.

We all acknowledge that that isn't even enough. We need more in the NOP budget to really get the job done. We have to keep pushing for it.

National Campaign groups and the National Organic Coalition have also supported a request for additional funds for the National Organic Certification Cost-Share Program in the amount of $1.5 million. The cost-share it the only program that goes directly in the pockets of farmers. It provides reimbursement for cost of certification. It is vital for organic farmers that this be continued.

But, for 2007, all funds have been expended from this program, and it awaits reauthorization in the next farm bill. Without additional funding, though, in 2007, there will be no national cost-
share money available, and the future in the next farm bill is in serious jeopardy. You can't go into the farm bill trying to reauthorize a program that has lapsed.

According to information directly from NOP, and you'll see on your chart, the National Organic Certification Cost-Share Program figures show that 89.16 percent of the funds allocated to the states has been used by the states. This usage doesn't really show quite all of the usage. It is probably a little higher than that. You will see California supposedly hasn't used its money. We know California will use all the money that it was allocated.

Of the 44 states that applied for funds, a mean of 82.99 percent was used by each state. This is a very, very well-used program and extremely important.

The Senate budget offered a compromise by proposing that $500,000 of the $1.31 million increase of NOP be used for
certification cost-share, leaving the rest for NOP. We support this compromise position at a time of severe fiscal restraints since this does provide for an increase for NOP and a small amount of money to pay for direct farmer payments. Farmers aren't and shouldn't be pitted against the agency in this compromise. Ideally, we would and we hope to find additional funds to make both funding proposals complete, but that just isn't always possible.

Also, please don't get confused with the Risk Management Agency, Ag Management Assistant Cost-Share. That is a whole different program, and that is where you might have gotten confused on some numbers that were presented earlier. There is another program, but that is only for 15 states.

So the federal program for all of our organic farmers in the pocket to help them support their work to produce organic
product and to protect environment is that certification cost-share.

Thank you.

CHAIRMAN O'RELL: Thank you, Lianna.

Any questions?

(No response.)

Thank you.

Julianne Mayo, and Lynn Coody is up next.

MS. MAYO: Hello, all. Julianne Mayo from Ocean Nutrition Canada. I am happy to be here from Nova Scotia, and I thank you very much for continuing to take comments, despite it being past our allotted time.

To put my comments in context, Ocean Nutrition is an omega-3 fish oil ingredient manufacturer and supplier. We make omega-3 fish oil patter that can be added to foodstuffs for human consumption.

This is different from
previously-discussed fish oil applications that you have heard today. This is intended for the food industry.

One of our applications is the addition to organic foods in the 5 percent non-organic portion. Therefore, we want to really address the agricultural/nonagricultural petitioning under 606 issue.

Our type of product is not really the first thing you think of when you consider organic applications. We want to be sure that our place in the organic industry as a healthy food ingredient is not lost in the shuffle in these debates we have been having. We have a very vested interest.

We have previously submitted comments on the NOSB recommendations in writing. So I did not bring duplicate copies today. You should have them, and they were posted on the NOSB website for anybody else in the audience who wants to
see them.

After hearing discussion over the past two days, I can say it has been extremely informative, very helpful for me.

I do want to reiterate that we are in support of the clarification of agricultural and nonagricultural definitions. More specifically, we do support the decision tree approach, and we would like the text of the tree rooted in the definition as well.

However, we do caution against oversimplification. It has been suggested that if something is truly agricultural, that means it can be grown organically. As you have seen from today, omega-3 fish oil, fish products, and, in particular, omega-3 fish oil is an example of an exception to that idea. We currently cannot have omega-3 fish oil that is organic.

However, we do feel that fish oil products like omega-3 fish oil for human
consumption are agricultural. Some people are onboard with that, but we have had others that have questioned it. We are concerned about that seemingly still gray area of how to consider products such as ours.

I had hoped to see acceptance of a revised agricultural and nonagricultural definition at this meeting, but, as we saw today, it is not looking that way, from the hand that was played earlier today.

As Arthur Neal pointed out earlier today, processing of petitions for 606 may be delayed where agricultural and nonagricultural designation is still unclear. This is a serious cause of concern for us.

We ask the Board to recognize that omega-3 fish oil for human consumption is an agricultural substance, so that we can continue and have our petition processed by the NOP. We have already submitted our
petition earlier in the summer for fish oil and for fish gelatin.

Further, during your continued work on the development of more robust definitions for agricultural and nonagricultural substances, we ask that you please consider explicit inclusion of aquatic animals. Omega-3 fish oil is sourced from the byproduct of wild fish. Therefore, it likely won't come as a surprise that we would specifically enjoy seeing the inclusion of wild captured fish in an agricultural definition.

So since you are still proceeding to work on it, and it is not looking like it will be decided at this meeting, at least it is a silver lining in the cloud that you can, hopefully, try to focus on including some specifics in the agricultural definition like certain animals as aquatic animals versus just animals. So that seems to be a bit of an issue still.
So I want to keep it super brief since you are here late and open it up to any questions, because I know we are in an area that is not necessarily something a lot of people have been exposed to. So if you have any questions at all, let me know.

CHAIRMAN O'RELL: Thank you.

Joe?

MR. SMILLIE: Yes, I'm obviously losing it.

(Laughter.)

MS. MAYO: It's late.

MR. SMILLIE: But why would --

MR. GIACOMINI: No, he's just obviously losing it.

(Laughter.)

MR. SMILLIE: Why wouldn't you want to be on 605(a)?

MS. MAYO: Oh, because that's for, if I remember correctly, nonagricultural, isn't it?

CHAIRMAN O'RELL: Yes,
nonagricultural.

MS. MAYO: Nonagricultural.

MR. SMILLIE: Right.

MS. MAYO: And so we feel it isn't --

MR. SMILLIE: Non-synthetics allowed.

MS. MAYO: Yes, well, we feel it is an agricultural ingredient because it is derived directly from fish.

MR. SMILLIE: Am I missing something?

(Laughter.)

We have a number of products that aren't like yours but that are similar that are on 605(a).

MS. MAYO: Yes.

MR. SMILLIE: I would love to see your product be allowed because I think it is a very healthy, good product, but I would see it as really a long, uphill battle to get it on 606 because of all the issues
surrounding it.

MS. MAYO: Right.

MR. SMILLIE: And I am just wondering that 605(a) wouldn't serve your purpose to keep it as allowed. Because if you don't get on 606 and you're not on 605(a), you will be one of the deaths.

MS. MAYO: Yes, that's what we are really concerned about. But our understanding of the agricultural, what is agricultural has always been that we do nothing to chemically alter this oil. We pull it out of the fish. It is a fish product. There is very little removed from the fish itself. Therefore, that is what makes it agricultural. So that is where it needs to be.

CHAIRMAN O'RELL: Gerald?

MR. DAVIS: Would your company's desire to have it be considered agricultural, it is because of concerns about the 95 percent organic versus 100
percent organic and all that, so you can position your product for more categories of organic?

MS. MAYO: No, no. Well, not in the foreseeable future would we ever operate as an organic product because it is fish. So we know that for a long time to come we will always be in the non-organic portion. So it would really be up to our customers if they are seeking a 95 percent or 70 percent designation.

But at this current time, and I don't foresee it in the early future, we would ever be in a product that was considered 100 percent organic. So our product development hasn't been based on that at all because know that we are always less than 5 percent in terms of the technical amount that you have add to get EPA and DHA levels. So it is up to the customer for what designation they want, but it is not something that we target at all.
CHAIRMAN O'RELL: Well, I would think that just if you want your customers to have the availability of use of organic products, that at least at this point in time, until there is some definitive direction for aquaculture and how the regulations apply to organic, that you file a petition to have them in 205.605(a) -- 605(a), yes.

MS. CAROE: As a nonagricultural ingredient.

CHAIRMAN O'RELL: Right, yes.

MS. MAYO: But it's not nonagricultural. Like we are not trying to do it to get around the regulations, and where do we get on a list so that we are on a list. We are trying to do it -- you know, we do feel we are agricultural. So we are attempting to be where we think we are supposed to be, which is as an agricultural ingredient.

CHAIRMAN O'RELL: Okay. You've
already --

MS. MAYO: But this is why we're here, because there is debate, and we're not really sure why.

CHAIRMAN O'RELL: Okay, I've stirred up the Board. They're awake now.

(Laughter.)

Nancy?

MS. OSTIGUY: Well, I'm somewhat puzzled as to what the argument would be that it is not agricultural. I don't understand --

MS. MAYO: As are we.

MS. OSTIGUY: I don't see how safflower oil or Canola oil is different.

MS. MAYO: Yes, that is one of the reasons that I am here and was hoping for discussion, because whenever we have had somebody say, "Well, we don't think you're agricultural," we've never gotten a good reason for why they think that. We just don't see the argument in it. So I am in
complete agreement. We don't know why.

MS. CAROE: I don't get it, either.

CHAIRMAN O'RELL: Kevin? Dan?

MR. GIACOMINI: Your company is the one that has already submitted the petition --

MS. MAYO: Yes.

MR. GIACOMINI: -- that is listed on our list? Okay.

MS. MAYO: Yes.

MR. GIACOMINI: I just wanted to clarify that.

MS. MAYO: Yes, Ocean Nutrition.

MR. GIACOMINI: So they have already submitted a petition for 606.

MS. MAYO: Yes, uh-hum, based on our understanding --

MR. GIACOMINI: Okay.

MS. MAYO: -- and guidance from various groups. We did try to go to several different groups before we filed, and we
kind of had to go with most people fell out on the agricultural side. That is where we really feel we need to be. So that is where we decided that the petition was most appropriate.

CHAIRMAN O'RELL: Gerald?

MR. DAVIS: But, realistically, for their problem, we are a long ways off from dealing with the wild-caught issue. Are we -- not talking organic; never mind.

MS. MAYO: Yes. No, we are not trying to get it organic, yes.

MR. GIACOMINI: It is just ag.

MS. CAROE: It was just the answer, you know, that this is not about making an organic fish oil.

CHAIRMAN O'RELL: Right.

MS. CAROE: This is about allowing fish oil, when it is unavailable in an organic form, as a conventional.

MS. MAYO: Yes.

MR. GIACOMINI: Considering it as
CHAIRMAN O'ReLL: So you've done the right thing.

(Laughter.)

MS. MAYO: Can I have that on the record, please?

(Laughter.)

CHAIRMAN O'ReLL: It is on the record.

MS. OSTIGUY: And I'm looking at 606 and kelp is on there. The last I knew kelp was ocean also.

MS. MAYO: Yes.

MS. OSTIGUY: So it can't be that it is ocean versus land. I'm just puzzled.

MS. MAYO: I understand your puzzlement.

(Laughter.)

MS. CAROE: Jim is going to answer the question.

CHAIRMAN O'ReLL: Okay, Jim.

MR. RIDDLE: Yes, Jim Riddle.
For the purpose of the organic regulation, it comes down to the definition of livestock, which specifically excludes aquatic animals. That is what we are stuck with right now. That, eventually, probably will be changed, but that is the way it is right now.

MS. MAYO: Isn't there, though -- I was trying to find it earlier today -- isn't there a section that says fish for use as food, like for food use? I was trying to remember where I found it, and I couldn't remember.

MR. RIDDLE: In the law, I think it is.

MS. MAYO: So, anyway, that's our issue.

CHAIRMAN O'RELL: It's a good one.

MS. MAYO: Thanks.

CHAIRMAN O'RELL: Judy Ellis is on deck.
MS. COODY: Oh, no.
No, no, no, you're up. Sorry, Lynn. We wouldn't do that.

MS. COODY: Well, here I am again. I have an issue that probably is just as fishy as the one heard about, but it has nothing to do with fish. This is about the Peer Review Panel and other issues related to accreditation.

My name is Lynn Coody. I am from Eugene, Oregon, and I have a consulting firm called Organic Ag Systems Consulting that specializes in certification and accreditation issues.

Earlier on, Joe gave a good overview of the peer review section, the regulatory language related to the Peer Review Panel. Remember that there is a mention of the Peer Review Panel in the Organic Foods Production Act, and that basically says certifiers should review each other.
Then in the rule it is a little bit different. There it says the Peer Review Panel reviews the NOP accreditation systems for compliance with an international standard called ISO 17011 and for compliance with the agency's own regulations.

So we heard Rich Theuer before go back, harken back to the original NOSB, but I'm going to go back to pre-history. Before there was an NOSB, before there was an NOP, there was me.

(Laughter.)

And I helped to write the Organic Foods Production Act.

CHAIRMAN O'RELL: You are the beginning.

MS. COODY: Well, I wasn't the only one, but I was there when we were writing it.

In the section on the Peer Review Panel, we thought of this as a mechanism to provide oversight of the NOP's accreditation
system. Of course, we didn't even really know what the accreditation system would be because in those days we didn't know much about accreditation.

Our collective understanding of accreditation issues was much different than it is today. So at that time, we decided that we needed some system, though, to oversee the whole thing. We wanted to make sure that there was a public/private component of this, that there was people from outside the USDA overseeing this. That is why it is written as it is, in the Organic Foods Production Act.

At that time, we were unaware of the international ISO standards for either certification or accreditation. It seems hard to believe, but that's the way it was.

These days, now, the expectations of organic guarantee systems are much higher and the concepts in the rule reflect the current practices more closely than those in
OFPA. So the rule is closer to what we know today than OFPA is.

So I only have a little time, and I have lots to say about accreditation. So I am just going to try to ask you to make sure you try to use the concepts in the rule other than OFPA when you are writing your peer review recommendations.

Remember, there already is an NOSB recommendation from 2001 that is based on the rule. So that is a darned good place to start.

So here are five things that I am concerned about about just relying completely on the OFPA standard:

I am concerned that the peer review system in OFPA does not provide a direct mechanism for evaluating the NOP's accreditation program. Attention would be focused on the deficits of an individual certifier instead of the inability of the accreditation system to find and deal with
the deficits.

Unless there were a mechanism that allows an overview of the results of the peer review process, as defined under OFPA, it would be very difficult to piece together a picture of the management of the entire accreditation program. That is the most important point.

Secondly, OFPA does not require the NOP to comply with ISO 17011 specifically. In my opinion, conformance with ISO requirements is essential for transparency, competency, and international acceptance of our NOP program.

A quote from the July 2003 NOP press release announcing the contract to hire ANSI to perform the so-called peer review assessment that we have right now says, "International acceptance of U.S. agricultural inspection and certification programs is important in order to ensure domestic producers are fairly treated around
the world." We know that this happens through ISO 17011.

Third, certifiers vary greatly in their ability to conduct an internal audit of another certification body, as would be required under the rule -- I mean under the OFPA system.

Conflict-of-interest issues arise when certification agencies have spent years investing the infrastructure of their quality systems, which would then be open to their competitors through the OFPA-based peer review auditing process.

And my fifth point is the NOSB's own recommendations on Peer Review Panel are based on the rule, not the concepts in OFPA. We have had little public exploration of a system based on certifiers doing peer review, and a thorough exploration of public comments would be necessary.

I have three other whole issues to talk about about accreditation, which
obviously I don't have any time to do. So I want to just let you know, finish up by saying, I did provide the CAC Committee with papers that explain whole models for incorporating bold things, so you don't get sued from not complying with OFPA, and yet you still are doing the rule process. They already have those papers.

If they need help to understand them, just call me. They are hard. It takes some thinking.

Thanks a lot.

CHAIRMAN O'RELL: Lynn, thank you.

MS. COODY: Okay.

CHAIRMAN O'RELL: We have a question.

MS. COODY: Okay.

CHAIRMAN O'RELL: Andrea?

MS. CAROE: One of the things that, Lynn, I am not quite sure you know about, and probably do, is the IG oversight
on this government program.

    MS. COODY: Right, yes.

    MS. CAROE: And the fact that there is a quality systems oversight --

    MS. COODY: Right.

    MS. CAROE: -- already happening --

    MS. COODY: Yes.

    MS. CAROE: -- as just being part of the government.

    MS. COODY: Yes.

    MS. CAROE: So, you know, one of the things that we will be looking at is, does ANSI or that type of audit or another systems audit actually get us any further down the line?

    MS. COODY: It gets you further down the line in complying with ISO 17011, as required by the rule, but it doesn't do, in my mind, much to comply with the peer review part of OFPA because it doesn't -- well, I can't really explain it all unless I
take a lot of time. But there are other components that need to be addressed.

I thought that both ANSI and the Inspector General efforts were extremely valuable. I think that the outcome of the reports were right on, and I am happy that the NOP is now saying that they are ready to work on their quality system in a really intense way. That makes me really happy, and I know that they will do that to try to comply with ISO 17011, since that was the outcome of those two, both reports that pointed out many non-compliances with that international standard.

So good luck to the Accreditation Committee. I know you have a lot ahead of you.

CHAIRMAN O'RELL: Well, don't think you're off the hook, Lynn.

(Laughter.)

We know your phone number.

MS. COODY: Yes. Okay.
CHAIRMAN O'RELL:  Thank you, Lynn.

MS. COODY:  Okay.  Thanks a lot.

CHAIRMAN O'RELL:  Judy Ellis is up, and David Engel is on deck.

MS. ELLIS:  Hello.  Thank you so much for all of this hard work that you all are doing.  It has been an eye-opener for me.  I'm an organic consumer, and it is very, very important to me that the quality of organic products is high.

So with that in mind, I would just like to read this.

With all due respect, were the regulations and precedents created to ensure the integrity of organic products are uncompromised or are the regulations and precedents established for the sake of protecting the regulations and precedents?

If yeast and organically-grown microorganisms are better for the organic movement under Section 606, then why don't
we or why don't you reinterpret the definition of agricultural to include organically-grown microorganisms as well as yeast? Why allow the precedent in which the original intent was to protect the organic movement prevent the organic movement from moving forward? That's my question. Could you reinterpret it without changing the definition?

CHAIRMAN O'RELL: I guess it is a question to us.

MS. ELLIS: You don't have to answer me.

CHAIRMAN O'RELL: Joe, take a stab.

MR. SMILLIE: I'll take a stab at it.

(Laughter.)

CHAIRMAN O'RELL: Thank you. Thank you.

MR. SMILLIE: I hear what you're saying, and that's the frustration. But,
you know, it is a question of process and regulation. The thing is you have to do the right thing by creating the right structure, so that all decisions are processed the same.

And you can't just say, well, we're going to take this particular product because it is the right thing to do and allow for it. Because once you have done that, you've broken the structure. So, therefore, you have literally opened the box. So then other people say, "Well, if you did that for them, you must do this for us."

So we have to have a level line from which to proceed. That is the regulation. So we have to find a regulatory basis to make good decisions.

And if we make good decisions and use bad process, then it will hurt us more in the long run. That is, I guess, the belief that we are all committed to.
So we want to make the right decisions, but we've got to have the right process, too. So we have to find regulatory justification and a consistent way of interpreting it.

MS. ELLIS: I understand. I am wondering if perhaps it could be amended. If something, like the gentleman mentioned, if something worked 10 years ago, but now we realize it is not working, is there a way to change it?

MR. SMILLIE: I think we are committed to finding the solution to solve that problem. It may not happen as quickly as we would like it to happen, but I think we are committed to finding that solution.

CHAIRMAN O'RELL: Dan? I'm sorry, Joe.

MR. GIACOMINI: We have a petition in front of us. As Joe was saying, if we an error, we have to fix it within the structure. We have a petition in front of
us to remove it from 605 and to put it on 606. That would essentially do that, and if we can do that without having to change the definition of agricultural product, we will proceed, if that is prudent, we will proceed in that way.

MS. ELLIS: That would -- sorry, you were going to say something?

MS. WEISMAN: Well, I was going to say, in addition to that, we are here because we are trying to work out how, you know, what changes are possible. That is exactly what we are here for. We are looking at all the different ways that -- you know, what different bases could we use for changing the definition.

But I can appreciate how frustrating it is when you get a snapshot view and haven't had a chance to sort of -- I mean this is something that has been engaged in over a long period of time because we are trying to find the right way
to do it. It is not that we are trying to shirk that or not do it.

MS. ELLIS: No.

MS. WEISMAN: I mean there are some issues that you have heard about today where there's a little, you might have sensed a little more of a feeling like, well, this is the way it is. This is not one of them. I think we are very willing to try and be creative and explore all the different ways that we could look at it.

MS. ELLIS: And please forgive me; I don't want to seem hostile at all. I'm very impressed with all of you and this meeting, and you're the cream of the crop. You're leading the world with the regulations. You're leading the world.

This group of people right here, the NOP and the NOSB, you are creating standards that are going to affect the international community. I highly respect you and I am thankful for the work that you
I am just wondering, can you reinterpret agricultural. That's all.

CHAIRMAN O'RELL: Okay. Well, thank you.

MS. ELLIS: Thank you.

CHAIRMAN O'RELL: We appreciate your comments. Thank you, Judy.

David Engel, and then Richard Siegel.

MR. ENGEL: Good evening. My name is David Engel. I am entering my 26th year as a dairy farmer, organic dairy farmer, and have been certified organic for almost 20 of those years. I have also been intimately involved with the certification side of the organic industry for the past 18 years, and I am presently the Executive Director of Nature's International Certification Services.

My comments this afternoon are addressed to the NOP and, Mr. Bradley, in an
effort to help us all reach a better level of communication which will be helpful to us all.

In all human endeavors, success of those endeavors rests primarily with the success of communication that takes place amongst those involved in those endeavors. This public/private partnership that the NOP is no exception to this, and as we have experienced over the years of all of our efforts, some of our communications have been successful and some of them have not, with predictable results coming from each success or failure of communication.

Each of us has felt frustrated from time to time about different things that have happened, and as we have tried to make decisions to further our mutual cause of good, healthy food produced without prohibitive inputs.

My overall point here is that it is critical that the NOP and the accredited
certification agencies, the ACAs, develop, establish, and maintain a professional two-way regulatory relationship/partnership which enables an ACA to make their certification decisions in an informed, professional, procedural manner and which allows the NOP to provide the necessary regulatory oversight of this process.

A significant problem now, in my opinion, is that the current relationship between the NOP and ACAs is a somewhat strained relationship, due to the inevitable juxtaposition within the NOP of its perceived and actual dual roles of both serving as an accredditor and helping to make certification decisions for various individual certifiers.

It is noted and acknowledged that the NOP has made purposeful efforts to provide nationwide and international training for ACAs and to help ACAs better understand and manage their role of making
certification decisions. The problem occurs when an ACA makes an informed and documented certification decision and then the NOP overrides or influences that decision.

As I say above, there is within the NOP and current regulatory setup an inevitable juxtaposition of their overall responsibility of the regulatory roles of certification and accreditation, Sections 400 and 500, respectively, in the rule, but it would be in all our mutual best interest to be able to have a well-developed, clearly-established process whereby the NOP concentrates its resources and attention on running a top-notch accreditation program while at the same time, when the NOP is approached with a certification issue, question, problem, interpretation, that the NOP is then able to tap into and utilize the measurable experience and knowledge of the ACAs via the ACA, the Accredited Certifiers Association.
In sum, I would highly recommend and encourage the NOP to develop and establish such a process. Indeed, I remember an NOP training session which took place at the May 2005 ATO meeting where the then-Accreditation Manager of the NOP, Mr. Mark Bradley, stated that he would prefer that the certifiers put their heads together in developing and establishing consistent, well-documented decisions on various rule interpretations.

Mr. Bradley further stated that he was mainly concerned with how well decisions are made, their documentation and justification per the rule, and that concerns regarding the actual rule interpretation itself could be addressed during required regulatory audits.

Mr. Bradley also invited the ACA members at that session to put together well-thought-out position papers on rule interpretations and submit them to the NOP
for dialog, emphasizing the need for a well-documented suggested solution, and the NOP would respond.

Right now, we are stuck in a situation that is widely variable as to how different ACAs do interpret the rule, with predictable resulting frustration amongst all ACAs.

In sum, again, I highly recommend and encourage both the NOP and the ACA to be proactive in their efforts at more successful communications for all our mutual benefits, so that we are not left pounding our fists on the counter.

Thank you.

CHAIRMAN O'RELL: Thank you, David.

Any questions for David?

(No response.)

Thank you.

Richard Siegel.

MS. JAMES: Do you have a proxy?
MR. SIEGEL: No.

CHAIRMAN O'RELL: Okay, we have somebody signed up on the list, just R-A-M, Ram. I don't know what that is. RAM, okay.

Then Richard Martin.

MR. SIEGEL: Thank you, members of the Board, for allowing me to comment, even though I missed original round of signups for today.

I am Richard Siegel, and I'm speaking now as counsel for Marroquin International Commodity Services, Grace Marroquin, who testified yesterday.

Yesterday, there were a number of people commenting and counseling the Board that they thought that the Board should not take action at this time to move a yeast from 605(a) to 606. They made a number of arguments which I think the Board took very much into account.

The hour is late, but I wanted to leave you with our responses to these three
points.

The first point that was developed was that putting yeast on 606 would affect livestock feed, and therefore, should be a time to examine this, problems that might flow from that.

The second point was that additional standards tailored to yeast should be developed before yeast should be moved to 606.

And the final main point that was brought up was that putting yeast on 606 cannot be done as the Committees recommended by way of a technical correction, that there would have to be a petition process.

What about feed? I have looked at the regulations, and I don't see any particular widespread problem that would develop if yeast moved over to 606 in the area of feed.

The feed regulations are described in Section 205.237. The
Composition of Feed is governed by Section 205.237 of the rule.

Dairy farmers, for example, that were mentioned yesterday as direct feeding microorganisms, as feed additives and supplements -- well, that regulation is very liberal about allowing feed additives and substances that are natural. They don't have to be organic.

So there is an area of these microorganisms that are fed do not have to be organic. So moving yeast over to 606 would not affect the kind of uses that farmers make on farm with microorganisms.

Who would be affected? The commercial feed manufacturers who are putting out processed feed products that are certified organic, and they would be subject to the 95.5. Well, their exposure to having to use organic agricultural ingredients would be no different from the exposure of food manufacturers. So these are people
that want to put out an organically-labeled product, and they would have, if yeast were commercial available for their needs, they would be subject to that, if yeast were on 606 and commercially available.

Now what about additional standards for yeast? We came to this Board more than two years ago, and we hate to hear another thing that might be a recipe for delay. And, moreover, it is not particularly necessary.

The regulations we have are very thorough. They are very detailed. They are very comprehensive.

We have a lot of smart certifiers in this industry, and they will be able to figure this out. In fact, they are already certifying yeast as organic. There are already certifiers that are finding yeast meets NOP standards.

So I don't see why we have to wait for the perfect set of tailored yeast
Mushrooms don't have their own standards yet. They're improvised. They're under crops. There is nothing wrong with that.

Manufacturers are just waiting to get this cleared up, so that they can make organic yeast available. Every time we delay, we keep the status quo, which is using conventional yeast instead of organic yeast. And I know this Board doesn't want the status quo.

Technical corrections, we can make this a technical correction. The Board did this itself in the year 2000. They put a comment, they gave a comment to the NOP on the second proposed rule, and they said there are seven substances on 605(a) that can move over to 606.

The NOP did that in the final rule. They took five of the seven and they moved them. They made them agricultural.
So there is good precedent for this.

Harvey does not apply because Harvey wants to put substances that are not out there yet on the National List, and that was where Harvey was focused. When the product is already on the National List, and the question is whether it is going to be a 605(a) product on the National List or a 606 on the National List, Harvey doesn't get into that.

CHAIRMAN O'RELL: Thank you, Dick.

Andrea?

MS. CAROE: Well, just stay there for just one second.

First off, the feed requirement is not 95 percent; it is 100 percent, excluding the supplements. Now very well yeast may be considered a supplement, but until we know that, I am not comfortable with us putting forward this recommendation that may have an impact. I think it would
be prudent of this Board to make sure of that.

As far as additional standards not being necessary, you may be right as well. But it just makes sense that we investigate that and look at the implications of that.

We are hearing from the trades that there's a lot more to it. It would be an error in judgment for us to ramrod forward with this recommendation, not investigating that.

And as far as the technical correction, as I mentioned earlier today, I feel that we need to just verify that that's a possibility and make sure with the program that that can happen.

Again, these are just three areas that I'm not saying have to change. I am saying they warrant further investigation before we put forward the recommendation.

MR. SIEGEL: Okay. Well, I --
MS. CAROE: And I do understand your frustration, Dick. I have seen you here at these meetings, and I know how hard that you have been working for this. However, it does nobody any good to put a recommendation out there that's going to fall flat or get us in trouble.

MR. SIEGEL: Well, I did want to leave you with my thoughts before we went to the meeting tomorrow. All right?

CHAIRMAN O'RELL: Thank you, Dick.

MR. SIEGEL: Thank you very much.

CHAIRMAN O'RELL: Thank you.

Richard Martin, and I'm just going to go back to the first name that we called, David Cox. This will be the last chance, and then you are the last.

MR. MARTIN: I'm it again.

CHAIRMAN O'RELL: You're it.

MR. MARTIN: Thank you for having me.
Richard Martin. I own Martin International Corporation. I hold a degree in marine biology and have been in the aquaculture business for 27 years.

On my way down today, I got sidelined by The Boston Globe with a big report on a study that was published today in JAMA that is a risk/benefit analysis conducted at the Harvard School of Public Health, which is a clear, very, very powerful statement about the benefit of omega-3 fatty acid delivery to human beings. I will just take a quick excerpt.

Also, just curiously, the headline on top of it: "Population Clock Reaches 300 Million People in the United States." So it is kind of a picture that is interesting right there. We have a lot of people and we have to feed them, and we have to feed them good food.

The major study was fish intake, contaminants, and health. "According to the
single most comprehensive study on the risk and benefits of fish consumption published today in JAMA, the Journal of the American Medical Association, Dr. Rimm and Dr. Darius Mozaffarian of the Harvard School of Public Health concluded one to two servings per week of fish, especially those high in omega-3 fatty acids, reduced the risk of coronary death by 36 percent and the overall mortality by 17 percent." They are astounding numbers.

"The documented benefits of fish consumption outweighed the hypothetical cancer risks from contamination by 100 to 1,000-fold. The authors state that even this is a likely underestimate of the benefit since the estimated risk of cancer already has a 10-fold safety net built in."

I think the statement says, and someone could challenge me, but my take on this is aquaculture of carnivorous aquatic species, which are the highest in omega-3
fatty acids, is the conveyor belt of omega-3 fatty acids to consumers.

In addressing your points, I will talk as fast as I can because I have a lot of stuff here. In context, I'm talking about the impact in the environment.

Open-net pen aquatic systems can minimize environmental impact through the reduction of input and maximizing bioefficiency within the feeding systems. It can be argued that a combination of polyculture, the co-culture of plants, invertebrates, and aquatic species of fish, can actually enhance the ecosystem within an aquatic environment.

A combination of limited organic input, feed, invertebrates that live off the effluent in filtered surrounding water and plant culture that contributes to the absorption of metabolic waste can be considered to be a viable model that improves the environment and location in
which these factors are in balance.

A lot of what we heard today so far compares or talks about the aquatic or aquaculture of carnivorous species, but they refer to the conventional model. They don't address what is currently in place in the organic model, which is very different and a very good place to look at what improvements have been made over the conventional model.

The differences between organic and conventional aquaculture standards are:

1. Organic aquaculture standards deliver enhanced value to the consumer in the following ways:
   - Organic aquaculture maximizes delivery of omega-3 fatty acids by lowering or eliminating feed components, especially corn derivatives, which tend to be rich in far less beneficial N-6 acids that do not contain omega fatty acids.
   - What a lot of people don't understand is in the conventional industry a
lot of the diet of carnivorous animals is pumped up with corn derivatives, which has very little value to us human beings when we eat the product or reduces it anyway.

Two, the elimination of the use of therapeutic agents such as antibiotics and anti-parasite agents are also part of the EU program. So you are removing chemicals from the system, very different from the conventional industry.

EU aquaculture has a requirement that mitigates environmental impact by limiting the use of fish oil. The fish in the EU-certified organic product is a maximum of 26 percent. The conventional industry right now uses up to 50 percent worldwide. So it is a 50 percent reduction in fish oil consumption. The elimination of the practice of forcing growth, as seen in the conventional system, is also taken out in the organic model.

The organic system currently in
place in the EU works within the natural growth rates of the species being raised, which minimizes negative environmental impact and reduces consumption of fish and fishmeal and oil.

Five, lower stocking densities in the EU model are 10 cubes per cubic meter versus 40 in the conventional model. So already you are reducing environmental impact by four-fold just by the footprint size in the requirements.

Utilization of recycled protein, the EU practice that requires all fishmeal to be solely comprised of recycled fish trimmings produced from human food use, the recycled fish protein is only obtained from fisheries produced within safe biological limits determined by its robust worldwide organizations as FAO and ICES. This is currently the only truly sustainable fishmeal model in the aquaculture industry.

Five, the elimination of the use
of synthetic pigment agents, GMO-free components, which are passed on directly to consumers.

The confusion regarding the apparent need for the certification of wild-caught fish for feed draws a parallel to the terrestrial equivalent of wild grass being consumed in the pasture by certified organic terrestrial creatures. The certified organic steer is required to spend a certain amount of time in pasture, and that has been analyzed and certified.

During the pasture time, that steer is free to consume any available feed. That includes wild grasses, weeds, and other vegetable matter.

Finish the statement?

CHAIRMAN O'RELL: Finish your thought.

MR. MARTIN: Okay. Although the pasture itself is certified and controlled, and the inputs that can be controlled are
controlled, the pasture remains to the environment, which includes rain, wind, and gases that cannot be controlled for purity, content, origin.

The feed components used in the aquatic system can be controlled, and to the extent that they can be evaluated, adjusted for environmental contamination, as well as source from renewable fisheries, creating well-controlled input, it is similar, if not more controllable, than a terrestrial model.

I have a lot more, but that's it.

CHAIRMAN O'RELL: Okay. Thank you, Richard.

We have a couple of questions. Bea?

MS. JAMES: Have you submitted your comments?

MR. MARTIN: I didn't. I can submit them, though.

CHAIRMAN O'RELL: Please.

MR. MARTIN: Okay.
MS. JAMES: That would be really helpful if you could do that, please.

MR. MARTIN: Yes.

Nancy, I wanted to address something you asked earlier about the animal doing what it wants to do and living the life it was meant to --

CHAIRMAN O'RELL: Nancy, are you asking a question?

MS. OSTIGUY: Yes, I was going to ask a question, and that was not it.

(Laughter.)

CHAIRMAN O'RELL: Okay. Would you like to ask a question?

MS. OSTIGUY: The question, actually, it is more of a statement than a question. You are referring to the Harvard study and the benefit that we see from humans consuming fish. Those fish are not organically-produced.

MR. MARTIN: No.

MS. OSTIGUY: So you cannot make
the analogy that, therefore, we need an organic fish standard in order to attain the benefit that was talked about in this study.

MR. MARTIN: I wasn't attempting to. What I'm saying is the conventional model produces this kind of health benefits. Now if you take the conventional model, you take chemical applications out of it. You give the animals more space and take away environmental or reduce environmental --

MS. OSTIGUY: These animals aren't all farmed.

MR. MARTIN: No, I understand that.

MS. OSTIGUY: Fish consumption is not all farmed conventional.

MR. MARTIN: Could I quote Dr. Rimm briefly?

According to Dr. Rimm, "even a modest amount of seafood such as 3 ounces of farmed salmon per week reduced the risk of death for coronary heart disease by 36
percent."

The other -- I was going to address your earlier question, if it is appropriate.

CHAIRMAN O'RELL: Okay.

MR. MARTIN: About the fish when they are in their net pen in their natural life, what the fish would do would be to migrate -- we're talking salmon here -- migrate down the river --

MS. OSTIGUY: Uh-hum.

MR. MARTIN: -- go out in the ocean, feed, get bigger, and then the only time they migrate, really when they are in the migratory pattern, is when they are going back to breed.

MS. OSTIGUY: That's right.

MR. MARTIN: In the farm system, they are never allowed to get that old. In the wild, they come back at year three. In the farm system, they are harvested by 16 months.
So they aren't denied their desire to migrate because they haven't gotten to the age where they would do that normally.

CHAIRMAN O'RELL: Did you have a question, Dan?

MR. GIACOMINI: It was Bea's question.

CHAIRMAN O'RELL: Oh, okay.

Joe?

MR. SMILLIE: Just a final thanks, and we look forward to your participation on a regular basis in the future.

MR. MARTIN: I'll be back.

Thank you.

MR. SMILLIE: Thank you for the balanced presentation.

CHAIRMAN O'RELL: I would like to thank everybody who gave public comment today.

Thanks to those who are in the
audience today and stuck it out with us. We appreciate that.

There's been a lot of good public comment, a lot of good dialog from the Board to commenters.

Tonight the committees will be working somehow to digest this information.

(Laughter.)

First, we're going to digest.

So, with that, we will recess until tomorrow morning. Is it eight o'clock? 8:00 a.m.

Thank you.

(Whereupon, at 7:00 p.m., the proceedings recessed for the day, to reconvene the next day, Thursday, October 19, 2006, at 8:00 a.m.)
UNITED STATES DEPARTMENT OF AGRICULTURE

NATIONAL ORGANIC STANDARDS BOARD

MEETING

THURSDAY,
OCTOBER 19, 2006

The meeting was held in Salons 1 and 2 of the Radisson Hotel Reagan National Airport, 2020 Jefferson Davis Highway, Arlington, Virginia, at 8:00 a.m., Kevin R. O'Rell, Chair, presiding.

BOARD MEMBERS PRESENT:

KEVIN R. O'RELL Chair
ANDREA CAROE Vice Chair
BEA E. JAMES Secretary
GERALD A. DAVIS Member
RIGOBERTO I. DELGADO Member
KEVIN ENGELBERT Member
DANIEL G. GIACOMINI Member
JENNIFER M. HALL Member
HUBERT J. KARREMAN Member
MICHAEL P. LACY Member
JEFFREY W. MOYER Member
NANCY M. OSTIGUY Member
JOSEPH SMILLIE Member
JULIE S. WEISMAN Member
NOP STAFF PRESENT:

KATHERINE BENHAM  Board Specialist
MARK BRADLEY      Associate Deputy Administrator
VALERIE FRANCES   NOSB Executive Director
BOB POOLER        Agriculture Marketing Specialist

Other Business and Closing Remarks ...... 179
MR. O'RELL: Okay, Board members.

NOP is here. We'd like to start our final day of the October meeting for NOSB. This morning we'll be voting on the recommendations that we discussed yesterday.

Those recommendations that have not changed, there's already been thorough presentation of those. They've been posted. So we can give a brief background and then just read the recommendation and then we'll accept a motion for that recommendation and begin with voting. So. Policy development committee, Rigo?

MR. DELGADO: Good morning, Kevin.

At this point if you remember the item that we had on the table was to accept the changes for the Policy and Procedures Manual. This, as I said yesterday, these changes make - it's an ongoing effort to update annually the Policy and Procedures Manual. So at this
point I would like to entertain a motion to
accept the updates to the Policy and

    MS. JAMES: I second.

    MR. O'RELL: There's a motion to
accept the recommendations from the Policy
Development Committee. It's been moved and
seconded for a Board vote.

    MS. CAROE: Who moved?

    MR. O'RELL: Rigo entered it in as
a motion. It was seconded by Bea. Is there
any discussion? Hearing none, we'll take the
vote. Start with Mike.

    MR. LACY: Do we need to do
anything about - we don't have any conflict
of interest on this one, do we?

    (Laughter)

    MR. O'RELL: No, but thank you for
- we all have a conflict on this one. But
yes, for our protocol, thank you for
reminding me. Before each vote I will ask if
there is anybody who has a conflict of
interest to declare. Thank you, Mike. So Mike?

MR. LACY: Yes.

MR. O'RELL: Yes. Hue?

MR. KARREMAN: Yes.

MR. O'RELL: Rigo?

MR. DELGADO: Yes.

MR. O'RELL: Gerald?

MR. DAVIS: Yes.

MR. O'RELL: Joe?

MR. SMILLIE: Yes.

MR. O'RELL: Bea?

MS. JAMES: Yes.

MR. O'RELL: Andrea?

MS. CAROE: Yes.

MR. O'RELL: Julie?

MS. WEISMAN: Yes.

MR. O'RELL: Nancy?

MS. OSTIGUY: Yes.

MR. O'RELL: Jennifer?

MS. HALL: Yes.

MR. O'RELL: Jeff?
MR. MOYER: Yes.

MR. O'RELL: Kevin?

MR. ENGELBERT: Yes.

MR. O'RELL: Dan?

MR. GIACOMINI: Yes.

MR. O'RELL: And the Chair votes yes. The motion carries with 14 yes, no no's, zero no's, no abstentions. Okay.

Thank you, Rigo.

MR. DELGADO: You're welcome.

MR. O'RELL: We'll move on to the Crops Committee Recommendations. Gerald?

MR. DAVIS: Okay. Okay, first item on the guidance document for use of compost, vermicompost processed new and compost teas. We've distributed a new one here that incorporates some very minor textual changes, and I want to point out what those changes that we made.

MR. O'RELL: Gerald, just a point of order.

MR. DAVIS: Oh, am I out of order?
MR. O'RELL: Well, can we start with the agenda just in case somebody was following and thinking that lime mud would be up first?

MR. DAVIS: Sure. So what order do you have?

MR. O'RELL: We have lime mud and then sodium lauryl sulfate, sulfuric acid, calcium.

MR. DAVIS: Okay. Great.

MR. O'RELL: Just so we're in -

MR. DAVIS: Thank you.

MR. O'RELL: - keeping order with the agenda. Sorry.

MR. DAVIS: For the petition substance lime mud, the one, we discussed it yesterday, and I wanted to open it up to any further discussion. Is that proper, if there are any other comments from the Board on - or we just?

MR. O'RELL: What you want to do is to read the recommendation, enter the
recommendation as a motion. If there's a second, then we move for discussion before vote.

MR. DAVIS: Okay.

MR. O'RELL: So there will be an opportunity for discussion.

MR. DAVIS: The Crops Committee recommends that the petition for lime mud to be added to the national list be denied. Stating that the evaluation criteria on all three counts, the Crops Committee felt that it did not pass the criteria on all three. And that it is synthetic, and the substance was rejected by a vote from entering the national list because it's synthetic, it is not mined in the form that it exists. Lime mud is too general of a term. It includes substances that differ from the material produced by the petitioner. The loading rate of contaminants is potentially too high as it is an industrial waste product. The rule prohibits the use of materials made in lime
kilns per Section 205.203(c) and (d). And there are wholly natural substitutes, including ground limestone and ground oyster shells.

MS. OSTIGUY: Second.

MR. O'RELL: Okay, I'll accept that as a motion to reject lime mud for listing on the national list.

MR. DAVIS: To reject it, yes.

MR. O'RELL: By Gerald and a second by Nancy. Is there discussion? Hearing no discussion, we'll take the vote. This is a vote -

MR. KARREMAN: How does the vote go? A yes means?

MR. O'RELL: A yes means that you accept the recommendation not to - to reject addition to the national list.

MS. CAROE: Read the conflicts on this one.

MR. O'RELL: Thank you. Are there any conflicts with any Board members on lime
mud? Hue?

MR. KARREMAN: Yes.

MR. O'RELL: Rigo?

MR. DELGADO: Yes.

MR. O'RELL: Gerald?

MR. DAVIS: Yes.

MR. O'RELL: Joe?

MR. SMILLIE: Yes.

MR. O'RELL: Bea?

MS. JAMES: Yes.

MR. O'RELL: Andrea?

MS. CAROE: Yes.

MR. O'RELL: Julie?

MS. WEISMAN: Yes.

MR. O'RELL: Nancy?

MS. OSTIGUY: Yes.

MR. O'RELL: Jennifer?

MS. HALL: Yes.

MR. O'RELL: Jeff?

MR. MOYER: Yes.

MR. O'RELL: Kevin?

MR. ENGELBERT: Yes.
MR. O'RELL: Dan?

MR. GIACOMINI: Yes.

MR. O'RELL: Mike?

MR. LACY: Yes.

MR. O'RELL: Chair votes yes.

Motion carries 14 yes, zero no's, no abstentions. Okay, Gerald, if you'll take us to the next recommendation on sodium lauryl sulfate.

MR. DAVIS: The next recommendation, a yes vote would be to reject from addition to the national list sodium lauryl sulfate.

MR. O'RELL: So there's a - a motion has been made to recommend the rejection of sodium lauryl sulfate to the national list.

MS. OSTIGUY: Second.

MR. O'RELL: It's been moved and seconded. Discussion?

MR. KARREMAN: Question. Then if there's no annotation on it because I think
it was being petitioned to be an active ingredient, correct? Of whatever formulation. But if you deny it here, what about its use, I guess, as a minor inert whatever. I mean, does that affect that status? Because the name sodium lauryl sulfate is still the same whether it's in the inert category or this active.

MR. O'RELL: Nancy?

MS. OSTIGUY: If it is an inert, then it's listed separately on the list as under inert ingredients. So it would be covered as an inert ingredient and acceptable as an inert, but not as an active.

MR. KARREMAN: So, I don't have the list memorized, but so it is specifically listed under inert?

MS. OSTIGUY: No, it does not need to be specifically listed. The way that we did that was we put all List 4 inerts on the national list. So if it's used as an inert, which means a pesticide, then it's
acceptable.

MS. FRANCES: Because the EPA is changing the terminology on that?

MS. OSTIGUY: Yes, they are. Yes. So actually, that brings up a question. Are we going to change the wording on the national list? Would that be a technical correction?

MR. MOYER: From "inert" to "other"?

MS. OSTIGUY: Yes, other whatever it is that the EPA is using.

MR. BRADLEY: When they make that change we will - we'll have to determine how the Board's going to respond to that, but I would think it would be a - it could be a technical correction to correspond with another legal requirement.

MS. OSTIGUY: Okay.

MR. O'RELL: Dan?

MR. GIACOMINI: Mr. Chairman, due to the nature of the way substances are on
the national list by usage, could we please
have included in the motion the usage that
it's being requested for that is being - that
we are rejecting? Rather than just general
to the subject. In the future, when someone
goes back to look at our -

MR. O'RELL: Thank you -

MR. GIACOMINI: - without having
to search through what the -

MR. O'RELL: That's a very good
point. The motion should be.

MR. DAVIS: It has been petitioned
to be added to the list as an herbicide.

MS. OSTIGUY: Well, could we just
put it as an active ingredient?

MR. DAVIS: For use in crops.

MS. OSTIGUY: Can we list it as
it's been petitioned as an active ingredient?

Because that's really what it is.

MR. KARREMAN: Active or inert,
right?

MR. GIACOMINI: But the petition
was for as an herbicide, correct?

MR. DAVIS: Correct.

MS. OSTIGUY: You'd rather list it as an herbicide?

MR. GIACOMINI: That's what we -

MR. O'RELL: That was the specific use.

MR. GIACOMINI: That's what the -

MR. O'RELL: - use.

MR. GIACOMINI: And that's how - since we need to put them on the list for a use, that's what it's being reviewed for, just like we have certain situations that are on the list in one case, they've been reviewed as something else and denied.

MS. OSTIGUY: Do we wish to really be that specific?

MR. GIACOMINI: I think so.

MS. OSTIGUY: On everything?

MR. GIACOMINI: It's related to the petition as the specific use that they're requesting it for.
MS. OSTIGUY: Again, in the past what we were told by NOP is that, and again, the interpretation may have differed, it may differ now, but we were told that if we put something on the list, it was on the list. And what category it was in was less important.

MR. O'RELL: Hue?

MR. KARREMAN: That would bring up some problems, though, with in crops having, what was it, spectrum? The antibiotic. And then why isn't it in the livestock.

MS. OSTIGUY: Oh, I agree.

MR. KARREMAN: I mean, just for instance. So I think we should actually -

MS. OSTIGUY: Hue, we argued about this at the time, but that was the interpretation that we were told, so I'm - if that's changed, as far as I'm concerned good news, but.

MR. GIACOMINI: Well even on this last docket that is currently waiting for
final there were things that were the list
already requested for a different use that
was denied by the Secretary. So I think the
use is important.

MS. OSTIGUY: Okay. I guess
that's how it was done before.

MR. O'ReLL: Go ahead, Andrea?

MS. CAROE: Just for
clarification, right now we do have
herbicides that are soap-based on the
national list as well as soaps, algicides and
demossers. And I'm just not sure, I just
want you to clarify the use that's been
petitioned as opposed to these already listed
uses for soap-based. I mean, I assume sodium
lauryl sulfate, I mean that's a soap.

MS. OSTIGUY: It is a detergent.
If we want to be particular.

MS. CAROE: But it's a surfactant
which is a soap, right?

MS. OSTIGUY: No, it's a
detergent. A detergent is synthetic, a soap
MR. O'RELL: What page are you on, Andrea?

MS. CAROE: But it's on 601 which is synthetic.

MS. OSTIGUY: I agree. It depends on sort of how we want to do this. In terms of why we rejected it, it was not because it was a soap. It was rejected because the use, if you look at that section, it is acceptable to use a soap as an herbicide along roadsides, next to buildings, those sorts of things. This was proposed for general use on crops.

MS. CAROE: Okay, that's important now. I didn't - but - okay. That clears it up, and maybe we should be specific in the motion.

MS. OSTIGUY: Are we wanting to do that? This is clarification, this is not an objection. Do we want to do that on each individual thing is to say specifically in
the motion why we are rejecting it? If so, that's how we can read the motions.

MS. CAROE: It's not why we're rejecting - I'm sorry.

MR. O'RELL: It's okay, go ahead.

MS. CAROE: I just feel that since soap-based herbicide's already on the list, it might be good in the motion to explain and distinguish from that already listed use.

MS. OSTIGUY: But it's more specific on the list. It's soap-based herbicides used for.

MS. CAROE: Right, but you're rejecting the broader range use for actually on the organic crops. I mean, maybe that's - that's kind of what I was thinking is maybe just, you know, include in the motion the overall use on all -

MR. GIACOMINI: For general crop use.

MS. CAROE: For general crop use, yes, that sort of thing. Because I mean, I
just - I don't know.

MR. DAVIS: The petitioner has petitioned for the use of sodium lauryl sulfate to be an approved synthetic to be used as an herbicide for in-crop use.

MR. O'RELL: As an active ingredient. I think we need to, in the recommendation, be specific because that was the petitioned use by the petitioner was for an active ingredient, so I think that should be included in the recommendation. So if you would like to -

MR. DAVIS: Restate that.

MR. O'RELL: Restate the recommendation, the motion.

MS. OSTIGUY: Gerry, do you want me to do that?

MR. DAVIS: Yes, please.

MS. OSTIGUY: Okay. We are moving to reject the listing of sodium lauryl sulfate as an active ingredient on the national - rejecting for placement on the
national list because it is an active ingredient in a soap-based herbicide whose use is more general purpose on crops beyond the categories on the national list.

MR. O'RELL: Can I make a suggestion maybe that we just be more specific in terms of the motion is to -

MS. OSTIGUY: I said to reject.

MR. O'RELL: To reject the petitioned use as an active ingredient for use in crops. And not -

MS. OSTIGUY: Why don't you word it because I said all those, I thought.

MR. O'RELL: But we're adding why we're rejecting it in the recommendation. And I don't think we need to add why we're rejecting it in the recommendation. The recommendation is just to reject for the specific use.

MS. OSTIGUY: Okay. I heard differently. Why don't you make the motion so you get it the way you want it?
MR. O'RELL: No. Chair's going to ask for somebody on the Board to make a recommendation.

MR. DAVIS: I'll give it a try. I think I understand what you mean.

MR. O'RELL: Thank you.

MR. DAVIS: The motion is to reject the addition of - to the national list of sodium lauryl sulfate as an active ingredient for general herbicide use in crops.

MR. O'RELL: Thank you.

MR. GIACOMINI: Second.

MR. O'RELL: Thank you.

MS. CAROE: Who was the second?

MR. O'RELL: Dan was the second. So we have a motion on the floor to reject sodium lauryl sulfate for the specific use in crops, petitioned use.

MS. CAROE: Point of procedure. We never - we did have a motion on the floor.

It was a motion that was made by Gerald and
then seconded by Nancy. It needs to be withdrawn.

MS. OSTIGUY: I withdraw my second.

MR. O'RELL: You withdraw your original -

MR. DAVIS: Withdraw my first motion.

MS. CAROE: Thank you.

MR. O'RELL: Thank you. So we'll accept your second motion is on the floor, it's been moved and seconded. Is there any discussion? I do have a question because a comment was made yesterday about the confusion and the fact that it is an inert that is allowed and it's kind of ironic that the committee is recommending not to use it. I'm just wondering if there's a little more discussion about the clarification of that?

MR. DAVIS: It's on the list, I am told, I never checked this, that EPA List 4 list of inerts of minimal concern. But it is
a synthetic and the Crops Committee looked at it as because it is a synthetic, even though it is in that List 4 category, it still needs to be reviewed and decided if we are to approve the use of a synthetic on a crop, an organic crop, no matter where it's classified on List 4. I thought that was our charge.

MR. O'RELL: No, thank you, I appreciate the clarification for myself and the public.

MR. KARREMAN: One other thing.

MR. O'RELL: Hue.

MR. KARREMAN: Didn't the petitioner also say it's used in, like, human products like shampoos and other things like that? That kind of made me wonder what's so -

MR. O'RELL: It's grass. It has grass status.

MR. KARREMAN: So the main thing is because it is synthetic and there's other natural available things. Okay.
MR. O'RELL: Any further discussion? Mark?

MR. BRADLEY: Just for a point of clarification, is it the intent of the Board that you're going to want to prohibit its use in any organic products even as an inert?

MR. O'RELL: No. The recommendation was specific that it was for an active ingredient. That's what we wanted to get in the recommendation.

MR. BRADLEY: So if you can make it clear that -

MR. O'RELL: That was in the motion.

MR. BRADLEY: - not recommending that as prohibited, but it's not allowed for use as an active ingredient, but it's still allowed for use as an inert or other ingredient.

MR. O'RELL: Well, that's - it's in the motion that was made that it was specific use for an active.
MR. BRADLEY: Right.

MR. O'RELL: Is that sufficient?

MR. BRADLEY: It was petitioned as an active ingredient.

MR. O'RELL: Yes.

MR. BRADLEY: Just so, you know, we have something in the record that says it was not the intent. So we have that now.

MR. O'RELL: I think we have that now.

MR. BRADLEY: I just wanted to be very clear that you overtly stated that so that there was no confusion later on down the line.

MR. O'RELL: I appreciate that.

MR. BRADLEY: Okay. Thank you.

MR. MOYER: Kevin, we didn't specifically mention that we are allowing it as an inert in this motion because that's not what the petition was for. But it's assumed that since it's in the inert that that would be okay. We just - the motion is to reject
is an active.

MR. O'RELL:  Correct. I think that's sufficient.

MR. MOYER:  I think so.

MR. O'RELL:  Valerie.

MS. FRANCES:  I'm just making an observation. We've discussed that we maybe should modify this form a little more and I'm thinking that this form should be structured to state what the petitioned use was, even a space for additional comment by a commenter that came up during the meeting and a final recommendation so that you can offer any kind of feedback to that comment and then you can make your motion to what your decision is. Like there's just an order so that it's clear in the record, the starting point, any modification and what the motion is and then you can.

MR. DAVIS:  I would agree that the form we have to work with is not completely clear in several ways and we've had comments
from people contacting the committee saying we don't understand what you meant by this.

   MS. FRANCES: Yes.

   MR. O'RELL: Okay, and that's another subject, but I appreciate that and I do think the point is that we do need clarification on the form going forward. But right now we have a motion on the floor that we're discussing. And Dan?

   MR. GIACOMINI: Just to further clarify Mark's statement, our motion is also not restricting its use as a soap-based herbicide for general farm maintenance and ornamental crops. It was only for the request for general crop use.

   MS. OSTIGUY: It was not petitioned for what you're describing, so it's not on the list. Therefore, by not approving it for general use we aren't by default accepting it for that specific use either. For the use around buildings, et cetera. That's still not okay. Wasn't
petitioned for that.

MR. GIACOMINI: It's on the list now for that. It qualifies as that on the list now.

MS. OSTIGUY: If it is used solely as a soap, yes.

MR. GIACOMINI: Right. Right.

MR. O'RELL: Okay. Any further discussion?

MS. JAMES: I request that the motion is restated just for clarity.

MS. CAROE: Can I restate what I have?

MR. O'RELL: In the record? Sure.

MS. CAROE: Yes, because I actually added the listing from the regulation. The motion is to reject the addition of sodium lauryl sulfate to 205.601 as an active ingredient for general use. Is that appropriate?

MR. DAVIS: General use in crops.

MS. CAROE: Thank you.
MR. O'RELL: That was your motion.

Okay, thank you. Any conflicts of interest? Rigo?

MR. DELGADO: Yes.

MR. O'RELL: Gerald?

MR. DAVIS: Yes.

MR. O'RELL: Joe?

MR. SMILLIE: Yes.

MR. O'RELL: Bea?

MS. JAMES: Yes.

MR. O'RELL: Andrea?

MS. CAROE: Yes.

MR. O'RELL: Julie?

MS. WEISMAN: Yes.

MR. O'RELL: Nancy?

MS. OSTIGUY: Yes.

MR. O'RELL: Jennifer?

MS. HALL: Yes.

MR. O'RELL: Jeff?

MR. MOYER: Yes.

MR. O'RELL: Kevin?

MR. ENDELMER: Yes.
MR. O'RELL: Dan?

MR. GIACOMINI: Yes.

MR. O'RELL: Mike?

MR. LACY: Yes.

MR. O'RELL: Hue?

MR. KARREMAN: Yes.

MR. O'RELL: And the Chair votes yes. The motion carries 14 yes, zero no, no abstentions.

MR. DAVIS: The next material petitioned is to add to the national list sulfuric acid for use in stabilization of nutrients in livestock manure. And the petitioner's representative in his comments yesterday was asking us to table the item and give them more time to do some more studies with alternate practices and/or materials. So the motion I have is that we would like to table this petition.

MS. OSTIGUY: Point of order. Could I suggest that we motion to defer because a table we have to specifically act
to bring it back? So the motion is to defer this sulfuric acid.

    MR. DAVIS: Okay. I move that we defer this item to a later date.

    MS. OSTIGUY: Second.

    MR. O'RELL: Andrea?

    MS. CAROE: Let me just record that. The only reason, Nancy, that I would see that maybe a table is more appropriate is because you're going to be considering more information at the time of the vote.

    MS. OSTIGUY: There's precedent first. The Board has deferred materials that we want to collect more information on historically and it does not require then a second motion for us to even talk about it, whereas a table would require a motion so we could even talk about it. Deferred, it can just be put on the agenda.

    MS. CAROE: I'm just, my only worry is that the actual documents that have been produced aren't the same.
MS. OSTIGUY: Doesn't matter.

MR. O'RELL: The Chair would agree with Nancy in this case. I think defer is proper. So there was a second, Nancy?

MS. OSTIGUY: Yes.

MR. O'RELL: Thank you. Okay.

Discussion? Joe?

MR. SMILLIE: I'm still a little confused by this. I understand we're deferring it, but the petition is for a material, not a process. The process is stabilizing manure to hold nutrients. That's the process that we're talking about. There's nothing in that process that's either allowed or not allowed. It's the material that's being used that's in question, in my understanding. So to defer the petition on sulfuric acid so that they can investigate citric acid, to me that would be a different petition. You'd be petitioning the use of citric acid for this use and not sulfuric.

MR. O'RELL: Nancy?
MS. OSTIGUY: No. My understanding, what the petitioner is interested in doing is obtaining more information about the alternatives that we are stating are possible for this process. So we still are focused on the material. They're wanting additional information to see if our alternatives are actually realistic.

MR. SMILLIE: Oh, okay. I've got it.

MR. O'RELL: Hue?

MR. KARREMAN: Right, and then they will come back for sulfuric acid.

MR. O'RELL: Yes, this is really a request of the petitioner saying we want to pull our petition back in response to the TAP to get further information and investigation.

MR. KARREMAN: Okay.

MR. O'RELL: Yes, Kevin?

MR. ENGELBERT: I'd just like to state that that isn't going to change our
position on sulfuric acid, so I'm not in favor of deferring. That's all.

MR. O'RELL: Any other discussion?

MR. KARREMAN: Just curious. I mean, if there's new information and citric acid is, let's just say, ineffective versus sulfuric acid, wouldn't the committee look at that information?

MR. ENGELBERT: No, not on everything we looked at for what this use is. It's not essential in organic production. This is a company that's trying to use sulfuric acid to treat manure that's not standard practice. No one's clamoring for it and I don't think it's appropriate for production.

MR. O'RELL: Well, Hue, to respond to your question, if there was new information brought to the committee, the committee would review it. It doesn't mean that the outcome wouldn't be the same, but
the committee would review the new
information brought forth by the public.
Andrea?

MS. CAROE: Once again, there's
nothing to lose by deferring this, even if
the outcome doesn't change. It's not doing
anything.

MR. ENGELBERT: Nobody dies.

MS. CAROE: Nobody dies.

(Laughter)

MR. O'RELL: With no further
discussion, is there any conflicts for
sulfuric acid? Hearing none, let's move to
the vote. This is to defer. A vote for yes
means to defer the petitioned -

MR. DAVIS: Until a later date.

MR. O'RELL: To a later date.

Okay. Gerald?

MR. DAVIS: Yes.

MR. O'RELL: Joe?

MR. SMILLIE: Yes.

MR. O'RELL: Bea?
MS. JAMES: Yes.

MR. O'RELL: Andrea?

MS. CAROE: Yes.

MR. O'RELL: Julie?

MS. WEISMAN: Yes.

MR. O'RELL: Nancy?

MS. OSTIGUY: Yes.

MR. O'RELL: Jennifer?

MS. HALL: Yes.

MR. O'RELL: Jeff?

MR. MOYER: Yes.

MR. O'RELL: Kevin?

MR. ENGELBERT: No.

MR. O'ReLL: Dan?

MR. GIACOMINI: Yes.

MR. O'RELL: Mike?

MR. LACY: Yes.

MR. O'RELL: Hue?

MR. KARREMAN: Yes.

MR. O'RELL: Rigo?

MR. DELGADO: Yes.

MR. O'RELL: And the Chair vote
yes. Motion carries. We have 13 yes, 1 no, zero abstentions. Gerald, now we move on to calcium chloride.

MR. DAVIS: Calcium chloride petitioned to change the annotation that currently restricts it to foliar use only to correct calcium deficiencies in plants. I wanted to - Kevin? I'm trying to - I'd like - I don't know how to, point of order, how to proceed to offer a minority, what would be anticipated to be a minority opinion, I guess, on - that would counter this recommendation.

MS. OSTIGUY: Point of order?

MR. DAVIS: How would that work?

MS. OSTIGUY: Shouldn't we have a motion on the floor first?

MR. O'RELL: Yes. Yes. We need to have a motion first and then open discussion. And as part of discussion you can enter a minority opinion.

MR. DAVIS: Okay. So I move that
we have a vote to reject the petitioned
annotation change for the use of calcium
chloride.

    MS. OSTIGUY: Second.

    MR. DAVIS: I'm sorry.

    MR. O'RELL: I was just wondering
in the motion if we could - it's been moved
and seconded, but I was wondering if we would
accept a friendly amendment to put the
specific usage for the annotation, the
listing, in the - 205 in the motion. Just to
be clear for the record.

    MR. DAVIS: What is that?

    MS. CAROE: It's 205.602(c).

    MR. O'RELL: 205.602(c). Is that?

    MS. CAROE: I'm missing a number.

        No, 602(c).

    MR. DAVIS: Okay. I move that we
vote to - whether or not to reject the
annotation as listed in Section 205.602(c)
prohibited for use except as a foliar spray
to treat a physiological disorder associated
with calcium uptake.

MS. OSTIGUY: Point of order.

Isn't the motion to remove it from the
prohibited list? That's what I believe the
petitioner was asking for us to do, not to
remove the annotation. If we remove the
annotation, then it's prohibited even for
treatment of physiological disorder for
calcium uptake because that would just put it
on the prohibited list.

MR. DAVIS: No, all the petition
is is to change the annotation.

MR. KARREMAN: But I think he
wants it to be more useful rather than be
totally prohibited. If it's on the
prohibited naturals list he doesn't want to
be -

MS. OSTIGUY: Prohibited.

MR. KARREMAN: Right.

MS. OSTIGUY: Yes. That's my -
right now it's on the prohibited naturals list.

MR. KARREMAN: Right.

MS. OSTIGUY: If we take the annotation off, then you can't use it for anything. I don't believe that that was the goal.

MR. DAVIS: Okay. So the recommendation is to leave the annotation as it currently stands.

MS. OSTIGUY: Right, to leave the annotation and to leave it on the prohibited list.

MS. CAROE: We need to take the motion off the floor and restate it.

MR. DAVIS: Yes. I rescind the previous motion. I'd like to make a new motion.

MR. O'RELL: Okay.

MR. DAVIS: That in reference to calcium chloride, the calcium chloride petition, the recommendation is that we leave
the current annotation in Section 205.602(c) as it stands currently, no change.

MS. CAROE: The current listing.

MR. DAVIS: Current listing.

MS. CAROE: Not the current annotation. The current listing, period. Correct?

MR. DAVIS: The correct listing.

MR. O'RELL: Rejecting the request for the annotation change.

MS. CAROE: No, it's actually not an annotation change. It's a removal.

Rejecting the removal.

MR. GIACOMINI: Excuse me, point of clarification. Wasn't the petition to match the annotation change of potassium chloride, essentially?

MS. OSTIGUY: I think he was arguing that it should be treated the same.

MR. DAVIS: Right, but we're trying to get a clear motion on -

MR. GIACOMINI: I understand.
MR. DAVIS: So it's clear on what we're voting for.

MR. GIACOMINI: I understand. I did not get the notion from anyone in any of the discussions that it was to totally remove it from the prohibited list. It was to merely match the more expansive annotation of potassium chloride.

MR. O'RELL: Do you have the petition, Valerie?

MS. FRANCES: It's on the disk.

MR. DAVIS: So the petition states it is to remove the prohibition for use of calcium chloride as a soil applied non-synthetic substance in organic crop production. So that would involve removing it from the prohibited naturals list in function, you know.

MR. KARREMAN: Right, and therefore if it's a natural and it's removed from the prohibited naturals list, it is therefore just allowed. That's what the
petition is asking for.

MS. WEISMAN: No, it's to remove
prohibition of a certain - I'm sorry.
They're not asking for removal of the
prohibition, but the prohibition of that
specific use. Even though they use that
language, it's the annotation that's at issue
here, not the entire.

MR. DAVIS: And they are seeking
an annotation more similar to what is already
on the list in the instance of potassium
chloride.

MS. HALL: They're seeking to
expand the annotation for usage on soil
application.

MS. WEISMAN: That works.

MR. MOYER: That's exactly what I
was going to say.

MR. O'RELL: Okay. Jennifer?

MS. CAROE: Hue's got a point.

This is on the prohibited list. If you
expand the annotation to be more inclusive,
you're expanding the prohibition. If this is except.

MR. KARREMAN: No. Except for.

Except for annotation.

MR. MOYER: And you want it to say specifically that it can be used for foliar and soil. He's adding soil to the annotation. He's not expanding it to be used as anything you want. Expanding it from foliar to include foliar and soil.

MR. KARREMAN: But nothing else in crops.

MR. MOYER: Correct. Adding soil to the annotation.

MR. KARREMAN: So he's adding the annotation to be used as a soil amendment.

MR. MOYER: That's the request. That was the request that was in front of our committee.

MS. CAROE: It's the exception on the prohibition.

MR. O'RELL: Yes, it's like a
double negative. Okay.

MS. CAROE: I think there's four or five negative exceptions.

MR. O'RELL: That's regulations.

MS. CAROE: Gerry, do you want to restate the motion for me?

MR. DAVIS: Do I have to remove the other one? Or did we ever get to that point?

MR. O'RELL: We didn't have - we don't have a current one on the floor, but what I would just ask is, since this is getting a little convoluted with the wording, that when the person is stating the motion, let's pause and take a breath before somebody seconds so we don't have to go back through this. So if we just make sure that we all say this is the motion, we agree, because we'll help where we can. Okay.

MR. DAVIS: This is confusing.

MR. O'RELL: If there's somebody who wants to enter a motion I would recognize
that. Jennifer?

    MS. HALL: The Crops Committee moves to reject the petition to expand the existing annotation on calcium chloride to - that requests to add soil application and usage.

    MR. DAVIS: Okay, let me try that.

    MR. O'RELL: That's a motion.

That is a motion.

    MS. CAROE: To reject the petition to expand the existing annotation -

    MS. HALL: To add soil application.

    MS. CAROE: To include soil application.

    MR. GIACOMINI: Mr. Chairman, in the section that it's in, should we add at the end of that "as an exception"?

    MS. OSTIGUY: No, because it's just expanding.

    MR. GIACOMINI: It already states that.
MS. OSTIGUY: It says it expands.

MR. GIACOMINI: Okay.

MR. O'RELL: So we have a motion on the floor. Is there a second?

MS. OSTIGUY: Second.

MR. O'RELL: Nancy seconds. We have a motion and a second. Any discussion?

MR. DAVIS: One thing I wanted to point out is the one reason I see for going through all these very specific wordings is that to remove it from the prohibited natural list altogether, which would make it an allowed natural for all usage, would allow different things such as using it as a cotton defoliant and herbicide. Not that that doesn't have merit, but we didn't - that's not what the petition was for. They're specifically asking for adding soil uses, not opening up every possible use of the material.

MR. O'RELL: Dan?

MR. GIACOMINI: When - I'm not by
any means a soil expert, and I don't know the
differences in usages of these products, but
I do know that high levels of potassium is
one of the things that we're going to be
dealing with in soils down the road and if
this is a reasonable alternative to that I
think it would certainly - it certainly has
merit.

MR. O'RELL: Joe? And then Hue.

MR. SMILLIE: My position is that,
and it's going to be difficult to vote
because what we have to consider also is the
restriction placed currently on potassium
chloride derived from a main source and
applied in a manner that minimizes chloride
accumulation in the soil. So if this ever
did move forward, it would have to have that
same type of restriction. I think that it is
basically patently unfair to allow the use of
muriate potash, potassium chloride, and not
allow the use of calcium. That doesn't
necessarily mean I'm for the use of calcium.
It just means that I think that the current use of muriate is not in the best interest of the organic community. So I'm not sure how to deal with that conflict. It's not so much that I'm probably calcium chloride, it's more that I'm anti potassium chloride in its current listing. But I just wanted to point out that as we move forward we would have to - if this material was ever considered, it would have to have the same restrictions on it that potassium chloride has.

The use as a calcium chloride is different than potassium chloride. Potassium chloride is used basically as a, you know, mainstream fertilizer to crank potassium into the soil. Calcium chloride is really used as a kind of a desalination, you know, for heavy alkaline soils where it's hard to get calcium. You can't use - gypsum is awful slow sometimes and a small, you know, amount of calcium chloride can get you through some short-term calcium problems until the gypsum
can take effect in the long-term soil 
application. So I'm somewhat conflicted on 
this issue, but I just wanted to point out 
that, you know, potassium chloride is an 
issue for me on considering calcium chloride.

   MR. O'RELL: I have Hue, then

Nancy.

   MR. KARREMAN: I'd agree with Joe 
on the discrepancy or inconsistency with 
potassium chloride and also that there are 
salty soils in the West, like Nevada, Arizona 
and whatnot that might find this useful. And 
it is a natural material, and it is a 
national program, so we've got to consider 
those other areas.

   MR. O'RELL: Nancy?

   MS. OSTIGUY: Two things. One is 
because there is a material that we might 
dislike more that's on the list does not mean 
that we should add something that is better 
just because it's better than what we 
dislike. That material maybe ought to be
petitioned to be removed completely so that it - or the annotation removed so that it's just a prohibited natural. We've sort of dealt with the same thing when we dealt with moxidecton where there was another material on the list that was efficacious but not as desirable, and did we want to put a second material on the list, et cetera. So it's similar argument that we have with moxidecton. This material really ought to be evaluated on its own.

In terms of the speed of release of calcium, the underlying goal of the Organic Management Plan is supposed to be to have good soil quality. And so speedy release of a nutrient is not a goal, especially when you're talking about something that has particular problems.

MR. O'RELL: Kevin?

MR. ENGELBERT: And I understand what you're saying, Joe, and I agree, but we're also along those same lines being
allowed as a folient or foliar feeding it is able to correct these deficiencies and still give time for that soil to be built up in a manner more in keeping with organic principles.

MR. SMILLIE: I do agree with you, Nancy, thank you for that perspective and Kevin. I'm in agreement with you both, but I just wanted to raise that issue. But I'm in agreement.

MR. O'RELL: Any other discussion?

MR. DAVIS: I had one other point to make, just in a general nature being that this is a natural material as produced, natural brining process, that the committee did vote saying that we felt that it did not satisfy any of the criteria, but that in some - in my opinion in some ways that was rather subjective, you know, when it comes to the - we answered some of the questions like on the environmental impact of it as a yes and no.
Yes at higher rates there probably would be
significant chloride leaching through the
soil profile and where does that go. But at
lower rates is that a significant effect? So
it's kind of a yes and no, maybe type of
level. And I wanted to propose the idea at
least that because it is a natural and it is
a - I see it as a fairly limited use material
that would not really make a lot of sense
other than in certain areas of the West that
because for a lot of the country maybe we
disagree with using the material, wouldn't
fit for our area, doesn't make any sense, but
rather than just vote against it, to approve
it. The idea would be to approve it, this
petition, to allow growers in those areas
where they could make use of this tool to
decide whether they want to or not. And let
them make the decision on using it the right
way so it's not detrimental, but it's
actually helpful. It could be an extra tool
that some growers could use in certain
situations. I don't know if that helps or not, but.

MR. O'RELL: Okay. Is there any additional discussion? And we will have Andrea read the motion that's on the floor before we vote. Any additional discussion? So that everybody's clear on it, because there's been a lot of discussion, confusion about this material. Andrea, could you read the motion that's on the floor?

MS. CAROE: Sure. The motion is to reject the petition to expand the existing annotation to include soil applications.

MR. O'RELL: Any conflict of interest? Hearing none, we'll begin with Joe.

MR. SMILLIE: Abstain.

MR. O'RELL: Bea?

MS. JAMES: Yes.

MR. O'RELL: Andrea?

MS. CAROE: Abstain.

MR. O'RELL: Julie?
MS. WEISMAN: Yes.

MR. O'RELL: Nancy?

MS. OSTIGUY: Yes.

MR. O'RELL: Jennifer?

MS. HALL: Yes.

MR. O'RELL: Jeff?

MR. MOYER: Yes.

MR. O'RELL: Kevin?

MR. ENGELBERT: Yes.

MR. O'RELL: Dan?

MR. GIACOMINI: No.

MR. O'RELL: Mike?

MR. LACY: Yes.

MR. O'RELL: Hue?

MR. KARREMAN: No.

MR. O'RELL: Rigo?

MR. DELGADO: Yes.

MR. O'RELL: Gerald?

MR. DAVIS: No.

MR. O'RELL: The Chair will

abstain.

MS. CAROE: Eight yes's, three
no's, three abstentions. Motion passes.

    MR. O'RELL: So the motion passes.

    MS. CAROE: Eight yes's, three no's, three abstentions, no abstentions with the majority, so the motion passes.

    MR. O'RELL: Okay. And lastly Gerald we have compost tea.

    MR. DAVIS: Do I have to make the motion before we can talk about the changes that we made to the document?

    MR. O'RELL: Oh. You can enter in as background the changes that were discussed from the previous motion or recommendation that was posted.

    MR. DAVIS: Right. From the posted version of the document, the guidance document for use of compost, vermicompost, processed manure and compost tea, the changes that were made in Section - these are based on comments received, the changes that were made. In the definition section for composting - okay. The previous - the change
we made is a process in which organic matter
of plant and/or animal origin is managed to,
instead of the word "promote" we inserted
"achieve." So managed to achieve aerobic
decomposition, not just promote aerobic
decomposition. Just a one-word change there.

And on the recommendation section,

Item 1, "Compost in addition to that
described in Section 205.203(c)(2) is
acceptable, (I) made from only allowed
feedstock materials." Based on comments
received, we agreed with striking the
parentheses statement that says "incidental
residues are allowed only if they will not
lead to contamination," agreeing with the
commenters that that is covered in other
areas and this is redundant to be restating
it and just would lead to more confusion on
what is intended. So that the new
recommendation is "Compost in addition to
that described in Section 205.203(c)(2) is
acceptable if, (I) made from only allowed
feedstock materials, (ii) the compost pile is mixed or managed to ensure that all of the feedstock heats to the minimum of 131 degrees Fahrenheit, 55 degrees C for the minimum time of three days."

The last change, also based on comments received, Item 4 of the recommendation section, "Compost teas must be made with potable water. Equipment used to prepare compost tea must be sanitized before use with a sanitizing agent as defined by 21 C.F.R. ' 178.1010," the addition is beginning after that. It would be, comma, using allowed materials found on the national list, period. And that's the only changes to the document.

MR. O'RELL: Andrea?

MS. CAROE: I appreciate the changes that were made. However, in Number 2 under the recommendations you also have the language "will not contaminate." It's inconsistent now with Number 1. It was put
in both places?

    MR. DAVIS: Oh yes, that needs to be struck too.

    MS. CAROE: And then also in Number 4 the recommendation, I thought the second sentence was going to be "Compost tea must be made with." Is that a rejected change, or is this an oversight?

    MR. DAVIS: Oh, that was one that we didn't get written down, that's all. That is a good -

    MS. CAROE: Can you pen and ink this recommendation?

    MR. KARREMAN: Although I think, Andrea, didn't he say that since this is just a guidance document you can't say "must"?

    MS. CAROE: You can say "must."

    MR. O'RELL: You can say "must," but it's not -

    MS. CAROE: Binding.

    MR. O'RELL: It doesn't have the
enforcement of the law.

MR. DAVIS: So in that section, Item 4 under recommendations, Andrea's talking about the sentence, that's the third sentence. "Compost tea must be made with compliant compost or vermicompost using the NOSB recommendation for compost and vermicompost mentioned above and as defined in Section 205.203(c)(2) of the NOP rule."

So that we are striking the word "should" and changing it to "must."

And the other section, in recommendation section Item 2, "Vermicompost is acceptable if, (I) made from only allowed feedstock materials, period." We'll strike "except for incidental residues that will not lead to contamination."

MS. CAROE: So, I'm sorry, I missed that Gerald. You're striking?

MR. DAVIS: In the recommendation section Item 2, "Vermicompost is acceptable if, (I) made from only allowed feedstock
materials, period." We are striking the words "except for incidental residues that will not lead to contamination" because it's redundant. It's already covered elsewhere.

MR. O'RELL: And after - Gerald, where you said (I) made from only allowed feedstock material, comma. Sorry, but commas make differences here.

MR. GIACOMINI: You have (ii) coming up.

MR. DAVIS: Oh, that's true, that is a comma because there's more. True. So those are the changes and I move that we vote on accepting this for submission to the program as a guidance document.

MS. HALL: Second.

MR. O'RELL: Okay, it's been moved and seconded to accept the recommendations from the Crops Committee on the guidance document for use of compost, vermicompost, processed manure and compost teas. Everybody has a revised version that was given out this
morning. We've made some changes to that. I want to make sure everybody's clear on what those changes are. And part of discussion, I think we're going to have some questions. Valerie, have you made the changes? Can you make those?

MS. FRANCES: This is only a PDF because I merged three documents into a PDF and didn't bring the original three.

MR. O'RELL: All right. Got it. Got it. Okay.

MS. FRANCES: Sorry. I'll work on that.

MR. O'RELL: Joe? You had a question?

MR. SMILLIE: Point of information. I think it's a great document. I'm very excited that we've gotten this out, but I really need to know if there's anyone who can clarify what an angled wedge system is. I have no idea and I used to do a fair bit of composting.
MR. DAVIS: That's a worm casting.

MR. SMILLIE: Is it a mechanical device? Is it a digester?

MR. DAVIS: It's a structure of how they do their windrows or whatever you call it. It's the way they shape their piles. And that's all I know about it.

MR. SMILLIE: Well, if that's accurate, that's good enough. I just don't want to vote for something if I don't know what it is.

MR. O'RELL: Emily?

MS. ROSEN: Emily Brown Rosen. That was my question and my comment too and I Googled it at one point and it described it as a windrow that you make the compost in and then they keep adding new materials to one side. And so the windrow becomes angled over time, and then they take it, I guess they take it from one side as more mature than the other. But I thought that was a little vague as far as what, you know, there's a timeline.
Anyway.

MR. SMILLIE: Well, at least I know -

MS. ROSEN: That's what that is.

MR. SMILLIE: Good enough.

MR. O'RELL: Thank you Emily.

Bea?

MS. JAMES: I'm a little uncomfortable with moving forward on voting with this document because I feel that in all honesty as Chair that I'm not sure that the document has been thoroughly reviewed and I want to feel comfortable that the Crops Committee really has reviewed and looked at all of the changes that are in this document. And I think that the Board still has a lot of questions about exactly what some of the things are that are in this guidance document and that perhaps we need to have more discussion before we vote.

MR. O'RELL: Nancy?

MS. OSTIGUY: I'm not quite sure
what substantial changes occurred between
when the committee voted on this and today
that we've not had it in front of us. If
people want to defer it because for whatever
reason, that's different, but we haven't done
much in the way of changes.

MR. O'ReLL: Andrea?

MS. CAROE: I agree with what
Nancy says, that the changes that were made
were oversights, but they were based on the
changes that Gerald already made on the
document. This is a guidance document. This
isn't rule change. And I think the intent is
maintained from the original intent, it was
just a bit of housekeeping to get that issue
that was deleted in the one section deleted
on the other section and the "should" to
"must." This is a guidance document. That
doesn't have a whole lot of change in itself.

MR. KARREMAN: The other thing is
public commenters didn't have much confusion
or problems with it and they've been waiting
five, six years or whatever, so I would respectfully disagree.

MR. O'RELL: I agree with Hue and with Andrea and with what Nancy had alluded to. The changes that have been made are not substantive to the material, to content, the intent of the document. They've been housekeeping, as it's been called, changes. Some of them have been based on discussion from the Board which is our job to do and the other was from input from public comment.

Rigo?

MR. DELGADO: I also want to add that we've been working on this document for several years so we've had enough time to review it and, yes, we do need to add some clarifications and whatever, but I don't think it changes the whole spirit and intent of the document.

MR. O'RELL: I guess I would just say that I want to be sure that we're clear on the changes that we've made and that those
changes have been recorded here. Andrea, have?

MS. CAROE: Pen and inked them in.

MR. O'RELL: You've inked them in.

Gerald, you have those changes in front of you. So if there's any questions about what we're voting on, the recommendation, we have an updated form here, but there have been a couple of changes. I would ask that we go through those one more time just to be clear.

MR. DAVIS: Okay. First page, under the definition section, composting, we changed one word in the first sentence. Well, there is only one sentence, excuse me.

"A process in which organic matter of plant and/or animal origin is managed to achieve," the word "achieve" was substituted instead of "promote." So that was a change from what was posted for public comment. It's already on the document we passed out this morning.

MR. O'RELL: Right.

MR. DAVIS: Second page,
recommendation section, Item 1, "Compost in addition to that described in Section 205.203(c)(2) is acceptable if (I) made from only allowed feedstock materials." That is how your document you're looking at reads. What we have removed from the posted version on the website for public comment is the parenthetical phrase "Incidental residues are allowed only if they will not lead to contamination."

    Same page, well no, it's not the same page. Page 3 under the recommendations section, Item 4.

    MR. O'RELL: Oh, there was a change in recommendation Number 2.

    MR. DAVIS: Oh yes. In Item 2 of the recommendation section vermicompost is acceptable if, (I) made from only allowed feedstock materials. Again to be consistent with the previous we deleted "except for incidental residues that will not lead to contamination."
Item Number 4, "Compost teas must be made with potable water. Equipment used to prepare compost teas must be sanitized before use with a sanitizing agent as defined by 21 C.F.R. ' 178.1010. And what we added was, comma, using allowed materials found on the national list.

MS. CAROE: Keep going, there's one more. Next sentence.

MR. DAVIS: Oh also, next sentence in compost tea, we deleted "should," the word "should," and changed it to "Compost tea must be made with compliant compost or vermicompost."

MR. O'RELL: Okay, thank you.

It's been moved and seconded that we accept the recommendation from the Crops Committee as revised and discussed. And there was a second. We've had discussion. We'll call the vote. Is there any conflicts with compost tea? We're voting to accept this as a guidance document, yes. And we'll begin
the voting with Bea.

MS. JAMES: Yes.

MR. O'RELL: Andrea?

MS. CAROE: Yes.

MR. O'RELL: Julie?

MS. WEISMAN: Yes.

MR. O'RELL: Nancy?

MS. OSTIGUY: Yes.

MR. O'RELL: Jennifer?

MS. HALL: Yes.

MR. O'RELL: Jeff?

MR. MOYER: Yes.

MR. O'RELL: Kevin?

MR. ENGELBERT: Yes.

MR. O'RELL: Dan?

MR. GIACOMINI: Yes.

MR. O'RELL: Mike?

MR. LACY: Yes.

MR. O'RELL: Hue?

MR. KARREMAN: Yes.

MR. O'RELL: Rigo?

MR. DELGADO: Yes.
MR. O'RELL: Gerald?

MR. DAVIS: Yes.

MR. O'RELL: Joe?

MR. SMILLIE: Yes.

MR. O'RELL: And the Chair votes yes. The motion carries 14 yes, zero no's, zero abstentions. Okay, thank you. That concludes the Crops Committee recommendations. We'd like to move now to the Joint Materials and Handling Committee recommendation for ag/non-ag. Julie?

MS. WEISMAN: There was a lot of public comment on this recommendation that was shared in writing before the meeting and also that we heard in the previous two days. And there were very - questions raised that had great merit. I guess procedurally should I go ahead and present this as is, or should I present the recommendation as we originally made it?

MR. O'RELL: No.

MS. WEISMAN: Not the best use of
our time. Right. Yesterday we were on the
verge of deferring action on this
recommendation, so I think the appropriate
thing - and we decided that now would be the
appropriate time to take that vote. So I
would like to proceed with that at this time.

MR. O'RELL: So I will accept that
as a motion from the Handling Committee and
Materials Committee -

MS. OSTIGUY: Second.

MR. O'RELL: - to defer.

MS. WEISMAN: I move that we defer
the recommendation relative to agricultural
and non-agricultural substances for national
list consideration.

MS. OSTIGUY: Second.

MR. O'RELL: It's been moved and
seconded. Discussion? I would just like to
add that I think this is the appropriate
thing to do and certainly the committees in
the discussion were wanting to move forward
with the concept of expanding additional
organic usage and interpretation of non-plant
life. I think there's a lot of good points
were brought up in the public comment. There
needs to be more work done around this issue.

We certainly are going to be reaching out to
the public from the committee side. It's on
the work plan as a priority. I don't think
this interferes with the work that needs to
be done in 606 in terms of classifying those
materials as agriculture and moving forward.

We have continually classified things as
agricultural without the use of this guidance
document. So I just wanted to make that as a
point. Andrea?

MS. CAROE: I just want to say
from the committee standpoint from being on
this joint committee I still don't feel that
this is a bad document. I think it still has
merit. However, I think it is the obligation
of this Board to consider compelling
arguments like we received during this public
comment. And we will investigate all of
those issues, but there may be no changes due to that. We may be just coming back with justification for continuing with this action. And specifically, I did want to state that the issues that are presented that were compelling is one that the comment period was insufficient. So, based on the fact that this is now out there and we can continue to receive input, that's the first thing that we needed to address. Too, we need to look at if there would be any interference with livestock operations that use yeast as either feed or a feed additive and we need to make sure that there is no reason to believe that that would hamper - this recommendation would hamper that use.

Next, we need to clarify whether there is reason to move ahead with standards for non-plant, non-animal life or if there is, how we can accommodate that in the future and go ahead with this recommendation. And also we need to verify our ability to move
items from 605 to 606 as a technical correction based on this further definition and whether that would be acceptable or whether we would need an intervening action of a petition. And again, to further get industry input so that we move forward with a good recommendation although I still think this is a good recommendation, but a recommendation that won't be questioned. So that's my five cents.

MR. O'RELL: Gerald?

MR. DAVIS: Andrea, that was very clearly stated, I thought that was very good how you broke that down, and I was wondering as a part of the Materials Committee, can we get your comments kind of itemized for our work that we continue with? That'd be nice.

MS. CAROE: Absolutely. I will provide you with it.

MR. DAVIS: Keep us on track?

MR. O'RELL: Any additional discussion? Okay. We have a motion on the
floor to defer the Handling Committee, Materials Committee joint recommendation on ag/non-ag. So a vote yes is to defer. Any conflicts of interest to declare? Hearing none, we'll take the vote. Andrea?

  MR. O'RELL: Andrea?
  MS. CAROE: Yes.
  MR. O'RELL: Julie?
  MS. WEISMAN: Yes.
  MR. O'RELL: Nancy?
  MS. OSTIGUY: Yes.
  MR. O'RELL: Jennifer?
  MS. HALL: Yes.
  MR. O'RELL: Jeff?
  MR. MOYER: Yes.
  MR. O'RELL: Kevin?
  MR. ENGELBERT: Yes.
  MR. O'RELL: Dan?
  MR. GIACOMINI: Yes.
  MR. O'RELL: Mike?
  MR. LACY: Yes.
  MR. O'RELL: Hue?
MR. KARREMAN: Yes.

MR. O'RELL: Rigo?

MR. DELGADO: Yes.

MR. O'RELL: Gerald?

MR. DAVIS: Yes.

MR. O'RELL: Joe?

MR. SMILLIE: Yes.

MR. O'RELL: Bea?

MS. JAMES: Yes.

MR. O'RELL: And the Chair votes yes. Motion carries 14 yes, zero no, zero abstentions.

MS. WEISMAN: Okay, the next item up for vote from the Handling Committee is the document on a recommendation for the establishment of commercial availability criteria. This also received a lot of discussion, a lot of very good feedback in the form of public comments and there were some changes suggested in the last two days on the basis of public comment. I did not make a new document and I'm wondering if we
have this in a - is this a PDF also, or is this a Word document? Okay. So I'm going to describe the changes based on the original document that was made up for the meeting and we'll have to pin it in.

MS. FRANCES: I'll make an effort to do that next time, next meeting, having all the documents in any form.

MS. WEISMAN: Right, okay. In Recommendation A, which would be the third page, where it says the second bullet point, after listing the types of info that the NOSB will be wanting to see included in the petition. And I would say actually after the note saying that the global market is the universe of supply, we would like to add "This information will aid the NOSB in evaluating the fragility of supply." That's an attempt to clarify what the NOSB sees their role in using this information. Does that?

MS. CAROE: I need the wording.
MS. WEISMAN: Okay. Add this sentence after that note on the global market, et cetera.

MR. SMILLIE: Is it part of the parentheses?

MS. WEISMAN: No, not part of the parentheses.

MS. CAROE: Is it a bullet?

MS. WEISMAN: Or maybe we should make it before the note. It's not another - okay. I'll accept suggestions as to where the best place to put it is. The purpose is to clarify that we are not going to be making - we're trying to clarify the purpose of collecting the information.

MS. CAROE: I thought that was going to be in the B section, in recommending an ag material should be - NOSB shall review the petitioner's claim that.

MS. WEISMAN: Well that's specific to - that's a separate thing.

MS. CAROE: But the NOSB shall
review the petitioner's claim that there is vulnerability or fragility in supply?

MS. WEISMAN: If that fits there and serves the same purpose.

MS. CAROE: Because in that section you do say that we're evaluating "no organic substitutes are commercially available" which was - that was contentious.

MS. WEISMAN: Right.

MS. CAROE: That's where we wanted to change that to -

MS. HALL: I was actually going to suggest something different based on Barbara's comments yesterday. It's kind of a clarification for myself that if this is truly to put more depth into the process if it doesn't effectively change the committee's role or the program's role as she was explaining I would actually suggest that we strike Section B, that it adds more questions, if we're not changing our roles from what they were previous to this.
document. And then just include your statement as a bullet like we're suggesting now right under those additional criteria.

MS. CAROE: But Jennifer, I don't know if it's ever been clearly stated what our role is in reviewing materials for 606. That's why I think it was originally stated on this recommendation.

MS. FRANCES: It's an amazing piece of technology. You can select text, I forgot. I just put it into Word. So if you want to.

MS. WEISMAN: Thank you.

MR. O'RELL: That's good.

MS. FRANCES: I need more coffee this morning.

MS. WEISMAN: You know, I have to apologize for not being as well prepared on this document as I am for the one afterwards, but I'm like reading the notes in my margins that I made yesterday and whoever said that this belongs as part of Section B is
absolutely correct. So let's just move to Recommendation B. Okay. In the first sentence, the NOSB shall review the petitioner's claim. Okay, the NOSB shall, (1) through technical review if necessary that a material is agricultural.

MS. FRANCES: You know, I'm really not clear where you are.

MS. WEISMAN: Okay. In Recommendation B now, which is the NOSB and NOP role. There. All right. Okay. Now, in that first line, "In recommending that an agricultural material shall be placed on 205.606, the NOSB shall before review -

MR. DAVIS: Mr. Chairman, that seems to be a different version than what we are working with. It's certainly a different format.

MS. WEISMAN: Well, the shall - the word wrap is just - the "shall" is on the first part of the second line, okay? After the word "shall" -
MR. DAVIS: I'm concerned about the rest of the document that changed the formatting three or four lines worth on the page.

MS. CAROE: It's just the word wrap. Same words, just format.

MS. FRANCES: The way the margins are set on the page. Her margin thing.

MR. O'RELL: It's the same document.

MS. WEISMAN: Okay, so shall - instead of "shall" write ascertain, comma, through technical review if necessary, comma, that material is agricultural.

MS. FRANCES: Sorry for typos.

MS. WEISMAN: And I think we want a semicolon there. And then we go on with "and review the claim that no organic substitutes." We continue with that. Just make that segueway there to the rest of it. Does that make sense?

MR. LACY: And Julie, did you have
an "if necessary" in there?

    MS. WEISMAN: No, we want "and review the petitioner's claim." The "and" needs to be there.

    MR. LACY: I thought you had after "technical review, if necessary." Did I not hear that right?

    MS. WEISMAN: Through technical review, yes, if necessary, thank you. I can't see that well from this side of the morning.

    MS. CAROE: I still - we're not going to be reviewing commercial availability. I mean, I don't agree with the after "and."

    MS. WEISMAN: Okay. So let's - this is where we want to make the emphasis more be on addressing the vulnerability of supply.

    MS. CAROE: So I think "and" -

    MS. WEISMAN: Should be struck.

    MS. CAROE: Strike the rest of
that sentence.

MS. FRANCES: Strike the entire sentence?

MS. WEISMAN: Yes, the rest after - "and" and after. But we're going to replace it with - well, you already have it. Ascertain. And evaluate the information regarding the fragility of supply.

MR. O'ReLL: Valerie, could you read that, what you have now and just concur that that's.

MS. FRANCES: In recommending that an agricultural material shall be placed on 205.606, the NOSB shall ascertain through technical review if necessary that material is agricultural and evaluate the information regarding the fragility of supply.

MS. JAMES: You need a "the" in between "that" and "material." That the material.

MS. FRANCES: Thank you.

MS. WEISMAN: Okay, then, now we
have another small change in Recommendation -
In Recommendation C there was concern about
pushing certifiers a little bit close to
being beyond what their appropriate role is.
So to help them out we would like to replace
in Number 3, instead of saying "notify the
certification applicant" we want to say - or
actually, I guess we want to strike that
sentence and replace it with "make available
sources of information" - make available to
the certification applicant or certified
operator - I'll read this over again -
sources of information. That list. Does
that?

MS. CAROE: You just have to say
make available.

MS. WEISMAN: Right. Make
available sources of information that list
organic ingredients. Period. Number 3, make
available sources of information that list
organic ingredients.

MR. KARREMAN: Question. Is that
- could that be construed on consulting on the part of the ACA?

   MS. WEISMAN: That's, we're trying to make it less that way.

   MS. CAROE: Just for information that is made available across the board is not consulting. Information that is made available specifically to, you know, or selective groups within the applicant pool would be considered consulting, but information that's provided across the board is not consulting.

   MS. WEISMAN: Those are all the changes.

   MR. O'RELL: Those are the two changes. Jeff?

   MR. DAVIS: Read that Sentence 3 again.

   MR. O'RELL: Okay. You have to re-read it.

   MS. WEISMAN: Okay. Make available sources of information that list
organic ingredients. Make available sources of information that list organic ingredients.

Is that what we list? Available. So we're going to use "available" twice in the same sentence. I know my English teachers wouldn't like that.

MS. FRANCES: Make available sources of information that list organic materials or ingredients?

MS. WEISMAN: Materials.

MR. SMILLIE: Provide, rather than make available?

MS. WEISMAN: Provide. Okay.

Provide.

MS. FRANCES: Indicate?

MR. KARREMAN: No, not provide, make available. Providing is like here you go.

MR. O'RELL: Yes.

MS. WEISMAN: Make available sources of information.

MS. FRANCES: One at a time. She
can't hear.

MS. WEISMAN: Okay, sorry.

MR. KARREMAN: Keep the sentence as it is, please.

MS. WEISMAN: Okay, I think that's going to be sufficient.

MR. O'RELL: Okay. We've had two changes made in the document. I'd like to go back to - Jeff, yes.

MR. MOYER: Well, I had a question about another change that I had made note on in my document in the item above that, Item 2. There was discussion yesterday about the word "credible." Are we keeping that word in there as it is?

MR. O'RELL: Andrea?

MS. CAROE: As we discussed, "credible" I guess it does require somewhat of a judgment call, but this is a guidance document and it just indicates that there -

MS. HALL: As I recall, we said that most certifiers currently do that, that
they make that decision themselves on credibility and that doesn't change anything.

MS. CAROE: Right. It doesn't, and it's something that actually the detail of that will be evaluated through the accreditation process as their systems are reviewed and the information that they are making their decisions on are reviewed. So noting it here is setting the track, but how that's actually implemented should be left to the accreditation process.

MR. MOYER: Which is the reason I wouldn't have the word "credible." I'd just say that the operator has documentation. A credible or non-credible is a judgment call. I don't think that it needs to be in this document. That was just my point. It was a discussion that came up yesterday.

MS. CAROE: I could go either way because it really doesn't make that much difference.

MR. GIACOMINI: In my
conversations with some certifiers, they claim that they don't have the leverage to question documentation in some situations and in this case I think if we can give them something that says, no, Joe the barber doesn't know what he's talking about, that we should give the certifiers that leverage.

MS. WEISMAN: Okay, leave it in.

MR. O'RELL: Joe?

MR. SMILLIE: At this point I'm not sure if it's appropriate or not, but I'd like to get Mark or the program's take on where we are with (c)(3), if that. Your current thoughts on (c)(3).

MS. FRANCES: Make available -

MR. BRADLEY: From the consulting standpoint?

MR. SMILLIE: Yes. The conflict of interest issue.

MS. FRANCES: Make available sources of information that list organic materials if the certifying agent finds that
such materials exist.

MR. BRADLEY: Oh, we struck that.

MS. WEISMAN: No, it's gone.

MS. CAROE: There's a period after "organic materials" and there's an "available" before the word "organic."

MR. BRADLEY: Really?

MS. CAROE: Yes.

MR. BRADLEY: We wanted to keep that then.

MS. CAROE: We need to - this is about available organic materials.

MS. WEISMAN: Commercially available? Do we want to say that?

MR. BRADLEY: No.

MS. WEISMAN: Okay. Oh, because that's what we're defining. Yes, of course.

MS. FRANCES: We just put "available" in there twice. That's why.

MS. CAROE: No, we determined it's bad English.

MS. WEISMAN: It's not so elegant,
but it does the job.

MR. BRADLEY: Is your objective here to try to promote the use of organic products?

MR. SMILLIE: No, the objective is to be able to provide to the public at large lists of information, not specific companies or specific products, but where people who want to find out what is available on the organic marketplace. And the certification agent is the one who gets this request. We want to remove the certification agent from a position of conflict of interest or consulting by telling people where they get things and instead put them in the position of being able to make available information lists such as an OTA list, an OMRI list, whatever else is available as a generic list of available organic products. So that they don't have a consulting conflict. In other words, they're not consulting the applicant or certified operator on what to do, how to
come into compliance.

MR. BRADLEY: Is this going to be in the context of them developing their organic systems plan, or is it after they have made a request for determination of commercial availability?

MR. O'RELL: Andrea.

MS. CAROE: This is the certifier is making it available just like they make available the list of all their certified entities. I mean, it's just having it out there and available. It's not a response to a request. It's not, you know, it's just information that we feel that the certifiers should have available. Let me put it in an example. You know, the certifier can't say you have to use organic saffron because we know it's available and the entity comes back and says but where. You can't tell them where. However, if you have a list, a clearinghouse of information available, then it's like, you know, pointing to the
dictionary and it's already there for everybody.

MR. BRADLEY: Are they going to charge to list this information?

MS. WEISMAN: No.

MS. CAROE: This is just reference to existing clearinghouses of information.

MR. O'RELL: Hue?

MR. KARREMAN: I think the term "clearinghouse" is important because I think, at least from being out in the field and all, I think certain certifiers are kind of cozy with certain companies and they would steer them maybe just to those companies versus - kind of like an extension service that has a myriad of supplies. Information. Do you know what I mean?

MR. SMILLIE: Yes, you're exactly right and that's what we're trying to craft here is to make sure that we get the information out without getting the certifier in a conflict of interest or consulting
position.

MR. KARREMAN: No, I understand that, but even on that Sentence Number 3, you know, the lists of organic materials might be, up in Maine and Vermont, quite different than the ones in California. And yet if they're - I don't know. It just seems there can be too much coziness between certifiers and information sources.

MR. O'RELL: I will recognize Leslie as a certifier if she has a -

MR. KARREMAN: May I just quickly add that -

MR. O'RELL: Yes, you may.

MR. KARREMAN: They can have very good lists, but I just want to guard against parochialism, I guess, or whatever.

MS. ZUCK: Thank you. Leslie Zuck, Pennsylvania Certified Organic. When I read this first it said "notify the certified applicant or certified operation" and that's where this turns on, to notify a particular
applicant versus making available information
to my entire clientele. This doesn't really
clarify that, though. It just says "make
available" and I don't know if it says make
available to whom or what, you know. But it
does take that part out and that was the
important part, for me to give them
information that would help them overcome an
identified barrier to certification. So
that's the issue.

MS. CAROE: So, Leslie, are you
happy with this change or are you unhappy
with the change?

MS. ZUCK: Well -

MR. SMILLIE: If we added
"publicly available."

MS. ZUCK: You don't really want
my opinion. Right, to whom. So you know,
publish, or some other type of wording. You
know, make available is really vague and if
you're really going to give guidance it
should be -
MR. O'RELL: If it said "published available sources of information"?

MR. SMILLIE: So you're going to make this available to the general public?

MS. ZUCK: Yes. What's kind of - it's really unclear to me how this is really going to work on the ground because if one time a certification applicant then says, you know, if we find that one particular item is not commercially available, or is, then do we change our list and publish it again? Do we do it quarterly? Every time we come up with this information?

MS. WEISMAN: You're not responsible for making the list.

MS. ZUCK: Okay.

MS. WEISMAN: There are lists that already exist even now.

MS. ZUCK: Oh, okay.

MS. CAROE: You're listing the list. You're not -

MS. WEISMAN: You're explaining to
them -

MR. O'RELL: Yes, it's not the certifier's list and maybe we need to clarify.

MS. ZUCK: That's what we need.

MR. O'RELL: Joe?

MR. SMILLIE: Yes, the Point is for the certifier to make publicly available to whoever requests it sources of organizations that have already publicly available lists. The examples I would use, I'm not discriminating, but examples could be the Organic Trade Association, OMRI, ATRA and whoever else is in the business or non-profit -

MR. O'RELL: Can I suggest - to accomplish that can I just, I know you were - can I just suggest "make available public sources of information"?

MS. FRANCES: Or even just "make public sources of information."

MR. O'RELL: Okay.
MR. GIACOMINI: I agree with the examples that Joe is using, I'm just not clear in my mind that this does that as opposed to a certifier pointing to a particular sales catalog.

MS. HALL: I think you could add "and do not present a conflict of interest" or something to that effect.

MR. O'RELL: Okay, I'm going to ask the Board because they're really having problems transcribing all of this when we just have an open, so we need to be recognized and we need to follow procedure, otherwise it's impossible for them to transcribe the conversation. Hue?

MR. KARREMAN: I just want to add that is exactly what I'm saying, what Dan just said. I agree that they're not steering them to specific suppliers only. I don't know how else to put it, but I want to guard against that. I want to make it as wide-ranging as possible, those lists. I don't
know how you can say it though.

MR. O'RELL: Kevin?

MR. ENGELBERT: So after the word "list" add "all appropriate."

MR. O'RELL: Dan?

MR. GIACOMINI: Wouldn't that include the sales catalogs?

MR. O'RELL: Hue.

MR. KARREMAN: There may only be like five sales catalogs that a certain certifier knows and another certifier's got a hundred for whatever products. It's difficult.

MR. O'RELL: Mike?

MR. LACY: I hate to jump in here -

MR. O'RELL: Please jump in here.

MR. LACY: If you put "generic" between "public" and "sources" would that help you all?

MS. WEISMAN: No, I don't think so.
MS. OSTIGUY: Can I make a suggestion?

MR. O'RELL: Yes, Nancy.

MS. OSTIGUY: Since there's no motion yet could we defer this until after the coffee break and then there could be an argument at that point during the coffee break and we come back with suggested wording rather than this?

MR. O'RELL: I appreciate that, Nancy. Let's take a 10 - 15 minute break, and let's let the appropriate people get together and make the correct wording, come back and we'll have it on the screen and we'll introduce it as a recommendation. Thank you, Nancy.

Whereupon, the foregoing matter went off the record at 9:53 a.m. and went back on the record at 10:09 a.m.)

MR. O'RELL: Okay Board members, we have a quorum so we are going to continue after that brief pause. Julie, would you
lead us through. I think we've made revisions to the recommendation that we would like to put forward. Could you walk us through those changes?

MS. WEISMAN: Okay. If Valerie wouldn't mind putting us back into B there are two changes now. B is now reading—actually, I'm going to have to move and use somebody's mic because I would rather read what's there than—

MR. O'RELL: Go around.

MS. WEISMAN: So now B, Section B of the recommendation is going to read regarding the NOSB NOP role in the review of petitions, "In recommending that an agricultural material should be placed on Section 205.606, the NOSB shall ascertain through technical review, if necessary, that the material is agricultural and evaluate the information regarding the fragility of supply." That's the change.

Now, let's scroll down to Section
C. We had just a very intense side bar and we are not able to come up with wording that meets everybody's concerns at this time. And so rather than possibly needing to defer the entire document, we are going to strike Number 3 right now. And it will be part of our work plan to address that as an amendment later. And that's it. That's the document.

MR. GIACOMINI: We need to reorder 4 and 5.

MS. WEISMAN: Oh, so 4 becomes 3.

MR. O'RELL: Thank you, Dan.

Okay, Julie, would you like to enter a motion that we accept the recommendation?

MS. WEISMAN: I enter a motion that we accept the recommendation as now presented with the right numbering.

MR. O'RELL: The recommendation for -

MS. CAROE: Second.

MR. O'RELL: - the establishment of commercial availability -
MS. WEISMAN: I move that the Board accepts this recommendation for the establishment of commercial availability criteria. I'm doing that from memory, is that okay?

MR. O'RELL: That's fine.

MS. WEISMAN: Okay.

MR. O'RELL: And there was a second?

MS. CAROE: Yes. I need to capture that motion.

MR. O'RELL: Andrea's capturing the motion.

(Laughter)

MR. O'RELL: So we have a motion on the floor. It's been moved and seconded that we accept the recommendation from the Handling Committee for the establishment of commercial availability criteria as a guidance document. Discussion, please. I think we've had thorough discussion, so hearing none, is there any conflict of
interest?

MR. KARREMAN: Not on conflict of interest. I think Katherine wanted to know who seconded the motion

MS. CAROE: I did.

MR. O'RELL: Andrea. Okay, we will begin the vote. Julie?

MS. WEISMAN: Yes.

MR. O'RELL: Nancy?

MS. OSTIGUY: Yes.

MR. O'RELL: Jennifer?

MS. HALL: Yes.

MR. O'RELL: Jeff?

MR. MOYER: Yes.

MR. O'RELL: Kevin?

MR. ENGELBERT: Yes.

MR. O'RELL: Dan?

MR. GIACOMINI: Yes.

MR. O'RELL: Mike?

MR. LACY: Yes.

MR. O'RELL: Hue?

MR. KARREMAN: Yes.
MR. O'RELL:  Rigo?

MR. DELGADO:  Yes.

MR. O'RELL:  Gerald?

MR. DAVIS:  Yes.

MR. O'RELL:  Joe?

MR. SMILLIE:  Yes.

MR. O'RELL:  Bea?

MS. JAMES:  Yes.

MR. O'RELL:  And the Chair votes yes.  Andrea, I'm sorry.

MS. CAROE:  I vote yes too.

MR. O'RELL:  Okay, Andrea.  And the Chair votes yes.  Fourteen yes's, no no's, no abstentions.  The motion carries.

Okay, next?

MS. WEISMAN:  Okay.  The next item on the Handling Committee agenda was the final recommendation for colors synthetic.

MR. O'RELL:  Pet food.

MS. WEISMAN:  Oh, I'm so sorry.

Yes, okay.  This was a recommendation that we accept the interim report of the Pet Food
Task Force that was presented to us in April at the April meeting and that we now begin to use that document to move forward with pet food standards.

MR. O'RELL: And is that a motion?

MS. WEISMAN: That is a motion to accept the recommendation of the Handling Committee, yes.

MS. CAROE: To accept the interim recommendation of the Pet Food Task Force for further work by the Handling Committee.

MS. JAMES: Second.

MR. O'RELL: It was seconded by Bea. So we have a motion and a second. Any discussion? Any conflicts of interest? Everybody likes pets. Nancy?

MR. O'RELL: Jennifer?

MS. HALL: Yes.

MR. O'RELL: Jeff?

MR. MOYER: Yes.

MR. O'RELL: Kevin?

MR. ENGELBERT: Yes.
MR. O'RELL: Dan?
MR. GIACOMINI: Yes.
MR. O'RELL: Mike?
MR. LACY: Yes.
MR. O'RELL: Hue?
MR. KARREMAN: Yes.
MR. O'RELL: Rigo?
MR. DELGADO: Yes.
MR. O'RELL: Gerald?
MR. DAVIS: Yes.
MR. O'RELL: Joe?
MR. SMILLIE: Yes.
MR. O'RELL: Bea?
MS. JAMES: Yes.
MR. O'RELL: Andrea?
MS. CAROE: Yes.
MR. O'RELL: Julie?
MS. WEISMAN: Yes.
MR. O'RELL: And the Chair votes yes. Fourteen yes's, motion carries. Now colors.
MS. WEISMAN: This was a final
recommendation coming out of sunset review regarding colors non-synthetic on Section 205.605(a) of the national list. And although we have heard comments, we have had a bit of comment on this, and there is a question about disruptions that may happen if these colors sunset. Unfortunately, we believe, the Handling Committee believes that this is a procedural issue regarding the fact that they appeared on the national list without any recommendation from the NOSB in the first place and that because of this we are not in a position to renew these colors for another five years on the list. So therefore I move that the full Board accept the recommendation of the Handling Committee that colors non-synthetic sources only not be renewed on Section 205.605(a) and effective the sunset date of October 22, 2007.

MS. OSTIGUY: Second.

MS. CAROE: Sorry. I was just going to offer re-wording of the motion.
Just to keep the motion brief, I had to accept the recommendation to sunset the 205.605(a) listing of colors.

MS. WEISMAN: Yes.

MR. O'RELL: It's been -

MS. WEISMAN: I withdraw my motion. Okay, I accept.

MR. O'RELL: And Nancy has seconded. Thank you. Discussion on colors?

Dan.

MR. GIACOMINI: I would just like clarification on this issue of this being a technical matter that essentially we're required to vote to take it off because of some procedural issue five years ago. I mean, I keep hearing that this is a directive from the program. I'd like some clarification on that.

MR. O'RELL: Nancy?

MS. OSTIGUY: I don't know about it being a directive for the program or not, but it's actually, and probably the key role
for the Board is the placement and removal of materials from the national list. OFThA very specifically gave that authority to the Board. No other way except by this I guess recent legislation can you put materials on a national list. So at the time the Board never acted on this and so this material does not belong on the list.

MR. O'RELL: Hue?

MR. KARREMAN: Just wondering are there any other materials on the national list that came on like this particular thing? Not one. Every single one had a TAP review no matter how pathetic way back when?

(Laughter)

MR. KARREMAN: I'm sorry. They've gotten very good now. They've gotten very, very good. But I always hear people worrying about the old TAPs. But every single material had a TAP review, went through the whole procedural process except colors non-synthetic? That's hard to believe.
MR. O'RELL: Jeff.

MR. MOYER: Joe, do you know potassium sulfate, did that get on the same way?

MR. O'RELL: It's a natural.

MR. MOYER: Oh it's not on this list, right.

MR. SMILLIE: Potassium sulfate is from lime sources.

MR. O'RELL: Valerie, do you?

MS. FRANCES: I don't think the only point is that there was a TAP review, it's that there was never a Board recommendation.

MR. O'RELL: That's the key. There was not a petition for colors. Colors was never petitioned.

MR. GIACOMINI: Mr. Chairman, I still don't understand. It's on the list. We're being asked to evaluate whether it should stay on the list or be removed from the list. Since it's on the list, the Board
decided not to take action five years ago. I don't see what the issue on that is forcing our vote.

MR. O'RELL: Nancy?

MS. OSTIGUY: No, actually the Board has repeatedly tried to deal with these issues of materials that they were supposed to go through the process. And it was not corrected, at least in my opinion. So it was asked for before and it was not corrected.

MR. O'RELL: Andrea?

MS. CAROE: Just because we're sunsetting this listing doesn't mean we're prohibiting the use of colors in the future. This action, as you remember from the April meeting, was to elicit the petitions to get the petition and the whole process buttoned up. And we did get that response and we've made a commitment to those petitioners that we will do everything within our abilities to get this reviewed and appropriately listed or not in the future. But as for this listing,
this is the right thing to do is to let it sunset.

MR. O'RELL: Julie?

MS. WEISMAN: And also I want to clarify. It may not need clarification, so I apologize, but we are not - this is not a recommendation to remove colors, it's a recommendation to allow it to sunset and in the meantime we already have petitions for colors to consider.

MR. GIACOMINI: I just, I have a, I feel a real difference when I am just making a decision of whether to sunset an item or being told that the vote needs to be in a certain - come to a certain conclusion because of something that the Board did or did not do, however something happened five years ago. It seems the decision should be made on the validity of colors being on the list now whether it's colors or any other substance that would be on the national list.

If it was something that needed to stay on
the national list, would we be forced in the same situation to take it off and sunset it simply because of a procedure five years ago?

I understand the value of procedure, but I think this would be a bad precedent.

MR. O'RELL: The Chair is going to - Jennifer, I have you next, but the Chair is going to recognize Kim Dietz as former Materials Committee Chair on the NOSB.

MS. DIETZ: Kim Dietz. Just trying to give you a little bit of historical perspective because I think that will help you. For five years the public, most people have known colors has been an issue, so we have gone out there publicly saying petition, it may come up for sunset. I think the people have had adequate time to make a decision to petition if they wanted to. And we have seen those petitions come in. Procedurally, it's the right thing to do. For four years we've been talking about sunset, so it's not just a matter of giving
people time for colors because they've had
the time.

MR. O'RELL: Jennifer?

MS. HALL: This is in response to
Dan. I actually see this as the opportunity
that the Board never had to determine the
validity of these non-organic colors being on
the list. And that they've never - and I
think for me the key is that they are not
organic and that was never assessed, their
validity to be in organic products.

MR. O'RELL: Dan, one of the
challenges we face in my opinion is that I
would love to see colors remain on the list
because obviously there are some things that
really need to happen quickly between now and
June with the Harvey case to continue
commerce as we know it. But this is a
procedural issue. This is something that can
be challenged. And if we go forward with the
recommendation of leaving colors on there and
the public then has a false sense of
security, it can be challenged legally and that's not going to be a good thing either for the industry. So procedurally I do agree with what Kim has said, I agree with what Nancy has said.

MR. GIACOMINI: The issue of Harvey is a 606 issue.

MS. CAROE: This is not a Harvey issue.

MR. GIACOMINI: This is not a Harvey issue, this is 605. These are synthetics, not the naturals.

MR. O'RELL: Well, it's -

MR. GIACOMINI: This could have been petitioned to be taken off at any point in time.

MR. O'RELL: Right. It's in regard to those materials that are being petitioned now for 606 to replace colors on 605. I recognize the placement of the colors, but right now we have a number of petitions in 606 that need to be out there
because when colors sunsets, there's going to be an issue. Hue?

MR. GIACOMINI: Mr. Chairman, I would just I guess put on the record that for clarity I will vote to keep colors on the list not as a matter – not as a view on the colors issue, but on the view of the procedural matter that I seem to feel that we're getting a little arm-twisting on.

MR. O'RELL: Okay. No further discussion? Hue.

MR. KARREMAN: Just one thing on what Jennifer said very well, you know, now is our time to speak up on this material so we can speak up either way.

MR. GIACOMINI: I agree with you on that but we haven't had that discussion. All we've been told is it needs to come off because of a procedural issue five years ago. We have not had any discussion on it.

MR. O'RELL: That's the recommendation and the discussion period is
now. So we're having that discussion.

    MR. GIACOMINI: Okay, on that issue I don't - we have been pushed in this direction of it being procedural for so long we haven't had the discussion and I don't think that saying this is it is a real fair platform for giving both sides an opportunity.

    MR. O'RELL: Is there any further discussion? Hearing none I'll ask is there any conflict of interest? Hearing none we'll take the vote. We have a motion on the floor to accept - Andrea, would you read the motion?

    MS. CAROE: To accept the recommendation to sunset the 205.605(a) listing of colors.

    MR. O'RELL: Thank you. Jennifer?

    MR. O'RELL: Jennifer?

    MS. HALL: Yes.

    MR. O'RELL: Jeff?

    MR. MOYER: Yes.
MR. O'RELL: Kevin?
MR. ENGELBERT: Yes.
MR. O'RELL: Dan?
MR. GIACOMINI: No.
MR. O'RELL: Mike?
MR. LACY: Yes.
MR. O'RELL: Hue?
MR. KARREMAN: No.
MR. O'RELL: Rigo?
MR. DELGADO: Yes.
MR. O'RELL: Gerald?
MR. DAVIS: Yes.
MR. O'RELL: Joe?
MR. SMILLIE: Yes.
MR. O'RELL: Bea?
MS. JAMES: Yes.
MR. O'RELL: Andrea?
MS. CAROE: Yes.
MR. O'RELL: Julie?
MS. WEISMAN: Yes.
MR. O'RELL: Nancy?
MS. OSTIGUY: Yes.
MR. O'RELL: And the Chair votes yes. Twelve yes, two no's. Lecithin, bleached.

MS. WEISMAN: Yes, actually we have a revised recommendation from the recommendation that was presented yesterday which I think everyone is going to be able to see on the screen. Based on public comment that was received prior to this meeting of a very detailed and higher quality than we had ever had before, we have actually - we feel that we have to reverse the recommendation as it was presented yesterday and that while we've seen that there is a variety of both non-synthetic and organic sources now for liquid bleached lecithin, there are no such alternatives for dry de-oiled bleached lecithin. And although we would love to have the option to not renew the liquid forms and just renew the dry forms, this is sunset and we are not allowed to make annotations during this time. Therefore, we feel our only
choice right now is to recommend the renewal of lecithin, bleached and we strongly hope that a petition will be presented in short order to restrict the use of bleached lecithin to dry forms only. I think there may be a word that doesn't belong there. There's a typo at the end. That "however" needs to come out. Thank you. Delete. So the Board - the recommendation of the Board, the Handling Committee recommends renewing the following substance in this use category, lecithin, bleached. 205.605(b), synthetics allowed.

MR. O'RELL: That is a motion.

MS. CAROE: I'll second.

MR. O'RELL: Andrea seconds.

Discussion?

MR. SMILLIE: Yes, I'm comfortable with our reversal because I think the market will eventually make the correction that we think is appropriate and it'll make that correction in due time.
MR. O'RELL: Gerald?

MR. DAVIS: From my point of view and looking at some of the testimony yesterday on how the dry powdered lecithin, bleached lecithin is extracted and then purified, I know I will vote against this because I think there is a point at some point personally I feel that you can't make an organic product out of everything. There's some things that if it can't be made without using a material like that, so be it.

MR. O'RELL: Andrea?

MS. CAROE: I'd just remind the Board that this is sunset. This is not new information. There's no new availability of other materials. This is looking at a prior Board decision, looking for that new information and determining whether it is still valid. There is no new information on this. There's no new availability. So I mean if we were looking at this material to be listed, your concerns would be worthy and
we would be looking at those things. But based on we're looking at sunset, it's a whole different ball of wax.

MR. O'RELL: Any further discussion? Hearing none I'll ask if there's any conflict of interest on lecithin, bleached. We will take the vote. Andrea, would you read the motion again just so we're clear?

MS. CAROE: The motion is to renew the 205.605(b) listing of lecithin, bleached.

MR. O'RELL: Okay, thank you. We have the motion and we'll start the vote with Jeff.

MR. MOYER: Yes.

MR. O'RELL: Kevin?

MR. ENGELBERT: Yes.

MR. O'RELL: Dan?

MR. GIACOMINI: Yes.

MR. O'RELL: Mike?

MR. LACY: Yes.

MR. O'RELL: Hue?
MR. KARREMAN: Yes.

MR. O'RELL: Rigo?

MR. DELGADO: Yes.

MR. O'RELL: Gerald?

MR. DAVIS: Yes.

MR. O'RELL: Joe?

MR. SMILLIE: Yes.

MR. O'RELL: Bea?

MS. JAMES: No.

MR. O'RELL: Andrea?

MS. CAROE: Yes.

MR. O'RELL: Julie?

MS. WEISMAN: Yes.

MR. O'RELL: Nancy?

MS. OSTIGUY: No.

MR. O'RELL: Jennifer?

MS. HALL: Yes.

MR. O'RELL: And the Chair votes yes.

MS. CAROE: The vote is 11-3-0-0.

MR. O'RELL: 11-3-0-0, motion carries. Thank you. Thank you, Julie. That
concludes the recommendations from the Handling Committee. We'll move forward with the Compliance Accreditation and Certification Committee with Andrea.

MS. CAROE: The first vote that we are considering is the adoption of the guidance document in regards to private label. This document was reviewed again, re-read, and the 2001, not 2007, document was also read. And it was determined that they are not in conflict to each other. Knowing that, we also recognize that the 2001 document needs to be followed up with, and that will be a work item, work plan item for this committee. However, since there is not that conflict at this time, we would like to move forward with the Q&A as a guidance document as was originally presented. Motion is to accept the private label Q&A document as a guidance.

MS. JAMES: I second.

MR. O'RELL: It's been moved and
seconded by Bea. Discussion on the Q&A question? It's the recommendation response from the Q&A question that was asked to the committee. No discussion?

MS. JAMES: I just want to be clear that we're talking about the guidance listing of certifying agent's name on a packaged product. So if you're looking for that.

MS. CAROE: It's the first item in Tab A.

MR. O'RELL: Any further discussion? Any conflicts of interest?

MS. JAMES: Potentially I should disclose that as a retailer that's involved in private label it could be a conflict of interest for me.

MR. O'RELL: The Board can consider whether that's a conflict. We appreciate your disclosure according to our Policy and Procedures Manual. Julie?

MS. WEISMAN: As a manufacturer of
processed products I think actually probably
I should reveal that sometimes I make private
label products, that I manufacture products
for other entities. I don't know if that
would be considered.

MR. O'RELL: We'll take one at a
time. I appreciate that disclosure. Hue?

MR. KARREMAN: I do get private
label things made for me sometimes by an
herbalist. And he calls things certified
organic this and that or not. So. I guess I
do have some private label things made.

(Laughter)

MR. O'RELL: I don't think that,
in the Chair's opinion, I appreciate the
public disclosure of potential conflicts of
interest. I don't see where - I would ask
does anybody think they have a material gain
by voting on this recommendation? So, okay.

Unless there's any other Board members that
feel that there is a material conflict of
interest. We appreciate the disclosure in
the public record. Okay, we will start the vote with Kevin?

    MR. ENGELBERT: Yes.

    MR. O'RELL: Dan?

    MR. GIACOMINI: Yes.

    MR. O'RELL: Mike?

    MR. LACY: Yes.

    MR. O'RELL: Hue?

    MR. KARREMAN: Yes.

    MR. O'RELL: Rigo?

    MR. DELGADO: Yes.

    MR. O'RELL: Gerald?

    MR. DAVIS: Yes.

    MR. O'RELL: Joe?

    MR. SMILLIE: Yes.

    MR. O'RELL: Bea?

    MS. JAMES: Yes.

    MR. O'RELL: Andrea?

    MS. CAROE: Yes.

    MR. O'RELL: Julie?

    MS. WEISMAN: Yes.

    MR. O'RELL: Nancy?
MS. OSTIGUY: Yes.

MR. O'RELL: Jennifer?

MS. HALL: Yes.

MR. O'RELL: Jeff?

MR. MOYER: Yes.

MR. O'RELL: And the Chair will vote yes. Fourteen yes, the motion carries.

MS. CAROE: Thank you. Okay, the next vote item that we had was the standard certificate information document. This document brought to us very valuable input from the industry. We recognize that there will be additions to this document including the categories of certification of the products. We recognize that there is interest in having a requirement for English on the document. We will further investigate that with the program to find out if there is any barriers to doing that. Also, we agree that there should be a list of attachments to tie to the document to its attachments. However, we recognize that there needs to be
more work done as far as the formatting of the document. We did receive a wide variety of input suggesting that what we had in the document was prescriptive. We did have also many requests to have a standard template for that information. So at this time the committee would like to defer this document for further work. Again, we do this because it is not immediately needed. We do want to make sure that this does serve the purposes that we listed in the document and is available for the certifiers to use without too much hardship. So at this time I would like to motion to defer the document on standard certificate format.

MS. HALL: Second.

MR. O'RELL: It's been moved and seconded by Jennifer. Do we have discussion? Joe?

MR. SMILLIE: Yes. On the issue of the prescriptive, you know, we talked about the 8.5x11 with three inches at the
bottom and we got a real range of opinion on that. Some people said that was too prescriptive and then other people said we wanted a template. I just wondered which direction you want to head?

MS. CAROE: I want to head into investigating it further since it is confused at this point.

MR. SMILLIE: Okay.

MR. O'ReLL: Nancy?

MS. OSTIGUY: I'd like to offer that actually those two recommendations aren't necessarily contradictory. If you are given a list of requirements that you have to meet but you are going to have to make up the form, that can be much more time-consuming than looking at a recommended document and saying, okay, that works but we need this little bit of information in there. So I can see how a template can be incredibly useful.

You can adopt it wholesale, you can make minor changes if we don't want to be
absolutely prescriptive, but you don't have
to go through the work of figuring out the
layout. So.

MS. CAROE: Thank you.

MR. O'RELL: Any additional
discussion? Hearing none, I'll ask if there
are any conflicts of interest? We have a
motion to defer the recommendation. Andrea,
would you read the motion one more time?

MS. CAROE: The motion is to defer
for further committee work - defer the
recommendation on standard certificate format
for further committee work.

MR. O'RELL: Thank you. So we'll
take the vote. Dan?

MR. GIACOMINI: Yes.

MR. O'RELL: Mike?

MR. LACY: Yes.

MR. O'RELL: Hue?

MR. KARREMAN: Yes.

MR. O'RELL: Rigo?

MR. DELGADO: Yes.
MR. O'RELL: Gerald?

MR. DAVIS: Yes.

MR. O'RELL: Joe?

MR. SMILLIE: Yes.

MR. O'RELL: Bea?

MS. JAMES: Yes.

MR. O'RELL: Andrea?

MS. CAROE: Yes.

MR. O'RELL: Julie?

MS. WEISMAN: Yes.

MR. O'RELL: Nancy?

MS. OSTIGUY: Yes.

MR. O'RELL: Jennifer?

MS. HALL: Yes.

MR. O'RELL: Jeff?

MR. MOYER: Yes.

MR. O'RELL: Kevin?

MR. ENGELBERT: Yes.

MR. O'RELL: And the Chair votes yes. The motion to defer carries, 14 yes.

Last one.

MS. CAROE: Okay. The last
document that we have for vote is the
document for rule change to require
expiration dates on certificates. Again, I
just want to reiterate this is expiration of
the document, not expiration of the
certification. And at this point the
committee is prepared to move forward and
offer this for vote to accept the
recommendation as written, no changes.

MS. OSTIGUY: Second.

MR. O'RELL: We have a motion to
move forward with the recommendation as it
was posted and a second. Is there
discussion? Nancy?

MS. OSTIGUY: There were comments
made by speakers yesterday and the day before
over expiration, date of issuance and I'm not
quite sure what to think about the pros and
cons of those various ideas. What was the
committee's thinking?

MS. CAROE: When considering those
issues it did not appear that they - there
was no change to the logistics. There was no
reason for those. I think the word
"expiration" the reason I clarified that it
was the document expiring and not the
certificate is that's the reason people are
getting hung up with the word "expiration."
We're talking about a document expiring.
Just like your credit card may expire it
doesn't mean your account is gone.

    MR. O'RELL: Jennifer?

    MS. HALL: I have two points.

One, given that we're trying to make explicit
that it's the certificate that 205.404(b)(2)
effective period of the certificate instead
of certification? Is maybe the word we want
to use. In the line that we're changing.

    MS. CAROE: (b)(2)? The effective
period of certification including.

    MS. HALL: That is actually the
certificate, not the certification.

    MS. CAROE: Of the certificate.

Valerie, can you make that change? It's
under the recommendation (b)(2).

MS. FRANCES: The effective period

- 

MS. CAROE: Right. The word

"period" is in bold.

MS. FRANCES: Yes. And -

MS. CAROE: Change "certification"

to "certificate."

MS. FRANCES: Okay.

MS. CAROE: And add "the" in front

of.

MS. HALL: Right. And then

secondly, that I do have concerns about using

"expiration date." From a consumer standpoint

I actually disagree with one of the comments

that was brought up about it being the onus

of the consumer to have to find out what the

effective date is at farmer's markets. I

think it's a really valuable tool for them to

understand whether or not they're valid

without having to go look it up or ask or

whatnot like that. I don't think the burden
should be the consumer's. But on the other side of that when it does say expiration date, I think that that is a disservice to small farmers in that same situation, that many times they may not get certified on time and may be waiting for that letter of extension or whatever. So I would like to see it be annual renewal date, or something that's not quite as - or annual inspection date, or something of that nature that's not quite as defining, that looks like they're out of compliance where the consumer audience doesn't recognize the additional six months that they might have to figure that out.

MR. O'RELL: Andrea?

MS. CAROE: In considering annual monitoring date, renewal date, those sort of things, it's not apparent if that date has passed if they're out of compliance or not. That's why expiration dates was considered more appropriate because you could be past your monitoring date and still within the
grace period, or maybe you're not following
to through with your annual monitoring and that
certificate is long gone. It's not, you
know. So the expiration date was to be clear
for processors and consumers that this was
indeed - is not - it is a requirement of the
certifiers to annually monitor. And we did
put a vehicle in here for extensions, letters
of extension, to continue that in those cases
where, you know, the crop is in the field or
the inspectors can't get out there for
whatever reason consistent with the
regulation.

MR. O'ReLL: Hue?

MR. KARREMAN: I think Jennifer
had a good point, though. At like farmer's
markets, you know, if you have two farmers
and they're both posting their certificate
and one is expired it's like looking at two
cartons of milk. I'm going to go to the one
that's not expired. Is that what you were
trying to say, Jennifer?
MS. HALL: Yes, or just because it's not as valuable a tool for them to express the validity that they're organic. And I kind of feel like in 205.406(b) where it says that the continuation of certification in issuing an updated certificate of organic inspection on the basis of the information submitted in the most recent on-site inspection conducted during the previous 12 months doesn't insinuate that it's an annual requirement. Or does mandate, not just insinuate.

MS. CAROE: The regulation mandates the annual requirement. It's there. It's already existing.

MS. HALL: Right.

MS. CAROE: And just to address you, Hue.

(Laughter)

MS. CAROE: I didn't mean that. We do want this for protection of the consumers at farmer's market, the protection

NEAL R. GROSS
COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
(202) 234-4433 WASHINGTON, D.C. 20005-3701 www.nealrgross.com
of processors buying ingredients. If that's expired and they're no longer in compliance with their annual monitoring, you know, we don't have a real tool, a real-time tool to look at that right now. So you know, you can have a certificate that's three or four years expired right now without anybody really knowing that, you know. It's issued - the certifier doesn't have a control over that to take that document back from you if they ever de-certify you or suspend you. So you could continue to use it all you want for years. With expiration date, you could do that for a limited time, but you're not going to get another document with the new dates on it, or effective dates.

MR. KARREMAN: All right, then I'm confused then. This document being presented is asking to show expiration dates?

MS. CAROE: Yes.

MR. KARREMAN: Good. Okay.

MR. O'RELL: Joe?
MR. SMILLIE: Just one other point and that is that 6-month extension. You know, that's a very useful tool and it doesn't make the certificate less. It really, you know, it does specifically state that document that there's an extension. So with that document in hand at a farmer's market it's valid as a certificate. And it's - I think six months is reasonable.

I think the certifier community is mixed on this issue, haven't gotten used to the other one and there's a bunch of things, but from my point of view, personally, I can't speak for all the certifiers, it also creates a compliance tool that's really valuable. And again, it was mentioned something it would make sure you get your fees paid on time. Well, that's one issue, but actually that's not the worst one. The worst one is, you know, these non-compliances that are issued to clients. Most clients have a certain level of non-compliances,
minor. And if they've got their certificate, there's just a lot less compelling need to get back to the certifier and resolve the compliances, you know. They'll do it, but you know, pulling teeth and stretching. Well, you know, we're past our annual monitoring date, we're coming back again, we still haven't gotten this non-compliance corrected. And with the expiration on the certificate I think we'll get better response from well-meaning clients who have some non-compliances to clear up.

MR. O'RELL: Valerie.

MS. FRANCES: I just think you have a grammatical problem with (b)(2). Effective period of the certificate include - including, and include.

MS. CAROE: Which includes.

MS. FRANCES: Which includes.

MS. CAROE: To include.

MS. FRANCES: Okay.

MS. CAROE: Thank you.
MR. O'RELL: Thank you. Dan?

MR. GIACOMINI: Sorry.

MR. O'RELL: No Bea, then Dan.

MS. JAMES: I appreciate the perspective of looking at how certificates affect somebody like a farmer's market. On the retail side I guess I'm just kind of reiterating a little bit of what Joe was saying. If you have certification and actually having that expiration date in keeping track of all of the certificates that you have to try to keep track of, it's very, very cumbersome and difficult to try to manage all the paperwork without the expiration date on the certificate. So there's, you know, for some areas it might be better to not have the expiration date, but for the majority of people that actually are using administratively the certificate to help manage certification, it's a positive thing to have the expiration date. So I just wanted to make that point.
MR. O'RELL: Dan?

MR. GIACOMINI: I appreciate all the work that has been done by the committee on this and I certainly support the overall intent and the general direction. I think there's a lot of positive things that we do here including the issues with inspection and everything. I'm just not quite convinced that putting the expiration date is the best way to go and I think there was enough concern that I heard from certifiers even among the ones who said we need something, and I definitely believe we need something, that personally I would just like us to reconsider this maybe a little bit more.

MR. O'RELL: The Chair will recognize Jim Riddle, past Chair of the NOSB.

I think he wants his job back.

MR. RIDDLE: No, I just want to try and offer a little language change to make it clear that it's the expiration date on the certificate. And if you just consider
That it read "the effective period of certification including the effective date and expiration date of the certificate."

That separates the issue of expiration of certification because the way it reads right now I think it's unclear, it's confusing. It's lumping the two in the same phrase unless you make it clear that it's the expiration date of the certificate.

MR. O'RELL: You're suggesting effective - could you read that one more time?

MR. RIDDLE: Yes. The way it reads, effective period of certification, comma, including the - that's just grammatical. So including the effective date and expiration date of the certificate. Is that?

MS. JAMES: I accept that.

MR. RIDDLE: Okay, thanks. Just trying to be helpful.

MR. O'RELL: Always, thank you.
The committee is fine with that. Thank you, Jim.

MS. JAMES: We miss your wordsmithing, Jim.

MR. KARREMAN: Okay. Just one question on that.

MR. O'RELL: Yes.

MR. KARREMAN: When it says effective period of the certification, the certification is for life I thought. Like a driver's license. So is that actually, Jim, would that be correct grammatically? Is there an effective period of the certification? I thought once you're certified, you're certified? Right, but an effective period would be like Point A to Point B chronologically.

MR. RIDDLE: You're not certified for life. You have to keep doing certain things. You have to keep complying. You have to pay your fees. You have to file an annual update. You have to be reinspected.
It's not just a given that because you're still alive you're still certified.

(Laughter)

MR. KARREMAN: I realize that, Jim. Thank you for that clarification. All right so that seems fine, I mean if everyone's fine with that.

MR. O'RELL: Gerry?

MR. DAVIS: So this wording change in the Board's opinion does not backtrack on what we were trying to fix a little while ago on this?

MR. O'RELL: I think it's providing clarification.

MS. CAROE: It's syntax.

MR. O'RELL: So I would ask Valerie, because this is the only change we've made in this document that was posted, could you just read one more time what we have up there for clarification?

MS. FRANCES: Just that line?

MR. O'RELL: Just that line. No,
the whole document.

    MS. FRANCES: The whole section (b)?

    MR. O'RELL: Just that line. I'm sorry.

    MS. FRANCES: All right. While the certifying agent must issue a certificate of organic operation which specifies the (2) effective period of certification to include the effective date and expiration date of the certificate.

    MR. O'RELL: Jennifer?

    MS. HALL: Sorry, I just still think it's murky and I would like to change it to just read effective date and expiration date of the certificate.

    MR. O'RELL: Effective date and expiration date of the certificate.

    MR. ENGELBERT: I agree with Jennifer and I see Hue's point. It's going to be almost impossible for an agency to
specify the certification period on a certificate.

MR. O'RELL: Okay, Jennifer is suggesting language. Let's have a discussion.

MS. WEISMAN: I would add one word into your phrase. I would say effective date of certification and expiration date of certificate.

MR. O'RELL: Oh, that's good. I like that. Because then we keep it separate as Jim Riddle had mentioned to do. Okay, Dan?

MR. GIACOMINI: Could we accomplish the same thing just by changing "certification" to "certificate"?

MS. CAROE: That's where we started.

MR. O'RELL: You don't want it lumped together.

MS. CAROE: That was like 15 minutes ago.
MR. O'RELL: I would just like for clarification, again, Valerie, read what was last put up.

MR. DAVIS: She doesn't have that down.

MS. FRANCES: I wasn't clear what was -

MR. O'RELL: You don't? Okay.

Then Julie, would you please?

MS. WEISMAN: All right, (b), the certifying agent must issue a certificate of organic operation which specifies the effective date of certification and expiration date of the certificate.

MR. O'RELL: Okay. That sounds good. And the committee accepts that amendment. Kevin?

MR. ENGELBERT: Julie didn't have a "the" after, and I just wanted to - that "the" needs to be removed.

MS. WEISMAN: I admit it. You're right, you're right. Of certificate.
Expiration date of the certificate.

MR. ENGELBERT: The date of certification.

MR. O'RELL: Okay. Do you think you have it?

MS. FRANCES: Do I got it?

MR. O'RELL: I can't see it.

MS. FRANCES: Effective date of certification and the expiration date of the certificate.

MR. O'RELL: Yes, bingo, thank you. Okay. Any further discussion? Any conflict of interest to declare?

MR. SMILLIE: Well, I work with these documents all the time. I don't think I have a conflict of interest.

MR. O'RELL: Just a disclosure that you do work with these documents and you're -

MR. SMILLIE: Oh. Every day.

MR. O'RELL: Yes.

MR. SMILLIE: I work with these
documents every day and I'm disclosing that I work with these documents every day. I don't have a conflict of interest. I have no material gain to make.

MR. O'RELL: That's fine, we accept that Joe, you don't have to - we just - it's not an inquisition. Okay. We're going to - we have a motion, we have seconded, we're voting on accepting the recommendation from the CAC on expiration dates on certificates of organic operation as amended. And we'll start the vote with Mike.

MR. LACY: Yes.

MR. O'RELL: Hue?

MR. KARREMAN: Yes.

MR. O'RELL: Rigo?

MR. DELGADO: Yes.

MR. O'RELL: Gerald?

MR. DAVIS: Yes.

MR. O'RELL: Joe?

MR. SMILLIE: Yes.

MR. O'RELL: Bea?
MS. JAMES: Yes.

MR. O'RELL: Andrea?

MS. CAROE: Yes.

MR. O'RELL: Julie?

MS. WEISMAN: Yes.

MR. O'RELL: Nancy?

MS. OSTIGUY: Yes.

MR. O'RELL: Jennifer?

MS. HALL: Yes.

MR. O'RELL: Jeff?

MR. MOYER: Yes.

MR. O'RELL: Kevin?

MR. ENGELBERT: Yes.

MR. O'RELL: Dan?

MR. GIACOMINI: No.

MR. O'RELL: And the Chair votes yes. With 13 yes, one no, the motion carries.

MS. CAROE: Who seconded?

MR. O'RELL: Nancy. And I thank the CAC and we have concluded the voting on recommendations to the program. Well, I'd
like to at least move on with, because we did
take a rather extensive break and we're a
little behind schedule. But I understand if
somebody needs to shuffle back and forth we
can do that. I'd like to continue at least
with the presentation of the committee work
plans by the Chairs. If we have a volunteer
to go first, who's ready?

MR. DELGADO: Mr. Chair, I'm
ready.

MR. O'RELL: Rigo. Rigo's ready
to go.

MR. DELGADO: Mr. Chair, members
of the Board, we have four items on the plan
here. The first one is to finalize the new
member guide. We need to include a couple of
sections there that involve the NOP. The
second item is to set up the research
variance ad hoc committee. That's working
together with members of the Crops and
Livestock Committee as well as the PDC.
Third item on the list is continue with our
work in temporary research variances.
Essentially we want to finalize the guidance
for certification of operations participating
in research. That's the document that we
need to finalize.

Last item includes updates to the
Policy and Procedures Manual. We have four
general specific actions there. The first
one is a follow-up of an item that we've been
carrying on since last year and that's
developing a clarification of deferral. And
we hope to complete this this time. Second
one is developing procedures for the
transition of committee Chairs. It was
obvious in this session that we need to put
something in place. Then we also need to
update the NOSB committee recommendation form
to specify the uses of petitioned materials.
So we would like to include that in the
form. And finally we just would like to
review the general format of the PPM, Policy
and Procedures Manual, to make sure that we
have consistency throughout and the nice introductory paragraphs to each section. So that is the plan for us. If you have any questions.

MR. O'RELL: I would like to see maybe we could add a format for putting together recommendations? Oh, I'm sorry.

MS. CAROE: No, that was for materials only, but you're talking about other recommendations as well?

MR. O'RELL: You're talking about for materials format?

MR. DELGADO: That's correct, yes, and you were talking about?

MR. O'RELL: Well, I think maybe that would cover it. I'm sorry I missed that. I spaced out. So, okay. Bea?

MS. JAMES: I wanted to make sure that I understood you correctly, Rigo. We had talked about putting together the succession plan. Is that what you meant when you were talking about committee Chairs?
MR. DELGADO: That is correct, yes.

MS. JAMES: Okay. And did you also have on there putting together procedures for presenting committee action items and recommendations?

MR. DELGADO: No, I did not in those specific words. And you did mention that in your -

MS. JAMES: Yes, I would like to add that.

MR. DELGADO: Absolutely.

MS. JAMES: And lastly, I would also like to continue to work with the NOP on the removed section from the new member guide.

MR. DELGADO: Yes, that's what I meant by the first point. Yes.

MR. O'RELL: Nancy?

MS. OSTIGUY: Can I make a suggestion on the committee recommendations for materials that there be space to actually
write out specifically what the motion is.

    MS. CAROE: Yes, that's like top
    on the list.

    MS. OSTIGUY: Yes. It's a piece
    that I've found very missing.

    MR. DELGADO: Yes.

    MR. O'RELL: Good.

    MR. DELGADO: Good, thank you.

    MR. O'RELL: Thank you, Rigo.

Crops? Gerald?

    MR. DAVIS: The Crops Committee
    work plan is, number one, to participate in
    the ad hoc committee set up by Policy
    Development to continue the work on the
    research variance document. And, number two,
    accomplish the information-gathering on
    hydroponics solicited from the certifiers and
    analyze the information and discuss whether
    to proceed with the guidance document.

    Number three, continuing petitions: potassium
    silicate, possibly sulfuric acid in manure,
    depending on the petitioner's response. New
petitions: pelargonic acid, sodium carbonate peroxypyrhydrate, sodium ferric hydroxy EDTA, sorbitol octanoate, sulfuric acid, and tetracycline.

MR. O'RELL: Any questions for Gerald and the Crops Committee?

MS. CAROE: Can you just repeat that first item on your Crops list?

MR. DAVIS: Pelargonic acid.

MS. CAROE: No, no, the first item.

MR. DAVIS: First item? I'm sorry. To participate in the ad hoc committee.

MS. CAROE: Okay thank you.

MR. DAVIS: To continue work on the temporary research variance document.

MR. O'RELL: Any other questions for Gerald and the Crops Committee? Thank you, Gerald. Mike, want to move to?

MR. KARREMAN: I have a question.

MR. O'RELL: Yes, Hue.
MR. KARREMAN: You mentioned tetracycline as the very last word there. Is that - was that - did that go through sunset? So is that going to be?

MR. DAVIS: There is a petition for expanded use. I haven't seen it yet, but it's on the list.

MR. O'RELL: Thank you. Mike?

MR. LACY: Thank you, Kevin.

We're - Livestock Committee is working on its succession plan and Hue is going to present our work plan.

MR. KARREMAN: Secession?

Succession.

MR. LACY: We're going to secede, yes.

MR. O'RELL: He's from the South.

MS. CAROE: He is from the South.

(Laughter)

MR. KARREMAN: All right, Livestock Committee work plan includes our, well, our main focus and priority will be to
move forward with the process of drafting the organic aquiculture standards. And Kevin Engelbert and myself will be working with Andrea and Joe on that towards writing a document that hopefully we can have a draft standard prepared by next spring, the spring meeting 2007. And then the aquiculture working group is going to continue to work on recommendations for shellfish and we'll continue to work with them as they finalize those, but at this point we can't provide anyone with a timeframe unfortunately.

And as was mentioned yesterday, we definitely look forward to bring closure to the pasture issue and remain ready to assist the NOP in any way possible at any time. Likewise we look forward to the ANPR from the NOP relative to the dairy animal replacement dilemma. And we have, you know, formally submitted a guidance statement asking for a single acquisition method, namely the last third of gestation after you're certified, no
manner how you were certified or when. And
again, we stand ready to help in any way.
And we'll be working with the NOP to see what
we can do to assure future annotations like
the withdrawal times for medications can be
applied to materials. In other words,
hopefully we can help if there's process in
the FDA and whatnot.

Oh, and also we've had the issue
of defining better what outdoor access for
poultry means on our work plan for a year,
but we simply haven't had the time because of
the aquiculture issue, the pasture symposium
and all that went with that, and also the
dairy replacement issue. And as time allows
we will work on that issue of poultry outdoor
access. And finally we'll also work with
Rigo on defining research variances
appropriate for organic livestock.

MR. O'RELL: Any questions for
Hue? Bea?

MS. JAMES: The pasture symposium

NEAL R. GROSS
COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
(202) 234-4433
WASHINGTON, D.C. 20005-3701
www.nealrgross.com
that we had was extremely valuable for I think the entire Board. I don't want to speak for everybody, but I know it was for me and I think it was for everyone else. And I see aquiculture as being a pretty complex issue, and we had a lot of really excellent comments and expertise that came up and helped enlighten us. And I would like to ask if it is possible for the NOP to consider a symposium on aquiculture for the NOSB. And I'm inserting that in with Livestock because I would see that that would be something that you would work on in conjunction with Livestock. If we could do that in Hawaii.

(Laughter)

MR. O'RELL: I agree, Bea. Kevin, did you have a?

MR. ENGELBERT: Just that we could make a motion right now for that.

MR. O'RELL: Mark, did you have a comment on that?

MR. BRADLEY: I'm not real sure.
Are you asking me if you're going to ask
that, or are you asking me now and want an
answer now?

MS. JAMES: No, I'm asking if you
would consider a symposium on aquiculture. I
think that there's a lot more that we need to
learn.

MR. BRADLEY: They're similar but
very different issues. The level of concern
that existed and the amount of controversy
that surrounded pasture lent itself very well
to a very public hearing with a lot of input
from a lot of different sources that
supported the direction that the program's
taking and the way that the Board was able to
respond to all that. It was also very
expensive. I think we probably spent upwards
of $70,000 out of a fixed budget that we have
for federal advisory committee activity. I'm
not going to say no, and maybe something
that's of a more controlled scale in
conjunction with the Board meeting again. I
would not be opposed to something like that.

Is that a - did I dodge that bullet?

MS. JAMES: Can I respond? I guess I would just, I mean I'm not sure if we need something to the extent of pasture even though I wouldn't rule it out. But if there were the opportunity to have an hour or two of people in the aquiculture industry at one of our meetings to be able to help give us more guidance I think it would be very valuable. Because I see it as an extremely important issue.

MR. BRADLEY: Agreed.

MR. O'RELL: Mike?

MR. LACY: Kevin, I think Bea's got a good point. I think the aquiculture will be different than the pasture in that there are few areas of contention in aquiculture and many areas where everybody agrees on probably the direction that we're going to go with aquiculture. So I think really on a really scaled-down version we
could have experts come in to talk on those particular stumbling areas and not have to go to the extent of a symposium and all the expense on that. We actually talked about trying to bring George Lockwood to this meeting to address the group and decided that it would be better to wait until we get those draft standards together and then have him come. So I think Bea's got a good point but it probably doesn't need to go to a symposium level. It can probably go to some experts that we call in.

MS. JAMES: Just one more response then I'll leave it alone. I just want to respond to that, that the advantage of actually having a focused time is that these people that do come in get more than five or ten minutes and I think that that's valuable.

MR. LACY: Yes, I agree with that.

MR. O'RELL: Nancy?

MS. OSTIGUY: We've done this in the past on different topics where we've
asked experts to come in to speak to the Board and it has been for an extended period of time but it's short of a full symposium.

MR. KARREMAN: Right, for instance like the FDA guys that came.

MR. O'RELL: Jennifer?

MS. HALL: I do think this one's a little bit different too in the sense that livestock has been included under the rule up to now so I feel like we're more intimate with that community and they know how to use the system a little bit better. And I think that that opportunity should be afforded to a whole new community of producers and that there actually might be more heightened concern than we're aware. If we open that door a little bit we might be able to cut it off at the pass and avoid getting there by being backed in the corner.

MR. O'RELL: Dan?

MR. GIACOMINI: I totally agree with the idea that Bea is proposing. I would
just like to make a technical correction and shift it to the Executive Committee as a possible work plan because we do have some other possible things that we're going to be going to NOP with that may alter how we're requesting their use of limited funds in the next year.

MR. O'ReLL: Joe?

MR. SMILLIE: Yes, I'm new to the process so my question is it comes down to our time, which we seem to be freely willing to give. The other question is money and I'm just wondering does this have to be funded through current funds? I think that industry could fund a symposium under our direction. I don't know if that's possible.

MR. KARREMAN: Are you offering that from QAI?

MR. SMILLIE: No, no, no.

(Laughter)

MR. SMILLIE: I'm just saying the aquaculture industry per se and the groups
there. I'm just asking. If money's the issue and we can't do it because of our limited budget are there just other ways to create the symposium. Not the control of it, just the funding of it. That's what's done in the private sector at all times. I'm attending a food safety conference in Wisconsin that's run by the university and it's funded by private sources.

MR. O'RELL: Rigo?

MR. DELGADO: I wouldn't like that idea being expanded. I would like to really exhaust the possibilities that we're getting funding from the NOP simply because we might have some misinterpretations that we have private funding coming to support this activity. And we really need to have extremely objective information thrown at us.

MR. O'RELL: Well, maybe this is something on the work plan and Livestock you can seek counsel with the Policy Development Committee and come back with a recommendation.
after you've thought out several of the options that have been discussed here. I think that a lot of good things have been thrown on the table. So I would still put it back on the Livestock committee to come back and seek advice from the Policy Development Committee as well as what some recommendations might be appropriate going forward. Thank you. CAC?

MS. CAROE: We only have three things on our list. First item is to follow up with the deferred recommendation that we have on standard certificate format. The second item is to continue the work on peer review process, peer review procedure in collaboration with the program investigating all the alternatives and their benefits to the program, to the community. And lastly, we're going to follow up on that July 2001 recommendation for rule change that was referenced during this meeting. That's it.

MR. O'RELL: Thank you, Andrea.
Any questions for Andrea? Bea?

MS. JAMES: I would also like to add to the committee work plan looking at defining the role of retail certification when it comes to private label products. Because we had talked about defining that a little bit better. The role of the actual retailer. Because currently in the guidance document that we put out we said that if somebody seeks voluntary certification and they want to use that certifying information on the final product, that they can do that and they inherit the responsibilities that come with doing that. However, in the case of a retailer, you have several departments, and if one department is certified it's a separate issue. It's a separate issue, and so I'm proposing it as a separate issue that we look at defining that if you're certified in one little area, you can't go and use that on a final product. We have to define that better.
MS. CAROE: We accept that addition to the work plan to define certification of retail establishments and all the specifics that go along with that.

MS. JAMES: Thank you.

MR. O'RELL: Thank you, Bea.

Thank you, Andrea. Julie from the Handling Committee, please.

MS. WEISMAN: There's a lot more on my list than yours. That doesn't seem fair. Number one, I have reviewing petitions as complete petitions are given from the program. And I actually, there's 44 things on the list right now by my count, so I am not going to list them all individually if that's okay with everyone.

MR. O'RELL: That's fine. We know they're on your work plan.

MS. WEISMAN: Okay. Number two is the re-work of ag/non-ag. We've specified a lot yesterday and today about what still needs to be done so I won't go into the
details right now. Also, awaiting patiently the green light to continue our work on synthetic/non-synthetic. That's the third item. Fourth item is to now take the report of the Pet Food Task Force and begin the task of how to make them into standards. Five, I still need to appoint a Vice Chair. I haven't had a Vice Chair all year, so that's a task. And respond to NOP Q&A's as needed.

One other, commercial availability I did not put on this list. I'm very happy that that's not here anymore, but there is one little item that is remaining. The item that we struck this morning needs to be addressed and I propose that because it's a certifier, it's about the certifier's role, I propose that either it be moved to the CAC's work plan or that we form an ad hoc committee including certification and handler committee members.

MS. CAROE: What was the issue again?
MS. WEISMAN: The issue was how much information and in what form can the certifier give to either their clients or certified applicant without running afoul of conflict of interest.

MR. GIACOMINI: The deleted number three we took a break for.

MS. CAROE: We accept that addition to our list, reluctantly.

MS. WEISMAN: Is that it? That's it for Handling Committee.

MR. O'RELL: Any questions for Handling Committee? Thank you, Julie.

MS. FRANCES: Actually, I have one thing. Do you want to clarify the petitioned materials versus 606 or 605, all of it?

MS. WEISMAN: All of it. I mean, I will make a note that their one item has a little flashing light for me which is a 605(a) material, fructoooligosaccharides because that's been in the pipeline for awhile and now there is a TAP review complete
so we actually have everything that we need now. It may even have been the case before this meeting but we had our nose to the grindstones on other things, so I will note that I'm aware that this is an item that is now ready for committee review for the next meeting.

MR. O'RELL: Okay. Any other questions for Julie?

MS. WEISMAN: Is that enough?

MR. O'RELL: That's fine. Thank you, Julie. Dan, Materials?

MR. GIACOMINI: The work plan for the Materials Committee is to manage and proceed with the petition process for 606 petition items and other section petitioned items in cooperation with the respective committees that they are involved with. To cooperate with the Executive Committee to coordinate any additional possible meetings that we can arrange through the program to help us through the 606 process in a timely
fashion. To cooperate with the Handling Committee on the continuation of the ag/non-ag document and to move forward with the synthetic/non-synthetic document as it's allowed.

MR. O'RELL: Any questions for Dan, Material Chair?

MS. CAROE: Just you have the 606 process but you also - a standing item is to follow up with the petitions that are in the queue somewhere? I mean, not just 606 but all petitions.

MR. GIACOMINI: No, it was all other section petitioned items also.

MS. CAROE: Okay.

MR. GIACOMINI: I just - rather than saying "all items," I made a note that 606 was a particular priority.

MS. CAROE: Okay.

MR. GIACOMINI: The -

MS. CAROE: Well, but you also have the process, the flow chart of 606.
MR. GIACOMINI: Well, what I'm referring to is the process of getting them approved. That's what I'm referring to as the process.

MS. CAROE: Okay. Then I would suggest the addition of the flow chart for 606 with the timeline for the 606 review process.

MR. GIACOMINI: We said that.

MR. O'RELL: Any additional questions for Dan? I'm sorry, Joe, I didn't see you.

MR. SMILLIE: What hasn't come up in the discussion on the 606 process? Again, maybe I'm a little fuzzy on it, but what is the status of the expedited review process?

MS. CAROE: Emergency provision?

MR. SMILLIE: Emergency provisions, yes. We haven't talked about that the last three days, and I remember that was a fairly interesting item that we never got any kind of firm response from the
program on. I just thought I should—at least, I can't recall us talking about it at all.

MR. O'RELL: Andrea?

MS. CAROE: It is my understanding that the emergency provision is a function of the program and not of the Board. So I don't—although we want to be informed on it, I don't believe, unless somebody at the program tell me if you're waiting for us to take action on this, but I kind of feel like we're going to react to what the program does on that.

MR. SMILLIE: That's my understanding also, but I guess what I would ask for is an update from the program on their current thinking on this issue.

MR. BRADLEY: Part of what we have been thinking on this issue is to see how the process settles out with what the Board wants to do and what the level of their involvement would be with an expedited process. It's
becoming apparent to me that we're going to really need one if we're going to keep some of these things available for use by the industry. And anything that we do, that we develop at the program level we will absolutely do it in collaboration with the Board. I'm discussing working with the various committees and the Executive Committee on how we're going to move these materials through the process quickly and to see what kind of legal corner-cutting we can do to get them out there for that one year allowance that would give them additional time to be more thoroughly reviewed. But we would work with the Board on that.

MR. O'RELL: Thank you, Mark. I think this is certainly going to be one of the biggest priorities of the Board going forward is tackling the queue of materials that are on 605 and 606 particularly. And Dan, I guess we'd look to you and your work plan on the Materials Committee to be working
with the program in collaboration to see how we can move this through on a priority basis and how we can expedite, including the timing of the next meeting, the time needed for the Board to review these petitions and to get them through their paces for recommendations, but that we have a public meeting that allows the program sufficient time following that meeting to be able to go through the rule-making process. That's certainly, Dan, a priority both with the Materials Committee and the Executive Committee I think needs to spearhead. Thank you. Any other comments? Jennifer?

MS. HALL: I have one. I wasn't sure if there was an Executive Committee report, but I actually like the suggestion and based on a number of the items we've talked about today as far as expediting processes like this and potentially holding an aquiculture symposium that I'd like to suggest that the program and the Executive
Committee work together to reinstate perhaps an annual budget report just so that there's a little more understanding of what prioritizing needs there might be or where the struggles are or what the sacrifices are to making certain decisions. I don't know how detailed that needs to be, but at least a little more information.

MR. O'RELL: I think that that's a good comment and certainly something that we could put on for discussion with the program on the next Executive Committee call. Thank you. Any other questions or comments about work plan items? Hearing none we'll go to the next portion of our agenda, recognition of outgoing Board members. And I'm not going to comment on myself, but I think Mark has - I'll turn it over to Mark Bradley and the program.

MR. BRADLEY: We changed our mind. You can't go.

(Laughter)
MR. BRADLEY: Someone got up the other - I don't remember who the commenter was. I think it was the lady that commented a couple of times that she was a consumer, a real consumer coming to these meetings and throwing herself amongst the midst of all the activities and seeing what was going on. And there were on numerous occasions her and others, there's this awe that was cast upon the Board that you guys are the leaders of the organic world. This is - and it's true.

The level of responsibility that has been placed on you and accepted by the Board members and the level of commitment for five years. Five years. You know what happens in five years? We have presidents that don't last that long. We have changes of administration. I mean, who appointed you, Kevin? Was that Veneman still?

MR. O'RELL: Yes, it was Veneman.

MR. BRADLEY: So it was, things have changed and you have been tasked with
adapting your responsibilities and your recommendations and your research to the prevailing political and economic and production climate. It's been a daunting task for the three folks that are leaving, Mike and Kevin and Nancy. The level of commitment, and I'm glad to see that the industry and the consuming public appreciates what you have done and places you in such high esteem. Because in five years, you know, you can go from having no children to toddlers and children in preschool and you can go from no grandchildren. You've given up parts of your lives in five years, sacrificed your careers.

(Laughter)

MR. BRADLEY: I didn't mean it like you've given up your careers. Well there's no way to back out of that one, is there? But given of your professional time and your personal time. So I want to thank you, the three of you in particular that are
finishing up your stints or however you want to view those. I'm not going to ask you if you would do it over. If you had the chance to do it over again if you would, because we have prospective nominees for this position in the audience. And I really don't want to dissuade them by saying too much negative about what's gone on, but I know there have been a lot of choices made.

Nancy and Kevin and Mike, I know there have been instances where you have not been able to make it to meetings because you had to make tough choices, and I really want to thank you for the times where you did choose to work for the NOSB. And the public service I know is a privilege and a responsibility, but there's a lot to be gained I hope for you of the time that you've sacrificed, the professional notoriety that you've gained and earned, the respect that you've provided or earned from the organic community and from the program. We will be
tapping your brains. I think there's a lot
to be said to the amount of asking that we're
still going to come to you with as far as for
your help, for your guidance, your continued
support. Old Board members, you know, don't
go away. And we hope you don't, in
particular. And we don't want you to either.

But is there anything that you would like to
offer as far as comments? We have of course
our tokens of appreciation that are something
you can hang on your wall and be proud of and
take pictures of and put on your websites and
show to your grandkids and possibly use to
explain why you have been gone from their
lives so much. It's not much, but it's
something that we would like you to have.
That would be a good idea, if you all would
come up. Let's add some structure to this.
Let's just let Dennis choreograph this.

The conscription here says -
conscription, that's like inscription. It's
a certificate of appreciation from the U.S.
Department of Agriculture presented to Kevin O'Rell and Michael Lacy and Nancy Ostiguy for five years of dedicated service as a member of the USDA's National Organic Standards Board from 2002 to 2007. So this is the class of 2007.

(Applause)

MR. BRADLEY: Thank you guys.

MR. O'RELL: Mark, on a personal note I thank you very much. It's certainly been a privilege and an honor for me to serve on this Board. It's been quite an experience and five years as you say is a lot of time. It was one hell of a learning process as well and I know that for the new Board members I would say that, you know, that first year it's tough. But I've got to look around this room and say that I'm really pleased with the contribution that the freshman class has contributed to this Board. I'd also like to on a personal note certainly thank Mike and thank Nancy for serving together for the 5-
year period of time. We're the three left of
the five that started and we made it to
graduation. And it is a lot of work and
effort that both of you have put in and
contributed, and I appreciate that very much.

It's been an honor to serve with both of
you.

It's also for me been great to
serve with some of the Board members that are
in the audience that I was privileged to be
on the Board with them. So you've got
current members and you've got past members
at the same time. It's kind of an exclusive
club, but I think there's a bond that really
forms with Board members and as you exit the
Board, you're not really gone. I mean,
hopefully you're still involved in the
organic community and people will seek your
input and you can still make a contribution.

So I thank all of you.

MS. OSTIGUY: I also want to just
say a couple of words. I've very much
enjoyed the time on the Board. Yes, there were some interesting experiences. I'm interested to hear how Kevin described that first year because it reminds me of the same thing that people say when they begin teaching. The first year is overwhelming. After that, it's okay. And actually, the learning process was incredibly enjoyable. It was very, very interesting. Always interesting to hear someone else's point of view and many of times be persuaded. Working with the NOP has been wonderful. A group of people that know how to shepherd things through the federal process which many of us don't have experience with and it's been a great partnership. Thank you, everybody.

(Applause)

MR. LACY: Kevin, I will be very brief. It has been, as Nancy and you both have said so eloquently, it has been an honor and a privilege to serve on this Board, especially with the people on this Board, and

NEAL R. GROSS
COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
(202) 234-4433
WASHINGTON, D.C. 20005-3701 www.nealrgross.com
I appreciate very much the friendships that I have gained and the knowledge that I have gained and the opportunity to be a part of this very dedicated and very committed group of people. Thank you.

MR. O'ReLL: Thank you.

(Applause)

MR. O'ReLL: Okay and with that I think we'll move on to election of officers.

I know we want to kind of keep on track because I know some people have made plane reservations based on us adjourning on time at 12:30 so we want to kind of stick with it if Board members are okay with that. So we will start with there are three offices that we will hold elections for, the Chair, the Vice Chair and the Secretary. And let's start with the Chair position. We'll entertain any nominations to the floor for the position of Chair.

MR. KARREMAN: I'd like to nominate Andrea Caroe for Chair of the NOSB.
MS. WEISMAN: Second. Oh, we don't have to do that, do we?

MR. O'RELL: Technically we don't have to second the nomination, but that's good to know there's support. Andrea, do you accept the nomination?

MS. CAROE: I accept the nomination.

MR. O'RELL: Are there any additional nominations for Chair position?

MR. LACY: I move that nominations be closed and that we elect Andrea by acclamation.

MR. O'RELL: That we need to second.

MR. ENGELBERT: I'll second that.

MR. O'RELL: Kevin seconded. We have a motion to close nominations and cast a unanimous ballet for Andrea as Chair. All those in favor, aye?

(Chorus of ayes)

MR. O'RELL: Opposed?
(Silence)

MR. O'RELL: Andrea, congratulations.

(Applause)

MR. O'RELL: We will go to Vice Chair position and accept nominations for Vice Chair. Do I have any nominations at this time from the floor?

MR. MOYER: I nominate Gerald Davis as Vice Chair.

MR. O'RELL: We have a nomination for Gerald Davis. Gerald, do you accept the nomination?

MR. DAVIS: I accept.

MR. O'RELL: Thank you.

MR. MOYER: I nominate Julie Weisman.

MR. O'RELL: We have a nomination for Julie Weisman. Julie?

MS. WEISMAN: I accept.

MR. O'RELL: You accept. Are there any other nominations from the floor?
Seeing no additional nominations from the floor we have two nominations, Gerald Davis and Julie Weisman for Vice Chair. So we will have a ballot. We can use these, everybody has them, they're the same size. So what I would ask is that everybody cast a vote and then I would ask the secretary if you would collect and tabulate the results. Do we have to go in a secret room to do this?

MR. DELGADO: No chance.

MS. CAROE: I feel like Survivor.

(Laughter)

MR. O'RELL: Okay, the results of the election by the Board is that Julie Weisman has been elected for Vice Chair of the NOSB. Congratulations, Julie.

(Applause)

MR. O'RELL: And Gerry, let me say there's three more years to go on the Board, so.

MR. DAVIS: I'm not worried.

MR. O'RELL: Thank you. Thank you
all. Now the next position is Secretary. Are there any nominations for Secretary?
Yes, Andrea?

   MS. CAROE: I would like to nominate Bea James for the position of Secretary?

   MR. O'RELL: Bea, will you accept the nomination? Bea accepts the nomination.
Are there any additional nominations for Secretary?

   MR. LACY: I would move that nominations be closed and that we elect Bea by acclamation.

   MS. WEISMAN: Second.

   MR. O'RELL: It has been moved and seconded that nominations be closed and that we vote to unanimously accept Bea for the position of Secretary. All those in favor?

   (Chorus of ayes)

   MR. O'RELL: Opposed?

   (Silence)

   MR. O'RELL: Bea, congratulations,
another year.

(Applause)

MR. SMILLIE: Sisterhood.

MS. CAROE: Charlie's Angels.

(Laughter)

MR. O'RELL: Oh, other business and closing comments. Before we go around and have closing comments I will ask is there any other business that needs to be addressed by any Board members?

MS. CAROE: We have two items. One we have to address committee chairs.

MR. O'RELL: Thank you.

MS. CAROE: And then the other thing that we have to address is scheduling the next meeting.

MR. O'RELL: Okay, committee chairs.

MS. CAROE: In taking on the role of Chair of this Board, I am going to step down from Chair of the CAC and I have asked Joe Smillie to take on that role as Chair of
CAC.

MR. SMILLIE: I don't recall being asked.

(Laughter)

MR. SMILLIE: But accepted.

MR. O'RELL: Accepted, okay.

MS. CAROE: And the other position that has come open with the leaving of Michael as Chair of the Livestock Committee, it leaves vacancy in that committee for a Chair. And I have asked Hue to take on that role as Chair of the Livestock Committee.

MR. KARREMAN: Happy to and I would also like to ask if Kevin Engelbert could be my Vice Chair.

MR. ENGELBERT: Yes.

MR. KARREMAN: Done deal.

MS. CAROE: And then all remaining Chairs will stay the same at this time. Committees will remains as are listed at this time pending the new members in the next couple of months and we'll look at the
staffing of each of the committees and possibly make adjustments at that time.

MR. O'RELL: Okay. Thank you, Andrea. In terms of setting a meeting date for the next meeting, and I know that we have tried both ways where we all get our calendars out and wrestle back and forth and get nowhere in terms of when the next meeting date is. In the past, the program has sent a calendar of available dates or asking for people's availability and then they compare that master calendar and try to come back with the recommendations on the Executive Committee that we will take care of for the next meeting. I would entertain discussion, though, in terms of timing for the next meeting. Andrea?

MS. CAROE: Well, I would like to pose a question to the program. We have requested two meetings this coming spring to accommodate the numerous materials we have for 606 in order to get those materials dealt
with prior to the June `07 deadline. And I just again want to check and see if there's any possibility of accommodating perhaps a February and an April meeting for 2007.

MR. BRADLEY: We have discussed this. This is Mark Bradley. There are several options that we can take as far as making sure that we have enough Board time to process the petitions and get them worked through the system in a timely manner. February is a possibility either as a work session or a full Board meeting. A closed work session, there's options there. The April Board meeting was set up for somewhere on the West Coast to get out of D.C. in April.

MS. CAROE: That's the west coast of Hawaii?

(Laughter)

MR. BRADLEY: So those are the two dates that we had considered. And yes, we think that you're probably going to need to
have a February at least work session or
Board meeting.

MR. O'RELL: I think I would
prefer, and I won't be here, but as opposed
to a work session I really think it needs to
be a meeting because they need to move
materials forward in terms of the public to
vote. So that would be my outgoing two
cents.

MR. BRADLEY: Well, we may - in
order to expedite things, you know, to take
advantage of the historical knowledge that
you and some of the other Board members may
have that are outgoing, we would invite you
back possibly. But we can work on that on a
case-by-case basis.

MR. O'RELL: Sure.

MR. BRADLEY: If you would
volunteer for that.

MR. O'RELL: I would absolutely.

MR. BRADLEY: Just as we often

have Kim Dietz for her historical information
with all our materials. If that's possible. But we can discuss that.

MR. O'RELL: Yes, absolutely. I'd be open to that.

MS. CAROE: So can we schedule a meeting at this time or are we going to just do this by email?

MR. O'RELL: Well, I think it's probably easier to do it by email to send out some dates of a calendar from the program and then have people fill in only the times that they're restricted that they cannot do it. In the past that has worked and then the program will tabulate that and will get back. And even then we know we'll have some conflicts but maybe things can move around. Yes, Kevin?

MR. ENGELBERT: It's not a conflict and I can't speak for the other producers and I realize the time constraints if we have two meetings how far apart they have to be. But as a producer, April
meetings are extremely difficult for me. I
never caught up last year from the April
pasture symposium. So even early April makes
a difference as opposed to middle or late
April for me.

MS. CAROE: Is early April good or
bad?

MR. ENGELBERT: Better. The
earlier the better, yes.

MR. O'RELL: Any other comments on
scheduling for the next meeting?

MR. ENGELBERT: But again, I'm
just one person, I don't expect everything to
change, I just, you know, I will make a
meeting whenever it's scheduled, but as
everybody looks at their own schedules, that
is certainly more accommodating for me as a
producer because I have a limited amount of
time that I can, you know, get my spring work
done.

MR. O'RELL: Yes, I don't know
holidays as well, that's why I think it's
just best if we get a calendar sent out from the program. And let's be sure to list holidays on that program because sometimes it comes and they're not listed. I tend to overlook that and get in trouble. So it would be nice if those are spelled out, then people can put - and I would encourage this to be done quickly, Mark, so that we can get it out while it's fresh and everybody would look at it and respond. By the next Executive Committee meeting which Andrea will be leading then I think it would be appropriate to have a discussion then and fix these dates so that we could work forward.

MS. BENHAM: It's also important because I would need to try to locate a hotel.

MR. O'RELL: Yes. Say your name for the record.

MS. BENHAM: Katherine Benham. I was saying that it is also important because I will need - I mean, that you guys just kind
of like really concentrate on getting that
calendar back to Valerie. Just get the
information back to her, particularly because
I would need to locate a hotel and, you know,
try to make sure that you guys, you know,
have somewhat a nice hotel. So.

MR. O'RELL: There's a request for one
with wireless in the meeting room.

MS. BENHAM: Yes, yes. And you
know if you're going to schedule something in
D.C. it can be very difficult, so.

MR. O'RELL: Yes. Thank you,
Katherine. Any other business before we go
to closing comments? Andrea?

MS. CAROE: I don't have anything.

MR. O'RELL: Well, we're going to
end on time, even early, which is good.

MS. CAROE: I guess the one
comment is this is like the first meeting
where at the end of the meeting we still have
more audience than we do Board members which
is, you know.
(Laughter)

MS. CAROE: Usually we have like three people sitting out there at this time.

MR. O'RELL: That's true. Yes, Katherine.

MS. BENHAM: I'm sorry, I've got one more thing too. Make sure I get your travel expenses back.

MR. O'RELL: Thank you. If you want your money, be sure to get your expenses in to Katherine. I guess I would just like to say, you know, once again it's for me my last official meeting in the capacity of a Board member and I'd like to thank this Board and past Boards that I served on for all of your help and guidance. It's been a very good time for me. I've enjoyed it and I've learned a lot.

I'd like to thank the public for this meeting in terms of their thoughtful comments. We had a lot of good comments during the comment period. I think you
should be commended. The comments were focused on our agenda which is really a good thing because it helps us and you can see the effect that the public comments have on the deliberation and the change in going forth with the recommendations from committees to full Board vote. So we want to encourage that in the future, the participation from the public.

I also want to say that I saw a very good sense of collaboration in a lot of the issues that were discussed at this meeting, collaboration with the NOP both beforehand in bringing recommendations to the floor during the meeting and collaboration with the public in terms of hearing input and working adjustments according to that input which has been good. There's a lot of work ahead on 606. We know that's a real issue. We know that's a priority. I just wanted to let the public know with the sunset of colors we recognize what needs to be done
and this Board, the Handling Committee and the officers going forward will take this task on as a huge priority in working with the program as well in any way we can expedite any processes to get through so that we don't leave any materials left hanging.

I'd like to thank the NOP for all of their assistance during the meeting, Valerie for your almost one year I think now of service and thank you very much. I think that's been a real help to the Board in terms of having Valerie in the Executive Director position as a liaison to the program and assisting us with minutes and scheduling. Very helpful. And I know that that's a role that's evolving and future Boards will get better at using the collaboration and working with you through that process. So I only see that as a very positive. Katherine, thank you so much for all the arrangements that you've made. I know there's a lot of work that goes in behind the scenes in pulling
this together so that we can have this
meeting. And I'd like to thank Mark and Bob, Arthur and Barbara in absentia. But we thank the full program for your comments and staying with the meeting and helping us through and working with the Board and the public. Before I ask if the NOP has any closing comments, any other Board members have anything to say in closing?

MR. LACY: Kevin, on behalf of the outgoing class I want to thank you very much for your very able leadership. Appreciate it very much.

MR. O'RELL: Thank you, Mike, I appreciate that. Mark, do you have any comments you'd like to make in closing? I'm sorry, Dan?

MR. GIACOMINI: At the April meeting we did get a Board photograph but it was missing two of the members. I would like to ask the Board if we could stay around for a few more minutes after and get a complete
photograph of the entire Board.

   MR. O'RELL: That would be great.
   We'll do - I think everybody can accommodate that. Who's going to take the picture?
   Where's Dennis?

   MR. GIACOMINI: He left. I mean, even if it's just we'll get something and I'll get them out to everybody on email.

   MR. O'RELL: Okay. Thank you.

Mark?

   MR. BRADLEY: Yes, thanks. This finishes up one year with me as the Associate Deputy Administrator. And I just wanted to thank Kevin in particular for he came into D.C. and we put our heads together for, you know, to try to plot and plan this past year back in January.

   MR. O'RELL: Yes.

   MR. BRADLEY: Came in, spent a whole day, worked through lunch and that seed of collaboration has just carried throughout this whole year. And the Board has been very
free with contacting Valerie. She came along
about the same time. And it has been a very
enjoyable experience. I'm very excited that
Andrea is going to be, you know, following in
Kevin's footsteps, or I don't know who's been
leading who, but you two have worked very
well as a team for the past year and I don't
see any disruption in the flow of work or
progress that's been made by the Board
happening because of this loss of experience,
but you'll be gaining some new experience.
So we will work very closely with trying to
bring in the new people to preserve the work
that you've done to close up some
recommendations that have been hanging out
there for a long time.

And I appreciate the public
comment, the frank and candid remarks and
recommendations and suggestions and the humor
that's been shared with the program. And we
take it to heart. Sometimes we don't - we
don't necessarily take it personally, but we
do listen and it's very much appreciated.
And if you'll stick around we'll try to get a
calendar to you before you get home. And if
anybody has any particular needs that they
want to share with Valerie and I about the
next meeting we can go ahead and get that
process started because we want to get this
scheduled, get Kat going on it and get all
the arrangements made because, you know,
February is not very far off and there's a
lot of work to be done. So we'll have a game
plan put together. That's all, thank you
very much.

MR. O'RELL: Thank you very much,
Mark. Andrea?

MS. CAROE: I just want to take
this opportunity to thank Kevin in particular
for teaching me so much in this last year
about leadership and about leading the Board
and his cool head and his good heart have
just - it's been inspiring to me. And I also
would like to thank for the vote of
confidence. I'm humbled because I work with the most brilliant people on this Board. So I appreciate that and I hope I can live up to that.

MR. O'RELL: Thank you, Andrea. And particularly before we close or ask for an adjournment I want to say that I really thank this Board. It's been a great productive year and my officers, Secretary Bea, I'll get hugs later, and Andrea. So. Seeing no other closing comments I will accept a motion for adjourn.

MS. WEISMAN: Motion to adjourn.

MR. O'RELL: Is it seconded?

MR. LACY: I would like to second that.

(Laughter)

MR. O'RELL: All those in favor?

(Chorus of ayes)

MR. O'RELL: Meeting adjourned.

Thank you.

(Applause)
(Whereupon, the foregoing matter went off the record at 12:04 p.m.)
UNITED STATES DEPARTMENT OF AGRICULTURE
WASHINGTON, D.C.

A meeting in the above-entitled matter was held on March 27, 2007, commencing at 1:03 p.m. in the Washington Plaza Hotel, Ten Thomas Circle, N.W., Washington, D.C. 20000.

Melanie Saffer, PCO
PROCEEDINGS

MS. CAROE: We're ready to call the meeting to order. Can everybody quiet down a little bit and take your seats? The spring meeting of the NOSB is now in session. I'd like to thank you all for coming.

This is going to be a very productive meeting. We're going to have more votes in this meeting than any NOSB meeting has ever had before. I thank you all for your comments in advance that we've received, and the comments that we'll receive here at the meeting. We have quite a few issues that evoked quite a bit of passionate comment, and we will take them very seriously as we deliberate to make the best recommendations possible.

At this time, I'd accept a motion to approve the agenda for the meeting. Do I have a motion?

MR. SMILLIE: So moved.

MS. CAROE: Do I have a second?

MS. JAMES: Second.

MS. CAROE: Is there any discussion on the agenda for the meeting? Hearing none, I'd like a vote for accepting the agenda. All those in favor say aye?

(A chorus of ayes was heard.)

MS. CAROE: All those opposed same sign? The motion passes. We have an agenda. I'd like to take the opportunity now to welcome four of our new members, or our
four new members. One of our new members, unfortunately, could not make it here today. That's Tina Eller. Tina is holding one of our environmental seats, and she is going to be -- she is holding spot on the Crops Committee and the Livestock Committee and has been engaged in that activity already, and is already a very valuable member of this Board.

I'd like to recognize Steve Demure. Steve is holding a handler's seat. And he is actually vice-chair of the Handling Committee. He is also on the Materials Committee.

Tracy Miedema.

MS. MIEDEMA: Miedema.

MS. CAROE: Miedema. I apologize. Tracy is a consumer rep, and she is going to be representing the Crops Committee and the CAC. And last but not least, Katrina Heinez, who is holding the scientist position on this Board, and has also been assigned to the Handling Committee and the Materials Committee.

All four of these members have been engaged in activity on the Board since they were appointed in January of this year. They, we have no novices anymore. These folks came in and have been harnessing the load for us.

At this time, I'd like to ask if there's any announcements from the Board? Any announcements? As I said, this is a very productive meeting. We have a lot of
materials that have been reviewed. We have several other
very important issues that we've taken up. We will be making
more votes than ever before, and they will be done fairly
quickly. The Board members have spent a tremendous amount of
time on these recommendations. And we expect there to be a
lot of public comment, because there are so many
recommendations on the table.

At this time I'd like to go around the table and
have the members introduce themselves. If you can tell us
your name, what seat you hold, the committees that you're on,
and why you're serving on this Board. I think it's important
for the public to understand what compels you to do this
insane amount of work as a volunteer. So we'll start with
Dan, since I don't want to start with a new member, put you
on the spot. Dan.

MR. GIACOMINI: Dan Giacomini. I'm on the consumer
seat on the Board. I am an animal management nutrition
consultant and mostly in the dairy industry with ruminant
livestock in California.

I've taken the position of consumer, you know, very
seriously, and as I've spent a lot of time trying to
understand the consumer and learn the consumer, and I -- as
it turns out, I am now finding myself trying to explain the
consumers to producers a lot more than I'd ever have to worry
about explaining producers to consumers. So I think it's
been -- it's an interesting position.

I was just at a large dairy producer meeting in Wisconsin last week, and that was essentially my whole talk is trying to get them to understand and see where the consumer is. And I try to continue that education on myself whenever I can.

MS. MIEDEMA: Good afternoon. My name is Tracy Miedema. I currently work for Stallbush Island Farms, a family farm in the Willamette Valley in Oregon. I am on the Crops Committee and CAC, as Andrea just mentioned. And my motivation for being part of the Board is that a fundamental belief that people should contribute at the level that they are capable of. And I felt like I could make a contribution and am here to do so. Thank you.

MR. ENGELBERT: Hello. I'm Kevin Engelbert. I'm a producer representative on the Board. I operate 120-cow organic dairy farm in upstate New York. I'm on the Crops Committee and the Livestock Committee, and I have been involved with organic agriculture all my life, and my boys got old enough that I can turn over some responsibility, and a good share of the responsibility of the farm to them, and that has allowed me to serve on this Board, and which I'm very grateful to be a part of.

MR. MOYER: I'm Jeff Moyer. I'm the farm manager for the Roedale Institute. I've been involved with organic
production for over 30 years now. I hold a producers seat on
the Board. I'm on the Livestock Committee, and I'm also the
vice-chair of the Crops Committee. I'm involved with the
Board here because of my lifelong commitment to organic, and
I feel that I can make a commitment and a contribution to the
Board's work.

MR. SMILLIE: I'm Joe Smillie. I'm the senior vice
president of Quality Assurance International, and I hold the
certifier seat on the Board. I've been involved in the
organic movement since 1977, based on a decision I made on
ecology in 1969 during a momentary vision of enlightenment.
And I want to serve on this Board because I really think that
it's time to put the community perspective of, and
regulations and industry together, and to work out
compromises so that everyone can achieve their objectives
underneath the regulation of organic integrity.

MS. WEISEMAN: My name is Julie Weisman. I hold
one of the handler positions on the Board. This is the
beginning of my third year on the NOSB. I'm on loan to the
NOSB from the two businesses that I'm involved in, Ewon
Vanilla, which supplies commercial ingredients to food
manufacturers and Flavorganics, which is a retail brand.

I'm chair of the Handling Committee, and I am also
on the Certification Accreditation and Compliance Committee
and the Materials Committee. And I'm here because I have
been involved in organic, at least as a consumer, you know, since I was, you know, adult enough to make my own food purchasing decisions. And it's a chance to really, you know, put into practice and work towards, you know, many, many values that have been important to me my whole adult life.

MS. CAROE: Hi. I'm Andrea Caroe. I'm executive director of Protected Harvest, a sustainable commodity certifier. I am presently the chair of this Board, and I am the past chair of the CAC. I am also a member of the Handling Committee, the Policy Committee, and have had the good fortune to be working with the Aquaculture working group.

The reason that I am on this Board is, back in the early nineties when I first was introduced to organic and asked to be an inspector, I was brought into this industry that was struggling with their next mutation to federal regulation. Being that my past is running environment laboratories and being under the thumb of EPA regulations, I felt that I had something to offer. I felt that I could help this industry adopt, adapt to a federally regulated industry and so I am here to serve.

MS. JAMES: My name is Bea James, and I hold the retail seat here on the NOSB. I am currently also the secretary for the NOSB. I am on the Policy Committee, and I am vice-chair of that committee, and Accreditation and
Certification, and I'm also a vice-chair of that committee.
I am currently working now with the NCGA, which is the National Cooperative Grocer's Association, and I am very excited to be here representing out of the 180 coops across the nation 130 of them.

And the reason that I took this position is because I want to contribute to our future generations, and I'm hoping to maintain the organic integrity that all of us old timers currently grew up with and believe in, and keep it alive for the little kids who are growing up and some day will be able to eat organic food as we know it.

MR. DELGATO: Very good. Hello. My name is Rigoberto Delgato. My user friendly name is Rigo. I'm the producer of West Texas. I can blame probably Jim Hightower and my dad for becoming involved in organics. And the reason I wanted to be involved in this process as an immigrant to this beautiful country was to provide a payback way, and contribute to the whole democratic process. So here I am.

I also want to make sure my children inherit the same things and the same spirit that my dad was, still willing to talk about. So here I am. I'm participating in the PDC. I'm the chair of the Policy Development Committee. I'm a member of the Crops Committee and the Livestock Committee. Thanks.

MS. HEINEZ: Hello. I'm Katrina Heinez. I am from
Minneapolis, Minnesota, where I work for General Mills Small Planet Foods. I work in the regulatory affairs department. I am the scientist representative on the Board, bringing my chemistry background to that. I serve on the Handling Committee and the Materials Committee.

The reason I wanted to be on the NOSB is that I grew up in a natural foods home eating organic as it was developing. And I think I have skills to offer to help make sure that we have strong, credible, organic regulations that both serve our consumers and help make sure that all consumers have access to food they can trust.

MS. HALL: Hello. I am Jennifer Hall. I am the consumer representative. I serve on both the Livestock Committee and the Certification Accreditation and Compliance Committee. I live in Spokane, Washington. I currently work for a residential developer who is quite active in getting farmers markets started and building in agriculture as a component of our developments. I have a long history in the restaurant industry with those restaurants who try to source as sustainably as possible, and also with helping smaller producers with marketing efforts.

The reason that I am here is, I've always been a purchaser of organics myself. I have definitely invested on an individual basis in more education and training about what it means, and what organic stands for, and as a consumer, I
am extremely proud and honored to be able to, I think, remind us all of the great trust that's placed in us. I was reminded a couple of days ago myself, a very intelligent friend of mine knew there were rules out there, buys organic, but really did not fundamentally in her head know that there was already a national organic rule.

So I was reminding, kind of bracing, just that there are so many people out there who really want that quality, but really don't understand the machine behind it. So it's important to keep that in mind.

MR. DEMURE: Good afternoon. My name is Steve Demure. I'm with Campbell Soup Company. I live out in Sacramento, California, and I'm on the Handling Committee and the Materials Committee. And even though Campbells is relatively new into the organic business, I have been involved since the late eighties, early nineties. I was on the startup team for Muir Glen, and very much like the organic industry.

I fully, personally, am very proactive as far as the philosophies and values of the organic industry, and I want to be able to give something back to that. It's given a lot of me and my family, and I want to do that back in return. So thank you. And I am the newbie, one of the newbies here.

MS. CAROE: We do have two members, besides our new
member, Tina, that are not here yet. Hugh Karreman will be here Thursday. He was unable to make it earlier. Hugh is the chair of our Livestock Committee, so his vice-chair, Kevin Engelbert, will be pinch hitting for him. Thank you, Kevin.

Also, Gerald Davis had some unfortunately airlines difficulties, as we all can appreciate. So we expect Gerald to be here sometime tonight, God willing.

Also, I'd like to take just a moment before we get to the NOP staff, to recognize the row of chairs back there, the three past chairs are all standing -- you're pasturing. So Kevin Orell, Jim Riddle, and Dave are here to show me where my seat is when I leave.

At this time, we'd like the staff to be able to give a little bit of introduction?

MR. BRADLEY: I'm Mark Bradley, I'm the associate deputy administrator of the National Organic Program.

MS. BENAN: Katherine Benan, Advisory Board Specialist.

MR. COOLER: Bob Cooler, nationalist coordinator for Kashi and Company.

MS. CAROE: Okay. Well, that's it for introductions. Oh, and Valerie Francis, I'm sorry. Valerie.

MS. FRANCES: Valerie Frances, executive secretary to the Board and just loving being here.
MS. CAROE: We find ourselves a little ahead of schedule. Don't get used to it. But at this point, I'd like to turn it over to Bea for secretary's report.

MS. JAMES: Since we have all that time, we can read the transcripts from the last -- okay. Well, I would like to move to accept the meeting transcripts as official record for the October 2006 NOSB meeting.

MS. CAROE: Is there a second?

MS. HEINEZ: Second.

MS. CAROE: Any discussion? Hearing none, all those in favor of the transcripts from the October 2006 meeting say aye?

(A chorus of ayes was heard.)

MS. CAROE: All those opposed, same sign? The motion passes.

MS. JAMES: Okay. I would also like to move to accept the meeting summaries as shown and posted on the NOSB website for the NOSB fall 2006 meeting, I'm sorry, 2006, and that was for October 17th, October 18th, and October 19th, three different meeting summary minutes.

MS. CAROE: Is there a second?

MR. SMILLIE: I'll second.

MS. CAROE: Who seconded? Joe. Okay. Is there any discussion on those summary transcripts or summary minutes? Hearing none, all those in favor of accepting the
summary minutes from the October 17th, 18th, and 19th meetings say aye?

    (A chorus of ayes was heard.)

    MS. CAROE: All those opposed, same sign? Motion passes.

    MS. JAMES: Okay. Last, I would like to -- the summarized votes for the October 2006 meeting have been updated as of yesterday. We did receive some public comment regarding the votes, and that comment was very good at pointing out that there could have been more clarification in how the votes were summarized. So that has been updated. And everybody received a copy of that.

    So the voting cast has remained the same. The updates on the voting summary include addition of clarification of the motion, and the addition of results from the motion after the voting results. So I'd like to move that we accept the updated voting results from the October 2006 NOSB meeting.

    MS. CAROE: Is there a second?

    MS. KEINEZ: I second.

    MS. CAROE: Katrina seconds. Is there any discussion?

    MS. FRANCES: Just one comment. I haven't had a chance to post a revised version of this on the website. So just for the public's interest.
MS. JAMES: Right. And I just want to restate that the voting results haven't changed, it's just there's more clarification as to exactly what the motion was and what the final outcome was after the votes.

MS. CAROE: Any other discussion? Okay. All those in favor of accepting the vote summary from the October 2006 meeting say aye?

(A chorus of ayes was heard.)

MS. CAROE: All those opposed, same sign? Motion passes.

MS. JAMES: And that would conclude the secretary's report.

MS. CAROE: Thank you, Bea. We're moving very quickly. Next on the agenda is the NOP report. Mark Bradley, are you available? Are you ready?

MR. BRADLEY: I am available. Want me to do it up here?

MS. CAROE: I think they need you on microphone for the transcripts.

MR. BRADLEY: I've got a microphone over here. I can come up there.

MS. CAROE: Thank you.

MR. BRADLEY: I don't want to be rude and turn my back to everyone. Thank you, Madam Chairman. It's wonderful for the program to be able to have the Board here in
Washington. We were originally planning to go up to the
pacific northwest, but budgetary constraints kept us here in
D.C., which is not always a bad thing. It's nice to be able
to play at your home town and to bring people in.

It's always a good excuse for folks to come into
Washington, set up other meetings, and of course the people
that are able to attend the meeting, from a gross headcount,
I think there's just about 100 attendees, which is a very
good attendance. It indicates a good interest in the
programs, activities and the work that you are doing.

I'm just going to give a very brief, brief update
on what's happening with the NOP. We have so much time to
visit with the Board these days, at times it has been that we
needed to carve out some special time during the meetings to
bring the Board up to date on what's happening with the
program. It's not so much the case anymore. There's a lot
of communications, I think. I don't expect that there's
going to be any surprises at this update, but perhaps most of
this is for the folks that have come so far to attend the
meetings, and for the new folks as well.

The program, of course, has eight full-time staff
employees that work to accomplish the mission of the NOP.
We've had some changes recently, rather remarkable changes,
in fact. Keith Jones, who was formerly the National Organic
Program manager was in charge of the program when the final
rule became effective, has -- he went on a detail to Capitol
Hill and found a home up there permanently. And now he is
the new staff director for the House Agriculture Committee,
subcommittee on horticulture and organics. It's good to have
a friend up at that level, and we wish Keith the best.

It would be nice if he could have been here, but
I'm sure that he's so overly gainfully occupied, he's just
like everyone else. He's very busy.

We also have a visiting member on staff,
Ms. Valerie Schmale, who is on detail from the process
products branch from the Fruit and Vegetable Program.
Valerie is doing a very important function for us. She is
conducting an internal quality system audit. This involves a
complete analysis of the program's activities based on ISO
17,011, the guidelines for accrediting, certification bodies
-- or guidelines for accreditation activities of accrediting
bodies.

It's a really wordy title, but it basically is our
guidelines for being an accrediting body and for developing
standards. And her review will take approximately four
months, and is how long she's been detailed for us. If we
can get the work accomplished in less time than that, we will
keep her around to help us develop some of the, any kind of
remedial actions that would need to be developed based on her
findings.
But we're truly fortunate to have someone of her caliber available to the program. She's a quality system lead auditor, trained under ISO 9,000 standards, and routinely conducts evaluations of certifiers and certified operations under the process fruits and vegetable programs. So that's a very fortunate situation for us.

We've conducted two major training events this year. For the certifiers, we conducted a training in conjunction with the Ecological Farming Conference in Pacific Grove, California in January. We try to do our training in January and February, during the slower months for the certifiers that are operating in the northern hemisphere. That was a very successful event with approximately 60-65 certifiers attending that. And also we try to hold an annual certifier training event in conjunction with the BFO Trade Fair in Nuremberg, Germany. That was conducted in February of 2007 of this year.

The total attendees was over 100 accredited certifying agents represented, which is as many as we've had in total since we've been conducting the training. It indicates an interest in the international community. The training has been expanded from a half day to a full day of training. And this year we issued written minutes of the meeting so that they had something to take home. And that was an interesting phenomenon. So many times we would say
something in the context of a training event. It would go in
one ear and out the other. And now they have something that
they can take home, and it's caused a little bit of a stir,
but it's a good thing.

We think that the controversies or the
clarifications that are indicated by the training will
provide some fodder for the Board to consider, and to make
clarifications in the policies or your recommendations as
they become relevant.

As far as training as well, we conducted a two-day
training event for the audit review and compliance staff, the
auditors that are responsible for accrediting certifying
agents. There were seven full-time employees that were
primarily tasked with the organic certification, accredited
certifiers, and conducting those reviews. They act as lead
auditors, and then they take less experienced auditors along
with them to gain experience.

We trained seven of those auditors in
Fredericksburg, Virginia, in November in anticipation of the
renewal audits of 40, well, now 39 accredited certifiers that
come new for renewal on April 29th of this year.

In the international arena we have eight recognized
governments that are authorized under the National Organic
Program to accredit certifying bodies to operate in their
country on behalf of the National Organic Program.
This is provided for in the regulations, and it's something that, it's a bit of a phenomenon with the organic community in that they are able to accredit certifiers only to operate within their country for products that are going to be exported to the United States.

There is some interest in having these, or by these recognized bodies to accredit their certifiers to conduct audits or to conduct certification activities outside of their country. We have determined from the NOP that unless they have regulatory authority outside their country, which, of course, they don't, they would not be able to conduct those certifications on our behalf. Anyone that's operating internationally would have to be directly accredited by the program.

We consider this to be a higher level of assurance which is necessary to make sure we have the authority to review products that come into the country. And if we need to do that under other agreements with countries, we can pursue that.

We have two new agreements which have been recently put in place. In Israel, the Ministry of Agricultural and Rural Development Planned Protection and Inspection Services, PPIS, has been accredited to certify operations or accredit certifiers in Israel. And also, recently, the Agriculture and Processed Food Products Export Development Authority,
commonly know as APEDA, has been recognized by the USDA to
certify agents in that, or accredit agents in that country.
They already have, I believe, 10 certifiers that operate
under their authority in that country, in India, and we have
already gone on site and conducted an assessment of their
activities. That was conducted in December.

And the report has been issued to India that we've
received comments back from it, and we're in the process of
issuing the final report. There were no substantive
comments. So those reports will be available to the public
when they become final. Again, we have a total of eight
agreements.

We have two new accredited certifiers. One was
Ecocert Belgium, and the other is Nature's International
Certification Services, NICS. And Dave Engle, I believe, is
in the audience. And congratulations, Dave.

That brings to our total 96 certifiers that are
accredited to the National Organic Program. We haven't got
over the 100 mark yet, and I don't know what our problem is.
We've evaluated over 120, but they either don't pass, for
some reason, or they decide that they go out of the NOP
business. So we're looking to pass that 100 mark.

But it's, I don't know if we're just aching for
punishment or whatever, but it's an incredible work load for
the staff of eight on the NOP in Washington. But it's good
to see that this level of service is available to the international community.

Our current work priorities for standardization, we covered with the Board the myriad of things that we do this morning, during the new members training. But just for a summary, we have national list sunset, which is going to be due at the end of this year towards October. That work is in a proposed final rule process.

The national list for materials for 205-606 which has to be in place for June 9th deadline for, under the Harvey lawsuit. Pasture requirements for ruminants is still currently in internal, in departmental clearance, but we're expecting some activity on that.

Dairy herd replacement requirements, as soon as we get done with the pasture requirements, we'll immediately move into rule making on that. And there is already a work plan in place for that. And, of course, the aquaculture standards development -- that part of the, once we get the Board's recommendation on that and receive more public comments, we will begin the regulatory process for that.

Just for the brief comments I have, are there any questions from the Board members on NOP activities or what we are up to?

MS. CAROE: Dan.

MR. GIACOMINI: Mark, can you give us an update on
the livestock materials docket that was, proposed rule was
what, last summer sometime, and final rule has not been out
yet?

MR. BRADLEY: We are currently incorporating the
comments into that document so that we can go ahead and
publish it as final. And I don't have a time frame on that,
but it is being worked on right now. We only have half of
the NOP staff here, and you can see we're a little bit thin
over there because we kept the other half of the staff at
home so they can get some work done. Most of the email
traffic and calls are from people that are in this room right
now, so it's kind of a good chance to sequester them so they
can get some stuff done.

MS. CAROE: Joe.

MR. SMILLIE: Mark, could you just let us know
where our discussions with Canada are on their regulation,
since they now have a regulation, and how that will mesh with
the U.S. regulation?

MR. BRADLEY: The Canadians have published a
regulation that's going to be, I'm not sure whether the
effective date is in 2008, I believe. It's some time off,
but we're already talking about, we're going to have a
meeting to talk about a meeting about talking about
equivalents. We are there far away from getting anything
substantive done on it. But we are actually planning a
meeting to talk about how we're going to approach this.

We have decided, or I don't know if we've decided or determined, I don't know if there is a decision that goes with that, but it would be most appropriate for Canada to ask us for equivalents, since we have a procedure for doing that. Canada doesn't have an equivalents procedure. So since we do, they thought they would ask us.

I don't know how this dance is going to take place, and we talked a little bit this morning about what the Board's involvement might be appropriate on that. We're concerned that we engage the Board in any kind of concessions that would be made to our regulations in the context of an equivalence agreement. We don't have any of those yet.

We have lots of people asking for equivalents, Switzerland, Japan. Israel has approached us, India. Most of the recognition agreements that we have were in lieu of an equivalents agreement. What we are, our equivalence procedures essentially say, when your procedures or your technical standards meet our standards, then we can discuss equivalents. Beyond that, exactly how that's going to play out, we don't know.

But Canada, there is a lot of activity between the Foreign Act Service and the Canadian officials, getting this process rolling. We're not close on it.

MS. CAROE: Kevin.
MR. ENGELBERT: Mark, for the benefit of the public, could you expound a little bit more on the pastural and where we are at, because it's not on our agenda at all? You know, when do you think now it is going to be out, and you know, the process it still had to go through?

MR. BRADLEY: The pastural, we said that we would have, try to have something out by August of last year, and then we said, by the end of the year, and now we are saying by the end of this year. It is a work load based issue.

There is, it's been in clearance with, for internal clearance for a matter of months now. The Office of General Counsel and the Office of Management and Budget will be involved in that clearance process. Exactly how long that takes, and even once we get a proposed rule out, there may be some -- there'll be substantive comment involved with that.

That process will involve at least, I would say, 90 days of public comment to make sure that everything is well vetted. And then they would have to go back into considering those comments, putting that out as a proposed rule; and then go ahead and publish that. But it's work load, Kevin. It is exactly work load.

We have a lot of things going on. The priorities that the program has to address first, has to be the sunset of things that are going to come off the national list, if we don't have that regulation finalized and through the process.
606, of course, you are much more in tune with the requirements or the work load that's associated with that, because I know you've all been working nights and weekends trying to get those comments incorporated so that you can get your recommendations for this meeting. Those will have to be a priority as well.

Beyond that, I would say the pasture, anytime that we have, I know that there is, the comments that we have already received on that are being incorporated in the pasture docket. I can't give you a time frame on it, though, as much as I would like to.

MS. CAROE: Any other questions? I actually have one.

MR. BRADLEY: Ma'am.

MS. CAROE: You had mentioned that any day now, or very soon, we'll see the reports on those recognized accreditation firms that we sent folks over to review. The two --

MR. BRADLEY: In India?

MS. CAROE: India and was it Israel was the other one?

MR. BRADLEY: India is the only one that we've evaluated so far.

MS. CAROE: Okay.

MR. BRADLEY: And we have received comments back
from the government of India on the draft report that we have. There is a process that that goes through. And again, that's just a matter of going final with the report.

MS. CAROE: When that report becomes final, you said it would be made available. Is that going to be through the website, or is that going to be something made available upon request, or how is that available?

MR. BRADLEY: The government of India has indicated that they would like for us to publish it for the whole world to see. And we don't disagree with that. So this is new to us. It's the first monitoring of those recognition agreements that we've been able to do. So it's a new process.

But I would expect that it would be best to just go ahead and public it. I don't have a problem with that at all. And I think it would support transparency in the process.

MS. CAROE: Okay. And my next question, since I don't have any others, you had, you said there was eight recognized accreditation firms?

MR. BRADLEY: Yes.

MS. CAROE: Where are those listed and where can we see who those are?

MR. BRADLEY: We have not done on site reviews of those. And that will be, you know, funding available. The
Indian recognition agreement was granted pending an on site review. It was, that was built into that agreement. The other agreements were done based on document reviews and existing knowledge, so were available to the program. There were relationships already established for those reviews.

So there was a decision made, I guess, based on resource availability to not do on site at that time. But there is, it is in the intent or the intention of the program to go ahead and conduct complete reviews of those and make sure that they are as functional as we hope they are.

MS. CAROE: But at this time, those agencies are allowed to accredit certifiers to certify to the NOP standard, correct?

MR. BRADLEY: Yes, ma'am.

MS. CAROE: All right.

MR. BRADLEY: The recognition agreements are effective the day that the administrator issues them, and then the on site, the on site validation will be an ongoing process.

MS. CAROE: Are there any other questions for the program? Okay. We are half an hour ahead of schedule.

MR. BRADLEY: We have, Mr. Bruce Knight is scheduled to come make an appearance here and offer some comments to the program, or to the Board. I think that we're looking at him being here at 2:15. So --
MS. CAROE: Well then my suggestion is that we take our comfort break now and be back at 2:00. Is anybody opposed to that idea, a 15 minute break now?

MR. BRADLEY: Thank you.

MS. CAROE: Thank you.

(Break.)

MS. CAROE: If I could have everybody's attention, we're going to call back to order. Board members, please take your seats. Okay. Thank you for shortening the break just a hair bit. Can I ask that conversations please be taken in the hallway? Thank you.

We are privileged today to have some distinguished guests that I would like to introduce at this point. We have Lloyd Day, our administrator here. And I would invite Mr. Day to the mike.

MR. DAY: Thank you, Madam Chair. Good afternoon everyone. I have the honor this afternoon of introducing the undersecretary for marketing and regulatory programs at USDA. Mr. Bruce Knight is a native of South Dakota, where he has a cow calf operation.

He has been sidetracked from South Dakota for the past couple decades, I'll say, where he's been here in Washington working for both houses of Congress, and also as the president of the Corn Refiners, I'm sorry, the Corn Growers, you can never do that.
Bruce is now, after leaving the Corn Growers, he came to work for USDA as the chief of the Natural Resources Conservation Service, and he is a true conservationist. And I think that's something that goes over usually very well with the Organics Board.

He is now the undersecretary of the marketing and regulatory programs. And I have to say, he's brought a great deal of vision, and a great deal of energy, and a great deal of leadership to MRP of which AMS is one of three agencies. And so with that, I'd like to introduce undersecretary Bruce Knight.

MR. KNIGHT: Thank you much, Lloyd and Andrea. Thank you for allowing me to address the Board. You know, Lloyd mentioned that I'm a farmer by trade from South Dakota, and for those of you who were fellow farmers, I think you will appreciate how I dub my current status.

I have been in this position for the last seven months, and I call it my walking the fields tour. You know when you add another tract of land to the operation, you spend that first year figuring out the bugs, figuring out where the weedy spots are, figuring out where the fences need to be mended.

And that's what a lot of the work that I've been doing the last seven months for the three agencies that we have within our purview. And that, of course, is the Ag
Marketing Service that many of you have interaction with from the organics. But it goes much beyond that, the marketing efforts that go with a host of crops, as well as the export verification programs that provide opportunities for farmers and ranchers both conventional and organic around the country.

APHIS is the Animal Plant Health Inspection Service, where we are doing everything from animal ID to work on avian influenza to BSC to protecting our borders. And of course, GIPSA, the Grain Inspector Packers and Stockyards. And for those of you in the livestock sector, you know one of the most important services are provided there, we're simply making sure that the scales are accurate at the local barn.

And of course, any of the grains that go into the marketplace ultimately use the standards that are established by GIPSA, primarily for international markets, but they are the defacto standards that are out there. And in many ways, that standardization function is very much like what you are accustomed to from the organics side of things.

Lloyd mentioned, I am a conservationist by trade. I spent the last five years as chief of the Natural Resources Conservation Service, and was very proud of the work that we did to really bring the conservation platform forward in a very holistic manner, making sure that the Equip Program, the other programs all fit well and had equal opportunity for
everyone, whether that is a conventional producer, a livestock producer, an organic producer, could have an opportunity that lies out of that.

Well, there are things that I wanted to mention to the folks here is that we have a tremendous opportunity in 2007 with the upcoming farm bill.

Secretary Johanns has taken a very proactive step in putting together what is quite soundly the most innovative administration proposal that I've seen out in the last five farm bills. It's very export-oriented. It is very business-oriented. It is very conservation-oriented, $7.5 billion dollar increase for Equip alone, just in that one particular aspect.

But the other thing that's very much a hallmark of what Secretary Johanns has put out in the farm bill and is a hallmark of what he expects folks like Lloyd Day and myself and everybody to administer are aspects of USDA in, is a passion towards equity and fairness in our farm policy.

As we did the listening sessions around the country on the preparation for the farm bill, remember we visited 48 states. We would have covered all 50 states, had it not been for Katrina, 53 listening sessions, 48 states. And we heard a lot of folks approach us with very common sense ways to improve the programs, common sense ways to make them managed better, make them better serve the farmers and ranchers that
they are intended to serve, but also better ways to serve the consumers who benefit from our bounty, as well as improving management on it.

The recurring theme is that we have to have a farm policy that is fair for everybody in agriculture. We cannot have a farm policy that in fact benefits one segment of agriculture to the detriment of another set of agriculture. And so we are really trying to do some of that rebalancing, that fairness and that equity. And in that context, I think you are going to see many opportunities out there for the organic community as well.

We've heard you talk about a desire to allow more people in with assistance on the certification and the transition. You see that opportunity out there. Many of the folks in the organic community are making incredible advancements as well in a desire for new market expansion. And you see opportunities for market development, market expansion, and perhaps as importantly, in market research and research in how to bring those specialty crops forward as well.

This is an incredibly advantageous time for American agriculture, and for farmers and ranchers as a whole. As I look forward to this next farm bill, I see a great deal of opportunities for us. Opportunities for farmers that are making that choice to go organic;
opportunities for farmers who are staying with that choice of
going with conventional methodologies; opportunities for
folks up and down the value chain of prosperity that is
offered by those things. And much of that keys off of being
able to lean forward and think about where we are going to
go, and how to have the right farm policies for where we want
to be in the future.

You know, I often tell folks the current farm
policies are about 70 years old. When you think about it,
those farms policies were developed at the time that my
father was making the transition from horse drawn agriculture
to the first tractors and mechanized agriculture. You think
about how any of us who are farming, how much we've seen
agriculture change in the last five years, the last 10 years,
the last 20 years.

We need a farm policy that reflects those changes.
We need a farm policy that reflects the fact that we have a
market segment, differing market segments with differing
needs. And we need to be able to be responsive for that.
That means that we need to be encouraging Congress to move
forth boldly with the next generation of farm policy that's
before us. That means we need to encourage Congress to seize
the day with this next farm bill opportunity.

With that, I appreciate very much the chance to
talk to you a little bit, and I encourage this Board to go
forth boldly, as well, not just on the farm policy, but also in providing USDA good sound advice on where we should go on the organic side of things as well.

I've had the pleasure over the years of being in the audience monitoring committees like this. I've been in the chairman's role. I've been in the staffing role. And these forums are incredibly vital for all of USDA. And they're very important for me as a venue of hearing from the public their concerns, their interests, of having that sounding board on how best to develop policies for the future. Thank you very much.

MS. CAROE: So moving onto our next agenda item, we have Dan Giacomini from the Materials Committee going to do a presentation on our process for materials. Dan.

MR. GIACOMINI: Thank you. Valerie, if you can get that up. As chairman of the Materials Committee I was asked to offer a review and update of the materials process and where we stand on some things, and also to make that a fairly complete review, since it's been a number of meetings since this review has been provided. Next slide.

As an outline, I'll try to go through these things fairly quickly. We'll look at the national list of allowed and prohibited substances, the category of the sections involved in that. I will talk about the Handling Committee subcommittee meeting of February 2007, the petitioned items
and sunset review discussion items that we will be looking at at this meeting; the material review process, the national list criterial, and final notes.

I just would like to say either to Valerie or Mark, however, I would really appreciate the ability to get that organic logo bullet, that was really cool on your presentation. Next please.

For under livestock, 603 synthetic substances allowed for use in organic livestock production. 604, again, nonsynthetic substances prohibited or use. Next.

Handling. First 605, nonagricultural, nonorganic substances allowed as ingredients in or on process products labeled as organic or made with organic, and then specific ingredients or fruit groups. There's two sections within 605. A is nonsynthetics allowed, and B is synthetics allowed.

So this is a difference between the crops and the livestock scenario where we had nonsynthetics allowed, not allowed, and synthetics allowed. This is a listing of everything involved that's not organic that goes into the handling processing parts, it needs to be on the list as
allowed.

Also handling 606 is nonorganically produced agricultural products allowed as ingredients in or on process products labeled as organic. Again, that's labeled as organic. That's a specific category of organic. Food labeling and any of these items would need to fall within that five percent allowance. Next.

The Handling Committee subcommittee meeting in February 2007, which was held in Washington, D.C. Next.

The meeting was a Handling Committee meeting to process an extensive number of materials petitioned for inclusion on the national list, specifically through 606. Other Board members were utilized in a subcommittee format to facilitate this process, and but all recommendations do come through the appropriate subcommittee with 605.606 materials coming through the handling committee. Next.

The Handling Committee subcommittees were set up to aid the Handling Committee in preparation by preparing the criterial evaluation form for each petitioned item, and inputs regarding the -- and inputs regarding recommendations were made. Each subcommittee was chaired by a Handling Committee member to maintain the continuity of the handling committee. There were three subcommittees involved designated as A, B and C. And the actual recommendations to the NOSB Board is again a function of the Handling Committee.
Next.

Petitioned items and sunset review. I won't name these specifically, but here is a list of the recommendation items that we were looking at to deal with at this meeting, which we have met with. The reasoning for the February meeting was to process this list of petitions, and this is only part of them. You will see another slide. As I understand, one of these has been withdrawn, but all the rest of them will be action items. Next list.

This is just the list of colors that we processed as recommendations, that we will be processing as recommendations. Next.

We will also be beginning the discussion process on sunset items at this meeting. These will be ones that need to be dealt with before 2008. 605 A, five ingredient substances listed there at 605 B, three substances. Next.

At this meeting we will be doing, we have two recommendations for petitioned items on the Crops Committee. And next, we will be getting discussions on five items, two of which have two uses for crops that are sunset items that will be done by 2008. Next.

Livestock has no petition or sunset items on the docket for the spring meeting; however, I do want to make note regarding the finding. The nature of the annotation is that it carries an end date. That makes this item not
eligible for sunset, since we are not able to change an
annotation during the sunsetting process, and the annotation
says, you can use this, I don't remember the exact date, but
let's say it says, you can use this through December 31st,
2007. If we, by not able to change that annotation, kept the
annotation on the national list in 2008 and 2009, it would
still say that you couldn't use it after 2007. So it's not a
sunset item and it will need to be repetitioned for
consideration.

Material review process, next. Minimum time frame
for the national list for material review is 145 days. Next.
Day one through 14, at a minimum, petitioners are received by
the NOP and reviewed for completeness. Communication is done
back and forth between the NOP and the petitioner to complete
those petitions. And upon determination of the completeness,
by the NOP, the petitions are forwarded to the NOSB materials
chairman. Next.

Material chairman forwards those petitions to the
chairman of the -- chair person of the designated NOSB
committee being crops, livestock or handling, whichever is
appropriate. And petitions are re-evaluated for
completeness, and to determine if they will be forwarded for
a tap review with no tap review being required for 606 items.

Jump in time to 30 days prior to the NOSB meeting,
NOSB. The tap reviews are posted on the NOP website for review and public comment, and in consideration of those tap reviews, the committee recommendations are posted for public comment.

Within 30 days, within 30 days prior to the meeting, public comment is accepted by the NOP and posted on the website. At the NOSB meeting, committee recommendations are submitted. Further comments are accepted from the public and all public comments are taken into consideration, and action is taken by the full NOSB Board regarding committee recommendations. Next, please.

And national list criteria. Next. In general, national list criteria includes, number one, the potential of such substance for detrimental chemical interactions with other materials used in organic farming systems. Two, the toxicity and mode of action of the substance and of its breakdown products of any contaminants and their persistence and areas of concentration in the environment.

The probability of environmental contamination during manufacture, use, misuse or disposal of such substances. The effect of the substances on human health. And the effect of the substance on biological and chemical interactions in the agro-eco system, including the physiological effects of the substance on soil organisms, crops and livestock.
The alternatives to using the substance in terms of practices or other available materials, and the compatibility with the system of sustainable agriculture. And that was from the recent commercial availability docket published in the Federal Register was where I got that specific list. It's also been published in other locations.

Processing aids and adjuvants have a slightly different list of consideration criteria. The substance cannot be produced from a natural source, and there is no organic substitute. Two, the substance, manufacture use and disposal do not have adverse effects on the environment, and are done in a manner compatible with organic handling.

Three, the nutritional quality of the food is maintained when the substance is used. And the substance itself or its breakdown products do not have an adverse effect on human health as defined by applicable federal regulation.

Four, the substance primary use is not as a preservative or to recreate or improve flavors, colors, textures or nutritive value lost during processing, except where the replacement of nutrients is required by law.

The substance is listed as generally recognized as safe grass by the FDA when used in accordance with FDA's good manufacturing practices, and contains no residues of heavy metals or other contaminants in excess of tolerances set by
FDA. And the substance is essential for the handling of organically produced agricultural products. And that is from section 600 B in the rule.

National list criteria for 606, agricultural and potentially unavailable. The NOSB will consider why the substance should be permitted in the production or handling of an organic product. The current industry information regarding availability of and history of unavailability of an organic form in the appropriate form, quality, and quantity of the substance.

Industry information should include but is not limited to the following; regions of production including factors such as climate and number of regions; number of suppliers and amount produced; current and historical supplies related to weather events such as hurricanes, floods and droughts that may temporarily halt production or destroy crops or supplies; trade related issues such as evidence of hoarding, war, trade barriers, civil unrest that may temporarily restrict supplies, and other issues which may present a challenge to consistent supply. That is from the Federal Register document regarding 606 and commercial availability, unavailability.

As a final note, there is a new process for public comment. All public comments are handled via www.regulations.gov according to the appropriate Federal
1 Register docket and government agency.
2 The effort to bring processing of public comments
3 to an equal level of efficiency for all the departments and
4 agencies is the reason for this change. It's not just a
5 change within the NOP itself. It's much broader than that.
6 The new process sets deadlines for having public
7 comment posted, and all public comment received by the NOP
8 even after these deadlines will be made available to the NOSB
9 members for review in advance of the respective vote whenever
10 possible.
11 And finally, website listings of interest NOP is
12 AMS.USDA.gov/nop. NOSB is the same, /NOSB. And the public
13 comment is www.regulations.gov. Thank you.
14 MS. CAROE: Thank you, Dan. Is there any questions
15 for Dan? I just wanted to point out to everybody, this is
16 the first meeting where we've accepted public comment through
17 the regulations.gov or regulations.gov?
18 MS. FRANCES: Regulatory.gov.
19 MS. CAROE: Regulatory.gov.
20 MR. GIACOMINI: Regulations.gov.
21 MS. CAROE: Regulations.gov. It is a new procedure
22 for us, and there are reasons for the procedure. It does add
23 a little bit, extra layer of procedure, and in doing so,
24 we're learning as we go. And Valerie has been working on
25 that to make sure that we receive all those comments. And
hopefully you've been able to negotiate and get your comments in through that site. Plenty of people have. We've gotten quite a few.

MS. FRANCES: Could I make a comment, Andrea?

MS. CAROE: Absolutely.

MS. FRANCES: I'm going to be working on a better set of instructions, now that we all got to experience the regulations.gov. I know some people had trouble getting their attachments in there, and I will make sure everything gets posted, and things that are received at this meeting will be scanned in and posted on our website. And I just want everyone to be assured that we are going to do everything we can to make it work as effectively as we can. We have to work with the system.

And I'll be going through and modifying the titles. I do have some control where I can go in and modify the titles of the comments that are on there, so that we can better go back and look at comments, if you want to find a specific comment. So I'm going to be putting people's names in, so you can find a comment by someone in particular. Because they are just in first come, first serve order. And so it's a little bit random experience. But we'll get there. We'll try to make it work.

MS. CAROE: Thank you. Any other questions? Bea.

MS. JAMES: Dan or anybody that's actually on the
Materials or Handling Committee. I'm wondering what the thoughts are around. Let's say that there are processors out there who maybe fell off of the radar of submitting a petition, and the certifier goes in and sees that they are in noncompliance and packaging needs to be changed, or whatever scenario is there. Do we have any kind of an idea of grace period or how that is going to be handled?

MS. CAROE: Mark, do you want to answer that question? Your mike is not on.

MR. BRADLEY: We really don't have any latitude based on the Court Order to do anything other than fully implement the regulation at that point.

MS. CAROE: On that topic, I will say that this Board recognized every complete petition that we received as of February 23rd, I believe. February 23rd. Every single petition was considered, well beyond the deadline that we had set. But we understand the repercussions of not reviewing those materials. So you have the handling committee chair to thank for that mad dash last minute effort to get those last minute petitions looked at. Any other comments, questions, on the material process? Julie.

MS. WEISMAN: Yes, I mean, on that last item, I just wanted to add that, of course, anyone who finds that they need access to a material, I expect them to be petitioning for the fall meeting.
So it's not that this, I mean, it will certainly be a dislocation. This was the deadline to have uninterrupted access to materials before the Court deadline, but it does not mean -- there will, just like anyone can petition things onto any other part of the national list at any time, it will -- I encourage everybody, even if you have missed this deadline, get it on the list for the fall meeting.

MS. CAROE: Thank you. Any other comments? Thank you very much, Dan. I appreciate your work. Moving onto the next agenda item, we have a report from the joint Handling/Materials Committee. And I turn it over to Julie on that.

MS. WEISMAN: Okay. Somehow, somehow this term, clarification of definition of materials, is sticking with us. I don't know why. But basically, this is the broad term used for the two, two big recommendations that are still pending from this joint Materials and Handling Committee, which is a recommendation on the definition of agricultural versus nonagricultural. And also a recommendation for the definitions of synthetic and nonsynthetic.

These have been kicking around for a long time, and the resolution to them is sorely needed. I'm not pleased to report what I'm about to report, but I liked the phrase that Mark used earlier. I think he said, work load based issue. Was that it?
MR. BRADLEY: Yes.

MS. WEISMAN: Okay. I believe that prior to this year, sunset review was creating the need for a sunset review of a large number of materials. And in this past year, because of the Court ordered deadline for materials to be listed on 606 created another looming train wreck that we had to work very hard and make a priority.

So we do not have any new documents at this meeting on either of those topics, but I will address each of them also separately for a moment.

On the issue of the ag/nonag, we actually, fellow Board members, you will find, I believe, in your meeting books a copy of the same recommendation that was in our fall meeting book, from the October meeting.

At that meeting, we were very close to having a good document, with the exception of one piece of the recommendation and that had, that we decided to defer, and that was because of the issue of how we were going to deal with, and what the implications would be of considering micro-organisms to be nonplant life and therefore agricultural products.

And I think at that meeting we realized that we didn't have enough understanding of what the impact on, for instance, livestock would be, and that we needed to get more information from the livestock industry about what the
ramifications would be, for instance, having yeast be
agricultural, learning -- what I personally did not know is
that yeast is a very, very frequent ingredient in livestock

And the issue was particularly critical against the
background of again this Court order deadline and things
needing to be listed on 606 if they are agricultural
ingredients.

We have not, because of other 606 issues have not
really gotten any more significant information. We have not
really been able to focus on getting that information to be
able to clarify that. And that's the main reason why there
is no new document at this meeting.

However, it will -- my proposal to the Board,
actually, well, it certainly, it is now a priority. It is
now a priority for the fall meeting that we have a
recommendation to vote on.

And it's my proposal to the Board that if, for
whatever reason, we do not feel at the fall meeting that we
can move forward with all the pieces of that recommendation,
because it had more than one piece to it, that we go for what
I have learned so far on the Board, is go for the low hanging
fruit.

That if there are pieces of it that remain
noncontroversial, that we move those forward at the fall
meeting, even if there are other pieces that we still don't feel like we are ready or that we have a good enough document for. So that's going to be my proposal for ag versus nonag.

And maybe if, I'd like to say a couple of things about the status of the synthetic/nonsynthetic document and where I see that going, and then maybe we can have time, perhaps, for a little discussion on the Board.

This synthetic/nonsynthetic definition, clarification is also long overdue and sorely, sorely needed. And we certainly could have used it. It was definitely a factor that affected us not being able to move forward on some of the petitioned items for this meeting, not having that clarification, but you know, we are stuck in this chicken and egg situation. So that is where it's at.

And the lack of this document as well has been very, very much impacted by the Court ordered deadline for materials for 606.

Now, we have had, certainly during the time that I've been on the Board, at least three drafts of this document. In addition, we've had excellent input from the industry on those documents, and excellent input from the program, from the USDA's scientific committee.

So this also is at the top of the Handling Committee work plan for the fall meeting is to go back with all those documents, and start, and make a new document, not
a revision of the, you know, five draft, revised drafts that I've seen in the last five years. We were talking about track changes earlier today, and you know, what happens when you've had too many of them, and then you can't make sense of the document anymore.

So we're going to start from scratch, but not really. Don't get scared. We're not really starting from scratch. But we have a wealth of input since we did those first, since those first recommendations were done. And we're going to use that. So that's my update on the status of ag/nonag and synthetic/nonsynthetic.

Would it be appropriate, Madam Chair, to open this up to the rest of the Board for some discussion?

MS. CAROE: Any discussion, comments, questions from the Board? Everybody is sleeping. We need coffee or something.

I will make a comment. These two documents that are sitting on the table, the ag versus nonag, the synthetic versus nonsynthetic, we did, as Julie mentioned, wanted to get these completed before we looked at the materials. However, the amount of time that it would have taken to do that would have prevented us from looking at all the materials that we did look at. And we definitely prioritized those to keep commerce, to keep business running after June 9th.
As a kind of side note on that, going through the process with all of these materials actually, I believe, helped us formulate some definition on these two. So these documents, I believe, when we come out with the redrafts, will be stronger because of this very, very time intensive exercise that we just went through.

And I thank you for doing that. It sounds like Handling Committee work plan it will be top heavy with a lot of high priority items. That said, I do want to make one more comment, and then I'm going to turn it over to Joe, and then you, Julie.

It is very important that we collaborate on this with the program. And so I am making this plea at this point, that the program be open to a dialogue on these so that we can put together documents that work for you as well as for us before we present them in the fall meeting. Okay, Joe.

MR. SMILLIE: Well, you captured what I was going to say, and that is, there's a lot of ways to go about it, and one is the top down where you work from the definition to create the criteria and then run the materials through. And the way, we started that way. We didn't finish. But then when we were running all these materials through on 606, it clearly called out for an ag/nonag definition to really work.
And also, by going through the materials, as you mentioned, we got a much better understanding of the ramifications of decisions that we might make in ag/nonag synthetic/nonsynthetic.

So I think that even though it's a laborious and painful process, I think it will end up with a better document. Because we can already see sometimes when you create a definition how it can be misused or it can create ramifications that you didn't intend.

And I know the previous Board chair was very, very useful in that exercise about what, when you are creating something, you have to watch out how, what can happen down the road. And I think previous NOSB Board's also experienced that, of what they felt was a good definition, and then later on it turned out to do things.

So I think as painful as it has been to still not have those operating definitions, I think we will be the wiser and have better work when we finally finish.

MS. CAROE: Julie.

MS. WEISMAN: I just wanted to clarify that I referred to these two things as being at the top of the Handling Committee work plan, but I also wanted to acknowledge that all this work will be joint work between the Handling and Materials Committee.

MS. CAROE: Thank you very much. Okay. We are
still a little bit ahead of schedule. I do have one reminder
for you folks, actually, two reminders. One, the
registration is -- Bob, do you have that in front of you, the
registration book? It's in the corner. If you have not
signed the registration, if you would please do so, we would
appreciate that.

Also, there is the sign up for the public comment
tomorrow afternoon, and Thursday is also available there, so
please if you want to make comments, there are slots open.
Go ahead and go there to do that.

I do want to remind people that we would appreciate
you turning your cell phones off, or at least putting them on
silent mode during the meeting. They can be a bit
disruptive, so do so. We won't hold you to the Board
standard that if a Board phone goes off, they buy a round of
drinks. But it can be very expensive.

(Discussion off the record.)

MS. CAROE: Okay. We are getting ready to go into
the public comment period, and I will read the seven
provisions of public comment that's in our Board policy
manual. But I actually want to talk a little bit more about
that.

We expected a lot of public comment at this
meeting. There's a lot of issues on the table. And we want
to hear all the public comment that we can. The Board may
hear your comments. If they are related to something we are voting on, and they have questions, they definitely are going to ask you questions and get clarifications.

If it is something that we are not going to take up at this meeting necessarily, they may make note and call you at a later date or talk to you off line, or get information for a further meeting, just so that we can keep the public comment going. We don't want to shorten the public comment period. We want everybody that's here that wants to be heard to be heard. But we're going to try to stay on point with that.

So I'm asking that you don't get insulted if we don't ask you questions about some issue that you bring up that you want the Board to take up. We're hearing you. We'll make note. But we may not engage you at this meeting, because it's very important that we hear information the issues we're dealing with.

As Joe pointed out, and Julie pointed out, the ag versus nonag document we had on the table, the reason that we took that off the table is because of good public comment. It's important. We want to hear that. We want it before that, these recommendations get voted on, to make sure that we understand those ramifications as Joe discussed.

So with that, I'll read the seven provisions that are in our Board manual. And this is NOSB policy for public
comment at NOSB meetings.

All persons wishing to comment at NOSB meetings during public comment period must sign up in advance. To that, we have filled the slots for today and for tomorrow morning, but we do have slots available tomorrow afternoon and Thursday.

Persons will be called upon to speak in order that they signed up. I will be calling you up in order. We'll call an on deck person, and we ask that you check in with Valerie, if you are on deck, so that she knows you are here, and then also if you have any written public comment or Powerpoint or anything like that, she can accommodate that.

Unless otherwise indicated by the chair, each person will be given five minutes to speak. The only reason that we would shorten this, is if we have too many people signed up that need to speak. Again, we don't want to do that so we are going to try to stay on point. We ask you to stay on point as much as possible.

Persons must give their name and affiliation for the record. A person may submit a written proxy to the NOP or NOSB requesting that another person speak on his or her behalf. And we've received those by email.

No person will be allowed to speak during the public comment period for more than 10 minutes. Individuals providing public comment will refrain from personal attacks
and from remarks otherwise impuning the character of any individual. You can criticize our recommendations. You can tell us that we are way off, but we will not accept criticism of personal -- personal criticism of members of this Board that are volunteering their time.

With that, we are prepared to go into public comment early.

MR. GIACOMINI: Madam Chairman, Madam Chairman?

MS. CAROE: Yes.

MR. GIACOMINI: In light of the new, this new process we have for public comments that were posted on the internet, on the website by a number, but not all of them had a name. If anybody knows the number of their public comment, it would be really helpful if they could include that in their discussion.

MS. CAROE: Some of those people may not be here.

MR. GIACOMINI: Well, but anybody who is coming up, if they submitted a written public comment, and they are going to ask us to refer to it or something, because it's very difficult just to sort through by number.

MS. CAROE: Okay. Julie.

MS. WEISMAN: Valerie, would commentors know what the number of their comment was? Is that information that they would necessarily have?

MS. FRANCES: It was on the website. It's
basically in the order that it was received.

MS. WEISMAN: So if they happen to check and see
and wrote the number down --

MS. FRANCES: If they happened to have noticed it,
yes.

MS. WEISMAN: It's a big if, but if you happened to
have done it, it would be nice.

MS. JAMES: Valerie, we can do a search on those
comments and put the person's name in there, and the comment
will come up, correct? There is a search feature on the --

MS. FRANCES: I haven't tried that.

MS. JAMES: I have.

MS. FRANCES: I was too busy to do so, but go
ahead.

MS. JAMES: Yes, I have.

MS. FRANCES: Okay.

MS. JAMES: And I think that that works most of the
time. So that's another way.

MS. CAROE: Dan.

MR. GIACOMINI: Some of the comments that were only
submitted as an email, if they did not put their name at the
bottom, don't have a name identified with them.

MS. CAROE: Any other comments?

MS. FRANCES: That's something I'll include in the
instructions in the future. If you are going to use the
general comments window of the regulations.gov, yes, there is
the submitter info field, but it doesn't get incorporated
into your comment when you print it off. It's just not
there. The only thing that is there is your statement.
So I'm going to add, some people did sign their
names and city/state kind of thing. That's helpful, or
association. I think I will encourage people, if they are
going to use that feature to put your name and your
city/state/association or whatever it is to identify
yourself, that would help.

MS. CAROE: Any other comments? Okay. Our first
public commentor, Will Fantle. On deck is Andrea Kavanaugh,
and Andrea, if you can check in with Valerie. Andrea, are
you here? Next on deck is Dr. Barbara Blakistone. If you
could check in with Valerie.

Before you get started, you have five minutes, and
Bea will give you a one minute warning. At the time that
your time -- as your time expires, we will allow you to
finish your thought, but not go on much further. Thank you.

MR. FANTLE: Hopefully, I can talk faster than five
minutes. My name is Will Fantle. I'm the research director
for the Cornucopia Institute.

And I am here today to talk about the Livestock
Committee's recommendation on cloning, which I understand may
have shifted over the weekend, but that's the difficulty of
preparing our remarks in advance. So I'm going to address
what has been publically released thus far.

Members of the National Organics Standards Board,
thank you for allowing me to make this presentation.
Cornucopia Institute, on behalf of our members, which include
many certified organic livestock producers and processor,
retailers of organic meat and milk, we respectfully submit
that the Board table at this time the Livestock Committee's
recommendation that the National Organic Program regulation
be amended to exclude cloning.

We strongly encourage the Board to request a formal
request public comment period so that stakeholders in the
organic community and industry and interested members of the
public can be heard and fully participate in this important
decision making process.

To be clear, we fully support the committee's
recommended prohibition of cloning technology, but in
addition to the definitions for excluded methods, in terms of
organic livestock production, we feel an important element of
widespread societal interest has not been addressed, and
that's whether or not progeny or the offspring of cloned
livestock should be allowed in the organic production system.

Good arguments can be made for excluding the
progeny of cloned animals from organic certification. Many
consumers of organic meat and dairy products have legitimate
concerns about a technology that is still in its infancy. Furthermore, there are many consumers who would not purchase livestock products if they did not feel that the organic certification embodies a higher humane standard for animal husbandry.

The well documented reproductive problems, including a high rate of congenital abnormalities requiring disposing of much of the offspring produced through cloning, makes the support of this technology repugnant to many of our industry’s local consumers.

Also, because this technology is unproven, and many of our customers embrace the precautionary principals, it would be prudent for us to respect their philosophical beliefs by delaying the introduction of cloned progeny in the organic products stream.

Even with recombinant DNA engineering of crops, with which society has comparatively more experience, and I say the word here is comparatively, since in terms of evolutionary plant genetics or experimentation of gene manipulation is not even a speck of sand in the hour glass, troubling and unforseen impacts continue to be observed.

As examples, recent new reports in India describe fatal toxicity top cattle grazed on residual BT cotton crops. Toxicity and developmental abnormalities have been experienced in mice fed transgenic corn based on testing in
France. And that comes on the heels of other well documented related problems to organ growth.

There are other problems unanticipated just a few years ago with some of these modified seeds and varieties when they were introduced. Besides the possible health impacts to livestock or humans, the NOSB should consider the marketing implications of any premature decision on this issue. FDA has not even concluded their public comments period yet. You are proposing to move in advance of that on this important issue.

The organic marketplace is a growing and lucrative, because it offers consumers a bonafide alternative to the industrial food production system. Regardless of the decisions at the FDA or through rule making at the USDA's Organic Program, a percentage of our society will continue to have reservations about cloning. We contend that that's a rather large percentage of our society. As astute marketers, which I think we believe we are, we should reserve this market for organics.

Cloned livestock and their progeny are excluded from organic production. This decision can always be reconsidered after adequate real world data is accumulated and the acceptability in the marketplace is gauged.

Now, I also want to bring before you a sign on letter that we began circulating last Friday, signed by 75
different organizations and individuals consisting primarily of retailers across the country, farm organizations, and other nonprofit groups. I'm going to leave that with the Chair, Ms. Caroe, for her to share with the rest of this committee. It's vitally important that we respect the views of the public on this issue, and I hope that you will. Thank you.

MS. CAROE: Thank you. Is there any questions for Will? Thank you for your comment. We have Dr. Barbara Blakistone. Thank you. And on deck, do we have Andrea Kavanaugh in the room yet? Okay. How about Nancy Hirschberg, are you here? Nancy? Nancy, could you check in with Valerie, please. At your leisure.

MS. BLAKISTONE: Okay. Good afternoon. I'm Dr. Barbara Blakistone, director of technical and regulatory affairs for the National Fisheries Institute, the nation's leading advocacy organization for the seafood industry.

NFI's member companies represent every element of the industry, from fishing vessels at sea, to fish farmers, to national seafood restaurant chains. NFI members commend the work of the NOSB on organic standards for aquaculture fish, and urge them to move expeditiously to begin rulemaking on the comprehensive recommendations made by the aquaculture working group, including AWG's recommendations and provisions for limited feed supplements with prescribed allowances for
wild fish meal and oil, and conditioned use of net pin
culture systems.

The NOSB should not defer the inclusion of certain
limited amounts of wild fish meal and oil in the feed for
carnivorous fish. As noted by the AWG recommendation, this
allowance is consistent with sustainability goals because the
sources would be limited to those species not exceeding fish
capacity, as determined by fisheries authorities.

AWG has recommended a limit of 12 percent, and a
sunset clause to drive research on alternatives to wild fish
meal and oil.

Given that salmon, a carnivorous fish is the number
three most consumed fish and consumer focus group researched
by the New Jersey Department of Agriculture concluded that 72
percent would buy organic seafood if available, we urge
immediate inclusion of limited amounts of fish meal and oil
in the diets of carnivorous fish like salmon, so that these
fish may be included under the USDA organic banner.

It seems paradoxical that the organic poultry
standards allow for the use of fish meal from wild fish as a
supplement to the diet of poultry, but the NOSB is
recommending against organic poultry in fish destined for the
organic market, especially when use of animal byproducts is
eco-efficient and hence a practice in sustainability.

AWG has already adequately responded to all
objections net pens through the public comment process. AWG
recommendations ensure adequate addressing of concerns such
as disease and parasite transfer, release of chemicals and
drugs, and impacts from pesticides and microbials and
antifallants, and predator controls.

NOSB chose to defer further work on an organic
standard for aquaculture shellfish due to significant
differences with fin fish culture. The shellfish industry
and its stakeholders have made significant progress in
crafting standards that separate organic shellfish culture
from traditional shellfish farming.

Thus, we urge expeditious initiation of work on our
organic shellfish standard, as soon as the fin fish standard
is completed. As NOSB completes its work on aquaculture fish
standard, NOP established by USDA to develop national organic
standards should also establish a wild capture fish working
group to thoroughly examine the parameters associated with
various fisheries, and determine if sufficient criteria
exists to detail an organic standard for certain wild fish.

Finally, if the NOSB chooses to accept the
livestock recommendation to delay the approval of net pen
culture, and use of wild sources of fish meal and oil to
accommodate additional dialogue, then this issue should be
brought to a conclusion at the next NOSB meeting. Thank you
for allowing me to provide these comments.
MS. CAROE: Thank you. Hold for questions. We have questions. Joe.

MR. SMILLIE: I appreciate your comments, and I am also a big fan of the aquacultural working group's recommendations. For a number of reasons, we have decided to delete those and want to have further discussion on those. And I don't think this particular meeting is going to be the forum for that.

We look forward to those comments, and active participation from everyone in those comments on the fish meal issue and on the net pen issue. And also look forward to aquaculture working groups recommendations on the shellfish. And we will deal with those as quickly as we possibly can.

We think that by putting forward our current recommendation to move it forward to the NOP, that that's, we're taking a step-by-step approach. And the issue of net pens and fish meal is controversial and contentious, and we want to have a full hearing on it, and then move forward with recommendations at that point in time. So probably there will be a lot of comments at this meeting on those two issues.

And what I think that we have decided as a Board is that we really want to engage in comments on our current recommendation, which you know, temporarily, let's say,
deletes those two issues, and then take up those two issues along with the shellfish issue at a further meeting. But I do appreciate your comments, and I can assure you that the NOSB is taking the aquaculture, you know, issue very seriously, and we're hoping to have a larger and more complete public meeting which focuses on those issues in the future.

MS. BLAKISTONE: Thank you.

MS. CAROE: Any other questions? Thank you for your comments. Next up is Nancy Hirschberg, and on deck have we gotten Andrea Kavanaugh yet? Okay. On deck, Jim Riddle. Check in with Valerie, please.

MS. HIRSCHBERG: Hi. Nancy Hirschberg from Stoneyfield Farm. On behalf of Stoneyfield Farm, I'd like to thank the Board for your extreme dedication and willingness to volunteer a huge amount of time to this issue. You have been subjected to a massive volume of work in response to urgent needs as a result of the Harvey lawsuit, and we do greatly appreciate your commitment and devotion to this issue and to organic.

We'd like to offer specific comments today, specifically on inulin enriched with oligofructose. It's very, very technical, and I will say I am not a technical expert, but we do have two experts here today, so if you have further questions, even after this, for the next two days, I
refer you to Rich Thur, right there, who many of you know, and Vin Carrs, right there in the white shirt. I really encourage you to talk to them. They can take this very complex information and make it really understandable.

Stoneyfield Farm has petitioned that the substance inulin enriched with oligofructose for placement on 606. We support the comments of the Irafty Group, which I have just handed to Valerie, which you will be getting shortly, if you didn't already get them, for more technical background.

This is, the oligofructose enriched inulin is essential to our products. It is in all of Stoneyfield Farm, I repeat all of Stoneyfield Farm yogurts and smoothies, and is integral to the function of our products. It has a superior effect to other types of inulin for avoiding fluid separation and improving texture and viscosity.

You've all opened yogurts and see the whey on top. Most of you don't like that. Inulin is a long chain polysaccharide compound extracted from plants, especially chicory, blue agave, and Jerusalem artichoke. While there is some organic inulin available in the world market, the subject of our petition is a slightly modified inulin product that consists of a combination of water-extracted inulin derived from chicory, and inulin that has been partially hydrolized by a mild enzymatic reaction to form the shorter chain oligofructose.
All of these steps are permitted under organic processing standards, so it's ultimately quite likely that we will eventually be able to source this as an organic oligofructose enriched inulin product. That's why oligofructose enriched inulin belongs on 205.606 because it's derived from plants, it will be available organically at some point, and development of the supply should be encouraged. If it's considered nonag and considered for 605, there will be no requirement and no incentive to develop organic sources.

This product provide numerous health benefits related to improved calcium uptake, and is very important to our customers; provides important functional properties in our yogurt, so we do consider it essential for our products. We understand that there is currently direct inconsistency between the existing definition, as Julie was explaining earlier, address the nonag/ag issue. We also realize that the Board has been working to clarify the distinction between ag and nonag substances for some time, in order to facilitate proper review and placement on the national list.

We suggest that you follow the prior recommendations of the Handling Committee when asking, when making a determination regarding an agricultural substance; specifically, the decision to the question that asks, is the
change in chemical structure a result of a naturally occurring biological process such as fermentation or enzymatic hydrolysis, or the result of a mechanical, physical process described under 205.270 A. If the answer is yes, then it's an agricultural product.

Under this criterion, oligofructose enriched inulin is an agricultural product. Please consider it for inclusion on 606. Thank you.

MS. HIRSCHBERG: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: How many years have you been using this in your product?

MS. HIRSCHBERG: I'm guessing five years, four years. Do you know, how many years have we been using this product?

AUDIENCE MEMBER: I think these products have been all over the U.S. market for a good 10 years now.

MS. HIRSCHBERG: But we've been using it for --

AUDIENCE MEMBER: I would have to guess, five or six years.

MR. ENGELBERT: And could you explain a little more why you now consider it essential, if you've only used it for the last five or six years?

MS. HIRSCHBERG: Because it improves the product,
as far as now we are shipping more product further. And when it gets handled, you have more whey separation, and so forth. And because of the added benefit of the calcium absorption. With so much competition on the shelves right now, in natural and in mass market, we are much deeper into mass market now, that having, if you have choice between two markets and one says on it, increases calcium absorption by 30 percent, that's a very important claim for our, you know, it's an important attribute for our consumers.

MS. CAROE: Other questions? Bea.

MS. JAMES: When you looked at using this ingredient in your product, was it for the function, or was it for the added value?

MS. HIRSCHBERG: And I might have to get that answer to you tomorrow, because I will call R&D to be absolutely sure. But my guess is that it was for both, but I don't know. I'll have to get back to you on that.

MS. JAMES: Is it marketed on your package as being --

MS. HIRSCHBERG: Yes. The claim that we can make, based on California allowing us to make this claim with this product, with no other inulin, is that it increases calcium absorption by 30 percent. And the reason we are able to make that claim is because this product is, has unique studies that have been completed which -- and because of the
attributes of the product which allow us to do that.

MS. CAROE: Any other questions? I just want to make a comment and address it to you, Nancy, but to the other petitioners as well. With 606 materials, we were faced with a unique situation.

MS. HIRSCHBERG: Oh, I know.

MS. CAROE: We didn't have a tap. We had the information from the petition only. If that petition left questions for us, we had two options. One is to send it back --

MS. HIRSCHBERG: Yes.

MS. CAROE: -- which we can talk about the repercussions of that; or two was to give it a no vote and elicit a comment that filled in those gaps. So your petition and others as well, we actually did this in order to give you an opportunity to give us that compelling argument and that data. I'm not going to say that we're going to vote one way or another, but I just wanted to explain to folks that the public comment is ultimately important to us on these petitions because we only have so many sources of information coming in to make our decision.

So thank you for responding to the vote and giving us more information.

MS. HIRSCHBERG: Sure. And as I said, we will be here, I will be here to the end.
MS. CAROE: Thank you. And Rich and Mr. Carr, you will be here for discussion tomorrow?

MS. HIRSCHBERG: Yes, he's giving public comment tomorrow.

AUDIENCE MEMBER: And I will also try to give you some more information through a presentation on the reasons why --

MS. CAROE: Okay.

AUDIENCE MEMBER: -- when I comment tomorrow.

MS. CAROE: Thank you so much, Nancy.

MS. HIRSCHBERG: Thank you.

MS. CAROE: Okay. Next up is Jim Riddle. Do we have Andrea Kavanaugh in the room yet? Okay. Oh, we do. Excellent. Thank you. So you are on deck. Jim, at your leisure.

MR. RIDDLE: At my leisure. Thank you. My name is Jim Riddle from Wynona, Minnesota. And I have a proxy from Steve Gilman from Nova, New York. So I have 10 minutes. And I currently work as the organic outreach coordinator of the University of Minnesota.

And I'm sending around some materials right now that talk about our program. We have a new publication out that I've co-authored, a Minnesota Guide to Organic Certification, and there is a sample copy making its way, and there are little postcards of how you can get a free copy.
And I have left a copy for the NOP, but I didn't bring enough for everyone.

But I'm not, I just wanted to mention that. I am speaking on my own behalf, however, and I would like to welcome the new members, Tracy, Katrina, Steve, and I'm really sorry that Tina couldn't be here at this meeting.

I'd like to direct my comments, first, to the Livestock Committee's recommendation on cloned animals, and I would just like to point out, this is still truly an experimental technology. From the FDA's own report, states that only 4 to 7 percent of cloning attempts are successful.

That means that approximately 95 percent of attempted clones result in gross abnormalities and death of the animals or the surrogate mother. This is still very much an experimental stage. And I have to agree with the statements, the Q and A's from USDA, National Organic Program, that cloning is not possible under natural conditions, and is not compatible with organic production.

I would like to support changes that the Livestock Committee has made over the weekend to your draft recommendation to include the progeny of cloned animals as prohibited. However, I would like to propose two small changes to that draft, and I'll give you a copy, a marked up version with these changes when I finish.

On your proposed definition of excluded methods, in
parenthesis you currently have a statement, or other methods of animal cloning. And I encourage you to change that to, or other methods of asexual reproduction of animals. Cloning is a colloquial term. It's being misunderstood. And what the FDA is talking about is a specific type of cloning, somatic cell, nuclear transfer where DNA is removed and transferred into an immature egg.

They're not talking about embryo splitting. They're not talking about induced twinning or other technologies. It's asexual and it's where the DNA from one male or a female is inserted. It's not where sperm and egg or DNA of a male and female are mixed. And so I think it's really important that you are precise in the language you use in your recommendation.

And along that same line, I encourage you to change the proposed new section 205.236 B(3), also in parentheses where it says, it ends in the phrase, or other cloning methods. I encourage you to change that to, or other asexual methods, just to avoid that colloquial term, cloning, because it can be misunderstood.

Otherwise, I really thank you for taking the comments you receive very seriously and making the changes that you have.

On the aquatic animal recommendation, I ask you to table the section referring to aquatic plant production. I
believe that is outside of the scope of the task force. When the call went out for nominees for the task force, it called for an aquatic animals task force. And this is under the Livestock Committee.

I think that, you know, there may be some valuable work there, but at this time it hasn't been given sufficient consideration, and I just urge you to set that subsection aside when you vote.

I also strongly encourage you to move forward with aquatic animal recommendations that are fully consistent with the rest of the organic livestock section. And in advance, I will take a chance and endorse the comments that will be offered by the Center for Food Safety and Pennsylvania Certified Organic later here.

Okay. Some comments on the Board policy manual changes that you are considering during this meeting. I do suggest that you vote separately on those changes, not as a package, and in particular ask that you set aside the one change that's being proposed to the sunset review policy, which says that there would be no changes to annotations during sunset.

I really think that that is contrary to language in OFA, under the section, on the national list, 6517 B, content of list, says that the list shall contain an itemization by specific use or application of each synthetic substance.
permitted, or each natural substance prohibited. So it's not just the substance, but it's, also it's use or itemization. That's its annotation. They both are open for review during sunset, and they need to be reviewed. It's not that you cannot act on one or the other, and I just urge you to, at the very least, table that, and seek some legal advice before you incorporate that in your policy manual.

On grower group certification, I know you don't have a recommendation in front of you, and there's a good reason, because in 2002 the Board unanimously adopted a very comprehensive recommendation on grower group certification that contained a framework for internal control systems. And that was five years ago. It may need to be revisited.

It may need to be strengthened in how the conflict of interest sections for the control officer of an internal control system is handled. But it does provide a solid basis for moving forward. We're looking at an impending crisis if the entire grower group certification system is thrown out the window.

If there are some either operations or certifying agents that are operating out of compliance, let's deal with them, case by case basis, but don't throw out the entire system, because many lives and many businesses are dependent on that system.

On the 606 materials, I'd love to give comments on
every one. Ha, ha. No, I've always hated that stuff. But I
do have one general comment, and that is, as just was pointed
out by Nancy, that you know, in order for something to be on
606, it must be possible to produce it organically.

And so any substance that's being considered, I
don't know if you have, I admit I haven't looked at every one
of the recommendations, you know, like you have, but if any
of those substances are produced using synthetic solvents,
they would not -- that's prohibited. That would disqualify
them ever from being available organically. And so I hope
you have looked at that, but at any rate, it must be possible
to make the product organically to even qualify for
consideration for the list.

I'd like to close just by saying, you have a
tremendous opportunity ahead of you. As someone who put in
my time, I extend my best to you. You have the opportunity
to provide leadership, and we are counting on you to be the
voice to protect organic integrity, and to help expand
organic agriculture.

And I know there is this new comment process, and I
struggled like five times to get mine posted, but I just urge
you as you work through it to make sure there's always 30
full days for the comments, for the public to be able to
submit comments. That March 16th deadline was really short.

And you've been in a pressure cooker yourselves.
But I do thank you for your time, and it sure feels good to be on this side of the mike. I have a minute and 10, that's fine. I'll cede it to someone at my pleasure. Marty will take it.

MS. CAROE: Thank you. Hold on for comments.

MR. RIDDLE: Okay.

MS. CAROE: Joe.

MR. SMILLIE: Jim, I just want to deal with one of your comments on the group certification. That's been a fairly recent thing. It's not on our agenda. It would really, the Board really can't deal with it today.

MR. RIDDLE: Right.

MR. SMILLIE: However, I appreciate you bringing it up and giving me a chance to comment on it. And I also share with you the concern for this industry, that this new, I won't say new, but this current guideline and interpretation that certifiers have to follow. And I think that it's a major industry issue, and my committee, I'm the chair of the Certification and Accreditation Compliance Committee, is going to put it on our work plan. And we hope to come back to the next meeting with a recommendation.

And needless to say, we will also, in our close collaboration with the NOP, work to ameliorate this situation, to preserve organic integrity, but also to support all of the -- a number of the grower groups that are
following, you know, and demonstrating organic integrity, and not have the damage to the industry that this could possibly cause result.

So, but unfortunately, you know, this meeting is booked to the, right to the end with current 606 and other issues, so we really can't take it up and make it a forum. But we are all aware of the issue, and we're going to deal with it as expeditiously as possible.

MR. RIDDLE: Yes, and I'd just encourage you to go back to that existing recommendation and --

MR. SMILLIE: Yes. It's --

MR. RIDDLE: -- the one that's posted on the website was the draft. It's not the final. So at least when Dave and I just looked. But if you need the final, I've got it, put it on the stack or whatever.

MR. SMILLIE: No, it's a good document. It obviously can be polished up. There's been five years of experience with that system since, and we need to polish it up. But again, it's on the record as an NOSB recommendation, so that's what we will lead with.

MS. CAROE: Rigo, Bea and then Dan.

MR. DELGATO: Jim, hello. Can you just clarify your comments and annotations. You mentioned 6517 B. Is that, I want to make sure I got it correct.

MR. RIDDLE: Right. Off 6517 B.
MR. DELGATO: Right.

MR. RIDDLE: Content of list, under national list section of the law and not the rule.

MS. CAROE: Bea.

MS. JAMES: First of all, thank you for continuing to come to these meetings after the grueling five years that you paid into these meetings. I appreciate all of your expertise.

I wanted to ask, you didn't mention anything about in OFA, 605, 6509 B, breeder stock. And I just was wondering if you had any views on that, that you would like to comment on regarding the fact that in OFA it clearly states, breeder stock may not be purchased from any source if such stock is not in the last third of gestation, in regards to cloning. And I'm just looking for your views on that, Jim?

MR. RIDDLE: Huh, yeah, it's breeder stock may be purchased from any source if such stock is not in the last third. Well, yeah, I don't think a prohibition on cloned animals or their progeny is inconsistent. There are many parts of livestock regulation, in particular, where the rule has gone into greater detail than the law.

I mean, the law is the skeleton, the rule puts the flesh on the bones, and the section, just a little further down, even acknowledges that the livestock section of the law was incomplete because it clearly gives the NOSB, shall
recommend to the secretary standards in addition to those in that section.

So what the Board says and has said that have been additional to these, I think, are certainly relevant. And given the importance of this issue, the cloning issue in particular, I think it's critical that this Board go on record with a very strong recommendation, you know, not just the cloned animals, but also their progeny and products. I mean, that's one of the reasons I see the Board's existence, you know, to offer good solid advice. And this is an issue of the day.

MS. CAROE: Dan.

MR. GIACOMINI: Two things on that. Do you think, do you feel that moving ahead of USDA or other government agencies is premature on cloning?

MR. RIDDLE: Yeah, I have to disagree with the earlier commentor on that. I don't think it's premature. The NOP and their Q and A specifically, you know, already took a stand on the cloned animals and the products, and asked for your advice on the progeny. So it's perfectly appropriate in that regard.

The larger issue of cloned animals and the FDA's proposal and, you know, they are proposing that they be deregulated and allowed with no tracking labeling and specifically meat and milk from cattle, goats and hogs, is
all it's limited to, not sheep and not other species, not fish.

But, you know, you're not commenting to FDA. You're commenting on the status of those animals and their products in organic, and that's perfectly appropriate.

MR. GIACOMINI: Okay. Finally, if you took five tries to get your public comment submitted, in reviewing all this, I think you were successful three times. You did real good.

MR. RIDDLE: Great.

MR. GIACOMINI: Vote early and vote often.

MR. RIDDLE: I guess. Maybe there should be some checker in the system there.

MS. CAROE: Any other questions of Jim from the Board?

MR. RIDDLE: I do have copies of those comments in paper that I will put on the back table. You already have them.

MS. CAROE: Thank you, Jim.

MR. RIDDLE: But if other people wanted them --

MS. CAROE: Thank you, Jim. Next up is Andrea Kavanaugh on deck. Jim Pierce, can you check in with Valerie, please?

MS. KAVANAUGH: Hi, good afternoon. Thank you so much. My name is Andrea Kavanaugh, and I'm the director of
the Pure Salmon Campaign, which is a global project of the National Environmental Trust. We have partners in, over 30 partners in different countries around the world, and we all have a common goal of trying to improve the standards for farm raised fish.

The comments that I submit today are, in writing and both orally, are pertaining to the aquaculture section from the Livestock Committee's report. And they are on behalf of the 38 different organizations in nine countries including Trout Unlimited in the United States, Friend of the Earth, Norway, as well as other local groups in the U.S., Norway, Chile, Scotland, Ireland, Belgium, Canada, and the U.K.

On behalf of those 38 groups, I would like to first comment the Livestock Committee for it's recommendation to exclude open net pens aquaculture, and the use of wild fish for organic feed for standards. And we would like to urge the Board to recommend that, to make that recommendation permanent.

I have four main areas that I'm going to comment on. Number one, is the support for the exclusion of open net cages, and using wild fish for feed. And the second thing is to request that that be made permanent.

The third is asking the Board to look at prohibiting organic claims on imported seafood in the absence
of U.S. standards; and fourth, to request substitution for
the term minimize with stronger, more precise language, in
the six places it appears in the text.

In addition, I have with me today a sign on letter
from 30, over 340 different individuals who are also
concerned about open net cages and wild fish for feed. And
as well, more than 600 individual comments from individuals
who all think that open net cages and wild fish for feed
could never be considered organic.

Okay. First of all, again, thank you very much to
the Livestock Committee. We think that they made the right
decision in excluding open net pens, and we think it's a
small victory for U.S. consumers who depend on a strong U.S.
organic standard.

We encourage the NOSB to adopt the committee's
recommendation to exclude them, open net cages, and to
exclude the use of wild fish for feed. We think, we also
would, again, urge you to make it permanent. And we think
that that would be the best thing to do for aquaculture and
organic centers in the United States.

And the reason why is that we don't consider open
net pens could ever meet the definition for organic, and
neither can using wild fish for feed. For one, the first
reason we don't think open net pens can be considered is that
it lacks a physical barrier between the fish and the wild
fish. And so the producer lacks control over the inputs and outputs of the aquaculture system.

It also uses nonorganic wild fish for feed, which is by definition, not organic. It cannot improve and in many cases can degrade the genetic and biological diversity of the surrounding environment, the outbreaks of diseases like sea lice and escapes.

And farming of migratory species like salmon ignores that species specific certain behavioral needs, and so we think that that also would never, should be considered as organic.

Right now what's happening in the U.S. is that there are imported salmon being sold as organic. And that's what happened, because there have not been, obviously, U.S. standards in place. We would urge you to, in the absence of standards, to make that impossible for those fish to be sold in the U.S. as organic. It helps to maintain the integrity of the organic label, and it would help lead to consumer -- it makes, gives consumers greater confidence.

We think that, you know, these are European things, European -- sorry. The European important salmon, they use toxic chemicals to kill parasites and sea lice. They use antibiotics in certain circumstances to treat disease. They use wild nonorganic feed. The feed is not cleaned of PCV's, dioxin or other contaminates. They do not disallow the
killing and harassment of marine males, and they don't present escapes.

We have submitted written testimony that details all of those issues in Norway, Scotland, Chile, Canada, of all the places where salmon has been farmed organically, but it is actually exactly the same as conventional net pens.

Just to give an example, we got data from the Scottish Environmental Protection Agency via a Freedom of Information request, and they, one of the things that they, the data that's available is that there were over 80,000 escapees of organic salmon since 2002, and zero of them were recovered. Sorry.

MS. CAROE: You can finish your thought.

MS. KAVANAUGH: Okay. Thanks. And then just on that also, according to the Scottish Environmental Protection Agency, there was a use, lots of use of a chemical called emamectin benzoate, commonly called slice. It's used to combat sea lice infestations. And the problem with using slice is that it's a chemical, but if you don't use slice, then you get these massive sea lice outbreaks, and so then it becomes a fish welfare problem.

MS. CAROE: All right.

MS. KAVANAUGH: So we would encourage you to look at that.

MS. CAROE: Thank you for your comments. And
again, those issues will be taken up at a later date in a different forum.

MS. KAVANAUGH: Okay.

MS. CAROE: Are there any questions for Andrea? Hearing none, thank you for your presentation.

MS. KAVANAUGH: Thank you.

MS. CAROE: Next up is Jim Pierce. On deck is Rick Moonen. Rick, are you in the room? If you could check in with Valerie, we'd appreciate it. Valerie, put your hand up. Put your hand up, Valerie.

MR. PIERCE: Do you have me on as both Organic Valley and then as the Wisconsin Aquaculture Association? Okay, I'll address those separate, because they are different topics and you might have questions in between them. All right. Are you ready?

For the record, I'm Jim Pierce, self-appointed certifications at CROPP Cooperative, a now over 1000-member farmer-owner cooperative, marketing under the Organic Valley and Organic Prairie brands. It's my pleasure to offer verbal reinforcement to our comments posted on the regulations.gov website. In fact, I feel sort of obligated to do so, since I am not confident anyone can find our needle in that haystack. Call me an old dog, but I'm not completely comfortable with this new trick. It is heartening to hear that this website is going to improve.
General 606 comments. My colleague, Kelly Shea, aptly refers to the 205.606 list as the entrepreneur's list of business opportunities. And I agree. Remember, these are not synthetics. These are the same commercially unavailable agriculture products that our certifiers have been diligently reviewing and ruthlessly forcing us to use since the Carter Administration.

The crux of the 606 biscuit is compatibility with the system of organic, not manufacture method or essentialness or current availability. If a material is available, we as organic processors have to use it. It's okay if nonfat dry milk -- it's okay to list nonfat dry milk. Nobody will be using it, though, as long as Organic Valley is cranking it out.

There are two kinds of 606 people. You've got your lumpers and you've got your splitters. Me, I'm a lumper from way back. In the recommendations before us, peppers are split, and hops are lumped. The hops decision is perfect, kind of common sense, but I suspect divine intervention considering the magnitude of the issue.

Even though the pepper petitions came in from multiple sources, the same lumping allowances approach could be used. Now, onto more specific 606 comments. One of the dogs in this hunt for organic priority is celery powder. That minor ingredient not currently available as organic in
sufficient quality, form and function, has transformed organic hams, bacons and hotdogs into rising star products. Organic celery powder is becoming available, and Organic Prairie is among the first in line to test and use it.

If, however, organic meat sales explode the way we predict, and there is a very real possibility of organic shortages. We are disappointed to see this material recommended for addition to the list for only three years, and so we repeat our request. If celery powder is compatible with a system of organic production, then list it for the full five-year term.

I know you mean well by attempting to stimulate the market, but you cannot control farm practices and market forces from Washington. Annatto, I like to say that, annatto. It sounds very Italian.

We agree with the three dissenters that the suggested annotation that conventional oil extracted annatto be extracted with organic oil is over prescriptive and should never have stuck to the wall. The real problem with annatto suspended in oil, however, is that it's suspended in oil, and I don't see oil proposed to the addition to the national list. Therefore, by my read, even if oil-based annatto is added to 606, it won't be allowed.

The same situation is true for vinegar brined peppers for organic pepper cheese, and every other multi-
ingredient minor ingredient.

Now, as much as I love saying annatto, I struggle with fructo-olego saccharide and oligofructose. So we'll refer to them as FOS and OFS. As the public comment period progresses in the next few days, you will hear repeated objections to the committee's conclusion that these materials be considered as synthetic. You will also hear carefully constructed solutions in order to list all inulin including FOS and OFS on 606.

Although fructo-olego saccharides and oligofructose sound pretty darn synthetic, they are not. Both can be produced from raw inulin which can and is certified organic by enzyme hydrolysis, an established biological process. Both are clearly compatible with organic practices and need to be added to 606.

Enzymes are allowed in organic productions and are on 605 A. There are plenty of examples of enzyme hydrolysis in organic food, including maltedextrine from cornstarch.

Perhaps more importantly here is the spirit of accepting petitions for 606 consideration. These two materials were petitioned in good faith as agricultural materials representing a significant number of producers whose products are currently certified by organic, by accredited certifiers. To abruptly change classification is to pull the rug out and cause significant economic disruption.
There is an irony here similar to the oil and annatto problem described earlier. There could very well be a 606 problem unless good old just plain inulin gets listed on 606. If for any number of reasons, including market expansion, the prohibition of SOS and OFS as synthetic, or any other various and sundries, organic inulin becomes commercially unavailable.

We're from the private sector and we are here to help. Please give serious consideration to the fructose solution that is being proposed. Think lumper.

Lastly, thank you for recommending natural casings for the addition to 606. It was a perfect decision. On behalf of Organic Valley and Organic Prairie, keep up the good work.

MS. FRANCES: That's the first five minutes.

MR. PIERCE: Yes.

MS. CAROE: Is there any questions?

MS. WEISMAN: Where's the proxy?

MS. CAROE: Well, it's separate. It's a separate agency that signed Jim up. So questions on Jim wearing his CROPP hat? Any.

MR. ENGELBERT: One, Andrea.

MS. CAROE: Kevin.

MR. ENGELBERT: Do you have any concerns at Organic Prairie with natural casings if they are approved with this
cloning issue that's popped up, and cloning animals being used for livestock?

MR. PIERCE: I hadn't really considered it. We will certainly have to work through our certifiers to verify that any casings are not coming from cloned animals, because that would be products of cloned animals. Yes. I think it could be done, though. I think it could be handled. We just have to work out an agreement with the casing supplier.

MS. CAROE: Any other questions for Jim on these comments? Okay, Jim, do a quick turn around and then come back at us.

MR. PIERCE: Yes. Actually, you are playing right into this. Hello. For the record, I am Jim Pierce. The following comments are on behalf of the Wisconsin Aquaculture Association, not Organic Valley. I will not literally but figuratively switch hats now to that of the Wisconsin Aquaculture Association. I was going to bring the old WAA hat, but being a true fish farm working hat, the one in fact that keeps the precursors of fish meal out of my hair, let us say that it is olfactorily challenging.

In another life, a simpler, quieter, dreamier Jeffersonian life, I raise rainbow trout in God's country. I have the privilege, as well, of being a director on the Wisconsin Aquaculture Association, and 80-odd member organization of cool and cold water fish producers.
Wisconsin aquaculturists are the model of sustainable fish producers. The Wisconsin Department of Natural Resources is among the strictest in the nation regarding prudent water use. Since our niche has always been high quality fish produced locally and sustainably, we are anxiously watching the progress of this project.

While our members would benefit significantly from organic standards, there is nothing in this recommendation for us beyond a glimmer of long-term hope, since the fish we grow rely on fish meal in their diet. By postponing standards for fish meal and pen culture, you have, in our view, effectively killed our opportunity for organic aquaculture, exactly what many people want, judging from the comments.

I'm here on behalf of our association to urge you not to leave the standards on fish meal and pen culture in the wake. Delaying the development of fish meal and pen culture could be the kiss of death. We have all gazed into the abyss that is the Federal Register process, that Doug placed in previous NOSB recommendations, critical livestock materials and a pasture law language.

There are a variable boatload of comments posted regarding aquaculture. Most are steadfast in their demand that pen raised aquaculture be banned let alone certified organic. It's unfortunate but undeniable that certain
aquaculture practices have received the harsh criticism they deserve. Like confinement poultry and pork production, those factory style fish farms represent the majority of production, but only a minority of producers.

The same paradigm that has devastated the family farm affects fish farmers. Corporate producers with lopsided influence and little regard for long term sustainability are spoiling the environment and reputation in the name of quarterly profit.

At the same time, most aquaculturists, just like most terrestrial farmers are dedicated stewards to the environment, and husbands to their livestock, and stand to benefit from the organic label.

There is a good deal of consumer confusion regarding aquaculture that is dragging these good farmers down with the sinking reputation. The good news here is that it's not your job to educate consumers. It is your job to write goal-based standards for aquaculture. Indeed it's your OFA anointed duty.

If a dairy farmer can figure out how to manage 5000 cows in compliance with the new pasture regulation, they should and they will. Likewise, if a fish farmer can raise fish sustainably in net pens, like say Kona Blue, without jeopardizing the resource, set the stage and let them do it.

And the stage is set. Pen culture remains in the
definitions. The aquaculture task force and IFO have
proposed a solid foundation of goal-based standards for pen
culture. Either accept them, expand on them, but please
don't abandon them.

The solution for fish meal is more difficult, but
just as critical. The good news here is that the IFO
community has wrested with this problem, has shared their
results. The WAA encourages you to continue to work with the
stakeholders to find compromise. Our plea today is to please
don't let this boat pull out without us, and the thousands of
small aquaculture producers that are already doing it right
and who would benefit from the organic standards for cold
water pacifiers species.

Yes, there are unsavory species -- yes, there are
unsavory practices in conventional aquaculture. Yes, the
issue of fish meal and pen culture are difficult. And yes,
there are righteous fish farmers, like many in the Wisconsin
Aquaculture Association who want to cater to the very
commentors who abhor these practices by providing them with
farm seafood raised sustainably and proudly displaying the
most powerful eco-label on the market, the USDA seal.

It merits repeating that organic standards are
goal-based. Build the goal and farmers will come. Thank
you.

MS. CAROE: Any questions for Jim? Thank you, Jim.
MR. PIERCE: Thank you.

MS. CAROE: Next up is Rick Moonen. On deck is Sue Ann McAvoy.

MR. MOONEN: Good afternoon. My name is Rick Moonen. I'm executive chef and owner of a seafood restaurant in Las Vegas. I've flown out here today to speak to you for five minutes.

I've been in the food industry for 30 years as a chef, 18 of them as focused primarily on seafood. I'm here to represent the viewpoints of many of my peers on the issue of the so-called organic seafood.

I understand that the Livestock Committee has suggested more dialogue is needed on the issue of whether fish farmed in open net cages and those requiring wild fish for feed should be considered for organic certification. And until now, I don't think you've heard from chefs or restaurants who are the gatekeepers, restaurant owners who are the gatekeepers of the food world on our feelings towards organic seafood.

Today I want to present to you a letter that is signed by 20-plus well-respected chefs from across the country regarding our concerns over the organic certification of seafood like farmed salmon, farmed cod, et cetera.

In my conversation with many of my peers, it's my sense that many of us are worried about the watering down or
the confusion of the term organic. When I think of the word organic, and I think most people, they think of this healthy, good for you, good for your family, safe, environmentally-friendly product. Most of the time it's farmed.

And we see organic farmed salmon offered by our seafood suppliers, for instance, and we're confused on how anything like farmed salmon can be called organic. And it's not something we're comfortable with at all.

I'm here to offer my support, along with a large group of the other chefs for the Livestock Committee's recommendation that fish farmed in open net cages and those requiring wild fish for feed be left out of the USDA organic standard. I'm also here to ask that the NOSB never consider these types of seafood for the organic standard. To me, based on my knowledge of organic food systems, it simply makes no sense that we're even considering labeling open net caged fish and carnivorous fish as organic.

In 1998 I took a trip to Norway. I used to be, I used to be a huge proponent of farmed salmon. I thought it was the greatest thing since sliced bread. I took a trip up to the Bay of Fundi, and I visited some salmon farms, and I thought it was the most fantastic thing in the world. Within hours, I was in New York City for 28 years, we'd get the fish gently taken out of water, you know, correctly handled, sent to us. It was inexpensive. It was an easy fish to sell.
Everybody understood salmon. They loved salmon. It was so many preparations. There's nothing about it that I didn't, that I couldn't embrace.

And then in 2004, I was attending in Vancouver the third world fisheries conference, and I took a trip into the Britain Archipelagos and met this lady called Alexandra Morton. And she was a researcher up there in Eco Bay. And there are, she was researching a lot of the salmon farms in the nearby area. And in particular, the effect of sea lice at these salmon farms. These open nets were producing large amounts of sea lice.

Now, sea lice go through a natural cycle where, you know, the population will be down at a certain time. There's five wild species of salmon in the Pacific Northwest. And when they are immature, they don't have a scale coating, so they are very vulnerable for sea lice. Sea lice will kill them.

What we did is we took a vote. We went nearby one of these salmon farms, we took a net and we pulled up a bunch of wild pink salmon, put them in a little aquarium and every single one of these salmon were dead or dying from sea lice.

From my own personal research on the impacts of fish farming, basically what we are doing is, we're wiping out wild species of salmon. And I can tell you that from first hand experience.
I've also met the natives from up there. They are called First Nations, and they sat down and told stories about how these salmon farms affected their land, their water there, the systems that surrounded their families for hundreds and hundreds of years.

As the letter that I present to you now states, my peers and I simply, (a) cannot support an organic system that takes more resources, fish, from the natural environment, and that it provides in return, as in the case with farming, all carnivorous fin fish, such as salmon. Kona Blue, for instance, 50 to 1 radio. It takes 50 pounds of feed to produce one pound of Kona Blue.

(b) It cannot support caging a highly migratory species like salmon and labeling it as organic. It's not exactly free range.

It cannot support organic certification for any food system that allows untreated waste from the farm to be discharged directly into the ocean, as in the case of an open net cage fish farming system. The effluent that comes from these fish farms creates this blanket suffocating everything around it, all clams, oysters, anything that's on the bottom dies.

I cannot, we cannot support organic certification for any system that does not eliminate the spread of harmful and sometimes lethal parasites to wildlife, as in the case
with open net cage salmon farms, as I had spoken. Cannot support an organic system that does not prevent escapees of farmed fish into the wild, as in the case of an open net cage fish farming system. And cannot support an organic label for a product where the feed, and therefore, the product itself may very well contain unhealthy levels of contaminate such as PCB's and dioxines in sometimes higher quantities than conventionally farmed product.

Basically, just to boil it all down, we're just asking that we don't confuse an already confused organic name. Thank you very much.

MS. JAMES: I want to make sure that I understand what you do support. So what I hear you saying is that you're okay with limited varieties of fish that would be raised organically, but not just a blanket on everything potentially being raised right now?

MR. MOONEN: Correct. Basically, what our major concerns are, twofold. In aquaculture, if it's, if they are pulling feed from -- if it's a carnivorous fish, the feed must come from the environment. And basically, we're punching holes into the environment by removing -- let's say it's sardines. We're taking sardines to produce pellets to feed carnivorous salmon or cod.
There is an imbalance in that, and then that creates a big problem. There is contaminates in the feed, and it's not an organic source, therefore, it can't be labeled as organic.

In the world of vegetarian fish, such as catfish and Tilapia, there I would support the word organic being used, because it's much more controlled and the source of their feed it not from, if it's noncarnivorous. Does that answer your question?

MS. CAROE: Kevin and then Dan.

MR. ENGELBERT: That was basically what I was going for, too. I wondered what you did support. But I'm also concerned about when you say never, and I heard, you know, you are not the first person to say never. That's a long time.

MR. MOONEN: Okay. When it comes to farming, what I would like to see happen, I think that aquaculture is very important, because there is a need for fish protein for consumption. But there's a permanent barrier between these farms and the natural environment. And it can be done, and it's shown to be done. It's more expensive, but it's the only solution I see as a viable answer to the word organic or anything in the future.

MR. ENGELBERT: Right. And as Joe and Andrea have said, this is the topic for our next meeting. But while I
have your ear, have you studied the proposed rules that the aquaculture working group came up with that we have set aside? I mean, as a novice, they seem very thorough, and a lot of the issues that you have just talked about seem to be addressed. But you, apparently, think there is no way that they can be. And I'm --

MR. MOONEN: I know that I maybe used a lot of extreme words as far as never. But what we want to do is we want to take steps in the right direction. I mean, I'm a seafood chef. I sell fish for a living. I don't want to remove fish from my menu, because then I would be serving tofu, you know. I would have to change my entire concept.

So I'd like to see it done in a responsible manner. And I did not read the entire standards. I gathered a lot of information from trusted sources, environmental groups that I'm affiliated with for many, many years. And I'm constantly on line. I have like a stack of things that I read on a daily basis involving sustainability of the ocean.

My menu in Las Vegas, the land of who gives a darn, you know, is -- I research everything that I put on there, and I try to make it as sustainable as I possibly can.

MR. ENGELBERT: Thank you for coming out.

MR. MOONEN: You're welcome.

MS. CAROE: Dan. Hold on.

MR. GIACOMINI: Essentially, you know, without
wanting to take longer than need on this, but it was the same
as Kevin was saying. I mean, the issues of efficiency of
food harvest versus food output of inflow and outflow of
waste and those things, a lot of those are dealt with or our
bars are set in these guidelines.

And I guess one of the things I'm asking is, is it
worth trying to set a high enough bar to fix the problems
that you're seeing I conventional farming, or is it just not
worth trying at all?

MR. MOONEN: It's absolutely worth trying, because
I think it's a viable solution.

MR. GIACOMINI: So if we set a high bar and it can
very few or never be done, then there is no organic salmon
available, I guess the question I don't have is what would be
wrong, what's wrong with setting the bar high and trying to
improve the problems that you are seeing with conventional.

MR. MOONEN: I just think the word organic
shouldn't be applied at this time to farmed carnivorous fish.
Until, until we find a way of producing some sort of feed
that doesn't have that large imbalance ratio -- Kona
Kampachi, I just found out a few minutes ago, that the ratio
is 50 to one. And that blew me away. Salmon isn't that bad,
I mean, comparatively, but still isn't great. You know, so
it's taxing our natural ecosystem.

And I'm not here to save the world. I'm here to
try to educate myself, my staff, my customers on making healthful choices for the environment for the future.

MS. CAROE: Thank you for your comments.

MR. MOONEN: You're welcome.

MS. CAROE: Next up is Sue Ann McAvoy. Did she check in with you, Valerie?

MS. FRANCES: Yes.

MS. CAROE: Okay. On deck is Mara Cool. I'm sorry, Marc Cool. Marc, are you hear?

MR. COOL: Yes.

MS. CAROE: Could you check in with Valerie, please? Thank you.

MS. McAVOY: Good afternoon. My name is Sue Ann McAvoy, and I'm with Sensient Colors in St. Louis. And I want to thank the Handling Committee for reading and commenting on all the color petitions that they received, 51 out of -- excuse me, 21 out of the 51. That was a lot of work.

And I want to thank the Board as a total for their consideration, and full consideration of all these items that are before you for comment to addition to 606 at this time. I will also thank you for the opportunity to submit public comment responding to the recommendations of the NOSB that will be finalized at this meeting.

And I want to thank you for accepting, please
accept our comment for specific, specific to the NOSB Handling Committee recommendations for the petitions received for color, annatto.

We understand that the NOSB received three petitioners for annatto extracts to be placed on the national list 205.606 nonorganic agricultural substances. Two were submitted by Sensient Colors, Incorporated, of which I'm the manager of regulatory compliance, and one was from another company.

We support the decision of the NOSB to review and make recommendations of petitions of similar substances by substance rather than individually by petitioner. In this case, however, the petitions for annatto extract are, in fact, for two different substances, annatto extract water soluble and annatto extra oil soluble.

Sensient submitted one petition for each and our other company, another company, submitted one petition for many colors that included the oil soluble annatto seed extract.

The current handling subcommittee recommendation to the Handling Committee is to approve both forms of annatto extract with the annotation that organic oil must be used for the oil extraction. The Handling Committee voted to reject the recommendation on the grounds that the annotation was overly prescriptive.
We agree with the Handling Committee regarding the annotation and respectfully offer the following suggestions. We propose that annatto extra water soluble and annatto extra oil soluble be considered as two separate substances, as they are manufactured differently and are distinctly different when used in formulations of organically handled products.

We propose that the Board consider a friendly amendment that would remove the annotation from the use of organic oil from the recommendation for annatto extract oil soluble, as it is determined to be outside the scope of 205.606. And we urge the NOSB to approve the two separate recommendations for the two forms of annatto extract that would allow for the use and offer the use as nonorganic agricultural substances on 205.606.

We'd like to emphasize that the most important points made in the Sensient petitions for annatto extract, while there are some supplies of annatto seed being produced in countries outside the United States, in our search for organic annatto seeds, we discovered limited supply, crop irregularities, certification and accreditation difficulties, improper form, or NOP prohibited manufacturing processes of raw materials and inferior quality.

Our determination was made after consulting with over six producers and processors of annatto seed and extracts. Annatto seed must be handled and the color
extracted immediately after harvest with controls
consistently in place at all points during shipping,
packaging, drying and storage.

When this process is not managed properly, the
result is diminished seed quality, which means inconsistent
unacceptable levels of bixin, which is the substance in the
extract that contains the coloring component.

We are actively engaged in working with producers
to successfully cultivate and develop an organic annatto seed
that will yield annatto extracts with consistent qualities,
appropriate form, and brilliant color to meet the production
standards in expectation of organic handlers and consumers.

Until that time, we urge the NOSB to separately approve
annatto extract water soluble, annatto extract oil soluble,
without annotation, for inclusion on the national list,
205.606.

Thank you very much for your consideration. We
look forward to production, a productive and successful
meeting.

MS. CAROE: For questions? Joe.

MR. SMILLIE: Thanks for the annatto information.

I appreciate it. Did you have, did Sensient or yourself make
any other comments on any of the other rejected colors?

MS. McAVOY: We chose at this time not to make
comment on those, not because we wouldn't be in support one
way or the other, but because we didn't petition for them.

MR. SMILLIE: Okay. Thanks.

MS. CAROE: Rigo.

MR. DELGATO: You mentioned you are working with producers to secure production, organic production of this product.

MS. McAVOY: That's correct.

MR. DELGATO: What are the challenges that you are facing with those producers, and when do you think you'll, you anticipate having a constant supply of annatto?

MS. McAVOY: The biggest challenge is where annatto seeds grow. It grows, they grow in equatorial climates at high elevations in similar places to where coffee grows. Many of the sources are Ecuador, and in Peru. And for example in Peru, the United States encourages, under the Andes Agreement, encourages cooperation with Peru. And the Andes Agreement is to help keep down the amount of drug trafficking. So instead of coca being grown, annatto or cochineal or another substance that will be an agricultural or product for use in foods, coffee, for example, will be grown instead. So to make it sustainable for those people.

The biggest problem we are facing in Central and mostly in South America is that the organic, lack of organic certifiers that are accepted by the NOP. We have yet to
really secure a very good source. And we've been in the
annatto seed trading business for 25 years, at least as far
as I go back with the company. So that's one of the issues,
is trying to find a certifier of those products in those
countries.

MS. CAROE: Any other questions. Julie.

MS. WEISMAN: Just in anticipation, possibly, this
is not for sure, but in anticipation possibly of making two
separate recommendations, I was hoping for your professional
technical opinion. Would it be more accurate to call these
things, for instance, annatto in water, or annatto water
soluble, or are they interchangeable? And the same for oil.
Would it be annatto in oil, or annatto oil soluble, because
we've been using them interchangeably on the Board.

MS. McAVOY: Right. It's water soluble annatto.
The water soluble product has potassium hydroxide with it.
The seed, the color -- I don't know how technical you want me
to get. The color is contained on the outside of the seed.
It's about 2.5 percent of the weight of the seed itself. And
it's in a resinous coating on the outside.

In order to get the color off you have to wash it,
for lack of a better term, in some manner. There are two
physical washing means. One is with oil, and that's the
traditional means that has been used to get the coating, the
resinous oil soluble coating off.
And the other one is water with potassium hydroxide, which is another traditional means that has been used. With the potassium, that product that makes it water soluble, there actually is a slightly different structure to the color. It's called noabixin. And the color that is oil soluble, that color component is called bixin. So we are looking at two different color components. Both are carcinoid in nature, but there are still two different structures.

MS. CAROE: Any further questions? Go ahead, Steve.

MR. DEMURE: I'm not sure I understand why you wouldn't be able to use, or want to use organic oil in the extraction process. Could you explain that?

MS. McAVOY: We felt, well, the annotation was added, and because of the annotation the Handling Committee recommended, even though they recommended it, it was voted down. We felt that when we had originally petitioned, we felt that oil, organic oil would be the more appropriate way to go, because that's more within the feel of the standard itself.

However, it was then felt that perhaps it should be up to the specific certifiers to decide whether or not organic oil has to be used in this nonsynthetic, excuse me, nonsynthetic, nonagricultural product at this time. Does
that make sense? Yes. Okay.

MS. CAROE: Just in response to that, Steve, we'll have further discussion when we talk about this material. I have a definite opinion on why that should or should not be unrelated to the product itself, but more about the process and about the appropriateness of these annotations. So thank you, Sue Ann. Do we have any other comments? None. Hearing none, thank you so much.

Next up is Marc Cool. On deck is Joe Mendelson. Joe, are you here? Joe? He's here? Can somebody make sure he checks in with Valerie? Go ahead.

MR. COOL: Thank you, Madam Chairman. My name is Marc Cool. I work with Seeds of Change. We are a certified organic food and seed company based in Santa Fe, New Mexico. We are very committed to the organic industry, both from the food and the seed side. We're also very supportive and appreciative of your efforts here as volunteers on this Board.

I'd like to speak to you today on a couple of points regarding organic seed. The first is the Omri Database. We're all aware of the Omri Database which lists allowed substances to use in organic agriculture, also has a seeds database. And this was placed a number of months ago by a consortium of seed companies. And this lists currently about 650 varieties of organic seed available to commercial
farmers.

About 250 of those are ours. There's about six or seven companies listed on this database, which is far too little. We really need to, as an industry, take a couple of next steps in making sure there are more and more varieties listed on this database. We do appreciate Mark Bradley's help to push and steer certifiers towards this database.

The second point is, what Seeds of Change is doing, and what the industry is doing to make organic seed available. As we all know, conventional seed companies really do not see the demand out there to provide them impetus to actually develop organic seed varieties.

What we are doing is, we have taken the step of actually -- you know, the question, the old question, the chicken or the egg. The answer to the chicken or the egg question is, the first thing that comes is commitment and resources. It takes a lot of time and energy to actually develop the supply side of the business, if there is no demand side of the business.

What we have done is develop a catalog. I've put a couple on the back table for you if you are interested to look at, which shows a little bit of something that some companies are doing to provide supply side on the organic seed industry.

The next thing is the farm bill. We're all aware
that there is mention of the organic research in the farm bill, and we would like to, obviously we are all here in favor of support of that. It like to ask you to please continue to push for support the inclusion of relevant organic research in the '07 farm bill.

The last thing, which is the most important thing I would like to touch on, is the transparency in granting the allowance to use nonorganic seed. We all know under NOP rule 205-204, the definition of how, when someone has to use organic seed is pretty much all the time unless organic seed is not commercially available in equivalent form which is relevant for the farmer in his or her operation. That's a fair exception, and we support that exception.

However, reality is that less than 1 percent of the organic fresh market and processed food grown in America is using organic seed. This as opposed to conventional untreated or nonchemically treated seed. There is very, very little organic seed used in this organic chain. And that's kind of a shame, because our seed is the start of the chain, and that start doesn't exist.

So what we would like to do in some kind of way as an industry, as a seed industry, to know what organic varieties are in demand out there? What do farmers want to plant in an organic form.

The easiest way, it would seem, would be to get
access to lists from the certifiers on what exceptions or
exemptions they have given farmers to use nonorganic seed.
Evidently, we've had a number of talks with several
certifiers, evidently this information is not available. The
certifiers themselves don't track or don't file these kinds
of records. But the farmers, it's the farmer's job to file
this.

So we thought about maybe doing a survey amongst
farmers to see what varieties, you know, are in need out
that. But that becomes very difficult. Surveys, of course,
generally have a very low response rate, and the people that
do respond can skew the results quite dramatically.

So what we actually would like to propose is the
following. We would like to recommend to NOP, and this is
consistent with some thoughts that have been voice before,
that NOP request certifiers to make the possible
consideration of exemptions to the use of nonorganic seed for
an organic crop system, to make this information public on a
website, for instance on the NOP website, make this available
in advance of granting this exemption.

What then can happen is the industry will be able
to look at this know what demand is out there and be able to,
if necessary, fill that. If a variety is not available, then
at least that list gives an overview of what exemptions have
been requested.
If we do the above, what we are going to do is provide impetus for the organic plant breeding companies to actually develop better varieties for the future that were developed specifically to do well under organic or low input agricultural systems. Also, we therefore, allow organic farmers access to the best possible varieties for them which is to their long term interest.

And finally, what we will then do is allow the consuming public to be satisfied with the authenticity and comfort that the organic seed chain, or the organic food chain is complete, starting all the way from the seed. Right now, that is not the case, and we think that should be the case.

We need to defend the brand organic. So with that, thank you very much. I'd like to, if there are any questions, answer those now, or anytime in the future. Thank you.

MS. CAROE: Are there any questions from the Board? Tracy?

MS. MIEDEMA: This sounds so sensible. Is there any opposing viewpoint to having this database?

MR. COOL: I think the -- thank you for mentioning this would be sensible. Joe might have some comments. I think the general comment, of course, is one of limited resources. Both the certifiers and NOP have very limited
resources. In my view, in the whole accreditation process, there is a whole number of steps and a lot of paperwork to be done, and I don't understand quite why it would not be possible to have one step, namely, a very simple website where people could very easily simply type in the information and make this available to the public. But there will be some comments regarding, of course, simply resources.

MS. CAROE: Joe.

MR. SMILLIE: You've taken the words right out of my mouth. It's back to the old USDA website issue, which we've batted around a few times. It would be really great to have a lot of this on the website, but there's a number of reasons why that hasn't occurred yet, resources being on of them.

Second one is, it's another burden that would be on the certifiers to put up there. And the reason why it's a burden on them, not so much the bureaucratic load, but also, farmers do not like to let people, other people know what varieties they are planting. It's, for a market gardener, it's a life and death issue, and for crop and field guys it's not so big. But there is a certain resistance in the farming community to really let, you know, to say that I'm using this particular type of seed for whatever market advantages, either perceived or real.

So there's a couple of things that prevent us, I
think, at this time from moving forward. But I agree with
you. I think it's important. I think it's a shame that
we're not using more organic seed. And again, if it was
available and people could get it, then I'm sure they would,
but again, we've got to get them to say what they need, and
then certifiers have to also be able to have a good database
to rely on to say, no, that's available. Excuse me.

Right now, we're still working with a system that
we've had for many years, which is show me your due diligence
efforts to procure the organic seed. And of course, that is
enforced among different certifier groups at different
levels, and you know, how much effort did they really make,
and how much is just show. And they just specked you to
death. Oh, I couldn't get this, and I've got to have this
variety or, you know, my market expects it, or the wholesaler
expects it.

So I agree with you in principal, and hopefully
between -- hopefully we'll be continually tightening the
screws, and hopefully we will have some sort of system that
works for everyone to increase the amount of organic seed
used.

MR. COOL: Well, thank you. Yes, where the
exception is relevant, obviously, everyone agrees to it. We
don't want to force growers to use a product they don't want
to use, and which they are not going to be successful with.
The database does exist that actually lists all the varieties available organically. It's the Omri Database.

Again, as an industry person, my goal is to actually increase the presence and listing of varieties and companies on that database. Your comment about farmers not wanting people to know what varieties they are using, an easy way around that would be to not link the name of the farmer or the operation and the variety that is being requested for exemption.

The goal of this is very clear, all of us want to make this chain true. The public will increasingly want to see this chain as being true. We have to defend the organic brands. And some of the concerns that are raised are things in my mind that we can actually sit down, discuss and overcome and not say up front, we can't do it because of our resource issues.

MS. CAROE: Any further questions? You have a question for Joe? Okay, Bea.

MS. JAMES: So, Joe, in your comment that we will get to this, are you saying that this is something that the CAC Committee would put on their work plan?

MR. SMILLIE: Yes. Yes, I think it could be. Again, I'd like to confer with the program and see where they're at with it right now, see what they are doing as far as their accreditation of certification agencies, and how
this is being enforced. Because technically, I mean, the regulations are clear. You have to use organic seed unless it's an exception.

And the fact that Marc brought up is like 1 percent, and there's like a lot of exceptions. In fact, it wouldn't be an exception at that kind of level. So we've obviously got a problem that we need to deal with. And yeah, I can see putting it on our work plan. Absolutely.

MS. CAROE: Any further -- Kevin, quickly.

MR. ENGELBERT: One quick question, Marc. Do you -- what types of seed do you sell? I mean, are we talking vegetables, field crops?

MR. COOL: Our company sells vegetable seeds, but also input crops along with that, so say insects, flowers, cover crops, et cetera, all 100 percent certified organic.

MR. ENGELBERT: Okay.

MR. COOL: Well, thank you, and we're very happy to help you as we pursue this issue, and I'm open to questions any time and at any time in the future. Thank you.

MS. CAROE: Any further questions? Okay. Thank you so much. Next up, Joe Mendelson, and on deck is Brian Baker. Is Brian in the room? Okay. Brian, you're going to be on deck, but we're going to take a little break after this speaker for comfort.

MR. MENDELSON: Good afternoon. My name is Joe
Mendelson. I'm with the Center for Food Safety. We're a consumer and environmental organization located in Washington, D.C. with offices also in San Francisco and members across the country. I want to thank the Board again for all its hard work, and welcome the new members. Thank you for dedicating the better part of your lives over the next five years, to many tasks.

In the interest of your break, and others, I'll try to be quick. I want to give Jim the chance to opt out on my comments. No? Okay.

Just I'd like to comment quickly on two topics. The first is cloning and the second is the aquaculture recommendations. First on the cloning issue, I have to say I haven't had the chance to read the revised draft that has been mentioned, but we want to, I would like to say we appreciate all the hard work of the Livestock Committee on the recommendation that had occurred before, taking up a very timely issue, certainly one that our organization is very interested in.

I'd just like to add that we, like other commentors, think that the prohibition has to extent to progeny. We think there are scientific reasons that validate that, in particular, and this is in our written comments, that there are studies out there showing that some of the genetic aberrations that occur in clones are passed down to
their progeny. And that suggests that these animals are fundamentally different than what would be a conventional animal. That is that they do not get reprogrammed into normalcy necessarily after a cloning occurs. And I would ask you to look at our comments that were submitted through the egovernment,eregulation website that cite to that.

That means, just like you would have if you took say a genetically engineered alfalfa, bred it with a conventional alfalfa, created next generation alfalfa that has the genetic trait, genetically engineered trait, and that would be prohibited under the excluded methods. So should the progeny in organic.

I would like to also support Jim's recommendation about using the term asexual and not cloning. I use that as a common, term of common art. But asexual reproduction is really what we are talking about.

A couple of other quick comments on the progeny issue. I was just in attendance at a meeting of the Transatlantic Consumer Dialogue. That is a meeting that is sponsored by the European union and the U.S. governments of consumer organizations from both the United States and the European union.

And we come together to develop consensus consumer positions. And we developed a consensus recommendation on cloning. It was attached to our comments. Within that
recommendation is a recommendation that clones and their progeny be prohibited from any type of organic production system. This is supported by groups in the United States such as, certainly, ours, the Center for Science in the Public Interest, Consumer Federation of America, Consumers International, and a host of very large and well-represented consumer groups in the EU.

Lastly, I dumped on Valerie a CD that had over 2600 comments from CSF members that were sent in based on the recommendation that you put forward to suggest and say that as consumers and environmentalists, we do not want progeny of clones to be allowed in organic.

So with that, I, again, would support Jim's recommendations for amending both 205.2 and 205.23 B(3). I have not seen that specific new provision, but we do think that you do need to create a part of the origin of livestock regulation to specifically prohibit livestock from cloning progeny, livestock asexual reproduction, excuse me, progeny of livestock and any reproductive materials derived from them.

One minute. Onto aquaculture. Again, we submitted comments in the past, twice. We strongly support the prohibitions on both net pens and fish meal. We have submitted to the Board previously a letter in support of that position from 25 organization, 24 organizations that are both
consumer, environment and organic organizations. And our comments speak to why we support that.

A couple quick points on 205.252 E which deals with the allowance of feed additives. We think that that needs to be specifically clarified, so that wild caught fish are not allowed to be used as a feed additive. It's my understanding that at a certifier training recently, that NOP said that all agricultural -- I'll finish up. All agricultural feed materials have to be from organic sources. That's certainly consistent with not allowing that feed additive and feed supplement provision. It would be a loophole to allow fish meal and fish oil from wild caught fish.

MS. CAROE: Thank you. Any questions? I'm hearing none.

MR. MENDELSON: Thank you.

MS. CAROE: We're going to take a 10 minute break. It is now 10 after, so if the Board can reconvene by 20 after, no later, please, so that we can stay on track.

(Break.)

MS. CAROE: Okay, Brian Baker, you're up. And on deck is Lisa Engelbert.

MR. BAKER: All right. Thank you. Good afternoon, members of the NOSB, Madam Chair. I appreciate the opportunity at the break to accommodate your comfort. I hope everybody is all relaxed and rested after that.
I'm Brian Baker. I'm the research director for the Organic Materials Review Institute. I'd like to especially congratulate the incoming members of the NOSB and welcome you. For those of you who are new and just to remind those who -- our movement started 10 years ago to provide the transparent independent and professional review of materials and methods used in organic production and handling. And we appreciate this opportunity to comment.

The petition substance's database is a definite improvement, and thanks to the NOP for revising and updating it. However, that coincided with a change in the regulatory process for which we were unprepared, and the last posting of petitions and agenda items made it very difficult to review all the great volume of material on materials. And we had a difficult time preparing comments for this meeting.

Before getting to those petitions, though, there are fundamental questions that are faced every day in the field and the factor, and that is, what's synthetic? What's not synthetic? What's agricultural? What's not agricultural? And that's very much relevant to the decisions that are going to be made in the next few days.

We'd like to know what the next step is with those documents, with those decisions, and how to go ahead with it. We'd like to caution, we've participated in the drafting of those and if further work is needed, we're more than happy to
work in any way that we can. However, any significant
changes would be disruptive.

Those documents drafted as they are being applied
by certifiers, by Omri, are being made, are being used to
make decisions by producers and handlers. And so, please, if
you are going to make significant changes, that really needs
to be weighed heavily, and opportunity for public comment is
needed, especially with agricultural/nonagricultural, a solid
foundation is needed to review the 606 petitions.

And I understand the obstacles that you face in
going ahead with that, especially with something like
aquaculture, fish oil and fish gelatin, where that fits in,
is definitely a gray area. And we're asking that you defer
when you are faced with a lack of clarity.

Solving one problem might create a whole lot of
other problems. And getting to the agricultural ingredient
petitions, we're not going to, Omri is not going to take a
petition on any individual petition. There are obviously
people who have opinions on all sorts of them. Things like
beets or carrots, cabbage, there are producers out there, and
the availability to some people seems somewhat, the lack of
organic availability seems questionable to a number of
people, but we're not going to, we're not going to
specifically address any one of those.

The whole process is flawed in rush. We've been
informed and we accept that it's not a perfect world, but the
NOSB should take its time and deliberate on these decisions.
Don't panic. When in doubt, go with organic. Don't put
tings on the list if there is the possibility of an organic
source. So that's my advice. Just go through the criteria
very deliberately. The criteria for all materials applies to
606. Consider the human health and environmental impacts of
growing these things conventionally.

It's easier to put things on the national list than
it is to take them off. Our experience with the sunset shows
that once something is on, it's really hard to take it off.

I'd like to also address the issue of
confidentiality and transparency. That is something that is
going to be an obstacle to determining commercial
availability. Certifiers need to work together, communicate
with one another, make this information available and share
it.

I'd also like to comment that nonorganic
ingredients processed with volatile solvents should be made,
limited to a made with organic claim, and it's very important
that such products be -- that colors in particular be treated
consistently with flavors, and that volatile solvents not be
allowed. Thank you.

MS. CAROE: Any questions for Brian? Comments?

Kevin.
MR. ENGELBERT: On the back of your comments, Brian, you state that five years is too long a period --

MR. BAKER: Right.

MR. ENGELBERT: -- for sunset agricultural readings. Would you elaborate quickly on that, and what --

MR. BAKER: Well, I would say that things should be evaluated on a year to year basis, and the commercial availability and market conditions are very dynamic, and they change; that with the emergency provision, particularly in light of the rush to get things on, it's important that the materials that come out not be put on in a permanent basis if there is any doubt that -- if there is a true emergency out there that is causing disruption, then that should be accommodated, but for a one-year basis, consistent with the provision change in the organic foods production act by Congress in fall of '05.

MS. CAROE: Joe and then, you pass. Okay.

MR. MOYER: I was wondering if you could expand a little bit on your comment here that you say putting too many items on the national list will prevent the development of organic sources, when we just heard some of the other speakers say that it's a business opportunity list. How do you reconcile that difference?

MR. BAKER: Well, I think the list of petitioned substances is a business opportunity list. That doesn't
necessarily mean that once they go on the national list, that
that will create an opportunity. Quite the contrary. It
will recognize and institutionalize the use of nonorganic
sources in a product that's labeled as organic. And that
will inhibit the development of those specific ingredients
for, in their organic form.

MR. MOYER: Thank you.

MS. CAROE: Just one comment. We need to remember
that listing on 606 does not mean you can use it. It means
you have the opportunity to show nonavailability of an
organic.

MR. BAKER: And if I may respond, Madam Chair, that
is true. However, in practice, the certifiers find
themselves faced with processors who are making assertions of
commercial unavailability that are at times difficult to
dispute. And they find themselves in a situation where they
don't have, where they are unable to refute those claims, and
don't have complete market information. And they are finding
themselves in situations where there are, it turns out that
those ingredients are available, and there's a breakdown in
communication.

You also heard from the, an organic seed supplier
who, and the situation with organic seed is much the same.
There is organic seed commercially available. It's not being
planted. Derogations are, if you will, exceptions are being
made, and that is a situation that needs to be addressed.
MS. CAROE: Well, I think, just from my perspective, that's a separate issue, and listing is one issue. How the list is used is another issue. And perhaps that's another action item for this Board to consider is how to provide guidance to how that list is used, how the certifiers verify or provide appropriate oversight of that due diligence search for these organic materials. But we'll have further discussion on that. I hope you will be around and we can discuss it further with these materials.

MR. BAKER: I'll be around.

MS. CAROE: Thank you. Oh, I'm sorry. Katrina.

MS. HEINEZ: You make the recommendation that for items added to 606 that we put them on for a shorter period than five years. Now, we've heard a lot already today about the work load of both the Board and the NOP in dealing with this. And that both the sunset items from last year, and then the 606 items from this year have prevented work on equally important topics. Can you speak to your recommendation on how it would balance against other items? I just see this perpetual not getting to pasture, not getting to other topics because we're back loaded with materials. I'm interested in your thoughts.

MR. BAKER: Right, my thoughts, my personal thought is that the 606 list shouldn't exist and that the market should sort out what's commercially available and what is
not. That's not the consensus of the Organic Materials Review Institute, and our experts have all sorts of opinions about what's available, what's not available, what should be on 606, what should not be on 606. Most disagree with me about what -- about 606 not existing.

However, I will say that every one of them, every expert I've talked to said that the NOSB should not put things on 606 that will jeopardize the availability of those organic ingredients. And that by shortening the time frame, that puts more pressure to make it available. And having it, having it re-examined annually on an emergency basis is one way to do that.

The other thing is that you've got this huge work load in front of you, this meeting, and by putting it on for a year, then you can sort out what really is needed and what's not. And if something down the road needs to be put on for five years, then you can make that decision at a future date.

What this does, what putting it on for one year does is buys you time to look at what's truly needed on 606, and what can be made available, quite readily in the organic marketplace.

MS. CAROE: Any further questions for Brian? Thank you, Brian.

MR. BAKER: Thank you.
MS. CAROE: Next up is Lisa Engelbert. On deck is, I've got three names listed, so I need a representative from Regal Springs Tilapia Company. Do I have somebody from that company here? Nobody from Regal Springs Tilapia Company? Okay, then going to the next is Carol King. Are you hear?

MS. ENGELBERT: I have her proxy.

MS. CAROE: You have Carol's proxy?

MS. ENGELBERT: I don't know that I'm going to need it, but I do have it.

MS. CAROE: Okay. Just before you get started, Lisa, I do have a note. There is a reception tonight for our new members that's being held at the Cosmo Club at 2121 Mass Avenue. It is open to everybody. It is not just for Board members, but all interested parties. It's tonight from 6:30 to 8:30, and it's sponsored by Covington, Burling, Whole Foods, Organic Valley, and CMT. And the dress is business casual. I was asked to announce that. So the Cosmo Club at 2121 Mass Avenue, for anybody that's interested in welcoming our new members. I'm sorry, Lisa.

MS. ENGELBERT: That's okay. Thank you, Andrea.

I'd like to welcome the new members to the Board.
We look forward to working with you and watching you over the next few years. I'd like to thank everyone for their continued hard work, not only the NOSB but the NOP as well. I'm not known for being brief. If you ask most people that know me, they seem to think I'm a little long winded. But I'm not going to be today. I'm going to try to be as brief as I can.

On the cloning issue, this is a huge issue, and it's so important for those of you that are going to be voting on it to get it right the first time. If that means deferring it, defer it. Don't make it -- don't come out with a recommendation that down the road is going to be challenged and you're going to have to go back and fix. If you need to defer it to get it right the first time, I really encourage you to do that.

I'm going to touch just briefly, even though it's not on your agenda on the pasture issue. Thanks, Marc, for the clarification on that. I noted at the last meeting that there weren't a lot of dairy producers there, and that was partially because of the time of year, as it is now; but also because they have faith in the program that this is going to get done. They still have faith that it's going to get done, but they're starting to lose that faith.

We understand you guys are so under staffed, you're so under funded. We understand that. But it's hard to keep
going back to our producers. They don't understand that quite as much as we do, because they are under funded, and they are under staffed as well. So thank you in advance for anything you can do to move that along.

Another issue that I think is, that bears mentioning, brokers currently are not required to be certified. I think that's weak link in the audit trail. What we're starting to see with organic grain and organic hey is people acting as brothers, and they are using a producer certificate as validation that it's actually certified, but there's no, there's no audit trail there. That's a concern.

We have a really reputable feed mill that we certify in New York State. They've been receiving phone calls from a broker of organic grains. And this guy is telling them that he has a great supply of organic corn, organic soybeans. It's not there. You know, it's like magic grain that is appearing. And he's using just the producer's certificate.

So our producer said to him, what is going to prevent you from, okay, selling maybe one load of organic grain using this producer certificate, and selling eight or nine loads of conventional grain as organic, using the same producer certificate? There is no verification for that. So it's just something that I think we all need to be aware of.

It's happening with hay as well. It just happened
with one of our producers with hay about a week ago. That
one turned out just fine. But the potential for abuse is
huge. I'd really, really like to see brokers and
distributors need to be certified. It would close that gap.
I guess that's all I have for you today. Anybody
have any questions?

MS. CAROE: Are there any questions for Lisa?

MS. ENGELBERT: Thank you.

MS. CAROE: Thank you. All right. So, and so you
didn't have any proxy for Carol? You didn't have any
information from her to pass along?

MS. ENGELBERT: No, no. That was in case I got
long winded.

MS. CAROE: I see. Okay. Well, without notice,
then, Leslie Zuck, are you in the room? She just left.
Okay. Leslie is on and then do we have the representative
from Regal Springs Tilapia Company? I have three names and
I'm not going to do well with any of them, but I'll go with
first names. Rudy, Israel or Michael from Regal Springs
Tilapia Company? Second call. Okay. Leslie is next and
then followed by Melanie Saffer. Emily is going to give her
comment in your place. Okay. Okay. Is Melanie available?
She won't be here. Well, this is going well. Okay. How
about Caralea Arnold?

MS. ARNOLD: Yes.
MS. CAROE: Caralea, do you want to go ahead and come up and we'll leave Emily on deck.

MS. ARNOLD: All right. Moving right along. A side note, this is on the cloning issue, and it was written before some of the changes that happened this weekend.

So, hi. I'm Caralea Arnold, and although I may look like my mother, Cathy Arnold, I am not her clone and I am 100 percent organic and reared under organic practices from conception. So in reality, I'm the daughter of organic dairy producers Rick and Cathy Arnold from Truckson, New York. And although I am currently working and living here in D.C., I still own a few of the dairy animals up there, and although not as many as my younger brother who just seems to get all the lucky breaks.

So I am here today to give comment on behalf of NODPA and Food Farmers. The Northeast Organic Dairy Producers Alliance, NODPA, represents over 450 organic producers here in the northeastern U.S., and the Federation of Organic Dairy Farmers, Food Farmers, is a national umbrella organization formed by the Northeast Organic Dairy Producers Alliance, the Midwestern Organic Dairy Producers Alliance, and the Western Organic Dairy Producers Alliance, who represent over 850 organic dairies across the U.S.

Food Farmer and NODPA support the Livestock Committee's recommendation as written, to revise the
definition of excluded methods to more specifically prohibit cloning. However, in addition to expanding this definition, it is imperative that progeny of clones be unequivocally disallowed by adding a new entry to the origin of livestock section of the regulation to specifically prohibit livestock, progeny of livestock, or reproductive materials from cloned animals.

Food Farmers and NODPA believe this is not an issue to take up later, but one that needs to be addressed now, to be prepared and ready should the FDA approve cloned animals and their products for use in the food system.

It does not matter that there is no test to determine whether an animal is derived from cloning or not. The National Organic Program is a process-based program, not a test-based program. As with field histories, purchased feed, et cetera, producers have to verify through record keeping, affidavits, and paper trail, that the organic standards process has been followed.

So too it should be necessary to document that no cloned livestock or progeny are brought into a heard of organic livestock, or transitioned to organic production. If the necessary documentation is not available on animals, then they cannot be considered for organic production.

On the pasture front, food farmers support adding regulatory language to clarify that production of organic
milk requires that organic dairy animals must consume at least 30 percent of their dry matter intake from pasture for the entire growing season, but for no less that 120 days. Food Farmers and NODPA urge the NOP to issue an exemplary proposed pasture regulation as soon as possible. The longer pasture remains in question, the more damage is done to our industry. So too with the replacement issue. The groups urge all due hast in getting out and PR on dairy replacements. And in closing, thank you NOSB for attending to this issue.

Please completely address the full range of concerns by explicitly prohibiting the progeny of clones as well as clones and their products, through revision of both the origin of livestock section and revision of terms defined. Your time and efforts are duly noted and very appreciated. Thanks.

MS. CAROE: Thank you very much. Is there any questions for Caralea?

MS. ARNOLD: Thank you.

MS. CAROE: Hearing none, Emily, you're up. On deck we have one more call for anybody from Regal Springs Tilapia Company? Okay, next up then after Emily is Tom Ferguson. Is Tom here?

MR. FERGUSON: Yes.

MS. CAROE: Okay, Tom. You're on deck.
MS. ROSEN: I'm speaking for Leslie and for Melanie Saffer. We had two slots.

MS. CAROE: Okay. Thank you.

MS. ROSEN: Hopefully, I won't need them both. Hi, my name is Emily Brown Rosen, and I work for Pennsylvania Certified Organic, an accredited certification agency in Pennsylvania. And I'm glad to be here and welcome all the new Board members. And thank you for your patience and endurance and all this hard work.

Briefly, I want to talk about a few things, and then mostly focus on aquaculture. I really finally got a chance to sit down and read the whole thing, so I have a lot of specific points, and I've drafted them up here for your later reference. I don't think I'll get to go through all this, but I do have some specific points.

But generally, before that, I'd also like to mention I had a comment filed on the Board policy on sunset review. I believe it's comment number -- no it's not. I think it's like 101, but it should be in your books.

And basically, I just don't -- I think you should really reconsider that and not necessarily rule out all possible future changes to annotations during the sunset process. You may need that time to do some reorganizing of the list, to consider new information, and particularly, I would say, a huge problem with -- if that's the policy, you
can never take a prohibited natural and remove it from use, that is currently allowed, for instance, potassium chloride or calcium chloride that are listed as prohibited natural, but annotation makes it allowed. So if you can't work on the annotation, then that means effectively during sunset you can't take it off the list.

And clearly the intention for sunset review was to be able to take some things off the list if they are no longer needed or if there is new information. And that, I don't think you should rule that out. I mean, that's kind of a -- I could talk to you more later if that's not clear. But we do have that odd section of prohibited naturals that are actually allowed.

And the annotation controls how they use an application of something. So it's something that should be considered altogether, I think, when you are doing sunset review. But you can, we can talk about that more later.

Going on to aquaculture. I'm really glad that the task force came up with this big analysis of the comments, because they did get a lot of comments last time, and it was helpful to look through why they did or didn't consider some things.

And we support their ban on net pens and or organic fish meal. I think it is not clear from the way you have presented it, and you've clarified a little bit about whether
or not there is a new comment period, or whether you are
going -- if these regulations are going forward as is and
then you are expecting NOP to work on it, and then you are
going to add to it. I think it's kind of dangerous to do
things in piecemeal fashion.

I would suggest if this is when you get your
recommendation done, send it off, and get them working on it,
and then perhaps we can phase in later these other changes do
it, so that we get something out of it, and then we can move
forward. But make it real clear with the time lines and the
deadlines for comment and such, you know, what you expect to
accomplish when because, like in my comments I found a number
of things that given the fact that you are taking out net
pens and wild fish meal, there are other inconsistencies left
in that rule. So you need to make it one way or the other.
You can't sort of mix and match, or else it will be
conflicted when you send on the new part.

So I think you should dedicate to getting part of
it done. We can have pond production. We can have some
supply of organic fish meal, and maybe, you know, that will
change the equation for people who are going forward with
organic fish.

So first, my first problem was in the feed section.
And it's this point about, it's actually a parallel of
what's in 603 for livestock feed. It says that aquaculture
feeds may be composed of feed ingredients, except that nonsynthetic substances and synthetic substances around on 603 may be used as additives and supplements.

We've had arguments for the last five years about this, and livestock feed, I mean, does everything, if you could call it a supplement or an additive, maybe it doesn't have to be organic. And the NOP did finally clarify this, very emphatically to the certifiers in January at our meat training. If there is an agricultural substance in a feed, like molasses, if there is wheat membranes, if there is soy oil, no matter what you call it, supplement additive, carrier, if it's agricultural it has to be organic.

So that's fine. That's really helpful to us to clarify and move forward so that we can all be on the same page. But the same reasoning should apply to feed fed to aquatic fish. If it's agricultural, it must be organic. So I suggest you fix this in the regulation there, giving a little technical fix, so that you don't have the same arguments going down the line about is it a supplement for a fish, you know, and what does the rule really mean. So let's start out with having it clear there. Only nonagricultural, nonsynthetic substances could be used as supplements and additives because the naturals are allowed in livestock feed.

And I made a similar correction on the next section about, because it implies that you can make fat silage and
lipids produced from organic fish that's enzyme processed is
goed, as long as it's organically produced. Well, if we're
talking about organic feed, the that's pretty much, you know,
not necessary, because they will have organic sources of
these things that will have to be processed organically. So
there is some redundancy there.

The same thing about pigments. It's very confusing
the way the language is there about pigments. It says now,
nutritional pigments that have been produced and handled in
accordance with organic requirements are okay, and/or, yes,
or appear on the national list or are organically produced.
It's not clear if you are saying that you only want organic
pigments, or if you think pigments that are on 603 are okay
that are nonagricultural or, you know, it needs to be cleared
up.

So I've offered some language here to say that they
should appear in 603 or else they're organic, and then
they'll go through the normal national list process. It
should refer to the existing national list process if you are
going to redo pigments.

Then moving on, there's a section about manure from
organic, using manure or compost to fertilize fish ponds.
And I didn't really find a lot of references to why they
think you can put compost in a fish pond, with only 30 days
to harvest, when we have had just years of debate about
compost and manure being applied on crops with a minimum of 90 to 120 days. So I would, you know, I'd just like to see more research about, you know, here we're putting it right in the water, and water can leach nutrients. And also if you have pathogens in your compost, then they can bloom in warm fish ponds. So I'd like to see a little more science about what the rational was for that.

MR. SMILLIE: That was 258?

MS. ROSEN: It is number J under the feed section. For some reason it was in the feed section. 252. It's on page two of my comments here. Then in the facilities, I agree with what's there on food safety, why one year of conversion on when you have direct soil/water contact? What is it less of a standard for fish than it is for, you know, dairy cows, which have to have the three years, poultry, you know. The fields have to be certified for that long. So maybe it's an arbitrary rule, but why shouldn't it be fair for all the different types of livestock.

And then again, getting to the 258 section on aquatic plants, you know, I commented before, and they rejected my comment that, you know, I didn't think the aquatic animal test really should be the one primarily in charge with crop standards for algae, which I know big ponds of algae for fish feed, maybe it's related and maybe you can use that further, but I think it needs to be looked at
It's really clear. They didn't know what the rules are for fertilizers and crops, because they put this huge loophole in here to say that you could put in dissolved macro and micro nutrients, including transminerals, and compost, and vitamins listed in 601 and 603.

Now, 603 is not a crop section. It's a livestock section. And where minerals and vitamins are listed, you're talking about FDA approved minerals for feeding to cows. If you look at that list it's really long. It includes almost every synthetic fertilizer there is.

So if you are saying all those are allowed for fish ponds, but, you know, they are certainly not allowed in any other form of organic agriculture, it really has to get crossed out. So I think that who section should be removed and revisited.

I don't know enough about algae growing myself, personally, but I think we should look at it a little more closely. And then again, it allows manure in those ponds, too.

So, and then the section on contaminates, there is really not a section anymore, but that was part of the aquatic working group's recommendation to have some very general standards about background levels and other similar species, which, a certifier would have a very hard time knowing how to do that. I mean, I think this is taken care
of right now if we are not talking about wild fish meal and fish oil in the feed. That's where your problem of concentrating the PCV's and the mercury, et cetera, come from. So as long as that's out, it's okay for the time being.

But if that is considered, we have to look really hard at real strict thresholds, so that the consumers who are expecting that they're not getting contaminated fish if they are buying organic, as 73 percent of the people they surveyed said, or whoever they took that from. They expect the organic label to mean contaminate free.

So I think if we go forward with fish meal in the future, that should be very seriously considered, and a really strict standard would have to be set. Okay. I think that's all I have to say. Any questions?

MS. CAROE: Any questions?

MS. HEINEZ: I think that on the one year transition, that pretty standard in aquaculture is a shorter time frame that a generation takes to produce to be ready to market. Would there be some room for putting in --

MS. ROSEN: Well, chickens can be produced in seven weeks.

MS. HEINEZ: I'm just saying, would there be any room in your mind for putting in a minimum number of generations, but nothing -- or a year, whichever meets the
goal?

MS. ROSEN: Well, I mean, if we go back to why do we have the three-year transition, it was sort of selected somewhat arbitrarily as the idea of the, what the type of chemicals or use history of the land was, and what the potential was for previous contaminates to be, have a chance to be ameliorated and improved. And we could go look and see what commercial fish ponds are like and see.

But there should be some reason to base it on, or a good argument. And I don't see a good reason to make it shorter at this point. You know, we have very short, quick growing livestock facilities currently. So I don't see why. I just see like this sector should not have preferential treatment, one or the other.

MS. HEINEZ: I think another reason, and I'm not opposed or for in any reason, but another is just the flushing capacity of that system being greater than land-based materials.

MS. ROSEN: Could be.

MS. CAROE: Bea.

MS. JAMES: Emily, I just wanted to thank you for your comments on the voting results, and how to make that more clear.

MS. ROSEN: Oh good. I'm glad you got that. Good. Thanks.
MS. CAROE: Any others? Emily, I have one, since the Board doesn't have anything else. You asked about time line for further development of these standards. I would love to put a time line down, but I think it's largely going to be based on budget constraints in order for us to be able to have some type of vehicle to get more information, especially on those two controversial issues.

So as we move forward, I believe that's the constraint that we're looking at in trying to figure out how we are going to be able to accommodate the robust public comment and discussion that we need in order to work out those issues. So I would have loved to have done that very soon, but it's not a possibility.

MS. ROSEN: That's understandable. It's complicated.

MS. CAROE: It is on a high priority for us.

MS. ROSEN: Are you just intending to send whatever comes out of this on, or are you going to -- you haven't decided that yet, I mean, the current version?

MS. CAROE: What we had planned on doing is establishing, establishing aquaculture standards to send a recommendation that would establish a place in the regulation for aquaculture, and then further develop that and add the other pieces as we are able to work them out with industry.

MS. ROSEN: Okay.
MS. CAROE: Obviously, we haven't even gotten the recommendation from the aquaculture working group on shellfish. We want to look at that and see if that's a possibility and put that in as well after we've gone through the process. However, to wait for all of it, you know, we just felt that establishing a place first --

MS. ROSEN: That's fine. That's fine. So a sort of phased rule making, in other words.

MS. CAROE: That's correct.

MS. ROSEN: That would be, that's great. Just so we have an idea where we are headed, but good. Thank you.

MS. CAROE: All right. Thank you, Emily. So now up we have Tom Ferguson, and one more call for anybody from Regal Springs Tilapia Company. Are you in the room? Okay. Tom, you're the last.

MR. FERGUSON: Thank you. I'm Tom Ferguson with Perdue Agrirecycle. And being in the manure business, I'm just to being last, so this is appropriate for me here today. Anyway, I would like to, after being in the business for 25 years, this is where I always am. But I thank you very much for your volunteer time. You work hard. And I know none of these issues are easy. We all have our own agenda. I know that. So just bear with me here and we'll see if we can get through this.

A brief introduction of Perdue Agrirecycle. Perdue
Agrirecycle was formed in 2000 to provide an alternative outlet for our poultry growers in Delmarva for excess manure that they couldn't use on their farms. We have a lot of farms that have two chicken houses and 10 acres of land. So we had to find a solution for their manure.

Perdue Agrirecycle, since 2000, has handled 375,000 tons of manure. We've turned 186,000 tons of that into a pasturized processed dried material that literally goes across the country in lots of different markets.

A brief overview of the process, Perdue Agrirecycle process heats raw poultry manure to a temperature of at least 170,000, and the moisture level is always below 12 percent. Testing by independent labs since we've started, we've never had a positive test for e coli and salmonella in our process. And as a side note, the dreaded 0157 e coli that you see in the news all the time is really not associated with chickens. It's associated with ruminants, pigs and sheep, not chickens. We're not a host for it.

So there's probably, not probably, if you talk to the CDC, 99.99 percent it would never be in chicken manure to start with. But if it did, it would be killed under our process. And all these notes that I'm referring to are in your handout and all our past notes.

What we're asking for. Since 2001, our product has been listed on the restricted list under the Organic Material
Review Institute on the basis that we were not composted, so
if it weren't composted, you only have two categories,
composted and raw. You don't recognize our process.

Our purpose today is to request that our product be
reclassified as a processed manure, and that our product be
fully approved through the National Organic Program without
restrictions.

As the organic market is growing, and growing, and
growing, we get more and more requests from large organic
growers about our product on tomatoes, vegetables, and a lot
of vegetable crops. We are the largest producer of this type
of product, and the most cost effective that I can see the
market. We have a great big plant. We produce a lot of
product. And we've got the ability to ship it around the
country.

Supporting requests on what I'm asking for here,
addendum A of the National Organic Standards Board compost
task force dated April 18, 2002, manures that have been
treated to reduce pathogen organisms are considered to be
processed manure. Process manure materials must be made from
manure that has been heated to 150 degrees for one hour and a
moisture level of less than 12 percent, or frozen.

Since processed materials will not be contributed
to the contamination of soil, it is under our, like compost,
processed manure materials do not have to be incorporated in
the soil, therefore can be applied top dress and side dress, similar to compost, with no waiting instructions.

Now, Perdue Agrirecycle got a letter dated March 3rd, 2004, from the Organic Material Review Institute. OMRI has listed your product as processed manure, without days to harvest and restrictions. Based on meeting the standards the product has been heated to 150 degrees for one hour or more, and the moisture level is less than 12 percent.

Then, dated September 13, 2006, again from your National Organic Standards Board Crops Committee, recommendations for guidelines for use of processed manure, composting, and et cetera. Since processed manures have been treated to reduce pathogens, applications are not subject to restrictions placed on raw animal manure. Okay.

The moisture of Perdue Agrirecycle's new products are less and 12 percent, and we exceed the brand new data on e coli dated March of '07 at 165 degrees kills it instantly. We do at 170 degrees all the time, so we get that kill.

So, I'm asking what we need to do to get moved from restricted to approved. That's why I'm here.

MS. CAROE: Does somebody want to address that?

Crops Committee?

MR. FERGUSON: I'm confused.

MS. CAROE: Okay. Julie, do you have a question?

MS. WEISMAN: Well, I do have a question. No, go
ahead.

MS. CAROE: Go ahead, Jeff. Oh, Kevin. It's Kevin.

MR. ENGELBERT: I'm just -- we're going to need more time, personally, I mean, to see exactly what has to be done. I can't look at this and say --

MR. FERGUSON: We sent our petition in in May. We didn't get any response to that. And I was here for public comment in October, but a computer glitch got me off the Board. So we've got plenty of time. The manure will be here forever. We'd just like it to come to an end.

MS. CAROE: Okay.

MR. ENGELBERT: What we'll do is we'll put it on our agenda as a work item. We'll take care of it.

MS. CAROE: Let me just, I just need to make sure I understand. So are you asking us to affect your OMRI listing?

MR. FERGUSON: No, I want you to approve us as NOP as an approved product without restriction under the NOP Program.

MS. CAROE: Okay. Have you, I'm going to take this back a little bit and this may be --

MR. FERGUSON: Sure.

MS. CAROE: -- a stupid comment, but have you looked at the regulation's restrictions on manure?
MR. FERGUSON: Yes. Raw manure, yes.

MS. CAROE: Okay. And there is an established three-point system that has to, three ways of establishing a composted manure. You're saying it's composted.

MR. FERGUSON: No, no. We do not compost.

MS. CAROE: You are not composted.

MR. FERGUSON: But it meets the same, it meets the same criteria, though. It exceeds it, actually.

MS. CAROE: Okay, so it's compost -- it's uncomposted but --

MR. FERGUSON: Processed.

MS. CAROE: -- pathogen reduced.

MR. FERGUSON: Guaranteed, yes. Pasturized.

MS. CAROE: Okay. So you are asking for a rule change or --

MR. FERGUSON: Yes.

MS. CAROE: -- guidance that would allow your product to be acceptable, since it is a raw manure but meets pathogen reduction.

MR. FERGUSON: It's not a raw manure. It's a processed manure.

MS. CAROE: It's a processed manure. Okay.

MR. FERGUSON: It's not a raw manure.

MS. CAROE: Julie.

MS. WEISMAN: I want to help you. It sounds to me,
what's being called for is a rule change that adds an additional category --

MR. FERGUSON: Right.

MS. CAROE: Okay.

MS. WEISMAN: -- of processed manure.

MR. FERGUSON: Correct.

MS. CAROE: Got it. Any -- Mark.

MR. BRADLEY: We've been meeting with Mr. Ferguson and Perdue Agrirecycling, and we're looking into the particular details of the program. We have a trip planned up there to look at the process. But we would defer to the Board before we would go off the track and, the way that we understand right now, the regulations have manure and composted manure. There is nothing here that provides a guidance for us to either issue guidance or a reg change.

MS. CAROE: Any other comments from the Board? Katrina and then you're next, Tracy.

MS. HEINEZ: I heard you say that you have submitted a petition. I just wanted to clarify that to what you said?

MR. FERGUSON: Yes, we applied. We sent one in in May.

MS. HEINEZ: Thank you.

MR. FERGUSON: Yes, ma'am.

MS. CAROE: Tracy.
MS. MIEDEMA: I'm on the Crops Committee.
MR. FERGUSON: Great.
MS. MIEDEMA: So I expect to be taking this up possibly at some point.
MR. FERGUSON: Congratulations.
MS. MIEDEMA: Is there some difference in a cooked manure like yours and a composted in the way it interacts with the soil, and the nutrient value delivered?
MR. FERGUSON: Well, according to your, a couple of your own peer groups, no. Not that we know of. And of course, the National Organic Board said that they looked at it. I think Barbara Bellows, years ago, did a study on it. The answer, as far as I know, is no.
MS. MIEDEMA: Why doesn't everyone just cook their manure, then?
MR. FERGUSON: It's very expensive.
MS. MIEDEMA: Okay.
MR. FERGUSON: It's extremely expensive.
MS. CAROE: Kevin.
MR. ENGELBERT: That's what I wanted to ask. Why don't you compost? What's the reasoning behind the processing?
MR. FERGUSON: You drive off all the nutrients. You end up with no NPK. Yes.
MR. MOYER: That's clearly, that's clearly not
true.

MS. CAROE: Hold on a second. Hold on, hold on.

MR. FERGUSON: Well, you don't end up with a 4 percent nitrogen if you compost manure.

MS. CAROE: Okay. Hold on. Jennifer, did you have something? No. Jeff? Tracy, did you have anything else? Okay, Jeff.

MR. MOYER: No, I was just going to say that you may not be able to get your 4 percent, but you don't end up with a material with no nutrients. And clearly the statute says that even with processed manure, it is not designed to be the sole source of fertilizer, nutrient free, or even the primary source.

MR. FERGUSON: There was one statement like that, then you contradicted it later on. I don't believe it should be your total nutrient deal, but I don't believe it needs to be treated like raw. We're far from raw.

MR. MOYER: No, I understand what you are saying.

MR. FERGUSON: Far from raw.

MS. CAROE: Anymore comments? Julie.

MS. WEISMAN: If it meets the criteria for composted manure, what is the difficulty with calling it that? I'm not in crops production, so pardon my ignorance.

MR. DAVIS: In California, processed manures are used extensively in organic vegetable production, at least,
and they are quite useful. A lot of growers use them and they are very valuable. But there is, there has been this problem with, no, they don't meet the compost criteria because the end goal is the same, pathogens are gone. The desired result is the same, but they don't meet the compost guideline criteria, because it's done a different way.

And that's what he's asking for, something that's very valid, is that it's time to clarify this and get a category for this type of material, being that it does not fit the compost rules. It doesn't not classify as a raw manure.

MS. CAROE: Are there any other comments. Rigo.

MR. DELGATO: Sir, I just have a question. The ball is on your court. Once you are satisfied with all the information, Mark, then you are going to send that to us, correct?

MR. BRADLEY: I'm sorry, what do you mean?

MR. DELGATO: The gentleman here submitted a petition. You have it on your desk.

MR. BRADLEY: I believe the petition was for a nonsynthetic, was that -- petition for a nonsynthetic for use in ag production. Go ahead.

MR. POOLER: The material was petitioned -- this is Bob Pooler, National Organic Program. The material was petitioned to add to the national list. It was reviewed and
considered to be a nonsynthetic. And I believe a letter has been sent, and the letter indicated that the material was a nonsynthetic, but was restricted by our regulations 205.203 the 90 and 120 day restriction before harvest. That's what I believe the letter has said. So the petition was not continued forward because it was considered a nonsynthetic.

MS. CAROE: Is there any other comments? Well, I think may Crops should consider taking this issue up and putting on the work plan, and working with the program. Bob?

MR. POOLER: There currently is a quote-unquote petition in front of the NOP and actually the Crops Committee dealing with the issue of processed manure and asking for revision of 205.203. And I will be working with the Crops Committee on this to try to get this petition as part of their work plan.

MS. CAROE: When you say petition, we're not talking about a material petition for listing on the national list.

MR. POOLER: No.

MS. CAROE: We're talking about a petition for a rule change.

MR. POOLER: A petition to revise the regulations in 205.203.

MS. CAROE: Yes. Okay. Great. I agree. But that's going to be done in collaboration with the Crops
Committee.

MR. POOLER: Correct.

MS. CAROE: Excellent. Any other -- Jeff, do you have something?

MR. MOYER: No, I was just going to say, that's what I said earlier, we're going to put it on our work plan.

MS. CAROE: Great. All right. Thank you so much.

MR. FERGUSON: Thank you all so much. Thank you all so much. Great time. Thanks.

MS. CAROE: That is our last commentor for today, so we are in recess until 8:00 a.m. tomorrow morning. And again, 6:30 to 8:30, the Cosmo Club, 2121 Mass Boulevard is a reception open to all interested parties. Thank you.

(Recess.)
ELECTRONIC CERTIFICATE

DEPOSITION SERVICES, INC., hereby certifies that the attached pages represent an accurate transcript of the electronic sound recording of the proceedings before the United States Department of Agriculture:

NATIONAL ORGANIC STANDARD BOARD MEETING

Teresa S. Hinds, Transcriber
A meeting in the above-entitled matter was held on March 28, 2007, commencing at 7:34 a.m. in the Washington Plaza Hotel, Ten Thomas Circle, N.W., Washington, D.C. 20000.

Andrea Caroe, Chairperson
APPEARANCES

BOARD MEMBERS:

Andrea Caroe, Chairperson

Bea E. James, Secretary

Daniel G. Giacomini, Chairperson, Materials Committee

Gerald A. Davis, Crops Committee

Jennifer M. Hall

Jeffrey W. Moyer

Joseph Smillie, Compliance Committee

Julie S. Weisman, Chairperson, Handling Committee

Kevin Engelbert, Livestock Committee

Katrina Heinez

Rigoberto I. Delgato, Policy Committee

Steve Demure

Tracy Miedema

Mark Bradley, Associate Deputy Administrator
PRESENTERS:

Gary Robertson, Smoki Foods/American Gold Seafood  5

Richard Martin  389
Steven Craig  397
MS. CAROE: We're going to start off this morning with public comments, so I'm going to reread from the Board policy manual the restrictions on public comment. Please just hold with us for one moment.

Okay. From the Board policy manual, NOSB policy for public comment at NOSB meetings. One, all persons wishing to comment at NOSB meetings during public comment period must sign up in advance. Today's morning session is full up, and I do have those received listings.

Two, persons will be called upon to speak in the order in which they signed up.

Three, unless otherwise indicated by the Chair, each person will be given five minutes to speak.

Four, persons must give their name and affiliation for the record.

Five, persons may submit a written proxy to the NOSB, NOP or NOSB requesting that another person speak on his or her behalf.

Six, no person will be allowed to speak during the public comment period for more than 10 minutes.

And seven, individuals providing public comment will refrain from personal attacks and from remarks that otherwise impune the character of any individual.

All right. So, starting off this morning, we have
Don Ripta. Don, are you in the room? Okay. Moving on.
Gary Robertson. Gary, are you here?
MR. ROBERTSON: I am here.
MS. CAROE: Okay. On deck we have Katy Highland, which Nancy are you taking Katy's spot?
MS. HIRSHBERG: Yes.
MS. CAROE: Do you want to check in with Valerie, please. You can start whenever you want.
MR. ROBERTSON: Great. Good morning, everyone, and thank you for the opportunity to address you this morning. My name is Gary Robertson. I'm the vice president of sales and marketing for American Gold Seafood and Smoki Foods out of Seattle, Washington.
And for those of you that aren't aware, American Gold -- there we go -- American Gold is the only U.S. owned and operated open net pen salmon farm in the United States. So as I've been told this morning, I think I am the devil. But I would like to take some opportunity to explain a little bit about who we are, what we do, and move forward from there.
Smoki Foods is a 22 year old company owned by Roger and Lisa May. We employ approximately 250 people. We are one of the nation's largest processors of wild salmon. We produce approximately 25 million pounds of wild salmon every year. We are the only, again, salmon farm that's
domestically owned and operated. We principally process halibut, wild and farmed salmon, black cod and king crab.

And our business is in a crossroads. We can either stay at the status quo and put our, essentially, our business and employees at risk, or we can become politically active and position ourselves for future growth. And it is with that intention that I address you today, and the future of our 250 employees, quite honestly, lays in your hands.

We consistently do swat analysis to identify our business, as most business do. And our weaknesses are, quite honestly, public opinion, because far too much bad science has actually received far too much publicity. And regrettably, that hasn't just impacted farms, that also impact salmon, and we've seen that in our numbers.

I think it's important to recognize the fact that we will not, and you will not hear a farm, a salmon farmer, excuse me, take shots at wild salmon. We won't do it. This is a salmon issue, and we want to make sure we address it as a salmon issue.

Also, headlines are made by tragedy, so stories about sustainable, safe, healthy food has a tendency not to be a very sexy story, so it's not something you hear on a regular basis.

And quite honestly, voice. This is the first time I'm addressing this Board, and it's my understanding that no
one from our company has had an opportunity to address this Board in the past. And so as a result we are playing catch up.

When we look at the threats to our business, there are obviously several. Competition is a big one. There are countries out there that are producing salmon at remarkably low prices for a myriad of reasons which I won't discuss today.

There are products being marketed as certified organic, and that comprise the integrity of the products that we produce. Although we conform to the same standards, we can't and won't use the term organic until this body approves use of that term. And to the above point, consumers are obviously having a trend towards organic.

The cost to produce natural products, which is the product that we produce that would be certified, and that we would offer to be certified as organic, obviously is very expensive. And it would be certified as organic in most places in the world. And obviously, there is also a tariff aversion, something that we have to address as a company, is also in the industry.

And also, obviously, there's biological. An algae bloom can have a devastating effect in what's going on with a pen salmon system.

The strength and opportunities we have, obviously
with what's going on with the U.S. government right today. You have the U.S. Commerce Secretary, Carlos Gutierrez promoting legislation to expand aquaculture. The numbers he recently shared, that seafood is a $7 billion dollar industry globally, only a billion dollars in the U.S. Obviously, a huge opportunity for growth.

80 percent of the seafood that's consumed in the United States is imported, and that's a trade deficit of approximately $9 billion dollars, and 40 percent of that is farmed.

We, obviously, as a company, have a nice balance between what's going on with wild salmon and farmed salmon. And we also have history. Some of the sites that we have in operation have been in operation for over 30 years, and actually two of our sites are located on preserves.

And we also have a very strong advocate in NOAA. The Manchester NOAA site is actually about 200 yards off of one of our net pen sites, and one of the biggest advocates I have are the people from that Manchester site.

Some of the things we're working on with NOAA is to produce products, actually salmon feed from byproducts of bioenergy production, using waste as feed for farmed salmon. Use of invasive, the invasive carp that you see in the Mississippi, for example, us that silage as feed for wild salmon. NOAA, they're helping us address that issue.
Development of a demonstration farm, potential for
the use of recirculation of water, and development of
alternative crops like sable fish and Maine cod, and also
black cod, if you will.
So I will leave you with this. Organics is a
belief system. It is not a science. Best practices is what
we hope to attain with this group. And that's why we're
working with NOAA. And I think I'm out of time.
MS. CAROE: Thank you. Any comments from the
Board. Questions?
MR. SMILLIE: Did you have a chance to look at the
recommendation that's currently in front of this Board?
MR. ROBERTSON: I have. And one of the concerns
that I have is the elimination of net pens. I wanted to make
sure that, again, that was addressed.
MR. SMILLIE: Well, again, as I said yesterday, it's
not in this draft, but we will take it up at future meetings,
hopefully some sort of symposium or some sort of more, larger
discussion because it is, you know, so controversial. But
any comments on the current draft that -- have you had a
chance to look at it and see how it would affect your
operation?
MR. ROBERTSON: I have, and at least I applaud the
direction that we are moving, and the fact that we are
moving, again, addressing, getting some organic standards put
in place. The feed conversions, as we were discussing earlier this morning, they are within the realm.

I think there is, again, there is some, there is some very faulty science out there regarding what is actually happening in the wild versus what's happening in a farm system that we could get into today, but I'm sure that you've got plenty of information in front of you that addresses that issue. But I just want to make sure that, again, we are clear about the need to keep things on the table. Thank you.

MS. CAROE: Next up, for Katy Highland. On deck we have Grace Marroquin. Grace, can you check in with Valerie?

MS. HIRSHBERG: Good morning. Just some other ingredients we want to mention today. We want, regarding specifically rice starch, we support the Handling Committee's recommendation to list rice starch at 606, although it has been proposed to list it only for two years.

As noted in our petition, we find that rice starch has certain qualities that cannot be duplicated by other substances, especially it's ability under freezing, thawing, and high water binding capacity.

We continue to work with a manufacturer to try and source organic versions of this type of waxy rice, that's specific to this product, that is needed. Two years may be a bit too short to accomplish this, but we will certainly try.

Please note, also, that both rice and corn starch
are permitted in the EU standards without qualification. And we think that rice starch merits inclusion in the U.S. standards as well.

Natural colors, Stony Field Farm uses a number of natural colors in our products, and we are pleased that the committee has recommended quite a few colors for inclusion on the list. We do use cherry juice color in some products, and have not found organic sources for this.

I should also qualify this by saying, there are many, many ingredients that Stony Field has brought to commercial availability, and so we're often leading the way for other smaller companies who don't have those R and D or sourcing capabilities.

We also currently have not found appropriate supplies of organic carrot juice color. And I'm sure you've heard from many people that it's not just about the carrot, but there is a lot of science behind the actual colors, and so forth. So there are many carrots available, but that doesn't necessarily equivocate to the same, to the quality of the color that we need, which also merits consideration for the national list.

If annatto is approved, this may be an alternative to carrot juice, so we're fine with that. But we believe that a listing for these colors on 606 would provide more flexibility for product formulation as a supply of organic
colors gradually increases.

Whey protein concentrates. We have petitioned for the addition of whey protein concentrate at 35 percent and 80 percent strengths. The recommendation by the committee was to list WPC 35, but not 80. We have provided further information to show that these two types of whey protein concentrate are manufactured in the identical fashion, and are concentrated by using ultra-filtration, a membrane filtration technique that is a mechanical process without the use of any chemicals.

There is subsequent use of processing aides for the purpose of pH adjustment that appear on the national list, such as citric acid and potassium and sodium hydroxide. We believe both concentrations should be listed similarly.

And the final ingredient is annatto. And to your question yesterday, Julie, I think the appropriate, and again I'm not a scientist, but the appropriate term is water extracted or oil extracted annatto.

Stony Field Farms supports the addition of annatto to 606. At present, we cannot find organic annatto in the quantity or quality needed for our purposes. The committee recommendation appears to reject annatto based on a disagreement about the annotation. While we agree there is no reason to require an organic oil be used to extract a nonorganic ingredient, we do support the listing as annatto,
water or oil extracted.

This restriction is important because nonorganic annatto is also legally permitted to be extracted with solvents such as acetone, ethylene dichloride, hexane, etcetera. If annatto is listed in 606 without restrictions, these toxic solvents could be considered permitted for purposes of extraction.

Currently there is natural annatto available that is extracted without these harsh solvents, and this should be the form which is what we currently use, and this should be the form specified as acceptable until adequate supplies of truly organic sources are available.

And finally, what I would like to really, is really more for the NOP. And believe me, I am the first person to be lobbying for more funds for NOP, because I know you are over-taxed and have many priorities. But I will say that there is an absolutely urgent, dire need for NOP to develop emergency procedures for designating agricultural products that are commercially unavailable in organic form.

As soon as Jim, was it seventh or ninth? And I'll give you some examples. Thank you. Supplies disappear. We're one of the larger buyers of organic ingredients. A few years ago we had developed a lot of strawberry projects, et cetera. Two companies came in, started a cereal with strawberries, organic strawberries. Pouf, the supply
disappeared.

It's not that it disadvantaged companies like us so much, as the smaller companies who are going to be hurt by this, because they don't have the buying power to lock in long term supplies.

And finally, as an example, Stony Field Farm buys approximately 200 million pounds or organic ingredients a year. We're growing, this year we'll buy 55 percent more organic milk that we did, or next year -- no, this year than we did last year. Some of these ingredients, we might use 10,000 pounds a year of, these minor ingredients.

We don't have the buying power to have someone develop an organic supply. They just won't even talk to us. And we're one of the larger buyers. So it's really -- the emergency procedures, I think, for supplies disappearing can be critical. Thank you.

MS. CAROE: Thank you, Nancy. Any question for Nancy?

MR. DEMURE: Hi, Nancy, Thank you.

MS. HIRSHBERG: Hi, yes.

MR. DEMURE: You had mentioned a problem with carrots.

MS. HIRSHBERG: Yes.

MR. DEMURE: Is it a processing problem, because there seem to be a lot of organic carrots out there?
MS. HIRSHBERG: There are a lot. And when I've
talked to them, again, this is a volume issue where, you
know, especially for a concentrate, because they have to shut
things down, develop them. In fact, I remember talking to
Stallbush, specifically, on one. And they just weren't
willing, for the volumes that we were able to use, to develop
the product for us, to do the R and D time, and the
quantities that we're talking about. If we're talking tens
of thousands of pounds, they just wouldn't do it.

MS. CAROE: Bea.

MS. JAMES: Hi, I was wondering if you were going
to address the question regarding inulin or --

MS. HIRSHBERG: Yesterday. And, in fact, I just
got on line and the person who emailed yesterday didn't
respond yet, so I'm going to go and call her.

MS. JAMES: Thank you.

MS. HIRSHBERG: Yes.

MS. CAROE: Tracy.

MS. MIEDEMA: Was that question just documenting
availability? Is that what Bea was asking about?

MS. HIRSHBERG: No, this is inulin about whether it
was, we went to it because of the marketing ability or the
structure function claims.

MS. MIEDEMA: Okay. Yesterday, Dan explained our
subcommittee is within Handling Committee. And I recall your
petition for cherry, in particular, was very compelling, but it just lacked documentation that due diligence had been done on the search. And it didn't seem to carry the burden of proof there. Do you have further documentation?

MS. HIRSHBERG: I don't have anything right here. I certainly can provide it. But this is my question, which Jim raised yesterday, which is, that burden of proof is on the certifier. And this is where I get confused about where I'm listing versus the certifier's role. Because every time we get certified, or reinspected, we have to provide that documentation on everything we've done to find it.

So even your listing it just shows that there is the potential that it could not be available, which I hope we've provided that much information. So, and maybe you can provide some clarification on that.

MS. CAROE: Julie.

MS. WEISMAN: Yes. I think, I think the way I heard Tracy ask the question, I think that you were assuming that Nancy is the petitioner on the cherry, and she's not. The supplier is the petitioner, who I believe is going to be presenting separately later. I'm not sure. No, we don't. Okay, we don't. Okay. Rumor control.

MS. HIRSHBERG: Yeah.

MS. WEISMAN: But anyway, she's not the petitioner. She's the end user. And what she's telling us is that we,
you know, we have looked for organic cherry juice for this purpose, and we can't find it.

MS. HIRSHBERG: And we've documented that for our certifier.

MS. WEISMAN: Right. And you're -- what was discussed at our subcommittee meetings, was the fact that the petitioner who is petitioning that the nonorganic form be used, that that's where, who our beef is with. That, you know, it may be true that there is not organic out there, but we can't act with no information. So we're going to ask anybody up here that has any experience with colors today, we're going to pound you for any information you can give us about availability of the colors that are currently listed to be rejected.

MS. HIRSHBERG: But this my question for you, which I'm a little unclear of, which is that we provide that documentation to our certifiers.

MS. WEISMAN: Right.

MS. HIRSHBERG: And so that's going, that's a given that that has to happen.

MS. WEISMAN: Right. And I think this is where, I think, there are two -- I think Jim divided people into lumpers and splitters. Well, on this issue we also have, there are two camps in the industry. There are two camps of stakeholders. There are those that think that item -- those
that have already argued that items should not be listed
unless they have been demonstrated at this level to be, to be
not available.

And then there are, you know, for industry, I know
that the need is to have it be, this is the universe from
which the certifier, you know, can decide that either, yes,
this, it can be used, nonorganic can be used for this purpose
or not. Am I being clear? Am I too -- have I had enough
coffee this morning?

MS. CAROE: Let me just address this really
quickly. You are right. The certifier is going to, at the
moment that you provide an organic systems plan, your
certifier is going to verify that you've done due diligence.
However, our criteria for listing on 606 requires the
petitioner to provide compelling evidence that there is some
fragility of supply.

So in doing that, we are looking for any
information about historic shortages. So most, a lot of
these petitions that were rejected were because we got, you
know, we got all the wonderful benefits, and the reasons why
this product is needed for organic, but we didn't get that
information and that data about the supply issue.

And yes, that's duplicative information that you
give to your certifier, but it didn't get through.

MS. HIRSHFIELD: Get to you. Can I just make one
statement which is that I hope in your deliberations, you 
realize that June is coming, and I'm sure you all know, we 
certainly are well aware of it, so therefore, I hope you err 
on the side of caution in that you have to understand that 
our certifiers have that information, and if we didn't get it 
to you, that was a miss on our part.

But I hope that you will keep that in mind in your 
deliberations, even if you give a one year or two year 
extension, or whatever, so that we can provide that 
documentation for you, because, clearly, it's out there.

MS. CAROE: Joe.

MR. SMILLIE: Not so much a question for Nancy, but 
a comment on what Steve alluded to, and that is, there are 
organic carrots out there. There are organic cherries out 
there. There is no organic cherry juice that satisfies the 
color needs of Nancy, but that is more an issue of cost than 
availability.

MS. HIRSHBERG: No, it's not.

MR. SMILLIE: Are you telling me that if you spent, 
if you were willing to pay whatever you wanted for organic 
carrot juice, you couldn't get it at any cost?

MS. CAROE: Julie.

MS. WEISMAN: No. The problem is, is that people 
who have the equipment that can process this, who are 
currently using it to use, to process carrots for color for
the conventional industry, which are enormous volumes. I don't know the numbers. If somebody else does, that would be great. But they, it is not -- they cannot afford to turn their machines on for less than say 20 metric tons a year. I mean, I'm not saying that -- there is a cost issue there, but the cost issue lives with someone who is not primarily an organic processor. And that's not how they make their living. So at the moment, in the industry, we're dealing with infrastructure that we're borrowing from the conventional. And they have a different set of criteria. They're not necessarily, it's not necessarily attractive for them to turn their equipment on for 10,000 pounds a year. So it's not that anybody who is making an organic product is avoiding the cost issue. It's that the nonorganic processors upon whom we currently depend, it's not worth their while.

MR. SMILLIE: Well, just to followup --

MS. CAROE: We're just going to have to make this a little bit shorter, because we do have a lot of other commentors this morning. But Jeff, go ahead.

MR. MOYER: I understand that Andrea, but I think it's key to the whole crux of the issue that we're talking about, so I think it's worth spending just a few minutes to talk about.

I understand what you are saying, Julie, but in the
context of most of the organic industry, that has always been true. It's true in the dairy industry. In the beginning, we borrowed processing equipment to process milk, and many of the other products. And I think it always has been an issue of cost.

Most companies are willing to do whatever it takes to get the product out the door, if you are willing to pay for it. You can't get it at the same price that you'll get the other juice at.

MS. HIRSHBERG: Well, I will just speak from personal experience, that we can't even get a foot in the door to talk to them. And they'll just say, we're not interested. Don't even -- you know, the capacity concerns, whatever. But I also want, well, just to let Emily, because this will really clarify it.

MS. ROSEN: Just very briefly, one other point about colors is that I think the gentleman from GTC was here last time. Hopefully they will be here later. But it's a different production process to develop vegetables for color. It's not like growing vegetables for vegetables. They grow specific varieties. They grow them closely spaced. They harvest them at a different maturity, so that they are fully advanced, you know, whatever the color pigments are. And they have to be harvested at the plant right away. So they generally grow them very close to these processing plants.
So they just haven't developed to the supply yet is the problem. And it can be done, but it's not there.

MS. CAROE: Joe, do you have a comment?

MR. SMILLIE: Well, actually, Emily said what I was going to say. Carrots are not always carrots.

MR. MOYER: Oh, I understand.

MR. SMILLIE: I mean, the carrots that you grow for color are different, not in every case. And we've got a long list. And one of the problems this committee had, was that we've got a long list of colors. Some of them, you know, a cherry might be a color cherry. But a carrot is not a color carrot. So we have to go through.

And again, to back up what Julie said is that, we had a lot of color petitions that did nail down that insufficient data thing. We went and we talk to these different grower groups, and this is the report on what we could get grown. We said, bingo, done, well, you got it.

Other color petitions just didn't have that information. I'm sure they're in the same case, but we can't rule on something that isn't in front of us.

So what our plea was, in rejecting that list of color is that please, those people who petitioned it, not the end users, but the people who petitioned it, have to come forward and say, this is the data that we can present, that we present to you to resolve that issue of the due diligence
of their search for growers of these particular varieties.

MS. HIRSHBERG: And I'll give you an example of carrots. In addition to talking to many other potential suppliers, our existing supplier, they grow all of the ingredients for their colors. They wouldn't even consider buying it, because they can't, for the reasons we said, they can't control it.

They are in the process of developing an organic carrot supply, but it's, you know, we don't have it now. So they can't really go out -- they can say that, and I think they did say that in their petition, but they don't go out and source from other places. That's just not colors are, manufacturers work.

MS. CAROE: Is the Board satisfied with the questions. Rigo?

MR. DELGATO: Nancy, I just have a question. What kind of actions are you taking to encourage producers to come out with the colors that you need or the raw material that you need and so forth? Are you content to --

MS. HIRSHBERG: Oh no. We are actively out there working with our suppliers. So for instance, in this case, we talked to them years ago, just and frankly like the inulin, saying, you know, what is the process? How are we going to get from here to there?

So, and our -- in the case of a lot of colors, it's
frankly testing everything out there that we can find
organically, so not just working with our existing suppliers,
but also working with the existing suppliers to develop a
process or a plan.

So we've come really far in colors, and frankly,
flavors, too, in developing the organic. We've really
increased so that we don't have that many more right now.
But we're just on the final ones.

MR. DELGATO: How much time do you think it's going
to take for you to bring, say, carrot color?

MS. HIRSHBERG: Carrot? Well, I know there are
going to be some next year, but is it enough to cover our
needs and others? I don't know that. So I can't answer that
very technically right now to say, this much in '08 or
whatever. So, but certainly, I would say within five years,
I would think everything, maybe even sooner, that we use
would be organic.

MS. CAROE: Any other comments, questions? Thank
you, Nancy.

MS. HIRSHBERG: Thanks.

MS. CAROE: Next up is Grace Marroquin, and on deck
we have Dom Repta.

MS. MARROQUIN: Good morning, everybody. My name
is Grace Marroquin, and I'm president of Marroquin
International Organic Commodities Services, Inc. My company
is based in Santa Cruz, California, and we import ingredients, and distribute ingredients for the natural products industry. We've been in business since 1991 in the organic industry.

I am here once again to support the classification of yeast on the national list as an agricultural product. This change would raise organic standards in a variety of processed foods. It would make it a requirement that these foods use organic yeast instead of conventional yeast.

As long as yeast is a nonagricultural product under section 205.605 A, manufacturers have the right to use traditional conventional yeast and still label their product organic. Certifiers have no way to require them to use organic yeast alternatives.

Organic yeast is far superior to conventional yeast for organic products. Organic yeast is grown on organically produced grains. Furthermore, there are no chemicals, like the ones that are being used in conventional yeast right now. There is no ammonia. There is no sulfuric acid. There is no caustic soda lye. There is no synthetic vitamins, and there are no synthetic anti-foaming agents.

In conventional yeast production, the waste water must be treated before disposal to avoid pollution, and I believe there are even special licenses required to handle it. In organic yeast, the waste water is a raw material
available for further production of other organic products. And that says a lot.

Because of the chemicals used making conventional yeast, the view developed in Europe that conventional yeast was not -- the view developed in Europe was that conventional yeast was not compatible with organic farming or food processing.

In 1980, a German Company, Agrono GMBH based in Riegel, Germany, began to develop an organic production method for yeast. In 1995, Agrono began marketing bio-real organically produced yeast. Our firm began importing it from, in 2002, and we are their North American agent.

The reason I am here is to request to move yeast from nonagricultural to the agricultural column, so that organic yeast can be a preferred organic ingredient subject to commercial availability.

Why has it taken so long, so very, very long, two and a half years? The Board first wants to have an overall policy to decide which materials should be agricultural as opposed to nonagricultural.

At the last meeting of the Board, last October, the Handling and Materials Committee offered a joint proposal. It would settle the ag/nonag questions as part of this proposal. Both committees agreed that yeast was an agricultural product, and thus should be listed in sections
This drew a lot of public comment, urging the Board to go slow. The Board voted to postpone further action, so that it could study the points raised. As we heard yesterday at the upcoming fall meeting, the Handling and Materials Committee plans to take this up and present a new proposal.

Let me try to sort this out where the matter stands. The proposal of the two committees, the one you have heard, the one you have in your Board books is basically sound, however, the public comment raised is some valid questions. Some of the commented, some of the comments objected to, including dairy cultures as agricultural.

Yeasts are not bacteria, but dairy cultures are bacteria. These were concerns about what it would mean to classify bacteria as agricultural, both for food and livestock feed. If bacteria would be designated as agricultural, then all bacteria and other microorganisms fed to livestock would also have to be organic.

Yeast is the only microorganism that is being produced organically. It would be premature to address the agricultural status of other microorganisms at this time. There were other questions, though, that came up specifically about yeast.

To respond to these questions we have filed a full length, our full length comments are on the new www.regs-
regulation.gov website, and these are comments 0090 and 0090.1. I have two main questions to address.

Yeast in livestock. There would not be a problem for organic livestock operators if they were to be required to use the yeast. I spoke with Midwest Bio Ag, a firm that in 2002 had developed an organic yeast for supplements. Because there were no rules requiring this, they ended up having to fold. Basically, they let their certification lapse. The equipment got sold. And it's sitting now in some empty warehouse, and they lost a lot of money. The product they produced was Rye Gain.

And I've spoken to them, and they said that they had enough yeast to be able to produce for the needs of the Livestock Committee. I've made it my business before the fall meeting to speak to other yeast producers to be able to see if the other ones can come on board with the yeast. I don't think there's a problem, from my initial conversations.

I'm going to cut to the chase here, but jump to another point, which is the EU will be adopting new organic standards later this year. The new EU regulations separates yeast from other microorganisms.

Unfortunately, I can't finish this, but what I'm here to do is to ask you to defer the yeast petition, meaning that you have so many other ones on your plate right now, and re-evaluate it again in fall.
MS. CAROE: Any questions from the Board? Joe?

MR. SMILLIE: I take it that that's what you want us to do, because you want us to come up with the finalized recommendations?

MS. MARROQUIN: Yes, exactly. I think you can't make a real decision on this until you decide what's ag or nonag. I mean, that's really the crux of it. And one of the things I'm concerned about is given what the status is, how the EU is handling this is, they are separating it out. They're not, they're separating yeast out from other microorganisms.

And if their draft passes with yeast in it, they're going to require yeast for food and feed. So then not only do we have our own issues here, but we, now we are creating another trade barrier because yeast is used a lot in various kinds of crackers and snacks. And any kind of snack going overseas will not be able to be used because now we've created this disharmony with the regs.

It's not final yet, but that's what's being proposed, and it's gone through the first acceptance. And yes, I'm asking for you to look at the ag part of this before you make a decision.

MS. CAROE: Okay. Joe.

MR. SMILLIE: Right now there is a debate in the certifier community over the certification of organic yeast.
There is actually USDA accredited certification organizations that are certifying yeast. I don't see people here. And I'm just wondering what the NOP, how the NOP views that?

MS. CAROE: Mark.

MR. SMILLIE: Is it within the realm of ACA to certify organic yeast, if they believe it meets the USDA NOP regulations?

MR. BRADLEY: Mark Bradley, National Organic Program. The first certified yeast that I was aware of I saw listed is ingredients yesterday. And certification is for agricultural products.

MR. SMILLIE: Right.

MR. BRADLEY: So it would be difficult to certify something that is listed as a nonagricultural product. But there are inconsistencies in the way that the regulations are being applied, between certifiers. And it brings in the issue of flavors as well. So this is something the program is looking into.

MR. SMILLIE: So once again, the program would look to the NOSB to create that definition and give you a recommendation?

MR. BRADLEY: Yes, we would really like that.

MS. MARROQUIN: So, and Joe, I would like to add that right now the way the NOP is dealing with some other nontraditional production systems, in that they don't have
specific standards for mushrooms, and they don't have
specific standards for bee keeping and greenhouse production,
and yet these have been treated separately, and they're being
certified presently. And we're asking for yeast. Until you
have those standards, that you just treat it the same way as
you have been with mushrooms and bee keeping and greenhouse
production.

MS. CAROE: Grace, as the petitioner, you have the
right to take your petition off the table. Is that what you
are requesting to do?

MS. MARROQUIN: Until the fall meeting.

MS. CAROE: Okay. We will not take it up at this
meeting, then. We will not discuss it today. The petitioner
has a right to take this off the table, and she has done so.

MS. MARROQUIN: Until fall, though. No longer.

MS. CAROE: Thank you, Grace. Anymore questions
for Grace? Okay, thank you. So we have Dom Repta, followed
by Kelly Shea. You're on deck.

MR. REPTA: All right. Thank you. This is my
second time here. I am from British Columbia. I was here
the last time, and I'm here to talk about the aquaculture
standards.

My name is Dom Repta. I'm here from the Coastal
Alliance for Aquaculture Reform, and more specifically, the
Friends of Clockwood Sound, which is one of the hubs of
salmon farming in British Columbia. And I am here presenting various ENGO's, scientists, and first nation groups who have been in British Columbia for thousands of years. I think it was said yesterday hundreds of years, but it actually is thousands of years.

I would, I am here to -- I only have five minutes, but I'm here to say we do support the Livestock's recommendation that species that require wild fish food be excluded from the aquaculture standards, and of course, any standards that would -- we're here also to support recommendations to exclude the open net pens from the aquaculture standards as well.

I do understand that this will probably be taken up at a later time, but I will give a few comments on that, and then progress onward from there. So a couple of new things since the last time I was here in British Columbia.

Of course, we do rely on peer review science for kind of the basis of our work. A new submission and a new peer review paper came out just a month ago that was showing that open net aquaculture, as far as sea lice, which is a major problem in British Columbia. We have vast amounts of wild salmon, and the interaction between farmed salmon and wild salmon just isn't proving to be sustainable.

A new paper which we have, we have a collaboration with another, the largest salmon farming company in the
world, and we have our on farm data showed that 12 salmon
farms, which is more than those in British Columbia, produced
billions, not millions, they produce billions of sea lice
eggs, which, of course, in turn, creates billions of sea
lice.

And as our last submission showed, and my last
talk which really did weigh a lot on sea lice showed that sea
lice are impacting migrating juvenile salmon in British
Columbia. We've seen drastic population declines in some of
the rivers and some of the populations in the archipelago.
And one can assume, as global trends show this happens
elsewhere in British Columbia. The problem is, we don't have
the science. We don't have the money to do the studies. And
industry might have the data, but the data is not shared.

So again, so we're talking about billions of sea
lice impacting wild salmon. So we are really, really pleased
that the recommendation is to exclude open net aquaculture.

Also, there is one salmon farm in British Columbia
who is claiming to operate under organic principals, and in
personal communications with this salmon farm, we have found
out that in 2006, they have had at least 46 sea lion deaths
in their farms.

And again, this is just one of the inherent
problems with open net aquaculture. You can't control the
inputs and you can't control the outputs. And this farm is
probably as sustainable as you can get in British Columbia,
yet we still have 46 sea lions, major keystone species in
Clockwood Sound, and we have 46 sea lions dying.

Yesterday, I heard there was a chef here talking
kind of on behalf of our groups. And he had mentioned that
organic salmon farming can never happen. Then he was
questioned about it.

And I am here to say, organic salmon farming can
never happen. And I would appreciate some questions about
that. I understood you did have some questions. Can it
ever, ever, ever be organic? It can never ever, ever, ever
be organic. And that's just the way it is.

Organic salmon farming can be less unsustainable.
For sure. And there are some global initiatives doing this.
There is closed containment initiatives. We work in
collaboration with something called a salmon aquaculture
dialogue, which works with WWF, probably about four other
ENGO's, a couple of the main producers globally, some
scientists, some first nations. And we work on moving the
industry to closed containment.

However, closed containment still is not organic.
It's probably less organic than open net pens, but it is more
sustainable. So trying to fit salmon farming in to organic
framework just doesn't work. If it's closed containment,
yes, it's way more sustainable. But at the same time, it's
more industrial. It's more intensive. It's, you have more
fish in one pen. The feed conversion ratio is probably
better, but at the same time, in organic farming, you can't
alter the feed of 80 percent of a species and call it
organic. It's just not possible.
So I would appreciate questions, the same questions
you gave the chef, I would love. Wow, five minutes goes
fast. It's a long flight for five minutes. I'm shocked all
the time. Gee it was quick.
MS. CAROE: Do we have questions from the Board?
MR. REPTA: I would love some questions. I'll just
say, organic and salmon farming can happen. It can be more
sustainable. I know there are some organic producers here of
aquaculture. It can be more sustainable. We've worked for
10 years with the industry to make it more sustainable.
We're not trying to shut it down. Organic is not salmon
farming.
MS. CAROE: Okay. Members, any questions?
MR. REPTA: Remember, it cannot be organic.
MS. JAMES: So if I hear you correctly, you are
saying that you really don't think that organic aquaculture
is a reality?
MR. REPTA: I'm not saying organic aquaculture.
I'm saying carnivorous, open net pen aquaculture, whether
it's salmon farming, because that's what we're dealing with now. But the industry could change to single fish in British Columbia tomorrow. There's 56 licenses of the 120. That cannot be organic either. But, you know, catfish on land could be organic. Tilapia could be organic. It's a controlled, closed system.

But even if you are altering 80 percent of a carnivor's diet, is that really organic? Not really. I mean, you're supposed to adhere to the natural diet as closely as possible. And to me, altering 70, 80, 60, 50 percent of a diet isn't under those principals.

And I come from a long organic background, too. And the one thing, we have -- I'm here on nine groups. Many of us were organic farmers, are organic farmers. I don't recall a time when nine groups would fly to Washington to oppose anything organic. It just doesn't happen. So this is really, I think, I think should be notice that the environmental groups, the ENG groups, the scientists, first nations are saying, hey, you can make it better, but come on, we've got to protect the organic name here.

MS. CAROE: Joe.

MR. REPTA: In my history of organics, it just has never happened before.

MS. CAROE: Joe Smillie and then Kevin Engelbert.

MR. SMILLIE: Just to make your flight worth while.
MR. REPTA: Okay, thank you. Yes, yes. 20 minutes would be great.

MS. CAROE: It's not going to happen.

MR. SMILLIE: The chair would take my head off. But do you have or does your group have any comments on our current recommendation? We are going to go back to net pens, and we will talk again. And we will explore that deeper.

MR. REPTA: Well, I think --

MR. SMILLIE: But we have a recommendation on the table, and have you guys and ladies taken time to look at that recommendation and make some comments about what is the current recommendations?

MR. REPTA: You might update me, but the recommendation that I am talking about is to exclude it right now. We made recommendations, we made a 30-page submission the last time I came here in October.

MR. SMILLIE: Right. Yes. We agree. For now, we're excluding the fish meal issue and the net pen issue. But all the other issues are steps towards an organic aquaculture recommendation are there, and I'm just wondering if you have any comments on those?

MR. REPTA: Well, I mean, the bar is set pretty high, although we, you know, I've looked at the standards and we've talked about them quite a lot, and we've tried to fit salmon farming, because that's the ideal one, into these
standards. And we just don't see it. We just can't, we can't fit it in. We can shove it in, but it's like shoving a square into a round peg.

MS. CAROE: Kevin, do you have questions?
MR. ENGELBERT: Joe alluded to a lot of it, but also, sometime, I'd like to know, did you submit written comments for this meeting?

MR. REPTA: I have them right here, yes.
MR. ENGELBERT: But not before this time?
MR. REPTA: No, not before the meeting.
MR. ENGELBERT: Okay.
MR. REPTA: I was, sorry, I was surfing in Mexico and skiing in Banff.
MR. ENGELBERT: Well, as everyone said, we are going to deal with this afterwards.
MR. REPTA: I know. I know. I understand.
Yesterday I heard that you were going to, so I was like, what am I going to talk about today? I could talk about surfing in Mexico and skiing in Banff, but --

MR. ENGELBERT: But when you submit your comments, what I'm leaning to is, we need specifics. We can't, you know, we can't go by it can never be done, because we have a certain obligation to try to make it happen. And until we can be convinced that it can't, we have to proceed.

MR. REPTA: Well, I think, if you --
MR. ENGELBERT: So when you make comments, we need sound backing, not --

MR. REPTA: Your obligation to make it be done, to me, I don't think you have an obligation to make it be done. You have an obligation to uphold organic production.

MR. ENGELBERT: That's right. Yes, and that's what I --

MR. REPTA: Whether salmon farming fits into that or open net -- it just doesn't fit into it. And I think if you look at the wealth of scientific publications, which I did submit last time, a long list of scientific publications showing impacts of open net aquaculture, it just can't. I'm not saying that it can't be done better, and it can't be done more sustainable. It can. But if it is done more sustainable, it's still not organic.

MR. ENGELBERT: Yeah.

MR. REPTA: I mean, it can be done way more sustainable, and it will be done. And that's what we look for. But at the same time, more sustainable doesn't mean organic.

MR. ENGELBERT: Right. The thing is, we've had, on conference calls, I've heard experts in this field looking at all this information and come away with exactly the opposite opinion.

MR. REPTA: Well, I would like to see your experts.
I would like to talk to them. And I would say, show me some peer review science that says the opposite, and I would gladly like to see that.

I mean, you might see some industry scientists, you might hear some industry folks say, it can be done. But where is the science? It's not published. It's not done. If you look at published science, the opposite.

MS. CAROE: Okay.

MR. REPTA: I think there's been 30 peer review published science saying the impacts in the last couple of years. Has there been one for the industry? It's just, it's not there.

MS. CAROE: One question from Bea James.

MS. JAMES: I was wondering if you might be able to comment, in your experience, if you have any views on the water quality maintenance and off-puts from land locked operations?

MR. REPTA: Actually, I was at a land-based salmon farm before the surfing and skiing tour about a month ago. And it was probably the most sustainable system I've ever seen.

It was raising sockeye salmon. Not a huge, not a commercial scale, but an open net aquaculture. They raise maybe 100,000 sockeye salmon, and they have a nature aquifer running through. Their off-puts, it went through a pond, it
went through a marsh, and the water output was really, really clean. It was super-sustainable. But it still wasn't organic. And the prof, he's a prof out of University in British Columbia, would agree. This was probably the most sustainable system I've ever seen. I'm actually working with this farmer to find a market for him to sell his fish, because it was probably the highest level of salmon farming I've ever seen.

People say, it couldn't be done. You can't do it on land. There's some issues with land-based salmon farming, but it was miles ahead of anything I've ever seen. The water was clean coming in. The water was clean going out. Amazing, you know, wildlife bio-indicators around the farm, raising 100,000 fish. It was great. It was phenomenal.

You can't have that everywhere, of course. The conditions where this farm were, were precisely what this farmer needed, cold water, sockeye salmon. I think he had nine or 10 pens.

At the same time, though, it was closed containment. It was relying on its carnivores, relying on altering the diet of the fish. It was super-sustainable, and the groups that I'm involved with are trying to find a market and say, yeah, this is a green, you know, a sustainable product. But it's still not organic. It's just not. Because we all understand what organic is.
MS. CAROE: Okay.

MR. REPTA: But we want to help this fellow, because he is the highest level that we've ever seen. It was a phenomenal farm. And there's two or three of them now operating in British Columbia. Even if we go to sustainable farms, closed pens and in the ocean, which we are trying to raise funds for from the government, from ministry, it still won't be organic.

MS. CAROE: Okay.

MR. REPTA: It might be less organic.

MS. CAROE: I think we got your message.

MR. REPTA: You got my message. Okay. I appreciate the time.

MS. CAROE: Is there any other comments from the Board?

MR. REPTA: For sure.

MS. CAROE: Okay. Thank you.

MR. REPTA: Actually, I appreciate the time. Thank you very much.

MS. CAROE: All right, Kelly Shea, you are up next. On deck is Harriet Behar. Harriet, are you in here? Great.

MS. SHEA: Good morning, you guys. How are you?

Just in the interest of time I'll sort of skip the opening remarks to thank you all so much for all your hard work, et cetera, et cetera.
But I think it is important to note that it was crucial for the Board to do the in person working session that you did in February. Yet, I think that maybe some kind of public input at that time, and I don't know the best way for it to have been done, but it could have led to some more correct conclusions by some of the committees and subcommittees, and consequently really taken some burden off the Board.

As my friend Jim Pierce noted earlier, I like to refer to 205.606 of the national list as the entrepreneur's list of business opportunities. 606 items are those that can be made organically if the proper ingredients are sufficiently available.

I think it's important to keep in mind that the overarching premise of the 606 list is that the items cannot automatically be used. A certified entity must justify commercial unavailability, and their certifier must grant permission to use the item.

I hope you all received the document I sent into the Board on February 16th. I also sent it to the NOP asking for clarification. OFPA sets forth two different methods for allowing the use of nonagricultural, nonorganic agricultural substance. And did you all receive that letter? Are you going to address it at today's Board meeting? Okay. Never mind. Let's go on. I'll get it to you again. It's really
The secretary has not yet promulgated the emergency decision making procedures. And so as we go forward, if the Board is going to hold as a strict criteria proof that the item is absolutely commercially unavailable at the meeting when you are looking at it, what happens down the road when there's an emergency. There's a hurricane. There's a typhoon. There's a crop failure. And if the Board is only meeting three times a year, there has to be procedures in place for reviewing these items. Okay. So I sucked up some time doing that.

606 items, White Wave Foods, my company produces the organic brands Horizon Organic Dairy, Silk Soy Milk and Tofu Town. And we want to address a couple different items today. Under colors, I want to talk about annatto, turmeric, purple black carrot juice, red cabbage juice, and then fructose, the short chain FOS.

Adding annatto to 606 is really critical. We have been researching and testing organic annatto colorings for the last three years, and we have yet to find a reliable source in the amounts necessary or the proper functionality. One source couldn't provide the product year round, and another source turned our cheeses pink, which my kids thought was cool, but I don't think the average consumer wants pink cheese. So though we're going to continue to
search for an organic source, annatto must be added to 606.

We also support the addition of turmeric as a color on the national list. The Handling Committee noted that more information was needed on the lack of availability of an organic supply. We have been pleased to see a few entrepreneurial companies beginning to provide organic turmeric color.

Horizon Organic and Silk Brands do use organic turmeric color in a couple of our seasonable products, like the eggnog. But we are not able to source enough for some of our product lines that are produced year round. The demand for organic turmeric far outweighs the supply today. So until this market matures, we need you to add that to the national list.

Also, purple black carrot juice and red cabbage juice, they are colors that are needed to provide the red and pink hue lost in the processing of red berry products. Now, in our Horizon Organic Strawberry Single Serve Milk, it comes in little acentric tetra pack. And you can't see it. So we don't put any color in it at all. It's white. Oh, one minute. Okay.

I'll just -- I have all the information showing all the suppliers we've contacted and the unavailability of all these. So we can supply that to you. Okay.

And short chain FOS, it's very crucial that the
Board realize this is a nonsynthetic agricultural product, and it has been used by our company for over four years in our products.

These fructins, inulins, OFS's, FOS that you are going to hear about, they are used today on the market in organic bakery products, organic energy bars, organic cereal, organic yogurt, organic soy milk, and organic kafir. And a number of cert agencies, including QAI, MOSA, Organtile, have all certified these fructins as appropriate for inclusion in organic products. They've allowed their use as agricultural ingredients not commercially available.

And these items are on your plate today because of the Harvey lawsuit, and because of the changes to 606. And I really want you to keep that in mind when you are looking at these, that they have been used in the industry for a long time, and certifiers have found them to be appropriate.

MR. SMILLIE: Thanks, Kelly, especially for the turmeric. Do you have any information on saffron, grape juice extract, grape skin extract, blueberry juice, cherry juice, hibiscus juice, carrot juice, pumpkin juice, tomato juice extract, purple potato juice, lycopene or beta carotin.

MS. SHEA: I have to admit I'm pretty much here for self-serving purposes, talking about the items that we use in our products. I am not a trade association nor a blah, blah,
1  blah. So I'm sorry. I don't.
2  MR. SMILLIE: But I need --
3  MS. SHEA: The only ones that we use --
4  MR. SMILLIE: I needed that opportunity --
5  MS. SHEA: Yes.
6  MR. SMILLIE: -- what we need back from the community.
7  MS. SHEA: I agree. And you know what, I think that the people that use these --
8  MR. SMILLIE: Great.
9  MS. SHEA: -- and they have vested interest in these should be talking about them. For me it's annatto, turmeric, purple black carrot juice, red cabbage juice, and the short chain FOS.
10  MR. SMILLIE: We appreciate your input.
11  MS. SHEA: Okay.
12  MS. CAROE: Katrina.
13  MS. HEINEZ: Hi, Kelly. Thank you for your comments. There was a question earlier about being willing to pay a higher price for some of these ingredients, and would that create the economic incentive. Could you provide some perspective on that?
14  MS. SHEA: Yes. The cost of a product is absolutely irrelevant in determining commercial availability or unavailability. And I think that's really important,
because I've heard it mentioned a couple of times by the Board.

When a certifying agent asks a certified entity about commercial availability or unavailability of a product, we're not discussing cost. We're discussing availability. And we've submitted comments on a definition of commercial availability and unavailability a number of years ago. And economics was not part of the discussion.

MS. HEINEZ: I guess the question is, if you were willing to pay more, could you make it commercially available?

MS. SHEA: I thought that's what I just answered. No. I mean, here is an example. In the case of the purple black carrot juice, okay, so we contacted every supplier out there, domestically and internationally. We could not locate a single source for organic red cabbage color.

In our search for a purple black carrot juice color, only one supplier had organic purple black carrot juice, and that was the juice, not the color form. And they are different. That particular supplier could not have been able to supply us with even the juice.

If we could buy the juice and go find a company that could turn it into a color for us, if that's even possible, due to their own juice needs, they couldn't have sold it to us. So it's not -- for love or money, these
things are not yet available.

MS. HEINEZ: Thank you.

MS. CAROE: Other comments from the Board? I have a couple.

MR. DELGATO: Yes, I do.

MS. CAROE: Okay. Rigo.

MR. DELGATO: So what do you do after that? You can't find it. Nobody is producing it. What's the next step you take?

MS. SHEA: Well, what we've done, you know, we've been doing this for over 15 years, is part of the development, and the reason a lot of things are available organically now is it's education and information. That's going to your suppliers and saying, this is what we want. And really, there is an incentive for a manufacturer to do this. We don't really want to sit back on our haunches and not be able to list things as certified organic on our ingredient declaration. We want them certified organic.

So we actually, our company puts funds into doing the research. We're constantly testing products. And that's at our cost. And it's also encouraging farmers to convert to organic, helping our suppliers find organic products.

Some of, for example, with the turmeric, that's
coming from India. And so it's a matter of educating some of
the farmers over there about why they actually want to get
NOP accredited, because that's another issue. Some of these
spices are grown overseas, and the certification agency might
not be NOP accredited. There's just a lot of layers to it.

But we're not going to sit back, just because you
put it on the list, we don't, you know, go -- and go home and
not do anything. And as soon as it's available, you'll find
me back up here petitioning to have it removed from 606.

MS. CAROE: Do we have other comments from the
Board? Okay. I have a couple. I really have to defend the
Handling meeting in February. As far as public input at that
meeting, we do. It's called a petition. We got the
petition, the petitions. There was numerous contact between
the program and the petitions trying to get more information.

At that time, which was the last minute possible to
make it for this meeting, we considered what was available to
us. We had two options, as I mentioned earlier. Our options
were to proceed with a novo an elicit more public comment, or
to defer, defer until the October meeting. If we did that,
you know, we stop commerce.

MS. SHEA: Agreed.

MS. CAROE: We are acutely aware of the June 9th
deadline in getting these things. This is an atypical
situation. This situation, I don't foresee in the near
future that we'll have another court order pushing us the way we are.

So, yes, maybe unconventional in our approach, but this meeting and these notices sent out were to elicit public comment. And I really appreciate you bringing to the table what you brought today. That's what we were hoping to get, the names of suppliers and the logistical battles that you have in getting these.

And we agree that these things have been on the market, and we want to keep them on the market if the organic consumer has accepted these as organic products. So really more of a comment than a question to you, but I did feel I needed to respond to that.

MS. SHEA: Yeah, and in light of that, I probably should have read my opening paragraphs about how grateful I was to all of you. But it just, I agree that it's a really unconventional time. And we know in the past, when we're looking at material petitions, that the processes always worked.

But I think just due to the nature of the situation, we could have maybe helped, is all I'm saying. You've had a huge burden getting through this. We always just want to help, right, be involved. It's our life, right?

So --

MS. CAROE: Thank you for your comments.
MS. SHEA: But just, I want to be on record as saying, I had no issue that there was a lack of transparency about the February meeting. That is not my issue. I think the Board absolutely has the responsibility and the ability to meet whenever they want. I trust you guys. I just wanted to be able to help. That's all.

MS. CAROE: Thank you, Kelly. Harriet, you're up, and next on deck is Nadine Bartholomew. Nadine, are you here? Nadine? Going once -- there you go, Nadine. Check in with Valerie, please.

MS. BEHAR: Hello. I'm Harriet Behar, an organic farmer, an organic inspector, an organic educator. Thank you for the opportunity to speak and welcome to the new members of NOSB. While I can see that the NOP has made progress in giving direction to certifiers concerning implementation of the organic regulations, there's still a lot of work to be done.

Various directives, guidance, and interpretations are given either to only one certifier at a time, or to groups of certifiers at trainings. This information is not available to all certifiers, nor is it available to the public. It has been over five years since the OFPA was implemented with the organic rule, and the National Organic Program does not yet have a program manual, one that is transparent, clear and effective.
Certification agencies need to have this type of manual in order to become accredited, and it is time for the NOP to put this in place for themselves as well.

In addition, the OPFA voted the appointment of a peer review panel which has not yet materialized. The maturation of the NOP cannot occur, and trust in the organic integrity is lessened without these two critical pieces necessary in the day to day administration of the NOP, as well as peer review of the accreditation process.

I'm concerned that the NOSB recommendation on commercial availability, which directs certification agencies to continually review items on 606 as not currently available as organic will not be consistently implemented by all certification agencies without clear directive from the NOP.

Many other NOSB recommendations have not either become regulation or directives, and to certifying agencies and to their producers. Again, a program manual would hopefully have a process for incorporating these NOSB recommendations into the implementation of the law, or offer a framework for a continued dialogue if those recommendations are not acceptable to the NOP.

The hard work of previous NOSB's as well as your hard work and all of the public comment received represent a strong foundation for retaining the excellent representation of the word, organic, which it currently has in the
The NOP should work closely with the NOSB and not ignore the recommendations. Get them someplace where people can find them and use them.

Another example of this is the recent NOP statement at a certifier training disallowing community growing groups with internal control systems, due to concerns over conflict of interest. A 2002 NOSB recommendation on this type of organic certification system was never implemented by the NOP, and addresses many of these core concerns.

I believe the legitimate NOP concerns of conflict of interest can be dealt with, and I do not see anyplace in the AFPA or the regulation that formally denies this type of certification. Other recommendations have also not been acted upon, such as pasture, mushroom, or aquaculture standards, resulting in inconsistent organic certification.

Organic products command a significant premium in the marketplace due to consumer confidence in organic integrity. Inconsistent definitions of any organically labeled product in the marketplace is damaging to all organically labeled products.

I would like to voice support for clarity on the issue of cloning. Although tracking the progeny of cloned animals may not be an easy job, I believe the organic community should take a strong stance on this issue, and make
it clear that this method, not just for the first, but all subsequent generations, if not compatible with organic production.

The use of GMO crops such as fertilizers, dry soybean meal, mulches like GMO corn stalks and vitamins are currently allowed in organic agriculture, since the specific GMO traits are not being exploited in the foreign system. The presence of these GMO's on organic farms or in organic food can be seen as lessening the integrity of the organic product. And perhaps it is time for the NOSB to look at this issue and openly discuss it, rather than choosing to ignore it and allowing there to be various interpretations of what is and what is not allowed.

I believe the aquaculture standards still need a lot more work, and perhaps the scope to be considered should be narrowed down to the systems that we feel comfortable can meet the current NOP requirements. This would include pond or raceway raised fish, rather than fish in open waters.

Organic fish should be held to the same high standards as all other organic livestock, with 100 percent organic feed and health care. The organic consumer demands no less.

In the NOSB manual it states that annotations should not be changed when materials are offered for the sunset review. This prohibition takes away an important tool
which would allow for modification to better meet the needs
of our dairy producers and safeguard organic integrity.

MS. CAROE: You timed that pretty close. Comments
from the Board. Joe.

MR. SMILLIE: A couple things, Harriet. We will
have a discussion on peer review. Our committee is looking
at it and --

MS. BEHAR: Thank you. And thank you from --

MR. SMILLIE: Right. And we do, we do expect to
have a recommendation for the October Board meeting, and we
are looking for input at this point in time. Also, again,
the group certification issue has just come up. It's not on
our agenda, but our committee will be taking that up, and we
will be looking for comments on the current NOSB
recommendation of 2002.

If there is any update, updating needed on that
document, or any input from the community on that document,
we are looking for input on that document, because that's
basically what we're going to lead with as far as our
committee work. And I'm fairly certain we'll have a
recommendation on that issue for the October meeting, which
is our next meeting.

The only thing I would disagree with you on is, I
believe that the current aquaculture recommendations do
exactly what you're saying here. We did narrow the scope --
MS. BEHAR: Yes. Yes.

MR. SMILLIE: -- to what we felt was, you know, herbivorous fish without net pens and all.

MS. BEHAR: So there is my support.

MR. SMILLIE: Okay. Great.

MS. BEHAR: But one of my points was, is that your recommendations don't always become a strong directive to certifiers, and so some, and it's actually very clear from the NOP that an NOSB recommendation is not the reg. And so my concern is, there isn't a clear process for turning those recommendations into something that is publicly known and used by all, because some do follow the recommendations, some do not.

I just mostly know the upper midwest, and I know maybe eight or 10 certifiers active in that area who are using different interpretations. And it's really hurting farmers and consumers by not having consistent definition. And I think a program manual would help.

MR. SMILLIE: It's very clear the NOSB has outstanding statutory powers compared to other factor groups, and we do have, do have statutory powers as far as the list goes. Anything else that the NOSB recommends is at the pleasure of the Secretary of Agriculture to accept or not accept. They do not have to, nor are they bound to respond to our recommendations if they don't want to.
So all we can do is put them out there, and they do not have any force whatsoever unless it, unless the collaboration, unless they need to utilize it.

MS. BEHAR: And I'm concerned that the commercial availability recommendation that you are making that certifiers need to do on 606 will also not be consistently implemented, because it's not in the reg.

MS. CAROE: Well, let me --

MR. SMILLIE: Okay.

MS. CAROE: There's a couple of things. Valeria Frances wants to talk, but I also want to explain really quickly that, you know, we're developing a collaboration with the program.

MS. BEHAR: Yes, I know that.

MS. CAROE: And it's just gaining leaps and bounds. It really is. So some of the old recommendations back when, you know, the Board was doing a lot of work kind of without, without better communication with the program.

Some of those things stopped because of logistical problems with government. And so they are kind of in limbo land. And I think Valerie is going to speak on that, you know. She has been tasked with looked at all those recommendations, finding out where they are, and seeing what's salvageable and how we can work together on it.

Moving forward, our new recommendations, involve
the program a lot more heavily, so that we can come up not
only with a good recommendation, but a method for
implementing it. And we've had discussions with Mark Bradley
and with the program about certifier training, accreditation,
where can we instill this consistency. So we are acutely
aware of what you've spoken of.

    MS BEHAR: Thank you.

    MS. CAROE: This are growing pains, and this is
areas where we are learning, you know, until we get it out
there and running, we really don't identify all the hitches.
And I think you're going to be seeing some improvements, but
I do appreciate you keeping us updated on what's happening
there. Valerie, do you have comments?

    MS. FRANCES: Yes, Harriet, I just wanted to
address what you said for the record. I mean, I've been, one
of the things I've been tucking in, along with everything
else, is cataloging ever recommendation ever made, and going
back and reading minutes from like 1992 all the way forward.
And I think I must have 10 or 15 pages of spread sheet of
every recommendation and what's happened. I'm working on
that.

    With everything else, you just sort of work real
hard on something, then you have to put it aside and do
something else, and then come back to it. So we will be
getting through these things. It just --
MS. BEHAR: Well, I look forward to seeing the process where some of these recommendations can come into place, and they're open to the public and all certifiers, so there is consistency. Thank you.

MS. CAROE: Okay. We have Nadine up, and then followed by Luke Kazmierski. I hope I didn't hurt that too badly.

MS. BARTHOLOMEW: Good morning Committee members, and attendees of this meeting. I'd like to thank you for the opportunity to comment today. I make these comments on behalf of the Sustainable Seafood Initiative of the Monterey Bay Aquarium, so at the end, I'm not prepared to answer comments outside of what's outlined in this paper.

Since it's inception in 1984, the mission of the Monterey Bay Aquarium has been to inspire conservation of the oceans. For the last six years, the Sustainable Seafood Initiative has been working to foster consumer and business awareness and action for sustainable seafood.

Over this time, we have distributed over 20 million easy to use pocket guides to consumers throughout the United States. We have previously submitted comments during this process, and contribute further to the discussion here today.

First, we would like to thank you for your careful attention to the development or organic aquaculture standards. We applaud your decision to prohibit the use of
open water net pens, and to prohibit the use of fish meal and
fish oil in organic production at this time, given the
opposition by NJO and the uncertainty of compliance of open
water net pens, and wild fish input with organic principals.

We are in support of organic aquaculture in systems
where inputs and outputs can be carefully controlled and for
the species that are compatible with available organic feed
inputs. At this point, it is unclear whether production of
high feed input species like salmon grown in open water net
pens can ever be consistent with organic production
principals.

The inconsistencies with organic production
surround the high use of marine resources for feed, the
effects of escaped fish on adjacent wild stocks, the affects
of disease and parasite transfer from farmed fish to wild
fish, the release of chemicals for health management into the
environment, the disturbance of local predator communities.
Additionally, the nature of open net systems means lack of
control over these inputs and outputs which is inconsistent
with the idea that organic equals control.

All of these scientifically documented impacts, and
the lack of control over inputs must be addressed if
production in open systems can be considered organic.

With respect to the use of fish meal and fish oil
we suggest that certifying the use of wild fish as an organic
feed input is a direct contradiction of organic principals, and the requirements of controls at all levels of production. In addition, the reduction and complete elimination of fish meal and fish oil is also not consistent with organic principals which state that species must be fed a diet consistent with their natural diet. This suggests that fish meal and fish oil will have to be derived from organic seafood byproducts, for example, Tilapia, if carnivorous species are to be certified organic.

Furthermore, although it has been argued that some reduction fisheries are sustainable, present fishery science models give little consideration to the importance of small pelagic fish in the wider ecosystem.

The ecosystem's sustainability of reduction fisheries must be resolved before species heavily dependent on these feed inputs can be certified as either sustainable or organic.

While it is likely that alternatives to fish meal and fish oils will be developed, it is unclear whether the ecological sustainability concerns, and by this we mean both the sustainability of catches and ecosystem effects, needs of sustainability of -- the needs of, sorry, the fish physiology and the tolerance of the human palette can be adequately aligned in a way that is organic.

In closing, the USDA organic label is an
established and trusted name to consumers, and organic production principals were never designed to be all inclusive. We would like to emphasize the importance of ensuring that the aquaculture industry adapts its production practices to meet the principals of organic production, and not vice-versa.

Given the numerous ways that the production of carnivorous fin fish in open systems are incongruent with organic production principals, we conclude that trying to certify these species produced in open systems at this time could erode the high standing that the USDA organic label has for consumers and business.

I'd like to thank you again for the opportunity to comment on behalf of the sustainable seafood initiative of the Monterey Bay Aquarium.

MR. KAZMIERSKI: Hi, good morning. Coni Francis that's scheduled to speak after myself, is also from GTC Nutrition. We have a Powerpoint presentation that we put together, and I'm planning on doing the first half of the presentation, and Coni Francis was going to do the second half of the presentation, if that's okay with the Board.

MS. CAROE: Board members, can you see the screen?
You might want to scoot around.

MR. KAZMIERSKI: The presentation is being passed around. A note with the screen that's up right now, and the presentation that's being handed out, we did reference our comment that was sent in for the initial recommendation that was done in February. It's on the slide that's up there now, but not on the presentation that's being distributed.

All right. First of all, Coni and I would like to thank you for letting us speak today on short chain fructoligo saccharides, or short chain FOS. And we're here to answer any questions that the Board has with short chain FOS.

Can you go to the next slide? Short chain FOS is found in nature at very low levels in a variety of fruits, vegetables, and grains. In order to obtain the same amount of short chain FOS as found in our product, you can see by the slide, one would have to consume 22 bananas, 15 onions, and 383 garlic cloves. Next.

Processing of short chain FOS begins with sugar beet and sugar cane plants. The beet or cane sugar is fermented using a naturally occurring enzyme to make the short chain FOS. I'd like to note that the short chain FOS that's created is the same form as short chain FOS that is found in nature. Clearly, by this, it is an agricultural product.
Short chain FOS is currently used in organic products, which means it has been approved by a USDA accredited certifying agent.

Short chain FOS is made by the fermentation of sugar. As defined by law in the NOSB recommendations, fermentation is an approved processing method for nonsynthetic substances, and therefore short chain FOS should be considered nonsynthetic.

When utilizing the NOSB's decision treaty to determine whether or not a substance is agricultural versus nonagricultural, there are several questions that are posed. First, is the substance in question derived from an agricultural product? And in regard to short chain FOS, the answer to that would be yes. The substance is derived from a sugar cane or sugar beat plant.

Has the substance been processed to the extent that it's chemical structure has been changed? The answer to that question is yes. The sugar is fermented to make short chain FOS.

Is the change in the chemical structure a result of a natural occurring biological process such as fermentation? Again, the answer would be yes. The sugar is fermented to make short chain FOS, the result of a natural occurring biological process which is fermentation.

Again, I guess I would want to reiterate with that
slide that the product would be considered agricultural, and would be properly classified under 205.606.

All right. In the initial Handling Committee recommendation for short chain FOS, there was some confusion in regard to the status of the substance. And I just wanted to note, in November of 2000, the FDA did affirm that short chain FOS is indeed generally recognized as safe.

Next line. Short chain FOS is agricultural and nonsynthetic, and the question of essentialness does not -- and therefore the question of essentialness does not apply. However, short chain FOS is essential to organic handling because it's a prebiotic fiber source. It enhances mineral absorption. It improves the digestive function and regularity, and also inhibits pathogen growth.

Coni Francis is now going to talk in regard, more to you about the essentialness of the product.

MS. FRANCIS: Good morning, and thank you for letting us come and help to clarify some of the things that were not clear to the Board. And we do apologize that our petition wasn't clear enough for you to understand.

I'd like to go forward and talk about each of these things, the fiber source, and the prebiotic function of it, and talk about the essentiality of it.

If you look at the definition that the American Association of Cereal Chemists has for fiber, you'll see that
oligo saccharides is, in fact, highlighted as part of that definition. So this definitely is a fiber.

In terms of the prebiotics of this particular thing -- in terms of fiber, let's go back and talk about that, one of the problems that we have in this country is that there is definitely a gap in the amount of fiber that's recommended, which is about 28 to 35 grams per day, and the amount that's actually consumed, which is about half of that.

And so we are not consuming enough fiber, and therefore we are having issues that are coming up, you know, that are health issues. And certainly we want to be able to provide fiber to individuals in the food stuffs that they are eating.

In terms of this being a prebiotic fiber, if we look at the definition of a prebiotic fiber, it is a substance that, in fact, helps the good bacteria in your gut to grow. And this is a positive thing, because, in fact, if we nourish the gut, then we improve digestion, and we improve a lot of other things. And most of the prebiotics are oligo saccharides that are used to nourish these prebiotics.

I also want to speak to the calcium, magnesium and other minerals absorption, just by giving you a few statistics about bone health in this country. Right now about 90 percent of girls and about 75 percent of boys between the ages of nine and 13 are not getting enough
calcium to achieve peak bone mass.

Now, if we think that those of us who are in our fifties and sixties are looking at an issue with osteoporosis, I am very frightened about what's going to happen when these children reach their thirties and forties, because they are not getting enough calcium from their diet.

In addition, 10 percent of Americans overall have low bone mass, and an additional statistic is that about 50 percent of women and 25 percent of men over the age of 50 will likely suffer an osteoporotic fracture in his or her remaining lifetime. And so our intention is to be able to utilize more of the calcium that's found naturally in foods.

Again, we have a gap of calcium between what's recommended, which is about one to 1.2 grams per day, and what we're taking in, which is about half to three-quarters of what's required. And considering the fact that we only absorb about 30 percent of the calcium that we take in, if there is a substance that would allow us to achieve more calcium absorption, it makes sense to do that when it's also providing other benefits in terms of fiber and the prebiotic effect of that.

In terms of digestive health, about 20 percent of Americans are suffering from some kind of digestive disease. And those of you that have had the occasional heartburn or a little bit of stomach upset, you know how annoying that can
be, and how difficult that is for an individual to live with on a regular basis. And so if there is something that we can naturally eat in our diet that, in fact, will allow us to have better digestive health, that's certainly a positive in terms of where we would go.

This particular graph is just to show that with short chain fructoligo saccharides, in fact, it doesn't matter whether it's at the beginning of the large intestine or the end of the large intestine. You can see that when short chain FOS is added to the diet, there is definitely an increase in the number of intestinal cells per crypt, which means that you've increased the absorptive area, and in fact, you are improving digestion because you have more surface area for nutrients to be digested upon.

Also, one of the things that these fructoligo saccharides do when they are fermented in the intestine, the bacteria there creates something called short chain fatty acids. These short chain fatty acids reduce the ph in the gut, and therefore they increase the ability of the bifidobacteria to live, but it decreases the amount of pathogens.

So this is showing that as we have average counts of bifidobacteria increasing, in fact, clostridium profringins, which is a known born food borne pathogen actually decreases. So, you know, we don't change the number
of bacteria in the gut, but we can modulate them to be better bacteria for us in terms of health.

So just to reiterate, short chain fructoligosaccharides or short chain FOS, is consistent with organic principals. In fact, it is found in nature in very small amounts, but the product that is produced is exactly that, that is in nature. And it is created by fermentation, which is a naturally occurring process.

And therefore, we would respectfully request that you add it to the national list as a 606 category.

MS. CAROE: Thank you. What timing.

MS. FRANCIS: Right on.

MS. CAROE: Board members, questions? Comments?

MS. FRANCIS: We can both answer questions.

MS. CAROE: Questions or comments? Bea.

MS. JAMES: Well, first of all, you didn’t mention anything about the possible side effects of FOS, and I know that some people do have a negative reaction in their digestion.

Secondly, I, you know, I don't, I don't understand if this is an added value ingredient into products, or if it is something that is necessary and has to be in the products for it to be proper form, function, quality, texture.

And I think that the side effects of a poor diet are not necessarily the responsibility of organic agriculture
or products. If it were, there would be a lot of other added value ingredients that we would be considering because, as you know, most people do have struggles with having good diet.

So I was just wondering if you could make comment on the essential importance of FOS being in an organic product?

MS. FRANCIS: I think part of that is the fact that if we look at what the consistent values, you know, people think of organic as being healthier for you, and these products are being used, these oligo saccharides and prebiotics are being used in all sorts of conventional products.

And so what I would hate to see is for a consumer to have to make a choice between eating the organic version, or the regular version, because one of them is going to provide me with this benefit of having additional calcium absorption, better digestion, et cetera.

We have provided a disk with a lot of the research to the Board. We gave it to Valerie so that you all would have that available. Our grant status shows that you can get up close to around 30 grams a day of this product, and you will have mild gas and bloating from this.

Typically, our recommendations are that people don't need to consume any more than three grams a day in
order to receive these benefits. And we have studies that show that at that level that they can achieve this benefit.

MS. CAROE: Tracy.

MS. MIEDEMA: If, for the sake of argument, we call this product agricultural and we call it essential, can you comment on availability of an organic version on the horizon?

MR. KAZMIERSKI: Yes. GTC has been looking into producing organic short chain FOS. We've run into some hurdles in regard to sourcing raw materials that would fit with organic principals, but it is something that we are pursuing.

MS. MIEDEMA: What are those materials, and what are the problems?

MR. KAZMIERSKI: The main ingredient is liquid sucrose that's used in production. We, in the United States, we're finding or having difficulty sourcing that, the availability of the liquid sucrose in organic form.

MS. MIEDEMA: What are the options? What are you thinking? Is it a number of years?

MR. KAZMIERSKI: We're actually, depending on what we find, we're looking at about a year from now, if we can find either a liquid organic sucrose or a means of converting a granular form of organic sucrose to liquid for the manufacturing.

MS. FRANCIS: Part of the problem when we do find
the liquid organic sugar is that it has a very short shelf life. And getting it transported to where we do the manufacturing can be problematic. So we start with a liquid product, and then we actually dry it so that it becomes a powder.

MS. CAROE: Kevin, you had a question?

MR. ENGELBERT: So the liquid sucrose you are referring to that you need to grow organic, are you saying there is no source of organic beets, or there is no source of a processing for that? I'm not sure what --

MS. FRANCIS: It's just, all of the organic product is made into granular sugar. And so up to this point in time, we have not found a source that is liquid that we are able to get in large enough quantities to supply for the organic market. And so we are looking into how we get that into the liquid form such that we can then make it.

MS. CAROE: Joe, did you have a question?

MR. SMILLIE: Yeah. Saying basically what Kevin said again is, if cane is included, I'm not an expert in the subject, but as far as I know, there is liquid organic sugar available. Again, quantities, quantities, I'm not sure of. Once again, though, reminding everyone that it's a two-step process, putting it on 606 doesn't necessarily allow its use, if organic is available, and it would serve, you know, the industry well that the connection between the
organic liquid sugar and your manufacturing process get connected so that it can become available organically.

MS. FRANCIS: And currently, we are the only manufacturer that makes this particular product, and so therefore there isn't any other availability. It's not like some other prebiotics that there are a number of manufacturers.

MS. CAROE: I just, really quickly, want to remind the Board that the criteria for essential in organic is a criteria under 600, 205.600 B, which is for processing aides. So under B for processing aides -- yes. It's 606 B(6) is the criteria for being essential for organic. This is an ingredient, not a processing aide as we're hearing.

MS. WEISMAN: I also wanted to add further to that, that these criteria in 600, these, in terms of what's essential, these have to do with synthetic and nonsynthetic substances only. They do not refer --

MS. FRANCIS: Right. And we are saying to the Board that we believe that we are a nonsynthetic. But we're saying, even if you consider us as synthetic, we still are showing that, you know, there is a reason to include these products.

MS. CAROE: Just, okay. I think we are clear. I just want to point out that the criteria is to establish for processing aides, and we are talking about a petition for an
ingredient. Okay. So thank you for your comments. Thank you for the Powerpoint presentation.

MS. FRANCIS: Thank you.

MS. CAROE: I have nobody on deck right now, because I was confused. But is Bob Hutkins in the room?

MS. FRANCIS: Actually, I have his proxy.

MS. CAROE: You have his proxy.

MS. FRANCIS: Yes.

MS. CAROE: So are you speaking now again, or are you --

MS. FRANCIS: Yes, I can do that, if that's okay with the Board.

MS. CAROE: Well, you are signed up.

MS. FRANCIS: Yes. I have his proxy.

MS. CAROE: Okay. On deck then is Kimberly Gilbert. Kimberly, are you in the room? Okay, great. Thank you.

MS. FRANCIS: This is a letter actually written to Valeria Frances, the Executive Board, and this is from Bob Hutkins who is a professor at the University of Nebraska, Lincoln.

Dear Ms. Frances, I am writing in regard to the status of short chain fructoligo saccharides. I am a professor of food microbiology at the University of Nebraska and have conducted research on prebiotic oligo saccharides
for nearly 10 years.

I publish numerous peer review papers in leading scientific journals on prebiotics and am considered an authority on the metabolism of prebiotic oligo saccharides by intestinal bacteria. In 2005 I was named the kem sahani professor of food microbiology for my research on prebiotics and probiotics. I am a charter member of the International Scientific Association for probiotics and prebiotics, and am currently on the Scientific Advisory Board of the International Probiotics Association and the GTC Nutrition Scientific Advisory Board.

I belong to the American Society for Microbiology and the Institute of Food Technology. I have also served on the board of directors of local food cooperatives, and I was recently an instructor during a recently held training workshop for organic food certification.

Fructoligo saccharides or FOS and other prebiotic oligo saccharides have gained significant attention among scientists, public health practitioners, and consumers, due to their ability to promote gastrointestinal health in humans and other animals. The prebiotic concept is actually based on rather simple, ecological principals.

Briefly, dietary FOS or FOS and other prebiotics escape digestion in the hydrolysis in the stomach and small intestine, and pass in tact into the colon. The most, most
intestinal bacteria lack the metabolic wherewithal to ferment these carbohydrates, and cannot use them as a growth substraight or energy source.

In contrast, other intestinal bacteria, in particular strains of lactobacilli and bifido bacteria do have the ability to ferment FOS. This gives these latter bacteria a decided competitive advantage in the intestinal environment.

Importantly, greater proportions of lactobacilli and bifido bacteria in the GI tract are positively correlated with improved gastrointestinal health. Thus, diets containing prebiotic FOS enrich for desirable bacteria at the expense of less desirable bacteria.

There is now substantial and convincing evidence in the biomedical and health sciences literature that prebiotic FOS stimulates and enhances growth of beneficial bacteria in the GI tract. The overall positive health effects of FOS are also well-established.

These ingredients have grass status, behave and are considered as dietary fiber, and pose no safety risk to consumers. They are widely used in Europe and Japan and throughout the world. They are produced naturally via fermentation with fruit grade microorganisms and are indistinguishable from the FOS that are already present in onions, garlic, and a variety of other foods.
Based on the collective scientific research from my lab and others, I conclude that FOS and other prebiotic oligosaccharides are safe and natural, and have the potential to improve human health significantly. Sincerely, Robert Hutkins.

MS. CAROE: Thank you. I don't know, can you answer any questions for --

MS. FRANCIS: I certainly could.

MS. CAROE: Questions from the Board? We don't have any anyways.

MS. FRANCIS: Okay.

MS. CAROE: Thank you.

MS. FRANCIS: Thank you.

MS. CAROE: Up next is Kimberly Gilbert, and on deck is Steve Fennimore. Steve, are you there? Just before you get started, I just want to ask the Board, we have six more speakers, seven more speakers including Kimberly. Can we hold out for a break? Is everybody okay? All right. Thank you, Kimberly.

MS. GILBERT: Okay. Thank you. I'm Kimberly Gilbert from Dow AgroSciences. Thank you for letting me respond to your comments on pelargonic acid. Dow AgroSciences is a petitioner for pelargonic acid to be listed, to be listed on the organics products list.

We are petitioning for use in farmstead
maintenance, roadways, ditches, as well as on ornamental
crops. We have rendered our petition for that.

Pelargonic acid, as you know, is a naturally
occurring fatty acid. It is contained already in a variety
of plant and animal foods, and nonfood products. It's even a
food additive and is used in processing programs right now.
It is currently registered with the EPA as a broad spectrum
herbicide and it is a nonsystemic contact herbicide.

Next slide, please. In your comments, there was a
question in regards to is pelargonic acid a soap? What is a
soap? It is a cleansing agent made from the salts of
vegetables or fatty acids, or animals fats. Natural soaps
can be sodium or potassium salts of those fatty acids.
Originally, soaps were made from boiling lard or other animal
fat together with lye or potash.

The term soap refers to the metallic salts of long
chain carboxylic acids. And that carboxylic acid is marked
by the presence of the carboxyl group, or the CO2H. And on
the next slide you can see that pelargonic acid does contain
that carboxylic acid piece of its molecule, the nine carbon
chain. Okay.

In addition to having the chemical structure of a
soap, it also has the mode of action of a herbicidal soap.
As you can see here, the free acids accumulate in cells
causing intracellular ph changes that lead to loss of cell
membrane integrity, cell leakage, and cell collapse, resulting in death of the plant tissue.

And in addition, per the TAP report, the references that went into the creation of the TAP report did refer to pelargonic acid as an example of a herbicide, often referred to as a herbicidal soap. Therefore, pelargonic acid is a herbicidal soap, based on its chemical structure, its mode of action, as well as it's already recognized by university and growers out in the community right now as a soap.

We do agree, there are other organic alternatives to this that are on the market right now, corn gluten, vinegar, clove. However, it's our understanding from university researchers and growers that some of those do not give consistent and adequate performance, as opposed to what pelargonic acid may provide.

In addition, yes, there are other cultural practices that could be used versus this herbicide, manual removal. However, that is time consuming, expensive. Pulling the weeds could disturb the roots of your ornamental plants, also contributes to soil erosion, and as well as disturbing the soil often creates more germination of the weed seeds.

Why we are petitioning for this is our end use product site, it has been requested numerous times from growers for another tool for the organic tool box, and we
hope that pelargonic acid would provide a sustainable natural
product that's more efficacious and easier to use than some
of the current alternatives. Yes.

MS. CAROE: Thank you for your presentation. Board
members, do you have questions? Gerry.

MR. DAVIS: In your presentation you make a
statement about carboxylic acid being considered a soap. Do
you have any specific references that can verify your
statement? You mentioned that --

MS. GILBERT: Well, actually, where I got that one
statement was about chemistry.com. I took that from that.
We do have other publications, I'm happy to provide for you,
as well as Wicopedia online, and --

MR. DAVIS: But we looked up some of that
information as part of the committee's deliberations, and
they mentioned the carboxylic acid part that they don't make,
they didn't make the direct statement that that is a soap.
And that's what we were -- we did not have the
information needed to -- we're not chemistry experts, and we
were waiting to hear from someone to say nine chain
carboxylic acid in the form that your material is, is a soap,
by something, some documentation that that is true. All we
had was just the statements by people that aren't backed up.

MS. GILBERT: Okay. We can definitely provide hard
and fast publications or data to back that up.
MR. DAVIS: That's what was needed.

MS. CAROE: Just before we take anymore questions, herbicidal soaps are on the national list and allowed. So I'm wondering, if you are saying that this is a soap, and it's a herbicidal soap, why are you petitioning anything if it is already on the list?

MS. GILBERT: I don't believe pelargonic acid is on the list.

MS. CAROE: But if it's a herbicidal soap, it fits into the category that is on the list.

MR. DAVIS: But that's the question. That's what we're getting at right now. It is truly recognized as a soap.

MS. CAROE: Got it. Other questions from the Board? Statements? All right. Thank you so much.

MS. GILBERT: Thank you.

MS. CAROE: Next up, Steve Fennimore. I hope I didn't hurt your name. Steve, you have a proxy as well?

MR. FENNIMORE: Yes, I'm speaking for Richard Smith. I'm Steve Fennimore. I'm --

MS. CAROE: Okay, hold on one second. I've just got to get somebody else on deck. Mike Thorp, are you in the room? Mike, you'll be up after Steve. Thank you. I'm sorry. You can start.

MR. FENNIMORE: I'm an extension weed science
specialist with the University of California Davis. I'm based on Selenus. I primarily work on cool season vegetables such as lettuce, broccoli, spinach, celery.

I have a lifetime of experience in agriculture from Oregon's Willamette Valley, where I grew up. I worked in industry in Mississippi. I also worked a number of years in the midwest, and now I am back in California again.

I appreciate the complexity that this Board deals with, with all of agriculture in the U.S. I have just seen part of it, and I am by no means unique with that cross-section of agricultural experience.

The one thing I want to impress with you, after reading the comments, I'm not sure that the comments of the Board necessarily appreciate the complexity of managing weeds in organic or in any agricultural system. And so that's what I want to emphasize.

I was on the organic research panel with USDA CSRES two years. And projects which were proposed which did not deal with organic systems in a systematic manner were soundly rejected.

Some of the comments that you made in the rejection of pelargonic acid imply to me that a lack of appreciation of the complexity and the need for tools in the system. And so my comments are going to be made to, speaking to the comments made in the rejection.
I have tested pelargonic acid several times. I've tested a number of organic products, including corn gluten meal, acetic acid, various vinegar formulations. And one thing I will say about pelargonic acid is that the formulation is actually a commercially viable formulation. It is on the market. It is making it as a conventional herbicide. And it's got some pretty good competition there. I think that speaks to the quality of the product. But what I get are consistent results. And I guess I'll challenge you all to, other than with a disk blade, which tillage does work every time, or generally every time, to get the consistency from some of the other products, because we have tested them.

There is no such thing as a weed. There are over 300 species of weeds recognized in the world. Some of them are perennial weeds, field bind weed is extremely difficult to manage. And so to make simplistic generalizations, the fact that a product should or should not be considered organic, I think one needs to appreciate the complexity. So one, I do know the product works. I have tested it conventionally. But what my point is, is integrated wheat management requires many different tools, because there are many, many different situations. And weeds are very effective at going from seed to seed in a very short period of time.
For example, shepard's purse. I have documented it going from seed, from emergents, to setting a viable seed in 40 days or less. In our climate it can do that.

I will cite the research of Andrea Grundy in England. She documented transitions from organic to conventional in England. And what, and consistently what researchers find is that there are increases in the weed seed bank, thereafter, during the transition. After several years, there seems to be some stability. But generally, organic growers are dealing with a higher weed population.

The reason is, this is recognizing weed science, whether it's right or not, it's sort of the consensus of the time, is that when you remove tools from, weed control tools, that you increase your weed control problems. So if you do not, for example, in an organic system, you do not have a residual herbicide, pre-emergent herbicide, and some would claim that corn gluten meal fits this. I would strongly challenge that.

You do not have residual weed control. You have post-emergents weed control. You can only control emerged weeds. And emerge weeds are only a very small fraction of the total weed population. Most of the weeds are seeds in the soil, seed bed. And so you need multiple tools. I will say that again and again.

One thing that you did not comment on here, you did
not recognize, apparently, is the use of propane flaming. Because some of the comments in here imply that herbicides are not necessary if we do, if we farm properly, we use cover crops, we do crop rotation, that we simply don't need these herbicides. And I guess I would really challenge that, because I'll give you an example, and this is a real guy. His name is Phil Foster. He raises organic onions in Holister, California. And what he does is, he prepares a stale seed bed. He has a raised bed. He plants -- he pre-irrigates, that is irrigation prior to the planting, and he removes the weeds with a Littleton cultivator. He comes in, if he has time, pre-irrigates again, and removes them with propane. The trick is to try to not disturb the soil. My point about the propane is, this is a real guy in a real production system, and it really works. The thing is, going over it with propane is basically a substitute a conventional grower might use Roundup or some other product in that instance. He's using what he can. He's compliant. He's a good farmer. He's highly skilled. But what that means is there is a need for a product that goes quickly over a field and removes weeds. The trouble with propane, propane is subject to the world price of energy, creates CO2, and we now have, we are trying to be compliant with the Kyoto Treaty in California, and perhaps the rest of the country will finally follow.
But I think we need to be conscious of this, because the world is absolutely taking it seriously. So, and also, it's a hazard. Propane is explosive. It's also very hot, and there are some worker safety issues.

So, and the other issue, shallow tillage is used to remove weeds from parastial seed beds, but you can't always do that. Rainy weather often interferes with that. Hillsides and such, you've got erosion issues. You just can't always put the tractor in the field.

And there are a lot of places where you can't use tillage. You can't use it everywhere in an orchard, in a vineyard. You can't use it that close to an irrigation valve. And so those are all places where something like propane, if you can use it, if it is a dry part of the season, you might not be able to use it because of a fire hazard. I would argue that something like Sife would be an excellent product to be able to use in an organic farmstead around irrigation valves, for example.

Okay. Vinegar. There's a comment in here that vinegar or acetic acid is a potential substitute for this pelargonic acid. And I guess, you know, the comment is made, up to a 20 percent solution. Has anybody here tried a 20 percent solution for acetic acid? It's very caustic. You do not want to get it in your eyes. You do not want to get it on your skin.
Also, it's very caustic to equipment, to nozzles. Those of you who may have used sulfuric acid will know, because it was used in onions, and it still is in some places, is extremely corrosive. And so this is, I'll just tell you straight out, it ain't easy. Maybe on paper it's there, available, but I'll tell you, just try it. It's not easy. And it's not fun. And it's not very nice.

Corn gluten meal. Yes, corn gluten meal is listed as an alternative. You quote Penn State. But you know, you say that Penn State lists it as a less toxic product. But what you didn't say, does Penn State say it works? I didn't see that comment in here.

I have tried it, and I have submitted to you a test we did a number of years ago, and it isn't just me. There's a number of colleagues who have tried it. We've tried to duplicate some of the work that's come out of Ohio State, or Iowa State, sorry, and have not been successful in replicating that work.

And I will close with just salt, which is listed as an alternative. Nobody would put sodium on their field. It's toxic to plants.

Cover crops and rotational crops were listed as an alternative. As a substitute for herbicide, I would say cover crops are in the field for a few months, perhaps. We grow crops year round in California. And also crop rotation
is listed as an alternative. Crop rotation and cover crops are extremely important, but they are integral tools, and they need to be utilized with a whole systems approach that includes an herbicide.

   I would argue that the growers already using compounds like herbicides in their system, and I'm talking about propane, this offers another alternative. I'm done.

   MS. CAROE: Hold on. Let's see if we have questions. Kevin.

   MR. ENGELBERT: I know we're running short of time, and I'll make it brief, but I want you to understand some of our perspective. We don't look at weeds, I'm an organic farmer, as a necessary evil. We use them to gauge the health of our fields. And we don't want the mentality to have farmers to go out and see a weed and spray it. Weeds are trying to tell farmers something is wrong with their soil.

   We use, you mentioned Shepard's purse. We used to have severe problems with Shepard's purse on our farm 30 years ago, when we were farming chemically. We don't have it on our farm anymore, and we didn't use any herbicide to get rid of it. We took care of our soils properly, let the rejuvenate and become healthy, and that has taken care of the problem.

   So I just want you to understand a little bit. It's not a case of not understanding the complexities of the
situation, but that's where we're coming from as we look at these things and, you know, make our decisions.

MR. FENNIMORE: What do you raise? What are your crops?

MR. ENGELBERT: Field crops, mainly.

MR. FENNIMORE: Okay.

MR. ENGELBERT: Some vegetables, but mainly field crops.

MR. FENNIMORE: Okay. I guess I realize the difficulty of establishing a seed bed for lettuce or for spinach or other small seeded crops. It's difficult to do with weeds. And given the food safety issues, and the disease issues, we don't have all of the genetic resistance to diseases that many of the field crops do.

I understand what you are saying about the soil health, but I guess I would also contend that organic agriculture has a longer history than conventional agriculture. And I'm talking about the 7,000 years of history. And weeds have been friends, companions throughout.

They are a cost.

I appreciate your position, but I don't know that it necessarily applies across the country in all situations.

MS. CAROE: Jeff.

MR. MOYER: Yes, my understanding is that this petition is not for crop land.
MR. FENNIMORE: That's my understanding, too, that it's for farmstead and ornamental use. Yes.

MR. MOYER: So in that case, it wouldn't help your producers with onions?

MR. FENNIMORE: Not yet, I guess. Not at this point. We need products like this, and I'm responding to the comments in here which implied that herbicide-like products are not needed. And I guess, personally, I don't think you guys should be dictating what a farmer should do. I think that should be, the decision would be left up to the marketplace. That's my opinion. I'm exercising my academic freedom to say that.

MS. CAROE: Joe.

MR. SMILLIE: Probably Julie is going to ask this, is it a soap?

MR. FENNIMORE: I'm not a chemist.

MR. SMILLIE: Right.

MR. FENNIMORE: I think that that question needs to be issued. From what I know of organic chemistry, it looks like a soap to me, but that's my opinion.

MS. CAROE: Gerry.

MR. DAVIS: We're short of time so I'll shorten my comments to only one. One of the primary natural materials or types of materials that we mentioned as an alternative was clove oil, things like that. And I noticed a curious lack of
mention from your presentation, there are products being sold in California that are clove oil, cinnamon oil materials, that I have personally looked at, and they are quite active as herbicides. And I wondered what experience you had with them?

MR. FENNIMORE: Well, I couldn't say everything in 10 minutes, but I did submit these written comments to you. I submitted a paper, a peer review paper from Weed Technology. And here is my comment. I'm quoting from our paper.

Percentage weed control with clove oil. I'll go with a number of weeds, it actually provided fairly poor control of purslane, provides poor control of grasses. The cost was quite high for effective weed control. The problem that we had is that the labeled weed control rates for clove oil, for example, were too low. And we tested effective rates, and came out with a cost of over $500 an acre. So yeah, I see --

MR. DAVIS: Was that a commercial formulated material?

MR. FENNIMORE: Yes.

MR. DAVIS: Or was that a straight clove oil?

MR. FENNIMORE: Yes, it was. It was. I don't remember off the top of my head.

MR. DAVIS: All right. You submitted those
comments in writing to us?

MR. FENNIMORE: Yes, I can give you another copy, right here.

MR. DAVIS: All right, great. Thank you.

MS. CAROE: The Crops Committee can take that up then in reviewing those comments. Thank you. Do we have any other comments from the Board? Okay. Thank you so much. We have Mike Thorp now and MJ Marshall, you are on deck. MJ, are you here? Is MJ Marshall in the room?

Before you get started, there has been a request that the conversations in the back of the room be taken outside. It's a little distracting to some of the people that are trying to listen to the commentors.

MR. THORP: Good morning. My name is Mike Thorp, organic manager for Tanimura and Antle based out of Selenus, California.

I've farmed organically for 20 years in the central California area, and have tried many of the approved materials. I will not say that some of them, of the other approved materials don't work. I just believe that Sif could be a good companion to some of those, and would work well on hard to kill weeds.

We have tried vinegar. We have tried corn gluten with very little success. We've also worked quite a bit with propane burners, but my main concern there is worker safety,
The other issue that has come about most recently is with the food safety for leafy greens being put into effect after the e coli outbreak of September 14th of last year. I think we do need more materials to clean up borders and ditch banks and roads, because those are going to be really looked at for mitigating road, unswept tiles, and other wildlife, just to keep the food safety issue at its best. So that is all I have.

MS. CAROE: Thank you. Hold on. Any comments? Thank you so much for your comments. MJ?

MS. FRANCES: She just stepped out.

MR. THEUER: I'm ready. Start the clock when I get everything organized. Thank you. My name is Rich Theuer. I'm from North Carolina. And I'm a consultant to industry. I've done a few other things, but I'm representing today, George Westin Bakers, who petitioned the committee, the NOSB, to allow and add natamycin to the national list at 605 A.

Now, I'd like to thank the committee for, the Materials Committee for its report as a checklist of things that we either did not give you enough information or we were not specifically precise enough to allow you to make a
decision. So as a boss once said, no is a request for more information, and that's why I'm here.

The committee report, as I synthesize it has said that natamycin was nonagricultural, synthetic, preservative, not needed for bread. Can I have the next?

Well, the position is, we agree with you, it's not agricultural. We disagree on nonsynthetic because by law and by the operation of the definition in the OFPA it is nonsynthetic. We agree it's a preservative. And believe it or not, we agree that it's not needed for bread. Could I have the next one?

It may not be needed for bread, but it's desperately needed for fresh English muffins. Now, I'm glad you are laughing. Can I have the next one, please?

This is an English muffin. It comes from the bakery. We're talking about fresh English muffins. Never frozen. In about two days or three days after it's baked, it shows up in the store. It has a shelf life label of 13 days. It's good for about 16 or 17 days before it turns moldy. Could I have the next?

That's a moldy English muffin. Now, you say, well, that green stuff is mold. It's Penicillium species, Aspergillus. I learned on the weather channel the other day that 22 percent of the American population, and I'm one of them, has allergies. Mold allergy is real, and moldy food, I
found on Medline, can actually produce death and anaphylaxis if you're sensitive and the mold count is high enough. Moldy is bad. Can I have the next slide, please?

So, why is it not necessary for bread, and why is it necessary for English muffins? And it's a very obvious answer. One is moister than the other one. The water activity of an English muffin is much higher than of bread.

English muffins contain more and 40 percent moisture. Breads, rolls, buns, must contain less than 38 percent moisture per FDA regulation. Can I have the next, please?

These are data taken from the ARS nutrient data laboratory database on the web, and it shows the moisture content of various baked goods. You'll see on the bottom, break, French or Vienna bread, they're about 28 percent moisture. Old bran muffins, 35; bread, whole wheat, commercially prepared, 38, against a 38 max in the regulation. English muffins are up above 40, 42-45 for whole wheat ones. Could I have the next one?

These are the data taking it one step further, showing the standard error and the number of samples of English muffins we tested by the USDA and English muffins plain. And it's pretty clear that that 42.1 percent level has an end of 140, standard error of 0.2, standard deviation would be about 2 or a little bit. So 40 percent seems to be
the big line. Could I have the next? The next, yes.

So, what did the petitioner do? It said, are there any other nonsynthetic preservatives on the national list? And the answer is yes. Citric acid, lactic acid. Could I have next?

We tried those. We tried citric acid, lactic acid. They were too tart, too sour. So tried again. Could I have the next one? Tried citric acid and organic vinegar, source of acetic acid, another antimicrobial, antimycotic. That one was tried. The commercial shelf life was 10 days, which is not adequate. Can I have the next?

Tried to sell them? It didn't work. They failed. The taste was too sour. And so you have a chance to have something to eat. We have -- let me get these out very quickly. My time is running out. You have a chance to taste them. Could I have the next one, please?

Now, this is what our -- well, they'll be here, and I'll give them to you in a minute. Our petition was to say, packaged back goods, yeast leaven, yeast leavened backed goods. Could I have the next one, please?

That was really too broad. And the really precise requirement is something containing more than 40 percent moisture, and for the treatment of English muffins, nothing else.

MS. CAROE: Thanks Rich. We do have the rest of
your slides in hard copy. And we'll accept those as comments as we look at these materials.

MR. THEUER: Okay.

MS. CAROE: Do we have any comments from the Board? Questions? Hearing none -- Jeff.

MR. THEUER: Yes.

MR. MOYER: Rich, what is the difference in shelf life when you use the product versus when you don't use it?

MR. THEUER: If you have a --

MR. MOYER: I mean, that's really what you are talking about, shelf life.

MR. THEUER: Yes, exactly. And I'd like to get one other thing in, so you have a full deck to answer that question. If you do not use a mechanism for controlling the mold, they go moldy in about five days, four to five days. And if you do use the natamycin at a level of actually half of what we are requesting, 20 parts per million, what the FDA allows, you can get up to 16 days, and you have a labeled shelf life of 13.

Now, I'm talking about fresh English muffins, the ones that are never frozen. There are other brands that freeze them, deliver them to the store, so that that distribution time can be controlled. And so you can find English muffins that have been previously frozen that, in one case, which I found in a store last night, Whole Foods, an
organic English muffin, apparently they thaw it out in the back room and they put it on the shelf. They also have these two agents in there now, vinegar and citric acid, and I would think at about the same level. And as I said, they go.

In the Whole Foods in Raleigh, where I am, there was a -- they did not have any kind of preservative. Those were frozen probably to get to the store, and then are in a refrigerator case. But they're not that many places where you have a refrigerator case in a bakery isle. And so for practically 100 percent of the stores in the United States, fresh is the only way to go.

MS. CAROE: Bea James.

MR. THEUER: Yes.

MS. JAMES: Pharmaceutically, is natamycin used as an antifungal and an antibiotic?

MR. THEUER: In the petition, we had information that natamycin has been used in some eye preparations for mold infections of the eye. It's also been used in some livestock uses as a, to fight mold, mold infection. Was that your question?

MS. JAMES: Yes. So do you know if it's also used as an antibiotic?

MR. THEUER: Oh, not too much anymore.

MS. JAMES: Systemic, yes.

MR. THEUER: No, no, not too much anymore. See,
natamycins are extremely insoluble. And the way they put this on is, let me throw one more, is they spray the outside of the muffin after baking. So it's only on the outside, which is where the mold grows.

MS. JAMES: Why not just sell the English muffins frozen?

MR. THEUER: Well, I looked in the frozen section of the grocery stores within a gallon of gas drive from my house, and I didn't see any in the frozen section.

MS. JAMES: Do you think a consumer would rather have a frozen without that ingredient, or a fresh with the ingredient?

MR. THEUER: I can't answer that question.

MS. CAROE: Kevin.

MR. ENGELBERT: I think I know the answer, Rich, but just to be sure, you can't make an English muffin at a lower moisture?

MR. THEUER: My understanding, based on the data is, I don't think so. I'm not really technically competent to answer that. But I --

MS. CAROE: Tracy.

MS. MIEDEMA: I guess this is a little more of a comment than a question. If this were added to 606, that's what this petition is, or --

MR. THEUER: No, 605.
MS. MIEDEMA: -- this is 605. Okay.

MS. CAROE: 605.

MS. MIEDEMA: It's not specifically to be used just as an English muffin spray, right? This would be something that anybody from here on in food production could use in unlimited quantities?

MR. THEUER: Can I suggest that we, our petition was amended, strictly for English muffins.

MS. MIEDEMA: Okay.

MR. THEUER: We suggested 40 parts per million in our petition. FDA allows 20 to 22, and the bakery uses 20. So it would be a specific requirement on the level and the surface application only, and only for English muffins.

MS. MIEDEMA: Okay.

MS. CAROE: Any other questions from the Board? Comments? Thanks, Rich. Are you going to be around for a while if the committee has any questions?

MR. THEUER: Yes, yes. Can I offer you some --

MS. CAROE: We have a break coming up in just a little bit.

MR. THEUER: -- sprayed or unsprayed. It has citric acid sprayed on it.

MS. CAROE: MJ Marshall, are you in the room again?

Okay. And then do we have Kim Eason in the room?

MS. EASON: Yes, I'm here.
MS. CAROE: Kim, you're on deck.

MS. MARSHALL: I have some slides, Valerie. Are you going to get those up?

MS. FRANCES: Yes.

MS. MARSHALL: Okay. Great. Good morning. I'm MJ Marshall. I'm the director of government relations for the Flavor and Extract Manufacturer's Association. I appreciate the opportunity to comment before you today.

FEMA represents the manufacturers and end users of flavoring substances that are used in foods, including foods labeled as organic, or made with organic. Our members vary from large international corporations to small family owned operations. And many of those companies are just beginning to investigate the potential of supplying their nonsynthetic flavors to the organic industry.

What I'd like to do is provide a summary of our written comments that we've supplied to you today, and comment on the current listing of flavors on the national list, section 205.605 A, whether most flavors could be considered as agricultural, and finally on some of the challenges that lie ahead, should individual flavor substances require petitioning onto the national list.

In late February, the NOP stated in a guidance document that quote, flavors, nonsynthetic and nature, nonagricultural were on the national list and do not need to
be petitioned for as long as they meet the existing definitions. FEMA strongly agrees with that statement. But we also recognize the conflict between listing of flavors on 205.605 A and the existing situation where some flavorings have been certified as organic. We believe this discrepancy can be resolved in a manner that would provide for the continued development of certified organic flavors without compromising the necessary listing of flavors under 205.605 A.

Second, with regards to agricultural and nonagricultural determinations and how they apply to flavors, while a decision treaty to delineate between agricultural and nonagricultural has been proposed, we would suggest that there are necessary and critical modifications that are essential in the language of this treaty prior to its adoption so it can apply to complex materials such as flavors.

Finally, in the remainder of our comments, we'd like to highlight some of the challenges that lie ahead, in attempting to place individual flavors on the national list without careful consideration and planning. And I have some slides, as I said, to illustrate that. Can you get that? Yes.

First, an orange tree classified as citrus sinensis produces the standard sweet orange, as we have there. This
orange can be squeezed to produce orange juice. We think we all would agree that this is an agricultural product, that the three things, excuse me, the orange tree, the orange and the orange juice will be classified as agricultural.

But now let's consider one possible flavoring preparation from an orange. Orange oil provides flavor to many foods, including beverages, flavored yogurts, and candy. It's produced by extraction or fractional distillation from orange rinds and pulp followed by further fractionation, blending, and standardization.

A flavor company makes its living by making every batch of orange oil that it produces exactly the same as the last. While orange oil may have begun its life as an agriculturally derived product, the process of purification, blending, and standardization removes it sufficiently from its origins so that it no longer has the same chemical composition as freshly distilled nonblended orange oil. Next slide.

To further add complexity, orange oil is, in fact, a natural flavoring material that's composed of many individual flavoring substances. At last count, roughly 60 substances have been identified that contribute to the orange oil flavoring affect. And we question whether or not, because these are individual substances, would each of them require a petition to be added to the national list? Next
slide.

In fact, if we were to look at more than the 200, more than 200 different flavorings of unique natural origin, we would find that there are more than 2000 different flavoring substances that are present in varying amounts, and almost 400 different natural flavoring preparations.

If each of these were considered agricultural and require a petition, we all have our work cut out for us, and while we recognize that NOSB is very hard working, we think -- and NOP as well, we think that they want time to see their families. Given the complex characteristics of flavoring materials, the large number of naturally derived flavoring substances and remaining ambiguities regarding NOSB definitions of substance and agricultural, we believe this issue requires careful contemplation.

While we'd like to say that we have a great proposal, that we feel NOSB should adopt today, we simply don't. However, we would like to work with NOSB and NOP on this endeavor.

MS. CAROE: Thank you, MJ. Joe.

MR. SMILLIE: Yes. Thanks. Good presentation, and obviously we need to work on our ag/nonag document to start to make it work for industry and the community.

MS. MARSHALL: Right.

MR. SMILLIE: You said that you felt that the
discrepancy between the certification of organic flavors
which is currently happening and many members of your trade
association are producing organic flavors.

MS. MARSHALL: Well, I'd say that just a very
limited number of them.

MR. SMILLIE: It's growing.

MS. MARSHALL: Yes.

MR. SMILLIE: And you say that the discrepancy can
be resolved in a manner that would allow for the continued
development of certified organic flavors without compromising
the listing under 605 A. I wonder if you would just
elucidate on that a bit?

MS. MARSHALL: Well, to be honest, Joe, that's one
thing that we are still working on internally, and that's why
I said that we really don't have something that we can
propose to you today. But we are talking about it a great
deal within FEMA.

And as I said, we would appreciate the opportunity
to work with NOSB and NOP on that particular issue. And
we've had some discussions with Mark Bradley and others about
that very thing. So we look forward to trying to resolve
this as quickly and as reasonably as we possibly can.

MR. SMILLIE: Okay.

MS. CAROE: Julie.

MS. WEISMAN: Yes, I also wanted to thank you for
your very short but rich presentation about what the
challenges are. I had one question and one comment of
couragement.

The question was, when you had that schematic on
the board, you said that after the orange goes through all of
these various stages, to be distilled and standardized and
blended, that it is, that it -- what, in those processes, do
you believe makes it likely that it's no longer considered an
agricultural product?

MS. MARSHALL: Well, I think as I said, all the
different distillations.

MS. WEISMAN: Okay. Distillation is an allowed
process in organic preparations.

MS. MARSHALL: Right, right. I know. I understand
that. And fractionization, things of that nature. But I
think that as I said, all of those processes, while they can
still be, as you said, organic compliant, and the end product
can still be considered natural, we just don't believe that
it's any longer recognizable as an agricultural product like
you have with orange juice and things like that, that are
freshly squeezed, that just come immediately from the orange
itself.

MS. WEISMAN: Okay. Well, I guess that's a nice
segway into the comment that, of encouragement that I wanted
to make, is that I -- it will be certainly discussed further,
I mean, this has obviously become a very important issue in the flavor industry, and in the organic industry. And I think that we are going to be discussing what kind of opportunities we can create at this point to engage your expertise, the expertise of the rest of your members, and bring them, you know, into -- you know, bring them to this table and the discussion.

MS. MARSHALL: Right. Obviously, we think the flavors are very essentially to organic products. And we don't want to lose any flavors, because as I said in the presentation, there are, you know, more than 2000 --

MS. WEISMAN: Right.

MS. MARSHALL: -- different flavors. And you can have 2000 different strawberry flavors alone.

MS. WEISMAN: That's right.

MS. CAROE: Any other questions? Comments? All right. One more petitioner, commentor left. Thank you, MJ. I have Kim Eason, and then we are going to take a small break. We are about, just a little over an hour behind schedule already. So, but Kim.

MS. EASON: Good morning. Thanks for holding out for the last but hopefully not least of all the presentations this morning. My name is Kimberly Eason. I'm the director of strategic relations for Trans Fair USA. We do fair trade certification for agricultural products coming from the
developed world into the U.S. market.

We work with over 1 million farmers and farming families, workers around the world that sell products under the fair trade certified label. And that's coffee, cocoa, tea, fresh food, and a number of other products. Over 80 percent of these products brought into the U.S. market are also organic certified.

In 2006 alone, we had over 50 million pounds of dual certified coffee, Fair Trade and organic certified coffee imported into the U.S. And the estimated retail value of that product was over $605 million dollars. Producer impact for farmers producing that product is over $85 million dollars in above market additional revenue back to small family farmers.

We work with 600 businesses that distribute these products into 40,000 retail chains across the country, retail outlets.

I'm here to comment on the possible change and possible ban of the internal control system for grower group certification which came to light very recently in meetings in Germany and in California, NOP certifiers training sessions.

I make my comments based on my understanding that the NOP will begin to require that 100 percent of all farms within a small farmer coop be inspected annually by
independent certification agencies. That's actually a new application of the existing law, 205.403.

I recognize that this is not on your agenda for this meeting. But I want to call caution in moving forward with this. As an organic consumer, a business person, an advocate for small scale farmers in the developing world, I'm alarmed about the devastating impact that this change in procedure could have on farmers and the organic market in particular here in the U.S.

The unintended consequence of this action will be the exclusion of vast numbers of small farmers worldwide from the U.S. market, and will also leave businesses and consumers without access to these quality organic products. For coffee, it could essentially wipe out the organic coffee market in the United States, because the small farmers are the ones that supply that coffee.

The organic certification community has recognized the need to adapt certification procedures to the socio-economic reality of organized small growers in developing countries, at the same time recognizing the need to protect the integrity of the system and the label.

For many years now, community grower groups have been inspected and certified based on an internal control system evaluation. The ICS system is not unlike other quality system based audits and even fair trade certification
uses a form of ICS for grower groups with a high degree of success. The EU and Japan are not, are not seeking to change the way they certify organic.

I did speak with one of the grower groups that we work with out of Nicaragua. They, it's about a 2000 member coffee cooperative. They say that their costs under this new kind of rule would be $50,000, and those are for farmers that maybe earn an income of $1000 to $2000 a year. So you can see that that would just not be possible for them to pay that high cost.

As you all know, there are many benefits of organic farming, far beyond the environment and social benefits. I don't have time to go into that here. I'm an active business member and a past board member of the Specialty Coffee Association. I'm currently on their sustainability committee, so I understand all the volunteer work that you all do, how important it is.

I have been made aware by many of the member business of the Specialty Coffee Association that this is an issue on the radar screen, and people are very concerned about it and urging caution and moving forward.

I guess the request is just to take some time here before pushing this issue forward. I believe that there is another solution. We need some time as the organic community and working with the certifiers to understand what we can do
to assure the integrity of the system, and at the same time, not totally disallow ICS's for grower group certification.

Trans Fair USA and the whole, our business network and grower network, and all the Specialty Coffee Association, all of those members, we are interested and willing to help put forth a solution, if we have time to do so. So thank you very much for your consideration.

MS. CAROE: Comments, questions? Joe?

MR. SMILLIE: Yes, again, I would, from the NOSB's point of view on this issue, it's new, and it will be put into the work plan for the Certification, Accreditation and Compliance Committee and where we will start is with the NOSB 2002 recommendation.

So all of your people should get a hold of that document. See what you think of that document, and get input back to us. And then hopefully we will move forward and create some sort of recommendation which we can then reinforce the recommendation that we already made in 2002 to the NOP.

MS. EASON: Okay.

MR. DELGATO: Can you describe for us what kind of process your farmers in Nicaragua follow to get their certificate?

MS. EASON: Yes. There is, the internal control
system there is a person or group of persons that are responsible for training the farmers for organic certification, and then overseeing the control, quality control of that system. When the organic inspector comes, they are allowed to inspect the internal control system, and a number, 20 percent of the members, to have actually the inspection visit on site. So the idea is that this is a system that's been used, and that has worked with a degree of success.

MS. CAROE: Any other questions? Comments? Thank you for your comments.

MS. EASON: Thank you.

MS. CAROE: Is Nancy Hirshberg in the room? She just left. Do you know what? We'll get her after break. I understand she has some answers to some questions the Board had. Nancy. She's right here.

MS. HIRSHBERG: I was just standing there waiting for you.

MS. CAROE: Nancy. Sorry to put you on the spot, but I understand you do have some answers for us. So I'll give you an opportunity before we break.

MS. HIRSHBERG: Yes. The question that Bea had asked was, did we start using this product because of the calcium marketing claim or because of the functional properties. And we started using this product back in '99-
2000 in our YoSelf, which is a product geared for women. And it had, so we were able to talk about calcium, fiber, and the prebiotic.

And what happened was, when we started using it, we found it had all these wonderful, in addition to the nutritional benefits, it had all these wonderful functional properties. And I got some more detail on those. Sorry.

That it improved the mouth feel and the texture. It decreased that syneresis, which is the separation. And it improved our shelf life. Because what happens over time, in yogurt, as you know, it gets more tart. The ph drops as you get towards the end of shelf life. And you get curds in it, lumps. And so this decreased that as well. So at that point we decided to move it into all of our products because of that.

MS. CAROE: Thank you, Nancy.

MS. HIRSHBERG: Sure.

MS. CAROE: Okay. Joe.

MR. SMILLIE: So it's a lumper -- it's a splitter not a lumper, right.

MS. CAROE: You needed to do that. Okay. We're going to take a short break. 10 minutes, no more. We are so far behind schedule. The Board back in your seats in 10 minutes, please.

(Break.)
MS. CAROE: All right. We're back in session and we're moving onto discussions on the Policy Committee recommendations. So I'm turning it over to Rigo Delgato.

MR. DELGATO: Madam Chair, thank you very much. We have two items to recommend. The first one is six changes to the policy and procedures manual. I'll review those very quickly. And first of all is a clarification on procedures for counting abstentions. That's on page 12, section 2.

On section 3 we have a flow chart that we included in there to clarify the role of the NOSB executive director. That's on section 3.

On section 4, 5, I'm sorry, we have added the description on the committee chair's role in facilitating transition for committee chairs. As you'll recall from our last meeting, that was an important topic that was recommended from the floor. We also have included procedures to present committee recommendations in section 5.

And finally, we have included a comment on the exclusion of annotations during sunset review. That's on page 52, section 8. So far we received comments on that last addition asking us to not go forth with that addition on exclusion of annotations. And we have not received any other comments on the other points.

The second recommendation is the official presentation of the new member guide, which is a document
that we think will help in the transitioning of new members, but I'm going to ask my vice-chair Bea James to give us a general description of the document.

MS. JAMES: The new member, the purpose of the new member guide is to introduce and not scare away any newly appointed members. The document is intended to be an accompaniment to the policy and procedure manual. The background is, we realize that no one should come into a five-year NOSB commitment without fully understanding the level of time and energy that it takes to contribute to the mission of the Board.

The new member guide is intended to be an educational, informational support reference for the NOSB, as well as any potential interested members in the public. The recommendation will be to accept the NOSB new member guide as an official document and post it on the website for all to use.

MR. DELGATO: And that are the two recommendations we have, Madam Chair. Thank you.

MS. CAROE: Okay. Do you want to take questions and comments, discussion on these one at a time?

MR. DELGATO: Yes, please.

MS. CAROE: Okay. And shall we start with the policy manual changes?
MR. DELGATO: Yes.

MS. CAROE: Does any of the, do the Board members have any questions or comments on any of the changes proposed to the policy and procedures manual? None. Any discussion on the last item, regarding, which we've heard comment on, regarding the sunset process, that actually sunset process was written in 2004, I believe, 2004-2005, as far as allowing changes to annotations. Jeff.

MR. MOYER: My understanding, when I first started on the Board in talking with Arthur Neal at the program level, was that we were not allowed to make changes to annotations. Was Arthur mistaken at that point in time or is that an accurate statement? Because we were always instructed that we could not. Many of us felt that changes to annotations were warranted, but that we could not do that.

MS. CAROE: I have an answer, but I'll let the program answer that question.

MS. DELGATO: Go ahead and answer.

MS. CAROE: Sunset is by definition, and not definition in OFPA, not definition in our regulation, but definition within government --

MR. MOYER: Right.

MS. CAROE: -- to mean the, an opportunity to look at regulations that have been in place for a length of time for their continued viability. And it is regulations as they
exist. Therefore, when the Sunset procedures were written and we looked at this, a material being listed on a list with particular restriction, in whole, is the regulation. So those restrictions of an annotation are, indeed, part of that listing. And we felt it was inappropriate to consider any changes to that, or further restrictions, which would be new legislation, new regulation. Sorry. So that was where we were with that. Is that consistent with what the program's view of sunset is?

MR. BRADLEY: Mark Bradley, National Organic Program. That is the way we have been dealing with this, and part of that was to expedite the sunset review process, so that we're not getting into the -- you can petition a change in annotation, or you can petition to have something removed from the national list as a separate function.

But in working with the Board, I think what we agreed was that it was more functional to go ahead and just consider the material and the annotation together with, for sunset, just to make a decision whether it was going to be renewed as written, or to go ahead and just let it go off the list. And it would go off completely with the annotation.

MS. CAROE: Does that answer your question, Jeff?

MR. MOYER: Well it does, but then my question to you is, what exactly are we talking about here, changing that policy?
MS. CAROE: We are considering the public comment, which is suggesting that we change that policy.

MR. DELGATO: Yes. Just to clarify the addition to the policy manual is, states as follows. The annotations cannot be included in a recommendation during sunset review. That's what we're looking at. So there is no question, no doubt that was the intent of this. Bea.

MS. JAMES: So I guess I would like some discussion around the idea that the comments that we heard from the public were that we potentially might be limiting ourselves by having that documented in the policy and procedure manual. And I wanted to know what your thoughts were on that, Mark.

MR. BRADLEY: I'm sorry. I couldn't hear.

MS. JAMES: The comments that we received from the public were that we are limiting ourselves by, potentially limiting ourselves by putting that change into the policy and procedure manual, that annotations are not allowed and not a part of sunset. And I wanted to know what your thoughts were on that?

MR. BRADLEY: You mean the recommendation or the comments that Jim was making yesterday about, about having the material and the annotations be subject for review at the end of it?

MS. JAMES: Yes, and Emily Brown Rosen as well as Harriet Behar also made that comment.
MR. BRADLEY: I can't really comment on that at this time, because we would want to consult the attorneys. And anything that we have developed as far as policy, you know, for the sunset process, has gone through our legal counsel. So that we can certainly discuss this, but I wouldn't want to do it just, you know, at the spur of the moment.

MR. DELGATO: Julie.

MS. WEISMAN: Yes, we certainly need to hear like the legal perspective, but I just wanted to, you know, say from a practical perspective, Bea, Rigo, we are all veterans of the first big sunset process. And I just want you to try and remember what we were doing at that time, and what that would have been like if we had been considering annotations and having to require and wait for TAP reviews on those materials.

The way I look at it, there's four other years during a listing when those changes and annotations can be considered. And that's a much better and more fruitful time to look at those things, I think.

MR. DELGATO: Andrea.

MS. CAROE: And again, this was stated before, but it needs to be restated. At any time somebody can petition for an annotation change. Sunset, sunset, we use as just, like I said, the continuation of that regulation. If the
annotation is inappropriate, then a petition is, can be
filed, and we can look at it. It's not never looking at
annotations, it's just not looking at them during sunset.

MR. DELGATO: Just to comment on that, one of the
suggestions was, or comments from the public was that given
the fact that the urgency of sunset has passed, and the need
to have that efficient process in place is probably no longer
necessary. It would probably more convenient to be able to
make changes to annotations. I wonder what you guys think
about that. Andrea.

MS. CAROE: Every five years we're going to look at
that bulk of materials. Every five years we're going to be
under that urgency. Trust me, five years flies by.

MS. WEISMAN: And every five years from now, given
the bulk of what we are doing today.

MR. DELGATO: Thanks, Julie. Can we have Bob and
then -- yes, Bob.

MR. POOLER: This is Bob Pooler. We understand the
sunset process is to review the regulation as is. And that's
what the listing in the national list, as is. And either you
accept it and review it, as is, or you do not. A change of
the annotation is basically changing the regulation. And
that, as Mark has indicated, is a separate, and Andrea, is a
separate process. That's not part of the sunset process.

Now, that is our understanding of the sunset
process. Perhaps we need to go back and take a look at what
the sunset process is to see if we can accommodate these
other changes. But our understanding at this point is to
either renew it, as is, or take it off the list.

MR. DELGATO: There was someone else that wanted to
participate? Okay. That's it. Table back to you. Any
discussions on items 1 through 5 of the additions to the
policy and procedures manual?

MS. CAROE: I just have one question.

MR. DELGATO: Yes.

MS. CAROE: And you said that no new member should
be given, thrown to the Board without knowing what they're
into, or would be? Because I don't think, I think we may
scare people off from ever applying to the Board.

But no, this is a fabulous piece of work that I
really want to commend both Bea and Rigo on, putting this
together. Bea, you know, when she first came in, noticed
that you were thrown into the fire, and we were inventing
things. And at this point in our maturity as a board, this
is an appropriate action to take in order to maximize our
efficiency with our Board members and our resources.

So my operations hat on there. So I just want to
say, I appreciate the effort, and I think it's a very good
work.

MR. DELGATO: Bea.
MS. JAMES: Thank you, and I think we are all excited to actually have a noncontroversial issue on the agenda.

MR. DELGATO: I also want to appreciate the help that we got from our executive director in completing that document. It was really a team effort, and thank you, Bea, for your always pointed comments on developing that document. And I hope that it helps the new members, and all those coming members in the future. On that note, back to you, Madam Chair.

MS. CAROE: All right. Moving along, we're going to move to Crops Committee. Gerry, if you are ready to present your recommendations.

MR. DAVIS: We have two materials ready to be presented for this meeting. One was ammonium salts or fatty acids, and that was petitioned to be allowed for general organic crop production use.

As it stands now, being that it is a soap salt of fatty acids, it could be used, technically, in compliance with the regulations as it already exists for noncrop use. But they specifically were requesting within crop use.

And the committee felt that it failed the --

MS. CAROE: I'm sorry, Gerry.

MR. DAVIS: What are we doing now?

MS. CAROE: Gerry, I'm sorry. I messed up the
order. You're not on quite yet. So if you could hold your
thoughts, I apologize.

    MS. FRANCES: He said, excellent.
    MS. CAROE: Excellent. Well, that's good.

Actually, we have some discussion items from the Joint Policy
Crops Livestock Committee in regards to research guidance. So with that presentation, I'm not sure who's making that
presentation.

    MR. DELGATO: I think I am.
    MS. CAROE: Okay, Rigo.
    MR. DELGATO: I'll give Gerry a break here. But just, we are presenting for discussion a document called,
Guidance for Certification of Operations Participating in Crop Production Research. We came out with this document to
simply provide clarification to those operations doing crop research. I'm going to discuss the essence of the
recommendation.

    It's split into three parts. And it mainly is focused on those products, prohibited materials involved in
research, and addresses the need for buffer zones, or the requirements for buffer zones when carrying out different
experimental analysis.

    And it also recognizes the use of distinct plots throughout the operation that will isolate the use of prohibited materials for experimental purposes.
In the second section, (b) -- can you scroll down, please -- the second component of the recommendation is a list of requirements that include, among others, a valid research plan, definition for description of the specific location of the experimental plot; the listing of prevented materials, and time frame devoted to the specific study as well as justification of the use of prohibited materials, and so forth.

In conclusion, we are hoping that this document will provide the clarification that researchers need to promote, as well, the development of new techniques, new knowledge, and at the same time, maintain the purity of the organic production.

On that note, I would like to ask for comments, discussion from the members. Andrea.

MS. CAROE: I just wanted to make very clear that this is not, this is not research variances, that variances are granted only by the secretary, and the Board has no authority in the granting of variances. That this is about guidance for those unique operations that participate in research efforts that are atypical of organic production for commerce purposes.

MR. DELGATO: That is correct, and when we're dealing with prohibited materials, we can't talk about variances. It's now allowed, simply. But what we did try to
do is create a framework where we can be able, are able to
use prohibited materials with the purpose of doing research,
comparative research, but at the same time, protecting the
integrity of the organic operation. We have a comment
from --

MR. MOYER: Yes, Andrea, it is also not geared
specifically to those organizations that might be doing
research, but even on farm research, so that farmers can fit
into the context of this without jeopardizing their
operation, those guidelines, as well.

MR. DELGATO: Dan.

MR. GIACOMINI: In an earlier version of this, it
included livestock coverage. I'm seeing this as exclusively
a Crops, from Crops and Policy Committee, Development
Committee, is there -- I know you still have Hugh as a
committee member on the Joint Committee. Is there a plan to
include a livestock similar document in the future, or --

MR. DELGATO: Yes, that's correct. And livestock
did participate in the development of this document. The
next step will be to come up, and we're working on the
document, is to come out with a document that does talk about
variances in both livestock and other types of areas.

So we should be having, hopefully, a version of
that mid-summer, and definitely for our next meeting. No
questions? Andrea.
MS. CAROE: Very good. Thank you so much. And so I'll look forward to an actual vote item on that at the fall meeting.

MR. DELGATO: That's correct. Thank you.

MS. CAROE: Okay. All right. Now looking at the correct schedule, I see that we are going to Compliance, Accreditation and Certification for two items of discussion.

MR. SMILLIE: Right. At the last meeting, we deferred our recommendation on standardized certificates. We had some good public input. There was, in general, the document was well received. People do feel a need for this. They thought that our recommendations was a little too prescriptive. And we've taken that under advisement.

There was also some debate in the community as to the level of detail we would go into in describing, you know, the products that would have to be on a certificate.

And we went back and asked for input, and we receive a very good input from the accredited certifiers association, and from NASOA, the National Association of State Organic Programs who both submitted documents to us. And we will take those under advisement and move forward to come out with a recommendation at the October meeting.

And I would like to -- and Jennifer is actually leading that document writing, so I'll defer to her for any
comments she would like to make on the development.

    MS. HALL: I'll just add that definitely we got feedback, and agree that the prescriptive detail of the formatting is something we will minimize, but still require English or a translation thereof.

    As well, there was some good input around adding that the category of certification be added to the requirements, and that was not something we had. So that was quite valuable. And we are just still deliberating over the level of detail of listing crops and what's too much and what's required to be sufficient at the job and certification.

    MR. SMILLIE: And we're also hoping to get this passed at the next meeting to that the NOP can take advantage of this input and combine it with the already approved NOSB document on certificate expiration dates, not certification expiration dates. And we've got that clarified, and we think that this will move a lot forward in the community, so that we've solved the problem of some of these floating certificates of ill repute.

    The second item that we will be coming out with a recommendation on in October is the peer review. And basically, we don't have that document, right, Val?

    MS. FRANCES: No.

    MR. SMILLIE: Okay. It's very brief. Let me just
bring it to everyone's attention. Harriet Behar has already commented on it. There may be other comments, too. But our committee is working in collaboration with the NOP to actually get this longstanding directive implemented.

As you know, peer review is a panel of industry peers that will participate formally in the review and auditing of the NOP accreditation system. It's mandated OFPA, the law, 1990 law, section 2117. It's also part of the regulation, 7 CFR part 205.509. And quite frankly, the program is under compliance, because we don't have a peer review panel. But we're working with them to put one in place, and we're looking for input from the community on this.

Basically, I think our role is just to recommend that NOP, you know, move forward on this. After that, we're not sure, at this point in time, how much role NOSB will have in that committee. There's some structural questions, I guess, to answer, which perhaps might need legal counsel, whether it would be a part or some sort of, how it would be joined with NOSB, or whether it would be at all, whether it would be a stand alone group.

So as we explore those options, we're hoping to have our fleshed out recommendation again for October. I would like to give Mark any opportunity to comment.

MR. BRADLEY: No, we've been very pleased with the
collaboration with the Board on this. We've had some
meetings and discussions on conference calls to talk about,
you know, their ideas and our ideas, and how we can reduce
duplications of effort and expense. So we're looking forward
to having something come out of this.

MR. SMILLIE: And I'm not sure if I'm out of order,
Andrea, but should I discuss new items on the work plan? Is
that for Thursday or --

MS. CAROE: That's Thursday --

MR. SMILLIE: That's Thursday.

MS. CAROE: -- when we'll talk about work items.

MR. SMILLIE: Okay. So that's the current
situation of the CAC Committee.

MS. CAROE: Any questions for Joe on these items?

Very good. Okay. Okay. Now, this is the real time for
Gerry.

MR. DAVIS: Okay. The first Crops Committee
recommendation that we have is for ammonium salts or fatty
acids for use as allowed for general organic crop production
as an herbicide. And the Committee looked at the information
and the evaluation criteria of what, whether we should
approve this petition.

And on the impact on humans and the environment, we
basically concluded that the material was reasonably benign,
as far as its impact on humans and environment. So
determined that it met that criteria, that gave that a yes.
On the category, the criteria of is it essential
for organic crop production, we voted that it did not satisfy
that criteria, mainly because there are alternative weed
management and practices, as well as some natural materials,
herbicidal materials that could be used if a grower wanted to
go that direction.

And also on the third criteria, is it compatible
and consistent with organic farming? We looked at the
regulation that states the herbicidal soaps are to be used
only for farmstead, you know, ditch banks, right-of-ways, and
so forth, and not -- or ornamental crops, but not in general
organic crop production.

So we felt that the petitioner's specific request
that it be approved for organic crop production for use in
crops, that our hands were basically tied, and we could not
approve that, because it directly violates the regulation at
this point.

So based on the, it -- on that, those
determinations, we felt it failed the criteria in category
two and three. And so we voted to reject the petition to
allow the use of soap salts, ammonium salts or fatty acids as
herbicides in organic crop production. The vote was five to
zero with one member absent. There was no minority opinion.
Questions?
MS. CAROE: Isn't this a herbicidal soap? I guess I don't understand because herbicidal soaps are on the list.

MR. DAVIS: For use in general farmstead --

MS. CAROE: In farmstead. So --

MR. DAVIS: ditch banks and right-of-ways.

MS. CAROE: So this, that is the gist of it, is that it would be used on the crop? That's the big difference?

MR. DAVIS: The petition was for it to allow it to be used in crops, food crops.

MS. CAROE: Okay.

MR. DAVIS: And that's what we rejected, not the fact that it could already be used in general right-of-way and farmstead applications, because it already fits the regulation.

MS. CAROE: Okay.

MR. DAVIS: Joe. Joe.

MR. GIACOMINI: Is that just in -- I must have been sleeping for a bit. Is that just in the regulation, or is that restriction in OFPA also?

MR. DAVIS: The regulation is based on the statement in OFPA that the categories of synthetic materials that the legislation allowed were, soaps were mentioned as one of the synthetic materials that are up for grabs, in other words, as far as something that can be used. So the
regulation was built from that.

But the original OFPA does not state on how soaps can be used, or whether they can be used as herbicides in crops. That was determined by a previous board, and then enacted as rules originally.

MR. GIACOMINI: So the mechanism to allow -- there is nothing in OFPA that absolutely prohibits this. So would the mechanism to allow this in crop production to be petitioned to change the annotation?

MR. DAVIS: Right. You would need a petition for rule change on eliminating that annotation that says farmstead, right-of-way, ditch bank use only. Any other questions?

The next petition and recommendation is for pelargonic acid, again, another herbicide. The specific petition was for pelargonic acid for use as an herbicide in farmstead maintenance, roadways, ditches, right-of-ways, building perimeters, et cetera, and ornamental crops.

So the background on that is, you know, soap type, soap-based herbicides are already allowed for this use. The question with the pelargonic acid is, is this a soap. And that's what we're grappling with, is the crux of the whole issue is, can the material be classified as a soap. And we were looking for information in various sources to try to determine that.
Again, in going over the evaluation criteria, impact on humans and the environment, we felt that it was reasonably benign material and not a huge impact on, and causing problems in that way. So the committee said it did satisfy the humans and environment criteria, as far as being safe enough.

Is it essential? We voted no on that one, because we felt that there were alternative materials, as well as mainly a lot of alternative practices, cultural practices, and so forth, that made it not essential. Helpful, maybe, in some circumstances, but we were trying to determine if it was essential or not.

The last category was, is it compatible and consistent with organic farming and the regulations? We also voted no on that criteria because mainly the soap issue. We could not find information from the EPA on, looking on an internet search and so forth.

The EPA information, various chemical websites that talk about, you know, from Wikipedia and everything else that we checked, they were willing to state that it was a carboxylic acid, but not one place mentioned this particular material was classified as a soap that we could find.

As a committee, we would be totally -- we would welcome that information to support the verbal claims that the petitioner made in their public comment today, that it
should be considered a soap, that we're looking for justification for that statement.

    So we felt that it was not consistent with what the current regulation says, because we can't call it a soap without further documentation.

    So the recommended action from the Committee was to reject adding pelargonic acid to the national list of synthetic substances allowed in organic crop production as an herbicide for use in farmstead and ornamental crop use. The vote was zero yes to add it, four no to add it to the list. Two were absent and there was no minority opinion.

Questions?

    MS. HEINEZ: Trying to live up to my scientist label here, so speaking to the herbicidal soap, I guess two comments. One, that TAP on line 58 says that pelargonic acid is an example of herbicides often referred to as herbicidal soaps.

    And then referring to its manufacturing process, it is consistent with how you would produce other soaps. So while you may not be able to find a reference that say it is soap, it's manufacturing process of combining a fat with an alkaline to convert it to something with a carbocyclic subgroup is consistent.

    I'm not sure if that addresses your concerns.

    MR. DAVIS: We considered that.
MS. HEINEZ: Sorry.

MR. DAVIS: The main sticking point, that you know, all the herbicidal soaps seem to be an alkaline base combined with a fatty acid to make this salt of a fatty acid. The pelargonic was specific in that it was an ozone type process to produce this fatty acid that had this. It did not have a metal salt associated with it. And we thought that the literature made it specific that that is what a soap is, is a metal salt plus the fatty acid in combination. And it seems like a minute point, maybe, but that's where we went with it.

And we kind of did that to see what kind of response we would get from the public in their public comments, to see if we could get a little more light shown on it to support a decision. Julie.

MS. WEISMAN: Not to sabotage the excellent work that Andrea just did getting us, that is getting us back on schedule, because we were an hour late before the break, but I think there are some organic chemists in the room, I think. And I was wondering if they would be willing to be called upon by us at this moment, or if the Board, if that might be an appropriate thing to do, is to ask an organic chemist to address the question of whether this pelargonic acid, in fact, is a byproduct of saponification.

MS. CAROE: Well, Katrina is a chemist.

MS. WEISMAN: Right. Okay.
MS. CAROE: Which we recognize her. Also, just outside of this, did anybody go back to the TAP reviewers which we hired to do this sort of work.

MR. DAVIS: We looked at the TAP and it's --

MS. CAROE: No, no, no, go back to the TAP reviewer.

MR. DAVIS: -- in that line, as we mentioned. Oh. That line that Katrina mentioned that is in the TAP, it is documented in our recommendation that we noted that, that the TAP reviewer made that mention. But there is no support for that statement given by the TAP reviewer. They just state it as a general thing.

And then I heard in the petitioner's public comment today another general statement that they had on their Powerpoint. But we're looking for scientific backup for those statements. And that's what we haven't had anyone show us yet.

MS. CAROE: Well, I know we've been dealing with a lot of 606 materials where we're getting just information from a petitioner, and we question that, or we look for some evidence to validate that.

However, when we have a TAP, that is a credible reference. That is a scientific reference. Those folks are under contract and they've been reviewed. And you can accept that information from the TAP reviewers as credible.
So I don't know that I feel that we really have to get validation of our TAP reviewers because that will go on forever if we continue to do that.

MR. DAVIS: Well, the basic -- we noted that comment in the TAP. It was a single sentence. But we also noted that the EPA does not class pelargonic acid as a soap. It is, at this point, it is unclassed by EPA. So that's where we stopped. We just -- go ahead.

MS. JAMES: I just want to recognize that we did have a discussion yesterday with the NOP where they pointed out that they were interested in having TAP reviews and seeking information in TAP reviews where there was more documented, specific information that could be referenced. So I'm just making that point. I don't know if Mr. Pooler would like to comment on that or not.

MR. DAVIS: Julie.

MS. WEISMAN: Yes, I also, I definite, looking at the, you know, how other agencies treat a material is, that's part of what we need to do in this process. That there is a difference between, part of what we were discussing was chemistry, what is the chemistry involved in making a soap and its byproducts. And that is quite a separate issue from how the EPA, from federal regulations classifying things.

Now, if EPA specifically said that this is not appropriate to consider as a soap, that we would have to
abide by. But their absence of saying positively that it is, 
does not mean that according to, you know, standard, 
according to standard chemistry, chemical understanding, that 
it is a soap. That's a thought.

MR. DAVIS: Again, not to belabor the point, just 
we as a Committee thought that the classification of what is 
a soap, I mean, not necessarily what EPA says about it, that 
a soap is, and several committee members pointed this out in 
our discussion was a soap is a metal salt of a fatty acid. 
And I, the committee would be interested in, if there are any 
organic chemists in the audience that want to give us some 
help on that, to see if this material, you know, how close it 
is.

MS. CAROE: Rich, I know you're a --

MR. THEUER: Hi, I'm Rich Theuer. I'm a BS chemist 
and Ph.D. and Masters in biochemistry. A chemistry says 
exactly what you said, a soap is a metal salt of a fatty 
acid. That's the standard definition.

MR. DAVIS: There's another gentleman that raised 
his hand, also.

MS. CAROE: The chair recognizes the gentleman in 
the third row. I don't know who you are.

MR. B. SMILLIE: I'm an organic chemist of nearly 
60 years. I agree. A soap -- my name is Bob Smillie.

MR. SMILLIE: He's right.
MS. CAROE: And your affiliation, sir?

MR. B. SMILLIE: Pelican Lab. We were the petitioners to allow ammonium pelargonic to be used as an herbicide. Ammonium pelargonic has been registered by the EPA for organic production, but that fits into the rule of not being used on food. We have a nonfood use registration. We have petitioned the EPA, of course, for a food registration, and that's now under review.

But going back to soap, a soap is a salt of a fatty acid. It has to be a salt. We all know what soaps are. What do we think of when we think of soap? We think of soap as a cleaning material, something to clean something.

The reason it cleans is because one end of the molecule has a tendency to get into water. The other end of the molecule is oil or tends to get into organic materials. So it basically emulsifies the oil dirt or whatever it is that we are cleaning, and you then get rid of the dirt by emulsifying it into the water. It works because one end of the molecule has this water attraction.

Pelargonic acid is water insoluble. There is, it has no, it has no tendency to do what a soap does. I'm very familiar with pelargonic acid. And I'll tell you, I would not wash my hands with it. I would wash my hands with soap with salts of pelargonic acid, and have done so. A soap, by definition, is a salt of a fatty acid. It has to be a salt.
Thank you.

MR. DAVIS: Thank you very much. So, I'm not sure where we left off here, but I guess we did finish the statement of what the Committee action was and how we came up with that vote to reject the petition to classify pelargonic acid from the petitioner as a soap-based herbicide.

MS. CAROE: So at this time, at this time, the Committee's recommendations stand? You don't, you're not going to reconvene or look at this material based on public comment? The Committee recommendation, as is, will be voted on tomorrow?

MR. DAVIS: No, I mean, I think based on public comment, and maybe some more that we may get in the, you know, later, during the next comment period, it's possible that this is something that people could change their mind on within the Committee's vote, or the overall Board could do that also.

But we just, we took just an interpretive look at what the rule says, and what is allowed, and we're not willing to, you know, call pelargonic acid a soap, against nothing in the EPA or from the science information available to us. We didn't want to classify it as a soap when no one else is.

MS. CAROE: I'm not suggesting that you do change your mind. I'm just trying to determine whether this is
going to be the recommendation we vote on tomorrow, or are we
expecting some changes to that recommendation?

    MR. DAVIS: I would not expect changes at this
point.

    MS. CAROE: Okay. Very good. Is there any further
questions for Gerry on those items? Okay. Well, we're
scheduled for a break right now, but I would ask the Board if
you would be willing to forego the break, since we had one
fairly recently, to try to gain back some of our time? Okay.

    Moving forward then, I think we have some
discussion on our next items in livestock. So I will turn
the, turn it over to Kevin, who is vice-chair of the
Livestock Committee, and start the discussions for
aquaculture and cloning.

    MR. ENGELBERT: Thank you, Andrea. For the good of
the cause, I will be brief. But before we start on Livestock
Committee business, Hugh asked me to pass along his
sentiments that he deeply regrets missing the first two days
of this meeting, but he hopes to be here tomorrow morning.
He had commitments that he simply had to honor.

    I'd also like to thank Mark for the update
yesterday on the issues relating to the Livestock Committee.
I guess it goes without saying that organic dairy farmers
across the country are very anxious for the pasture rule to
be released, and for the ANPR on origin of livestock.
The Livestock Committee remains optimistic that their time is near, and we stand, you know, ready to help in any way we can to continue to facilitate that process. Okay. And as I am sure everyone is aware, the two items that we have spent most of our time on since the last NOSB meeting, are aquaculture and cloning, the first, having been on the LC work plan for a number of years, and the latter just recently appearing on our radar screen.

Given the amount of work that we have to do and the amount of time we have to do it in, I know I should just go directly to that word, but I must take a minute to talk about aquaculture and how we got to where we are today.

The standards were first discussed in 1998 with the first attempt at writing them taken in 1999. That led to the Wittenberg report in 2001, which in turn led to the Aquatic Animal Task Force and the publication of the Anderson report.

A group of 85 people calling themselves the National Organic Aquaculture Working Group used the livestock standards, the Wittenberg report, the Anderson report, and 12 international standards to write a white paper that was published on the NOP website.

Finally, and most recently, there were 12 members appointed to the current aquaculture working group who presented the current report to the Livestock Committee. So as I'm sure everyone is aware, there are many, many, many
people who have devoted countless hours and effort to get to
where we are today.

As a relatively recent participant in this
aquaculture process, I hesitate to attempt to name everyone
that deserves special attention, because there are so many,
and I don't want to leave anybody out. But I think everybody
knows, you know, if you have been paying attention to this,
who these people are throughout the years, and right up until
today.

Many people from the NOSB, the NOP, from the
organic community, and from the aquaculture industry have
contributed a great deal of valuable input to the proposed
standards. They deserve our deepest appreciation, and
everyone should be proud of the work that has been
accomplished.

And on a personal note, it's been a privilege to
work with the AWG and everybody else who has been involved in
it presently.

Now, with respect to the Committee's
recommendation, we owe a thank you to Andrea, senior member
of the NOSB and long time AWG member, for guiding the
Livestock Committee through the process of issuing this
recommendation. There have been many worthwhile public
comments posted and presented. So it remains a work in
progress.
Given the controversy that surrounds the feeding of wild caught fish meal and fish oil and open cage net pens, the Livestock Committee decided to remove these sections from the AWG's report.

Those two issues, which remain the most contentious of the six the Livestock Committee had previously asked for comment upon, along with the shellfish and bivalves, which will continue to be worked on, we hope to have a recommendation for them for the fall meeting. That's one of our goals. But we will focus today on the recommendation as we have presented it.

The AWG's report was extremely thorough, very professional, and we believe very close to a standard that's necessary to protect organic integrity. One footnote on that report, there is a typo on the Committee vote. There were actually six votes in favor and one absent vote. There wasn't a no vote on that, on the Livestock Committee's vote.

At this time, I would like Andrea, I ask Andrea to recognize George Lockwood.

MS. CAROE: If George Lockwood, would you come to the podium as we discuss this. Special thanks to George who has done --

MR. ENGELBERT: Yes.

MS. CAROE: -- well above and beyond, meetings twice a week and a lot of documents. And it is greatly
appreciate, all your hard work and effort towards this.

MR. LOCKWOOD: Thank you, Madam Chairman.

MR. ENGELBERT: Exactly what I was going to say when I got you up there, George. Thank you very much for all your -- you know, you've just gone above and beyond what anybody should expect from somebody that's volunteering in a position like that. And with that, we'll just turn this discussion over for questions and comments from the Board and see if we can work through this report.

MR. LOCKWOOD: Most of the comments we've received so far during these hearings have pertained to the fish meal, fish oil and net pen issues. And since those are not on the table at this time, there were some comments received yesterday that I do believe need to be attended to, in a letter from Emily Rosen, Emily Brown Rosen.

If you have that document, and unfortunately the audience doesn't have it, but if you do have that document, I would like -- I think we can go through these questions or these issues very quickly.

Item number one is a fish meal and fish oil matter, and I think it probably needs to be deferred. That's aquaculture feed, paragraph E.

Also at the very end, contaminate levels is a fish meal and fish oil issue, and it should be properly deferred until we deal --
MS. CAROE: Hold on, George. Let's take them one at a time, and slowly enough that Valerie can do some changes, as -- oh, you want to bring up Emily's --

MR. ENGELBERT: Whatever is the best way to do it. You two can decide how to do it.

MS. FRANCES: I don't have Emily's comments in the system.

MS. CAROE: Okay. Then let's take the comments one at a time. Let George address, and then the Committee can discuss --

MS. FRANCES: Emily does.

MS. CAROE: So you do have them.

MR. ENGELBERT: I don't think we need them.

MS. CAROE: Okay.

MR. ENGELBERT: I think George is going to make the changes. I think George is going to make the changes to the document. I think this will be fairly quick. We won't take up much time, Madam Chair.

MR. LOCKWOOD: Well, as I indicated, the first comment has to do with paragraph E of section 252, and I believe that properly belongs in our future discussion, since it deals with fish meal.

And also, her last comment, her last paragraph has to do with contaminant levels, and again, I suggest that be deferred until fish meal and fish oil is discussed.
Vanishing with her comments, paragraph G
deals with silage. And there is a misquote or a missed
citation. The citation should be section 205.601. We
believe that the one of the frontiers of aquaculture is
indeed recycling fish carcases after the filets have been
removed, so that the nutrients that are in the fish carcases
can be recovered. This will allow that. It references
silage to fish enzymes, emulsions and so forth, which are
allowed. And that's the section that we are citing.

Paragraph H, we believe it is essential. It has to
do with organic aquaculture feeds may include meals and oils
containing essential fatty acid produced by processes allowed
in organic production. Again, if we are going to have
limitations on oil and lipids from natural sources, this will
allow us to have an alternate source of oils. And we think
it's very important to be stated here in the affirmative.

The next comment has to do with paragraph I,
nutritional pigmented compounds that have been produced and
handled in accordance with organic requirements appear on the
national list, that's 205.603, are allowed in the US, and
allowed by the US Food and Drug Administration for inclusion
in aquaculture feeds, may be used. She has offered some
suggestions, word changes which we concur with. So paragraph
I we would concur with.

Paragraph 6 has to do with composted manure. And I
think there is a bit of confusion here. The indication is that we should be consistent with crops, and we are. Under the crop standards, there is a method for the composting of manure. There is no time limit. We have in our using of composted manure for fertilizing ponds a 30-day withdrawal prior to human consumption. And we believe that is adequate. Let me say that this is now being practiced in the growing of shrimp. Shrimp crops are generally fairly short crops, 120 days. And if the period of withdrawal were to be significantly greater than what is proposed here, it would preclude the use.

What happens here is an instant ecological development in that the carbon and nitrogen source for micro-algae comes from the compost. Micro-algae is grown as a primary producer. Then cocoa pods and ether, small crustaceans eat that algae, which is then eaten by the shrimp. This greatly reduces the off-farm inputs into a shrimp growing operations. And we believe this is one of the frontiers.

MR. ENGELBERT: George, how many more separate items do you have that you want to go through while --

MR. LOCKWOOD: About three.

MR. ENGELBERT: Three?

MR. LOCKWOOD: Three.

MR. ENGELBERT: Okay. Let's go through all those
three, so we can get a brief overview, and then let's go back
one at a time to give Valerie a chance to incorporate these
changes into the proposed recommendation, and to give the
Board a chance to talk about each one of these changes.

MR. LOCKWOOD: Okay.

MR. ENGELBERT: Okay.

MR. LOCKWOOD: The next proposal has to do with
aquaculture facilities, and it has to do with the conversion
period. We have proposed one year, and she is suggesting we
go to 36 months, which is the time period for land
conversion.

Aquatic systems are dramatically different than
terrestrial systems. And this is one area. We believe that
there is substantial science to indicate that the, any
prohibited substances that would be in a pond would be dealt
with within a 12-month period of time. This is a substantial
difference than terrestrial, but the aquatic system is
substantially different in this respect.

The next item has to do with farmed aquatic plants.
Farmed aquatic plants are essential for many aquaculture
systems, particularly in those that rely on lower tropic
level feed inputs. The objection is, we believe that we are
also allowing aquatic plants may be grown in organic systems
for human consumption. We certainly would be willing to
postpone that section of farmed aquatic plants, if we could
go ahead with the allowance for the use of farmed aquatic plants as aquaculture feeds.

So that's, those are our comments here.

MR. ENGELBERT: Okay. Now, can we go right back to the top and talk about the first recommendation or the first change that the AWG agrees to, and we can talk about that.

MR. MOYER: Item A was the table --

MR. ENGELBERT: Okay, yes, that, we're just going to table that, the things that we are just going to talk about changing, so that we can get a recommendation ready for vote tomorrow. The first one is --

MR. MOYER: You have to change the citation for 605 and 601.

MR. ENGELBERT: Okay. Valerie, the first change is in G. There is a typo there. We need to change that to read, from reading -- it's in 252 section --

MS. FRANCES: What page?

MR. MOYER: 205.

MR. ENGELBERT: Section G.

MS. CAROE: It's all the way at the end of the document where the actual rules are, because the first part is all public comment.

MR. ENGELBERT: It's on page eight.

MS. FRANCES: Page eight. Page eight of the rules, or page eight of where the public comment discussion. In
your actually recommendation. Okay.

    MR. ENGELBERT: In the proposed recommendation, under 205.252 letter G.

    MS. FRANCES: The silage?

    MR. ENGELBERT: Yes. Yes. We need to change that 205.605 to 205.601.

    MS. FRANCES: Okay, that's a typo.

    MR. ENGELBERT: Yes, Dan.

    MR. GIACOMINI: 601, this is aquaculture feed section. This is the section that's looking at what is going to be allowed as the use in feeding these animals. 601 is the crop section. I understand that it may have been convenient to go there as a source of where it is in the existing rule, but I'm totally opposed with the fact that I don't believe that's the appropriate place to go.

    This needs to be 603, which is where we deal with livestock issues. And if we then need to add substances on 603 to make this work, I think that would be the appropriate way to do it. But I don't think it's appropriate to go to the crop section for livestock feed, livestock aquatic feed issues.

    MR. ENGELBERT: All we're saying, Dan, is you've already provided for silage for fish emulsion, and we simply want to make sure that silage is included within the aquaculture section. That's the only citation we have. It
has nothing to do with soil amendment. We're obviously not
amending soil.

MR. GIACOMINI: Joe.

MR. SMILLIE: Yes, it's what -- I think you are
right, Dan. I -- it's dealt with in our current terrestrial
systems, if 601 is a fish emulsion product. And what you're
talking about is a fish feed, but done through the exact same
process. So I think Dan is right. I think 603 is the proper
place for it.

MR. ENGELBERT: Well, then, that would have to be
an amendment you would carry.

MS. CAROE: It's not a motion. It's not an
amendment. It's a change.

MR. SMILLIE: Yes. I think we can --

MS. CAROE: Kevin --

MR. SMILLIE: We can make that change.

MR. ENGELBERT: I'm not sure. I don't know.

Andrea.

MS. CAROE: I think the issue is, you're looking to
get a particular material available to you, and it happens to
be on a list, but it's not the appropriate list. So to Dan's
point, 603 is the appropriate list, unless we even build a
new list out of the reserved sections, which we could do. I
don't think it's necessary. I think we can go to 603.

However, a follow on action, and perhaps an action
for the fall meeting is looking at materials that need to be added to 603 to accommodate this new production technique, in which case that material that you are citing off of, a crops list may be one that needs to be petitioned and looked at. But, you know, the tail is wagging the dog if we cite 601. We need to, I think Dan is correct. 603 is appropriate, but your material that you want is not necessarily there. So there is further action in order to do this the right way.

MR. ENGELBERT: So then you are saying, this should be 603, and that's what we should probably go with right now. Is that what I'm understanding?

MS. CAROE: It's my opinion, yes.

MR. ENGELBERT: Okay.

MR. SMILLIE: One clarification. 603 is synthetic substances.

MR. LOCKWOOD: Well, that's what's -- so what's required here is the use of acid, synthetic mineral acids that are allowed for fish emulsion. It's the same process as silage.

MR. SMILLIE: Okay. Okay.

MR. LOCKWOOD: If you are going to rewrite that and put it in 603, there is a pH limit of 3.5 for the fish emulsion. I would suggest that we go a little bit lower to 2.5 perhaps.

MR. SMILLIE: Andrea?
MS. CAROE: Again, that would be the section action. That would be looking at, petitioning, and putting appropriate materials on the list for this particular production practice. So I think that can be, you know, evaluated.

But it's not, the material that is listed there is listed under a crop section. The regulation allows it in the crop use. It's inappropriate for us to apply that to production system, which was not looked at by original Board that put that on the list, nor the TAP reviewers that evaluated it for that purpose.

So, again, the after action is to look at, or listing appropriate materials on the appropriate list.

MR. LOCKWOOD: That takes a whole new petition process, then?

MS. CAROE: It would take a petition. And, I know, I know. But this is the pain of putting in a new production system into a standard that exists. There are things that are not considered and that need to be started from scratch.

MR. LOCKWOOD: Okay.

MR. ENGELBERT: Okay. Now, the next item you brought up is under H on 205.252. And you disagree with Emily Brown Rosen's suggestion?

MR. LOCKWOOD: She uses the word implies, I guess, the proper word being first. We're not implying anything.
We're very clearly stating that organic aquaculture feeds may include meals and oils containing essential fatty acid produced by processes allowed in organic production. And that is new technology is coming on line that will allow as an alternate source of fish oils.

MR. ENGELBERT: Bea.

MS. JAMES: I just have a question on point of order here. We're changing this recommendation, and I'm assuming that after that, then we are going to get into discussion about the recommendation in general? Okay.

MR. ENGELBERT: Yes. Any other comments on H, what we need to do there? Dan.

MR. GIACOMINI: Yeah, George, I think this would also be a place where you might want to address, there were a number of public comments that addressed the allowance of fish and fish meal, fish oil, fish meal in particular through the additives section. And that this was considered a loophole in getting into aquaculture, and how much would then be allowed going, jumping from an additive to a feed. Do you have anything to address on those issues?

MR. LOCKWOOD: Dan, all during this conference we've been saying these issues are going to be postponed, and we think it's proper to address them when you are addressing them later on. And I seem to notice here that this apparently is an issue in livestock also, the wording of this
particular clause.

The clause you're talking about was picked directly from the livestock standard. At present, we would not want to deviate from what you are doing in livestock.

MR. ENGELBERT: Joe.

MR. SMILLIE: Yes, I just wanted to clarify what George has said, that the H is not referring to fish meal or fish oil, right? It's a new algol process for omega 3's that looks to be a promising alternative to fish meal and fish oil.

MR. LOCKWOOD: And Bob Bolus, one of our Committee members is where, and he will be giving public comments later.

MR. SMILLIE: So my recommendation is to leave it as is.

MR. ENGELBERT: Leave it as is. Okay. Okay. Anybody else? Okay. Next, George was, under J, maybe you could explain your position a little bit.

MR. LOCKWOOD: I think it's I, isn't it?

MR. LOCKWOOD: We find the change that is being proposed here probably clarifies matters.

MR. ENGELBERT: Okay.

MR. LOCKWOOD: It's acceptable.

MR. ENGELBERT: So on I, Valerie, it starts out,
nutritional pigment compounds, and then we want to delete, that have been produced and handled in accordance with organic requirements. And then pickup again with, appear on the national list at 205.603.

MR. LOCKWOOD: I think it's --

MR. ENGELBERT: And then add in, or are organically produced. And the pick up with the rest of the wording, and allowed by the U.S. Food and Drug Administration for inclusion in aquaculture feeds may be used.

I'll read straight through the whole thing.

Nutritional pigment compounds -- pardon me -- that appear -- no. Nutritional pigment compounds that appear on the national list at 205.603 or are organically produced and allowed by the U.S. Food and Drug Administration for inclusion in aquaculture feeds may be used.

MS. FRANCES: Did I get that?

MR. ENGELBERT: I can't see it from here.

MR. LOCKWOOD: There should be the word that in there, nutritional pigment compounds that appear, no comma.

MR. ENGELBERT: Okay. Valerie, would you re-read that, please?

MS. FRANCES: Nutritional compounds that appear on 205.603 or are organically produced and allowed by U.S. Food and Drug Administration for inclusion in aquaculture feeds may be used.
MR. ENGELBERT: Is that it? Thank you. Okay.

Does anybody have any other comments on that wording? Okay.

Next is J then. The question is, why is that under feed when you are using composted manure to fertilize the pond?

MR. LOCKWOOD: Where else would we have put it? I'm at a loss right now. Would you want it under living conditions?

MR. ENGELBERT: Yeah --

(Discussion off the record.)

MR. ENGELBERT: Is there any discussion on this from any other members of the Board? Does anybody want to try to help us out here? Andrea.

MS. CAROE: We're talking about these manures in the ponds?

MR. ENGELBERT: Yes.

MS. CAROE: I think living conditions may be a place that you can do it, because it becomes an environmental control, right? Is that not correct?

MR. MOYER: I think what they're trying to do is fertilize the pond to grow the algae and micro-algae. And micro-algae is a feed, and I think that's why they stuck it in here under feed. But you are really not feeding fish with the compost, so it doesn't really belong there.

MS. CAROE: Kevin?

MR. ENGELBERT: Yes, Andrea.
MS. CAROE: Okay, so ultimately, what you just said, it could be put into the aquatic plant section, because that's what you are doing is growing aquatic plants. You're fertilizing aquatic plants.

However, in this situation, I think the reason that it's here is because you're trying to restrict the proper use of these so that you don't have an environmental issue. It becomes living condition.

MR. ENGELBERT: Right.

MS. CAROE: That's why I was suggesting, it becomes living condition. It's not a feed issue. Hopefully, they are not eating it, but I don't know. But anyways, but it might be an environmental issue with the place that they are swimming around.

MR. ENGELBERT: Yeah, I'm trying to think of a comparison with terrestrial agriculture. I'm not sure that -- I still think maybe in plants is the better place, you know what I mean. Applying a fertilizer to a field to try to grow the crop is analogous to what I think is trying to be accomplished here.

MR. SMILLIE: Well, I want to point out that it also does appear, much the same language in 258, farmed aquatic plants, which we'll be dealing with. So it's there. I don't know, do you need it in both places, George?

MR. LOCKWOOD: Well, we're doing something more
than just growing plants here. We're establishing an ecosystem that supports the growth of shrimp.

MR. SMILLIE: Yes, so living.

MR. LOCKWOOD: It doesn't make a lot of difference to us where it appears.

MR. SMILLIE: Okay.

MR. LOCKWOOD: We just want to make sure it's in there.

MR. SMILLIE: Okay.

MR. ENGELBERT: Yes. Okay. We'll have to work on that.

MR. SMILLIE: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes, Andrea.

MS. CAROE: Really quickly, it is now after 12:00. Actually, is it 1:00? Am I reading it -- it's 12:00. 10 after 12:00. How much longer do you want to debate this? I'm wondering if we should cut this at some point so that we can break for lunch, take a shorter lunch, come back. Shorter lunch.

MR. ENGELBERT: Jennifer.

MS. HALL: Can I suggest we get through the changes and then maybe break and come back for discussion?

MR. ENGELBERT: Okay. We can do that. Okay.

What's --
MR. MOYER: Next is 205.255.

MR. ENGELBERT: Next is 205.255, page 13, item K, related to the one-year period. Go ahead George and tell us.

MR. LOCKWOOD: The reason we have opted for one year here is that with aquatic systems, a pond that's filled with water, the prohibited systems would be dealt with due to not only the biology but the simple fact that water is there and the pond will be drained, and so forth, before it is used. That being said, this isn't a deal killer with us.

MR. ENGELBERT: Right.

MR. LOCKWOOD: If you really think in your judgment that a three-year period is necessary in order to be consistent throughout the standards, that's fine.

MR. ENGELBERT: Yes. That's always been my opinion, but again, that's why we're here trying to work this out.

MR. LOCKWOOD: We would prefer one year. We think the science supports it. But like I say, if three years is what you want, we can live with it.

MR. ENGELBERT: Okay.

MR. LOCKWOOD: And the prohibited substances that are in 602, I guess it is, we don't use any of them. There is very little use of chemicals in aquaculture.

MR. ENGELBERT: But if there are any, that's the distinction we have to make. We have to --
MR. LOCKWOOD: The list you have, we don't use.

MR. ENGELBERT: Well, maybe in the future, they will be, and we're trying to write, you know, trying to write a long lasting recommendation here. So I think to have a good chance of getting this to go through, we need to change that to 36 months, three years. Any other discussion, comments? Steve.

MR. DEMURE: Are there any testing, any scientific evidence on whether one year versus three years is better?

MR. ENGELBERT: It's, again, this is part of the subjectiveness of writing a rule. Three years was a compromise with land, you know, with land, terrestrial-based system. And it -- tests are expensive. They can be done, but it's, yes, Jeff.

MR. MOYER: Steve, to answer, I mean, I have scientists that work in my own organization that will say that they can scientifically show that they can transition land in under a year and have it be organic. I mean, that's not what this is all about. It's not about testing. It's about the process.

I mean, you test a lot of land, and you will find residuals, but if they went through the three-year process. So it's not about testing, it's about the time. And it's not trying, we're not trying to short cycle things here. I agree with Kevin, that if you have three years for land, it's hard
to not say you have three years for water, and justify that.

If we get into some sort of testing thing, we're in
deep unchartered waters there. We don't want to go there.
You don't want to go there.

MR. LOCKWOOD: Jeff, let me point out that IFOM has
one year or one crop, whichever is less. So the
international standards are going for one year, and we
thought that was reasonable. But again, Kevin, this is not
the deal killer.

MR. ENGELBERT: Okay. Okay, let's -- yes, we can
change that. Valerie on 205.255, aquaculture facilities
under K, we want to strike one year, and put in three years
or 36 months from the date of the last prohibited substance.
Joe.

MR. SMILLIE: George, do you understand that from
the date of the last prohibited substance. So if you are
claiming that most, in most cases these particular substances
are not used, then you shouldn't have a problem with it.

MR. ENGELBERT: Right. That's, you know --

MR. LOCKWOOD: We understand that.

MR. ENGELBERT: If they can document --

MR. LOCKWOOD: That's why we can live with it.

MR. SMILLIE: Okay.

MR. LOCKWOOD: These prohibited substances aren't
used in aquaculture anyway.
MR. SMILLIE: Understanding that that's a compromise.

MR. ENGELBERT: Because that's what works in the rest of the rule anyway.

MS. JAMES: Kevin, Kevin.

MR. ENGELBERT: Yes, Bea.

MS. JAMES: Why are we changing it based on what we have for crops? Don't you think we should be making these regulations based on the science for aquaculture?

MR. ENGELBERT: It's based on -- right, it's not in the science for crops. It's based on --

MS. JAMES: Well, I heard you reference that it should be changed because we have this three-year period with crops, so therefore.

MR. ENGELBERT: But it's not --

MS. JAMES: However, then I'm hearing George and Joe say, well, a lot of these things aren't used anyway, and within a year -- so I'm just confused, why three years then?

MR. ENGELBERT: Joe.

MR. SMILLIE: Bea, I think what we are saying is, three years from the date of the last prohibited material being applied. Ponds are very much like fields in that they have bottom, and the bottom is generally some sort of soil-based material. These chemicals can fall down, impede themselves -- it's no different than ponding on a field, only
it's deeper and you are raising fish in. So that's why we are saying, three months from -- just the same as with crops. 36 months, I'm sorry.

MR. LOCKWOOD: I might add --

MR. SMILLIE: If they haven't applied anything to the pond for the last 36 months, technically, when George walks out the door, it's certified organic if we voted on this, just like a farmer's field would be. They are very comparative. And farmer's fields are not based on science per se. I mean, there is science, but --

MR. LOCKWOOD: One of our members, John Hargraves, is a scientist who works in the area of ponds. And in our commentary to you, which was delivered on March 23rd, John wrote the following. Conversion periods in terrestrial agriculture are intended to allow dissipation of residue, chemical residues that may have accumulated in the soils subject to repeated exposure to pesticides and other agricultural chemicals.

Aquaculture production systems are fundamentally different from terrestrial agriculture in this regard. Very few agricultural chemicals are applied to aquaculture production systems because of concerns related to accumulation of chemical residues in cultured fish.

Furthermore, chemical residues partition between the water and the soil. So simply draining water from a
culture unit will remove a variable portion of residues.
So that's a scientist who works in this area's opinion. Again, it's your decision. We have suggested one year, but --

MR. ENGELBERT: Right, but we still believe because there are, if -- the key word is, there are very few used, but there are some. Andrea and the Rigo.

MS. CAROE: I just want to point out that 205.202, present land recommendations, number, or letter B, indicates, have no prohibited substances as listed in 205.105 applied to the -- applied to it for a period of three years immediately preceding harvest of the crop. So in order to apply this identically, you have to say, three years prior to the harvest of the fish.

MR. ENGELBERT: Of the animal, right.

MS. CAROE: So --

MR. ENGELBERT: That's a good point.

MS. CAROE: -- this is actually more restrictive than it is for terrestrial farming.

MR. ENGELBERT: Yes, that's true. That's a good point. Okay. Can you repeat that for Valerie to add into that?

MS. CAROE: Well, I mean, it has to be changed somewhat, because we don't have a prohibited section to refer to.
MR. ENGELBERT: Right.

MS. CAROE: But essentially it is immediately preceding harvest of the, what do you call it? It's not --

MR. ENGELBERT: It's not --

MR. LOCKWOOD: It's a crop.

MS. CAROE: Crop? You call it a crop?

MR. LOCKWOOD: Sure.

MR. ENGELBERT: I guess.

MS. CAROE: Okay. Call it a crop.

MS. FRANCES: Aquatic crop.

MR. LOCKWOOD: Aquatic animals.

MS. CAROE: They're fish, or shrimp, or whatever.

MR. LOCKWOOD: We call fish aquatic animals.

MS. CAROE: Okay.

MR. LOCKWOOD: That's in our definitions.

MR. ENGELBERT: So why don't we go with that, then. Let's go with aquatic animals.

MS. CAROE: Harvest of aquatic animals.

MR. ENGELBERT: Yes.

MS. CAROE: I'll bring this to Valerie.

MR. ENGELBERT: Okay.

MR. SMILLIE: So let's proceed.

MR. ENGELBERT: Oh, that's right. Rigo.

MR. DELGATO: Going back to the topic of the three years, and when I think of a pond, I think of very clay
bottom soils, not much permeability. The water is going to stay there.

And thinking of land crops, three years, we don't have the science to back those three years. But you're saying that in the case of aquaculture, we do have the science to say that three years will be plenty of time to somehow eliminate any prohibited substances if they fall to the bottom and then they are somehow leaked outside of the system. Is that correct?

MR. LOCKWOOD: Our scientists who work in this area believe that one year is adequate, and certainly three years would be more than adequate.

MR. ENGELBERT: Okay. Now onto 205.258, farmed aquatic plants. Page 15, Valerie. Okay. George, would you refresh everyone's memory on what we are referring to there, and what you think we should change to leave that in rather than taking out the entire section, because you said that it's needed, aquatic plants are needed.

MR. LOCKWOOD: Aquatic plants are essential for some forms of aquaculture. And it is also the frontier of the future of aquaculture. There is a strong effort to push down to a lower tropic level so we get away from fish meal and fish oil and fish diets. And this is accomplished by having a system that grows plants, aquatic plants. So we feel it is essential for aquaculture of certain species.
Now, originally written here, we have a clause for human consumption, as well as feed for aquatic species. The reason for that is, there are aquatic plants, nori, for instance, that are grown and cultured, and there is a large market in Japan for nori. And we wanted to cover nori and others.

If this is a matter that you want to consider further, then we're quite willing to go along with that, as long as feed for aquatic animals is included.

MR. ENGELBERT: Joe.

MR. SMILLIE: Yes, I think we're just way better off in striking the human consumption and as from this document, because the whole sea vegetable production systems are a different --

MR. LOCKWOOD: Okay.

MR. SMILLIE: I wasn't going to say that. Anyhow, it's a different thing. So I think we are just better off for your industry, for the aquaculture industry at this point in time, to just work without the human consumption.

MR. LOCKWOOD: Well, would it be your intention to revisit this?

MR. SMILLIE: Well, currently, to my understanding, we are certifying sea vegetables mostly under the while crop provisions of the regulation, and there have been a number of different, you know, programs that are based on the current
NOP, that allow the certification of sea vegetables for human consumption, such as nori, hakama and I can't remember them all.

MR. ENGELBERT: Sorry, Joe. But, yes, George, I think this will be addressed, but it may very well come under the Crop Committee --

MR. LOCKWOOD: Fine.

MR. ENGELBERT: -- because it will be for human consumption at that point.

MR. LOCKWOOD: We just ask that -- this is an integral part of aquaculture.

MR. ENGELBERT: Right, but I think if we, as Joe suggested, and Valerie, if we start out with aquatic plants may be grown in organic system for feed for aquatic species that utilizes algae for food provided that. If we take out those four words, human consumption and as, I think we can continue with this in the recommendation, and keep everybody -- Andrea.

MS. CAROE: Just, I think, I think that's a good thing to do. And just to take this back to the precedence of what we already have in the rule, this would be analogous to pasture requirements in the livestock section, as opposed to crop production practices in the crop production.

MR. ENGELBERT: Right.

MS. CAROE: So this, this, right now, is addressing
pasture for fish. And we certainly want to have them have pasture access.

MR. LOCKWOOD: Well, I hope we don't get, we don't confuse -- I hope we don't confuse wild with cultured. Now, Joe, I have one other possible suggestion here, if we want to really clearly differentiate from wild, insert the clause after organic systems, insert, in ponds or other containment vessels, if that would help you in dealing with, you're certifying now wild seaweeds, or seaweeds grown in the ocean. And we could deliver that limitation, but we are not proposing it.

MR. ENGELBERT: Andrea.

MS. CAROE: I think that can be taken up as a crop section later on.

MR. LOCKWOOD: Okay.

MS. CAROE: Yes.

MR. LOCKWOOD: Now, moving on, the one year in number one there --

MR. ENGELBERT: Yes.

MR. LOCKWOOD: -- we just talked about changing to 36 months.

MR. ENGELBERT: Yes, we changed that to 36 months.

MR. LOCKWOOD: Again, this is from the application, prohibited substances.

MR. ENGELBERT: Right.
MR. LOCKWOOD: So if somebody has a concrete tank that they just build --

MR. ENGELBERT: Yes.

MR. LOCKWOOD: -- and no prohibited substance has ever been used, they can go into organic production immediately.

MR. ENGELBERT: Yes, they can. Yes, they will, or they may.

MR. LOCKWOOD: So that needs to be changed. Valerie, that's A(1).

MR. ENGELBERT: A(1), any uncontaminated vessel from which algae are intended to be represented as organic, must have had no prohibited substances as listed in 205.602 applied for 36 months immediately preceding harvest of the crop.

MS. FRANCES: It also should be just 602, just prohibited substances.

MR. ENGELBERT: Just prohibited substances, true. Yes.

MS. FRANCES: Should we just delete that phrase?

MR. ENGELBERT: Just, yes, prohibited substances applied for 36 months.

MR. LOCKWOOD: Kevin, under paragraph 2 there, there is a mis-citation which should be taken out.

MR. ENGELBERT: Okay.
MR. LOCKWOOD: It says, 205.601, which is correct, and 205.603, which is incorrect.

MR. ENGELBERT: That should be taken out. Okay.

MR. LOCKWOOD: That has to do with animals.

MR. ENGELBERT: Okay. Valerie, under 2 we need to strike, and 205.603. George, did you address the comments from IFOM with respect to our standards, and incorporated them in your latest recommendations that you presented today?

MR. LOCKWOOD: That's the only area where we --

MR. ENGELBERT: That was it?

MR. LOCKWOOD: Yes.

MR. ENGELBERT: Okay.

MR. LOCKWOOD: Now, Kevin, there are a couple of other changes that we have submitted to you in writing that I think you might want to address. Going back to feed, Valerie, item B has a typographical error that needs to be corrected.

MR. ENGELBERT: That's on page 8, Valerie.

MS. FRANCES: Which?

MR. LOCKWOOD: Item B, Valerie. The way it reads, it just doesn't make sense. And the and should be must.

MR. ENGELBERT: Right here. Use of fish meal and fish oil must minimize?

MR. LOCKWOOD: Yes. Now, that being said, we suggest another change there. It's not the fish meal and
fish oil. It's the aquatic animal feeds. So we would recommend changing use of fish meal and fish oil to read, use of aquatic animal feeds must minimize.

MR. ENGELBERT: Okay. Good.

MR. LOCKWOOD: It just makes it a little bit clearer.

MR. ENGELBERT: Yes. Okay, now do we -- do we want to remove item A under 252 for right now because of the fish oil and fish meal? We said we'd come back to that, but maybe we can talk about that right now before we break a little bit. Andrea.

MS. CAROE: We're not prohibiting the use of fish meal and fish oil. We're prohibiting the use of nonorganic fish meal and fish oil.

MR. ENGELBERT: Nonorganic. Okay.

MS. CAROE: Keep it in there because the industry may be generating fish meal and fish oil off of these plant eaters.

MR. ENGELBERT: Okay. Is there anything else from anyone? George.

MR. LOCKWOOD: Yes. The public comments received in writing include some very good ones from the Humane Society that we recommend be included.

MR. ENGELBERT: Okay.

MR. LOCKWOOD: First of all, under aquaculture
general, 250, item 9, Valerie. What they have recommended
and we concur is, it should read, aquaculture facilities
shall be designed, operated and managed in a manner that
seeks to maximizes the welfare of cultured aquatic animals,
minimizes stress on those animals, and prevents the spread of
disease within the facility, and so forth.

Those comments are included in addendum one, which
was handed out yesterday of our public, of our digested
public comments.

MS. FRANCES: Could you state that again?

MR. LOCKWOOD: Nine should be amended to read,
aquaculture facilities shall be designed, operated and
managed in manner that seeks to, and then add, maximize the
welfare of the cultured aquatic animals, comma, minimize
stress on those animals, and prevent, as it reads now, and
prevent, yes.

MR. ENGELBERT: Okay.

MR. LOCKWOOD: So that's one amendment.

MR. ENGELBERT: Okay. Let's wait just a minute,
George. Let's make sure Valerie gets it and reads it.

MS. FRANCES: I got it. Do you want to read it?

MR. ENGELBERT: Read it back, please, and then --

MS. FRANCES: Aquatic, I mean, aquaculture
facilities shall be designed, operated, and managed in a
manner that seeks to maximize the welfare of cultured aquatic
animals, minimize the stress on the animals, and prevents the
spread of disease.

MR. LOCKWOOD: It should be, on those animals.

MR. ENGELBERT: Okay. Any comments or discussion
from anybody on the Board? Okay.

MS. CAROE: Are you done with changes?

MR. ENGELBERT: No, just this one.

MS. CAROE: Okay.

MR. ENGELBERT: We're going to move onto the next
one now.

MR. LOCKWOOD: There's a couple more amendments.

MR. ENGELBERT: A couple more.

MR. LOCKWOOD: There's two more.

MR. ENGELBERT: Let's do it, two more.

MR. LOCKWOOD: I'm just as hungry as you are.

205.254, aquaculture living conditions. Section A -- I'm
reading from something different.

MR. MOYER: It's page 12.

MR. LOCKWOOD: It would be 12. And paragraph 2.

It's recommended that there be a new three added which says,
appropriate population or biomass densities that promote
natural behaviors and limits aggressive and dominant
behaviors from others.

MR. ENGELBERT: One more time, please, George.

MR. LOCKWOOD: Appropriate population or biomass
densities that promote natural behaviors and limits
aggressive and dominant behaviors from others.

MR. ENGELBERT: Okay. Any comments or questions
from the Board? Did you get that, Valerie.

MS. FRANCES: I'm assuming we mean other aquatic
animals? Okay.

(Discussion off the record.)

MR. LOCKWOOD: Fish farmers are very gentle people.

MR. ENGELBERT: Okay. Would you read that back,
please, Valerie.

MS. FRANCES: Three, as appropriate population or
biomass densities that promote natural behaviors and limits
aggressive and dominant behaviors from other aquatic animals.

MR. ENGELBERT: Thank you.

MR. LOCKWOOD: Okay the --

MR. ENGELBERT: Any discussion? Okay. Next,

George.

MR. LOCKWOOD: 205.259, harvest transport post-
harvest handling. Which B must be --

MR. ENGELBERT: Page 16.

MR. LOCKWOOD: 16.

MR. ENGELBERT: For those of you following at home.
Okay.

MR. LOCKWOOD: Item D, number D --

MR. ENGELBERT: Yes, I've got it.
MR. LOCKWOOD: Fish will be held in high-quality water for the duration of food deprivation prior to transport and slaughter for a period not to exceed the time necessary to allow clearance of the stomach and intestine contents. Insert, after slaughter for a period not to exceed the time necessary -- to allow.

MR. ENGELBERT: Cross the S off.

MR. LOCKWOOD: Take that, allows and change it to be to allow. Okay. And that, and then there is a change on --

MR. ENGELBERT: Wait just a minute, George. Read that right -- read through that again the way it should read, so we can be sure Valerie has it. Are you set, Valerie? Go ahead and read it, then.

MS. FRANCES: Fish should be held in high quality water for the duration of food deprivation prior to transport and slaughter for a period not to exceed the time necessary to allow clearance of stomach and intestined contents.

MR. ENGELBERT: Thank you. Any discussion on that? I'm seeing none.

MR. LOCKWOOD: Under E, just below that, I believe is L, permitted procedures include, okay, it says (1), E(1).

MR. ENGELBERT: E(1).

MR. LOCKWOOD: And then two small i's. Electrical stunning sufficient to achieve insentence --
MR. ENGELBERT: So right after electrical stunning insert --

MR. LOCKWOOD: Before immediate. Insert after electrical stunning --

MR. ENGELBERT: Sufficient --

MR. LOCKWOOD: -- sufficient to achieve insentencence.

(Discussion off the record.)

MR. ENGELBERT: Any discussion? Do we need that read again? Does anybody like to have Valerie read that? Okay. We're all set. George, I know everybody wants to break, but quickly would you talk about the ice slurry, and why you have, why you disagree with the comments on that, and why you feel that should still be allowed? Because there will be some discussion on that, I'm sure, amongst Board members eventually.

MR. LOCKWOOD: Our proposal is for warm water fish, ice slurry be allowed for a period of five years. The reason being that the technology for the stunning of cold water fish is already developed and in practice. The technology for warm water fish is not quite there yet. And we propose a five-year period to allow that technology to catch up.

MR. ENGELBERT: Okay. Does anybody else have any questions or comments, concerns while we're -- before we turn this back over to Andrea? Thank you, everybody, for your
patience in helping us work through this process. Andrea.

MS. CAROE: I just ask George, after the break, if
-- after we go to lunch and come back, the Committee may want
to discuss some more general topics about aquaculture yet.
So if you could make yourself available, it would be
appreciated.

MR. LOCKWOOD: I'll be here.

MS. CAROE: Okay. Then anything else from you,
Kevin?

MR. ENGELBERT: Not right now.

MS. CAROE: Okay.

MR. LOCKWOOD: Thank you very much for your
patience, everybody. Thank you for your interest in this.

MR. ENGELBERT: Yes, and everybody in the audience,
also. Thank you very much for your patience.

MS. CAROE: Dan.

MR. ENGELBERT: Dan.

MR. GIACOMINI: Would it be possible for members of
the Board to get flash drive distribution of the updated
document, so that we can take a look at it before tomorrow?

MS. FRANCES: You'll have to bring your little
thing and I will do it.

MS. CAROE: Bring her your stick. Okay. So we
were supposed to break for lunch 35 minutes ago. And we were
supposed to also get through cloning. So we're a bit behind,
but I am going to ask the Board, do you feel that you can be back at 1:15? It's 12:35.

(Discussion off the record.)

MS. CAROE: All right. 1:30, but we are going to be here for a little while tonight. Everybody will be here promptly at 1:30.

(Luncheon recess.)

MS. CAROE: Do you want to address anymore aquaculture questions at this time from the Board?

MR. ENGELBERT: That's up to the Board, Andrea. If anybody on the Board has anything they want to bring up, we could ask George to come back up and we could try to address these issue right now. I don't see George in the room. But we can start, anyway.

MS. CAROE: Okay. Why don't you go ahead and see if anybody has any questions on any part, or in general, on his recommendation.

MR. ENGELBERT: Having said that, are there anymore discussions, comments, criticisms that anybody on the Board would like to bring up about aquaculture before we move on? You had one.

MR. SMILLIE: Just one comment, and that is that once again, as everybody knows, but just to make sure, that this is not set in stone; that there's been a number of good comments that we've received, and we haven't been able to,
perhaps, put into the document. And it's going to be an
ongoing document, so the Board and everyone else -- it is a
work in progress.

MR. ENGELBERT: Right, a work in progress.

MR. SMILLIE: It's going to be a recommendation.

We've still got lots more time to hone it and perfect it, and
it's still a ways before it's a regulation.

So I think that having been said, a couple of the
petitioners that got in very reasonable petitions that could
have been accepted, weren't accepted at this go round. That
doesn't means that those comments are lost. We will
definitely get back to them when we get time, and as we
continue to work on the document. Hopefully, it gets voted
for positively tomorrow, then we'll continue to work on it.
So those comments that didn't get specifically answered today
from petitioners are still kept.

MR. ENGELBERT: Tracy.

MS. MIEDEMA: Yes, I just have a question on the
terminology aquatic animal versus aquatic species that's
mentioned in our responses to public comments. Aquatic
animals includes, or it accepts amphibians, reptiles, birds
and mammals. But the term aquatic species includes
amphibians, reptiles, aquatic plants? I just wanted to make
sure we don't have any confusion of that in using the term
aquatic animal we are excluding the species I just mentioned?
MR. ENGELBERT: Where are those references, exactly, to each?

MS. MIEDEMA: It's on page four and on page 25, where the two terms are defined.

MR. ENGELBERT: Okay. What was your question again? I don't see aquatic species.

MS. MIEDEMA: The broader question is just aquaculture as we are defining it here only applies to fish and crustaceans, not amphibians, reptiles, or any mammals that are raised in the water.

MR. ENGELBERT: That's my understanding. Yes.

MS. MIEDEMA: Okay.

MR. ENGELBERT: Yes. That's what we believe.

MS. MIEDEMA: Okay.

MR. ENGELBERT: Bea.

MS. JAMES: Well, I guess I'll just play devil's advocate here, what else is new. I just want to know what the rationale was with the Livestock Committee on pushing this forward so quickly, when there is obviously so much more information that we need?

MR. ENGELBERT: Andrea, do you want to address that?

MS. CAROE: It's far from quick. This, there has been a tremendous amount of work over a lot of time being done on this. I believe that we've requested a lot of
volunteer time from industry. They will not, they will not
stay with us and work with us any longer if we don't show
progress.

We are not finished with this. We have further
work that we are going to do. This is the noncontroversial
part. And you know, we've pulled out -- you've heard a lot
of comment today and yesterday about two sections that we've
pulled because we know they are controversial. So those two
sections, you know, we agree they need further work. But
establishing something and showing progress is important for,
you know, to return.

Essentially, we can have organic catfish and
Tilapia after we task this. We can't have carnivors unless
Tilapia and catfish become fish meal and fish oil to meet
those dietary requirements of carnivorous fish. But this
will establish some organic production, and it will show that
we, as we have said, we are going to make progress. And it's
been, it's been two years of work -- two years of volunteer
time. I mean, I don't think that's quick.

MS. JAMES: Well, I would disagree. And I don't
think that two years is a long time in this industry. And I
think that the recommendation has a lot of unanswered
questions in it, in my opinion. And I believe that it's
better to have the full recommendation with all things
considered than to just put something forward because the
industry is pounding at our door.

That's just, that's my opinion. I feel like I don't really fully understand the water quality maintenance and the off puts from land locked operations. I understand that when I questioned one of the people that came up about it, they had -- were able to reference one facility that they were familiar with. But I haven't, I've read through a lot of the comments that are saying that there are issues around that.

That there are issues with the auditing; that there are going to be issues with adding this into the certifiers process. Are they ready for that. And so I think that there is a lot of information that still needs to be considered, and I appreciate and respect all of the hard work that's been done with this.

But I would be hesitant to put something forward, just because we're trying to please the industry. I think that our duty is to make sure that we fully understand the impact of whatever recommendation that we put forward, and we have all the necessary information before we put a recommendation out there.

MR. ENGELBERT: Andrea.

MS. CAROE: This recommendation has been available for NOSB members to look at for a while and ask questions. I feel like I've been a part of this. I've been working with
this. I think it's been available to us. You have a vote.
If you feel that way, you know, a minority opinion is a good thing. But I can't -- I will say that we agree to disagree on this.

MR. ENGELBERT: Katrina and then Jennifer. Or Jennifer. Katrina and the Jennifer.

MS. HEINEZ: I'm not sure who can most appropriately answer this, but as I'm trying to wrap my arms around this recommendation, I'm trying to understand what the impact will be for consumers once a final rule is issued.

Today, when I go to the grocery store, there is a wide variety of fish available. Some are labeled organic. So for example, organic salmon. If this recommendation -- if we approve the recommendation and a final rule is issued, what I'm understanding is that only noncarnivorous fish could then be certified organic?

I guess I need someone to explain what does, what does the future look like for consumers?

MR. ENGELBERT: Andrea.

MS. CAROE: At this time, we are not allowing any deviation from 100 percent organic feed. That presents a pretty significant challenge to anybody that is raising fish that require fish meal or fish oil as part of that diet. It's not impossible. It's improbable, but it's not impossible.
However, that is what is being established today. We will be looking for a possible provision and other methods to accommodate this period of time where availability of those organic supplies are not there. That's tabled. That we have already said we are going to engage in some type of dialogue with industry to establish that. But at this time, it doesn't prevent those things from making it out to market, it just makes it extremely difficult.

MS. HEINEZ: I guess I don't, I'm not saying that having those off the market is a bad thing. I'm just trying to understand. They exist today, and we've heard lots of public testimony that maybe they shouldn't be on the market today.

So maybe, Mark, this is a question for you. The current things that I can see at the grocery store that are labeled organic salmon, would those then not be able to be labeled as such, unless they meet these requirements?

MR. BRADLEY: Are you asking if they come forward with an herbivorous fish standard only, if it would exclude carnivorous fish from being sold? That's something we're going to have to look at, but that's something that the Board need to consider as well, is if this would be the aquaculture standard, or if it would be an aquatic species standard for herbivorous fish that would leave the rest of them still able to be marketed? I think it would be very confusing.
I mean, there's a lot of confusion going on right now, and we consistently get comments about, how are they marketing this, and you know, on the other side, the industry has been waiting for a standard for a while.

MS. HEINEZ: Thank you.

MR. ENGELBERT: Jennifer was on behalf of Katrina, so Joe.

MR. SMILLIE: Well, two things. Number one, as Andrea said, and I want to reiterate, it doesn't ban piscivorus, I think is a more correct term, and carnivorous fish. For example, if the organic -- if we pass a standard and we have organic Tilapia, catfish, et cetera, those fish could become legitimate organic feed and be fed to piscivorus fish.

So it doesn't specifically exclude piscivorus fish. It excludes wild fish meal as organic feed at this point in time for further discussion.

Number two is, rather than confusing the consumer, the consumer is now confused. The aquaculture industry in the United States is just an absolute welter of different claims and different promotions, including, you know, organic being banned in California and Georgia. I don't know where Georgia came from. But it's banned in California and Georgia, yet there's organic labeled product all of the U.S. which is European organic, which is still allowable in this
country to call it organic, since there is no regulation.

So by putting down a regulation, we are at least starting to clear up the consumer confusion issues by saying, here's what's allowed in the U.S. as organic. And that way, you know, it could create trade barriers for organic fish from Europe in the future, because we will have an aquaculture standard. So I think it will take a big step towards clearing what is an extremely confusing eco-seal, humane seal, you know, all sorts of different claims in the marketplace now.

MR. ENGELBERT: Yes, Bea.

MS. JAMES: I want to comment on that. I don't necessarily think that having this partial recommendation is going to clarify things for the consumer. I think that the consumer, it's going to potentially cause more confusion because the retailer is going to, and I'm just speaking from experience in the retail industry, assume that there are now regulations within the United States, and there will be more labeling of organic fish that potentially is not considered organic by the NOP.

MR. ENGELBERT: Okay. And I would like to just comment, quickly, that I don't want, Bea, to give the impression that the livestock committee is trying to force anything on anybody on this Board. That's not our intent at all. And if that was the impression that was given, I
apologize. That's not it at all. Andrea and then Jennifer.

MS. CAROE: Just for clarification, one of the reasons why, when we took this on, we looked at this is because of the confusion of marketplace labels.

Ultimately when the decision is made, after we have this fact finding, whether there is going to be some other method to allow for the fish that eat fish to get into the organic systems, or whether there is going to be net pens, when we have that dialogue and we come up with our recommendation after that, I fully expect if this Board determines that it's inappropriate to allow some short period of time when nonorganic fish are allowed as feed, if that doesn't happen, we're establishing a rule across the board like any other food labeled in organic.

So, you know, if it is a no for -- any product on the market that's labeled as an organic fish will also have to meet these standards. So European standards, which presently, since there is no established rule, have a place in the marketplace, won't. It will be establishing that federal regulation.

So your argument, I guess, I see it the opposite direction. I see this as a means to correct what's happening.

MR. ENGELBERG: Did you want to comment? Jennifer.

MS. HALL: I'm not sure how many people are
familiar with Monterey Bay Aquarium Seafood Watch Guidelines, but currently that is probably the most widely recognized consumer education on seafood purchasing in a sustainable manner. And with the document that we have that's been revised that we're currently considering, it is on a very consistent and parallel path with how that defines sustainable purchasing at this time, which is vegetarian or nonpiscivorous fish that are farmed, are in the green category, and farmed salmon is in the red category. So I think if anything it helps to work hand in glove with efforts that are in place already.

MR. ENGELBERT: Okay. Anybody else on the Board have any comments or questions they'd like to bring up before we move on? Seeing none, that was fun.

Now we go onto our next recommendation, relatively recent on the radar screen, and that's cloning. The Livestock Committee took heed of the message sent by the overwhelming majority of the public comment sent in since the posting of our recommendation, and we have voted to add wording to deal with the progeny of cloned livestock. Valerie is putting that on the screen. And what we have proposed since the recommendation came out was on the introduction on the second paragraph, we have voted on striking out the entire last sentence. And we have also voted on adding the following under 205.236, origin of
livestock, B, the following are prohibited, then number 3.
Livestock, progeny and all succeeding generations from cloned
livestock, reproductive materials, or any other products
derived from animals produced using animal cloning
technology, and then in parentheses, includes somatic cell,
nuclear transfer, or other cloning methods. Those would be
prohibited under origin of livestock.

We've had some good suggestions yesterday on public
comment, and I think that if we can adopt those suggestions
also, and change under excluded methods, state or other
methods of asexual reproduction of animals -- I can't see the
screen.

MS. FRANCES: I am confused. Where are we?

MR. ENGELBERT: Okay. Under 205.2 --

MS. FRANCES: Right.

MR. ENGELBERT: -- terms defined, excluded methods.

MS. FRANCES: Right.

MR. ENGELBERT: The second sentence. We have
proposed adding in somatic cell, nuclear transfer, or other
methods of animal cloning. And it has been suggested and the
Livestock Committee agrees that we should change that to
asexual reproduction of animals, or other methods of asexual
reproduction of animals.

And then the same thing under 3 on what we proposed
under the filing are prohibited. The last two words would
need to be struck and add in, methods of asexual reproduction of animals.

Okay. Then the last change that we proposed, the original first working draft contained the word forever quite a few times, and I went through and took it out and have discovered that I missed one. Right at the top of that page under for recommendation, the paragraph reads, the Livestock Committee recommends that the NOP implement rule change to clarify that cloning technology and all its products, including all progeny and succeeding generations from those progeny in organic production be forever excluded from organic production. We would like to strike the word forever there, also. Right there. Strike that word.

That's the only place it was. And that's what we have for our, the Livestock Committee's recommendation on cloning. And I will open it up for questions, comments, discussion from the Board. Dan.

MR. GIACOMINI: Thanks, Kevin. The original, the previous version of this document, not including progeny, allowed for us to use some terminology without being quite as specific as we could have been. In the process of including progeny on this, we are now then, and using the term somatic cell nuclear transfer, I contacted a fair number of reproductive and AI Bull industry experts, who said that that would include embryo splitting, which is currently allowed.
There may be some people in the industry that do not feel that it would be. And it's not that it's allowed within to organic industry, you could not do this on your own operation, but by the language we are including now, we would be prohibiting the progeny of those animals.

There are thousands of bulls in the last probably five to 10 years that have, that are in AI service that were from these techniques. They are identified as ET, embryo transfer, at least within the dairy industry. I'm not sure how they are identified in the beef industry. But they are not separated from any other ET animals. There is no additional identification of them, other than just being embryo transfer, the result of embryo transfer.

So I'm very concerned that we are theoretical, essentially creating a prohibition on a large number of animals that number one are currently allowed in the organic industry; and number two, there is absolutely no way in the current landscape to track these animals. And from the people that I've talked to, if this is also a concern of other members of the Board, a result around this would be simply to add the word adult between includes and somatic in the origin of livestock paragraph.

That would eliminate the embryonic somatic cell transfer problem that is currently, this document, this language currently creates. And the fact, if someone has a
problem with adult and saying, well, I don't want to be able, I don't want them to be able to clone calves, the use of the asexual reproductive techniques that we follow that first phrase with would outlaw it for them also.

But this would, by adding adult, I believe we would go a long way towards not restricting and prohibiting animal, techniques in animals that are -- animals that are a result of techniques that are currently allowed and is not part of this document, is not part of this debate. This is an adult cloning problem that we're trying to address. And I think this would solve the problem. Otherwise, I think this really creates some problems in the industry.

Mr. Engelbert: Anybody else have any comments?

Joe?

Mr. Smillie: Just a clarification, Dan. Could you, the language for those of us that are not as familiar with the livestock issues, in going with the ban on progeny it creates a problem on enforceability of --

Mr. Giacomini: There is currently technique that's been used for --

Mr. Smillie: Right.

Mr. Giacomini: -- fairly regularly, for a large number of years, where the embryos, some or all the embryos harvested in an embryo transfer process are, let's say, I don't know the exact numbers, but let's say at 16 cells, they
are split to two eight cells, reintroduced in evacuated eggs, and then implanted in recipients. That's currently allowed -- that's not allowed in organic, but the progeny of those animals is not illegal.

This language would make the progeny of those animals illegal. There are thousands of bulls currently in use, and there is absolutely no identification of them. And there is no way to track that.

MR. SMILLIE: So it would create an unenforceable rule?

MR. GIACOMINI: Well, there is debate now of whether this would even, as the best language we put together is an enforceable rule. We would be outlying a tremendous number of animals that are currently allowed in organic production.

MR. ENGELBERT: Jeff.

MR. MOYER: Yes, I think, Joe, to answer your question, on top of what Dan already said is, it will do both. It will create a situation where animals that are currently being used as breeding stock in the organic industry would no longer be allowed, nor would it be an enforceable rule. So it's both true.

MR. ENGELBERT: Andrea.

MS. CAROE: Originally, the first draft of this document, we looked at changing or adding to the definition
of excluded methods to include or to clarify that this type
type of technology is excluded. However, understanding that
progeny of these, even though we felt that the rule does not
allow that, adding language and putting that in we avoided,
and we avoided it for this reason, in that all of these
problems exist. All these consequences exist for trying to
enforce that.

The original language was somewhat vague saying
that we're committed to working with the program identifying
these areas and areas in which we can create enforceability
for this. This draft kind of went past that. And I respect
the fact that the Livestock Committee wanted to be very clear
on their opinions about this excluded method and its progeny.
However, I don't think we're doing ourselves any justice by
putting something out there that's useless.

Because since these animals don't come with a
pedigree, and there is no markers to indicate that they, you
know, that mom or dad or grandma or grandpa was, you know,
just like their sister, it just doesn't, it -- I just don't
see that we are doing anything. I think this is words for
words. It's making a stand but it's, you know, it doesn't
really make much sense to me to do this.

So I would, I would like the committee to
reconsider language that commits to working with the program,
and identifying enforceable regulation here, whereas, you
know, and I think that's the commitment we need to show at this point, instead of stating something that we can't do.

MR. ENGELBERT: Jeff.

MR. MOYER: Andrea, from the very beginning, you have the same position as I have on this with the words for words sake, and sort of placating people by putting the word progeny in there is a nice idea, but I don't see how it is enforceable.

On the other hand, by putting the words in there the way we talked about doing it in the second draft, does indicate the intent of the Board and the intent of the direction that we want to go. And even though it may not be enforceable, it's been argued that it does show farmers the intent that we don't want it to be there.

On the other hand, an inspector could never verify that it was there, nor could he verify that it wasn't there. So I agree with exactly what you are saying.

MS. CAROE: Is there a compromise position? Is there language we can use that does not suggest rule change that's not enforceable, but makes that commitment to include progeny? That's what I'm looking for is a compromise position.

MS. JAMES: I believe that if we were to change the
language again to have a more compromised position, that we should allow public comment on that.

MR. ENGELBERT: That's a good point. Anyone else? I mean, to defend the Livestock Committee's decision, I think it's important that we come out strongly against cloning in organic agriculture. I don't think there is any place for it. I think we're all in agreement on that. I also don't think there is any place for progeny of cloned livestock in organic agriculture. And I think we need to deal with it.

I think the issue has been identified. I think this is, at the present time, is as good a language as we can come up with for it. I don't see it as just word smithing or placating the public. I think this is important to get on the record right now.

When the original rules were drafted, there was no cloned livestock in the marketplace. And there is going to be soon. And as a process-based system, there is a lot of things that can't be proven in organic agriculture. But we still need to have the guidelines there so that people know what's right and what's wrong and what's accepted. And if someone is caught doing something that's not acceptable, they can be, they can be taken to task for that. And if it's not there, it's almost an unrestricted type of situation in my opinion. Bea.
MS. JAMES: I also think that we need to remember that this recommendation still has more stages to go through, that it will go to the NOP and that the NOP, perhaps, would, you know, whether we change the language now or we don't, they are going to be faced with the situation of looking at how to deal with tracking progeny.

MR. ENGELBERT: Right. Joe.

MR. SMILLIE: Bea said exactly what I was going to say.

MR. ENGELBERT: Andrea.

MS. CAROE: I'd like to actually direct my question to Mark. Where is this recommendation going to go with language like this?

MR. BRADLEY: Mark Bradley with the National Organic Program. The program asks for clarification and a statement from the Board and some consideration as to, you know, what to do about progeny. We've already said that cloning is a prohibited practice underneath the NOP regulations. We didn't know exactly how the Board was going to view, or the public was going to view the progeny issue. I think we got the message. And it's, I think it's something that we can just work with.

In terms of, you know, the problem about the Board coming out with the recommendation saying that progeny is excluded and then how do you track that? I think the main
thing would be like Kevin is saying, that the intent is there. It's getting it in the regulations, and the program can -- I don't know if it's going to cause a reg change or not, because, I mean, if it's an excluded method now, perhaps, you know, that will be enough, that we can make it clear to the industry and to the consumers that this is not acceptable under the regulations. And it's under an existing regulation.

So from this, from here we would work with the attorneys to see if it would take a reg change; but I would think a recommendation from the program or the Board would be in order.

MR. ENGELBERT: Rigo.

MR. DELGATO: I just wanted to echo what you said, Kevin, previously. And I was one of the ones who was struggling whether we should come out with this recommendation or not. But it seems to me that the industry is changing so much that I think that the fact that we're coming out with a statement of intent has more validity than waiting for the industry to develop a way of tracking or enforcing our recommendation. That's what I wanted to say.

MR. ENGELBERT: Dan, I'd like to address your point, just for a second, not that I'm a reproductive, you know, Ph.D., or anything like that. But the techniques that you're referring to I don't think would be looked at
favorably from the organic public. And I'm not convinced
that that is actually cloning, splitting an embryo, because
you haven't removed a cell from an animal and then fertilized
it separately and then made it grow in another animal. So
that to me is still a gray area as to, given the wording
change to asexual reproduction of animals, if we really are
infringing upon that practice.

MR. GIACOMINI: The wording that is infringing on
that practice is somatic cell nuclear transfer.

MR. ENGELBERT: Okay.

MR. GIACOMINI: That is the term for that
procedure. There are other versions of that, for lack of a
better term, but that is the -- what that procedure is called
of the splitting of embryos.

And the fact that we're specifically identifying
that as a prohibited, as an excluded method, which I don't --
that is currently, that's currently the way the regulation
is. What we are changing by this is by prohibiting the
progeny of those animals. And that's an entire shift in the
way the regulation currently is, and it's not part of this
argument.

MR. ENGELBERT: Explain again then now adding adult
won't open up trouble by implying that we than approve of
that technology with anything younger than what would be
considered an adult animal.
MR. GIACOMINI: Well, the adding of the word adult is to classify the somatic cell nuclear transfer away from the embryonic process. By putting adult in, you are, in a way, and I talked about this with the people that I talked to, you are setting up a possibility of a loophole of younger animals.

It seems, and while they don't know organic regulations and/or anything else, but they felt that the addition of that, the clause that follows that of or other cloning methods, or other asexual reproductive techniques, would include the young stock as not being allowed. But it pulls, but adding the adult, it pulls it away from the embryo splitting problem.

MR. ENGELBERT: Anybody else?

MR. GIACOMINI: If you were to do it with calves, it would be an asexual reproductive technique --

MR. ENGELBERT: Right.

MR. GIACOMINI: -- which we are saying is not allowed.

MR. ENGELBERT: Right.

MR. GIACOMINI: Okay. But by saying, adult somatic cell nuclear transfer, we are not saying that the embryonic somatic cell nuclear transfer is prohibited.

MR. ENGELBERT: And I agree, but that's a concern, you know. To me it makes it seem like we're giving our
blessing to embryonic somatic cell nuclear transfer, and I
don't want to do that, I don't believe.

MR. GIACOMINI: It's been done. We would be
changing the regulation. And it's not that it's not
prohibited. It is a prohibited excluded method on organic
livestock operations. But the progeny of that technique is
not currently prohibited.

MR. ENGELBERT: Mark, do you have anymore insight,
what you think we should do with this?

MR. BRADLEY: I wish I did. Is this a postpartum
thing that you're thinking of, Dan, just anything after birth
that's -- and once it's been born you don't want, you know,
to do cell transfer?

MR. GIACOMINI: Well, all somatic cell nuclear
transfer or asexual reproductive technique done after birth
would be prohibited from this wording and would not be
allowed. And the progeny of them would not be allowed.

MR. BRADLEY: If this goes to a reg change, then we
can include language in the preamble that explains fully what
the intent is, and what the implications are. If it doesn't
go to a reg change, and it's just a guidance document, we can
include all that in there.

But in your recommendations, what we would
appreciate, if you could send forward, would be something
that fully explains what your intent is, and then we can --
you know, you can make the recommendation about the actual reg language, but the most important thing right now is that we get a clear signal from the Board that progeny is not accepted.

But if there are certain techniques that you wish to remain in place, then make that clear too, if you can.

MR. ENGELBERT: Jennifer?

MS. HALL: I don't have the perfect suggestion, but it seems since it's a clarification of one term, that there may be the opportunity just to reformat that paragraph in some kind of a bullet style or a list style that specifies a qualification of a term that's acutely just about that one item, since it's in a list format instead of kind of jumbled together. So that might be something we could work on.

MS. JAMES: Well, another suggestion might be to think about in the terms defined, defining out exactly what those methods mean, and include it. And I think Mark alluded to, was potentially alluding to that a little bit.

MR. ENGELBERT: Yes. Anyone else? Yes, I'd like to conclude by thanking the entire Livestock Committee for all their --

MR. GIACOMINI: Where are we going with the document?

MR. ENGELBERT: We're going to, we're going to have
to try to get together sometime before the vote tomorrow, the Livestock Committee, and see what we can agree to put in for our regs, for our -- Andrea.

MS. CAROE: We won't be prepared to vote, then, tomorrow, because this Board needs to consider whatever recommendation you are putting forward. I don't have a recommendation that you are putting forward to discuss.

MR. ENGELBERT: All right. Bea.

MS. JAMES: And, Kevin, I just want to point out that if you do add terms defined or you do change it significantly, that we really should look at the public giving comment to that, and I don't know what the, you know, how the rest of the Board fees about having this go into the fall. I know --

MR. ENGELBERT: Yeah, I don't think it should. I think as Mark has stated, we need to get a recommendation out here.

MS. JAMES: Is it possible to look at voting on this and then in the fall meeting have terms defined?

MR. ENGELBERT: I can't answer that. I don't know. Andrea?

MS. CAROE: You know, if the intent is to send a message to this industry that this is prohibited, even if this recommendation gets deferred, the Board is showing its intent.
USDA, and we've heard this before, you know, their interpretation of the regs has precedence. There interpretation of the regs say it's prohibited now. We're just adding clarification. Right now, the USDA lawyer said, cloning the progeny of cloning is not allowed by the regulations as they exist today. We were simply adding clarification language.

MR. ENGELBERT: Okay.

MS. CAROE: Okay. Let me just say, we have heard the statement. Mark, correct me if I am wrong, but we have heard the USDA lawyers emphatically say it's not allowed by the regs as they exist. Is that not correct?

MR. BRADLEY: That is correct. Cloning is a prohibited practice under the NOP regulations. Cloning is a prohibited practice under the NOP regulations. We asked you about progeny.

MS. CAROE: So my suggestion, and not being a member of your committee, is to defer this to fall.

MR. ENGELBERT: I would prefer to have a vote and have it not pass then to defer it. Because I think we are abducting our -- not living up to our responsibilities to come up with some type of recommendation dealing with progeny for the NOP. That's my personal opinion.

MS. JAMES: But Kevin, voting on something and having it not pass sends a mixed message.
MS. CAROE: That's right.

MR. ENGELBERT: Yeah.

MS. JAMES: I mean, I understand your dilemma --

MR. ENGELBERT: Well, I guess if we, if we put in adult, would you think that then we could go ahead with a vote? Would you concur that that alleviates your concerns about current technology that's being used in agriculture?

MR. GIACOMINI: Yeah, I think that alleviates the problem with --

MS. CAROE: Microphone.

MR. GIACOMINI: Yeah, I think that alleviates the problem of prohibiting progeny from where they currently are not prohibited. And I think we have enough additional language there of asexual reproductive techniques to cover the entire animal's life span from birth on.

MR. ENGELBERT: Bea.

MS. JAMES: I just want to remind the Board how long we spent trying to define pasture. And it makes me a little nervous putting forward something that needs further clarification. So I don't, I'm just going to state my opinion, for the record.

I think that if the NOP and Mark Bradley, you know, that they have made this announcement that the lawyers have taken this position that the USDA does not allow cloning in organic production, that that is a pretty powerful statement.
And that to wait until the fall to have your accurate
document for recommendation with the public comment, might
better suit the overall purpose of what we are trying to say
here.

MR. ENGELBERT: Jennifer.

MS. HALL: As a member of the livestock committee, and I fully support what the intent of what you want out of this, Kevin. What I'm hearing Mark say is that he has the ammunition he feels like he needs, having requested from us a statement about progeny. And it may be deferred, but then at least we have a greater chance of getting it passed and permanent, as much as that's really a fact. So I would suggest we defer.

MR. ENGELBERT: Jeff.

MR. MOYER: I guess Jennifer pretty much answered my question. I was going to ask it of Mark. If we table this, as the Livestock Committee, until fall, does that in any way jeopardize the NOP's position and your understanding of what you need to accomplish?

MR. BRADLEY: We would wait on the Board to come with a recommendation on progeny if you did defer on that. But we would say that the Board is working on it. And that's the current statement right now, is that the Board is considering, you know, the fate of progeny of cloned animals. But waiting until the fall meeting may give you the time you
need to mince out exactly how Dan's concerns about, you know, the progeny of split embryos. And we would need to have clarifications on that anyway.

    MR. ENGELBERT: Dan.

    MR. GIACOMINI: Mark, do you need better wording than cloning?

    MR. BRADLEY: Do we need better wording than cloning?

    MR. GIACOMINI: Do you need more specific wording than cloning? Is the recommendation coming from us, if we just said, that, would that -- and their progeny. Would that be clear enough for you, and if we totally got out of, without the specifics of somatic cell nuclear transfer, asexual reproductive techniques, without giving you those specifics, is just cloning and their progeny, would that be enough for the program, or would you be looking for something more specific from us?

    MR. BRADLEY: Is your intent that progeny of split embryos remain eligible for organic production? If that's your intent, and that is captured by cloning right now, then --

    MR. GIACOMINI: It's not captured by cloning right now. It's captured by the wording we're using to describe cloning.

    MR. BRADLEY: Okay.
MS. CAROE: I would suggest that that is something that gets discussed in Livestock Committee instead of right now with Mark. I don't -- I think you need to discuss that in committee.

MR. ENGELBERT: Yes, so how do we --

MS. CAROE: And let me just, I just want to add one more thing. Could somebody, or a question to you, to the livestock committee, and from the little bit I know about this technology, what is the likelihood that progeny of clones are even going to be available to organic anytime soon?

MR. ENGELBERT: Dan.

MR. GIACOMINI: The gentleman that I talked to that's an executive with one of the major bull studs in the U.S. said that they are seriously looking at the fact that they won't even get cloning in, that they'll never be allowed to market those animals because of the results of what have come up from this risk assessment document.

MR. ENGELBERT: Okay, then we'll defer the recommendation then.

MS. CAROE: I think you've sent the message, Kevin. I think you've done great work on this. I don't mean to sound like I'm combating the work that's been done. I think it's good work. However, I think it needs to be a little bit better thought out so that it can be work that actually is
enforceable from the day that it hits.
And I just want to say that because I know that
I've been contradicting a lot of what you've stated here.
But I think it's a prudent move, and based on the fact that
the risk of this technology ending up in the organic herds is
not likely to happen in the next six months. I feel like you
can buy some time.

Okay, so that concludes the livestock discussion.

MR. ENGELBERT: Yes.

MS. CAROE: Thank you. Two tough issues. Thank
you so much. Moving along to Handling Committee. There's a
couple recommendations that they have. All right, Julie, if
you want to get started.

MS. WEISMAN: Okay. Just for my fellow Board
members that are on the Handling Committee, I just passed
around for your reference a list of the order in which we are
going to present the something like 58 materials that the
Handling Committee has to consider and vote on by tomorrow
sometimes, hopefully not in the night.

Before we, before we tackle the list, I thought
that it would be helpful to make a few general comments, not
that I want to take anymore time than is necessary, but I
think it might move the process along, and also in the
interest of transparency, that everyone on the Board, and
everyone in the public that is here, should understand what's
gone on so far.

I won't repeat all the good presentation that was made by Dan Giacomini yesterday about the February meeting and what that was all about. What I do want to say is that at the February meeting, there were subcommittees which were described yesterday. Each subcommittee had a Handling Committee member on it, in addition to other Board members who were extra pairs of eyes to help the process. And then, at a following subcommittee votes, the Handling Committee is who voted on the recommendations that we're considering at this meeting.

Some of those votes were taken before we left Washington at the February meeting, at the very end, and also on subsequent conference calls. In the, for nonhandling committee members, one of the first, one of the early pages in the tabbed section seven is the summary in alphabetical order of the materials, and it shows you in the far right hand column what the subcommittee motion and votes were. And then it shows you what each Handling Committee member voted, with a summary of the committee vote in that middle bold column.

And so you will notice that there were some instances in which the -- there were many instances in which the Handling Committee voted, vote was in accordance with the subcommittee vote. In other words, the Handling Committee
concurred with what the subcommittee had come up with. In other cases, the Handling Committee, you know, had some issues with the way the subcommittee, sometimes it was a function of the fact that there were not seasoned Handling Committee members who were accustomed to dealing with these issues.

So for instance, even though subcommittees voted to recommend things like paprika and annatto with annotations that only organic oils be used, when the Handling Committee got a look at it we said, you know what, that doesn't work. You know, in handling you can't have that prescriptive annotation. And that's something that you're going to see dealt with during the discussion this afternoon.

And I think that it was a good process, because we got help from everybody on the Board, but the check was that ultimately everything came through the Handling Committee.

There were a number of issues that came up in considering some of these items which asked questions about, what are the evaluation criteria for 606? And what's the eloquent way to state this. Basically, that there is the question of demonstrating -- the question gets asked, traditionally, when we've considered materials, one of the important questions to answer is, is this essential for organic production?

And it was important to keep in mind that that is a
question, really, that is reserved to be asked for synthetics. If we're talking about an agricultural ingredient, that is not a question that needs to be asked. You know, I don't know if there is going to be, if there needs to be further discussion about that, but that's what I'm -- that's where I'm coming from right now.

So the third point that I wanted to make is that we hired a lot of public comment yesterday, already, between yesterday and -- we heard a lot of public comment even just yesterday that added information that we felt that we were lacking. And that we, as a result of that, there are certain -- the Handling Committee met after public comment, and we actually, we voted to change some of the recommendations that have been posted for the last 30 days. So we want to get that out there.

I'm going to briefly mention what they are, and then they will be discussed in a little more detail as those particular materials get presented.

So, for instance, we voted on the issue of three, you know, annotations for various numbers of years that are less than five. We voted to remove all the annotations that were for less than five-year listing, in other words, it's either on the list or it's off the list. And there is nothing at any time in the next five years that prevents anybody from petitioning to have something removed.
One exception to that is the rice starch. We didn't -- because that was a two-year listing, particularly taking into account the fact that it had a less than a 30-day comment period. And so we thought because of that extenuating circumstance that it was appropriate to have a short listing.

We also voted last night, the Handling Committee voted to reconsider whey protein concentrate at 80 percent. We also, now did we vote here to reconsider or to recommend? Okay. We voted to reconsider and then recommended that annatto be made into two separate recommendations, annatto water extracted and annatto oil extracted, and that paprika also be similarly separated into two recommendations, paprika water extracted and paprika oil extracted all for 606.

And lastly, we voted to reconsider, and then we voted to recommend FOS and inulin, OFS, for listing on 606.

Does everyone on the Handling Committee agree that that's what we did last night? Okay. So --

MS. FRANCES: Question. I don't have any of those revised documents. I don't know if you revised them.

MS. WEISMAN: You mean --

MS. FRANCES: The recommendations.

MS. WEISMAN: You mean new cover sheets?

MS. FRANCES: Yes.

MS. WEISMAN: It's only -- no, no, the votes and
the annotations will change. Do you -- is it possible that
those can be provided for you by tomorrow before the vote?

MS. FRANCES: I just was wondering if I should be
scrolling through those as you advise --

MS. WEISMAN: Oh, no, no, no. No. We -- there was
time for much last night, but making new documents for that
did not happen.

MS. FRANCES: Okay.

MS. WEISMAN: Okay. So we, for the purposes of
voting tomorrow, we made a decision that we're going to go
through each item and vote on them individually. However,
today, for the purposes of discussion and presentation, in
the hopes that it might save some time, we felt that it was
appropriate that there were certain groupings of items that
could be presented together.

And we have a very, very brave new member of the
Board, Katrina, that actually is going to lead us off. But I
just, for, maybe for clarity sake, I just wanted to just say
briefly that I think the groupings, roughly, that you are
going to be hearing are colors that were accepted by the
Handling Committee. Katrina is going to discuss those.

Colors that were rejected by the Handling Committee. And
mostly that's going to be with the exception of annatto and
paprika, which Joe is going to talk about.

Then we had spice materials that were accepted, and
Steve Demure, another brave new soul, is going to talk about that group. And then we had a couple of rejected spice petitions, which Andrea is going to talk about one and I'll talk about the other.

After that we have, I'm not going to get too detailed, but then we have a sort of a general category of materials that were accepted. There's about a dozen of those, and a general category of materials that were rejected. All of, I've mentioned that we've already changed some Handling Committee recommendations, some of the things on that list. And two things on that list, yeast and whey protein isolin were both withdrawn by their petitioners.

And then lastly we had one materials that was deferred, which I'll discuss, and three, where we voted in February not to consider them for technical reasons, which Andrea will go into.

So if Katrina's -- are you ready? Her light's on. I guess that means yes.

MS. HEINEZ: Okay. The Handling Committee reviewed petitions for seven colors that are produced from agricultural materials that we voted to recommend for listing on 205.606. Is that better? Okay.

These colors are, color purple and black carrot, color elderberry, color red cabbage, red radish, color red cabbage, color black current, and color choke berry, and
finally, color beet juice.

All these colors are produced through a physical process then soaked in water and concentrated. And in all the cases, the petitions provided evidence that the agricultural products used to make these colors were not available in sufficient form, quantity or quality. And we heard public comment to that effect this morning, that production of these colors relies on using specific varieties under specific growing conditions that produce a color with the correct hue and strength.

We also heard these colors are used in a wide variety of products to make them visually appealing for consumers.

One point of note, the hosted recommendation for color choke berry includes an annotation to list the material on 606 for three years. When we met last night we amended that recommendation to remove the annotation.

So again, the Handling Committee recommends inclusion of all these colors on the national list, 205.606, and all those votes were five for and zero against.

Discussion?

MS. CAROE: That's one of the easy ones.

MS. WEISMAN: All right. The next, the next group
of color materials being petitioned for 606 are the ones that
were rejected at this point. And I just, I'll let Joe
discuss the annatto and paprika. And then I'll make a couple
comments about the other ones.

MR. SMILLIE: Yeah, there was, as has already been
discussed, and well petitioned and well commented on, we are
dividing annatto into the oil and the water sections. And
after due consideration and a certain amount of arm twisting,
there will be a friendly amendment to remove the annotation.

And in the other case, another decision was made to
take any three or five year, make all things five year,
rather than the three year. That pretty much clears the
decks as far as the Handling Committee is concerned for the
acceptance by the Board of annatto.

Paprika is in the same boat as it were, as far as
the annotation, the three to five year issue, and the oil and
water soluble issue. But at this point in time, the Handling
Committee would like to have any public comment on the
diligence of the search for paprika sources.

We still feel that although the petition for
paprika did go into the availability of sources, we felt at
that time that it wasn't particularly global, and that
certain areas of rich paprika production, paprika, as it
were, production, weren't mentioned. And we were hoping that
the petitioner or petitioners would get back to us with more
information on a more global search.

So that's where we are right now. I'm not 100 percent sure that we've changed our recommendation, even with the removal of the annotations and the three-year issue on the paprika. But I could be fuzzy on that. Any other Handling Committee members? Is that pretty much it?

MS. WEISMAN: Jeff.

MR. SMILLIE: Yes.

MR. MOYER: I guess I'm not quite clear on the annatto. Can you go over that one again? You split it into oil and water, and you're changing your vote now to approve --

MR. SMILLIE: Correct.

MR. MOYER: -- water but not oil?

MR. SMILLIE: No, approve both, with all -- with the annotation for the organic oil requirement being removed. There's two annotations.

MR. MOYER: Yes.

MR. SMILLIE: Okay. One is to allow for three years. We're changing that. It will be five years.

MR. MOYER: Yes. Right.

MR. SMILLIE: The other annotation was that organic oil be used in the production of oil soluble annatto, oil extracted, sorry, oil extracted annatto. And we're also removing that annotation.
MR. MOYER: Okay.

MS. SMILLIE: And with those annotations removed, the Handling Committee is voting favorably on the acceptance of both oil extracted and water extracted annatto.

MS. WEISMAN: Andrea.

MS. CAROE: I voted against this material being listed, specifically because the annotation that was attached was for organic oil for oil extracted. If that, being that that annotation is being removed, my vote will change for this. I will vote for list.

MR. SMILLIE: Great.

MS. WEISMAN: I was also thinking that for nonhandling committee members that haven't really, you've had other things that you've been eating, sleeping and breathing for the last six weeks, but not this, that I wanted to emphasize that this nonorganic agricultural ingredient is being petitioned for listing on 606 including it's production method, which includes nonorganic oil. That's the package. That is the package. Okay. Any other questions or discussion?

MS. MIEDEMA: On this entire grouping?

MS. WEISMAN: Well, just on the annatto and paprika, yes. Tracy.

MS. MIEDEMA: So do I have this correct that both forms of annatto are now being recommended by the Handling
Committee to pass, will not have any annotations about time limits or organic oil?

MR. SMILLIE: Correct.

MS. MIEDEMA: Okay. And then in terms of paprika, the annotations have been removed for the organic oil, and a time limit, but no one has come forward to demonstrate that these are not available?

MS. WEISMAN: Actually, I do, I'm going to recognize myself, because I'm -- the petitioner actually did submit additional comment on March 21st. That was handed out yesterday. It didn't, wasn't in time to be posted on our wonderful new regulations.gov website.

But one of -- they specified, they were more specific about four different reasons why they found something to be not available as organic. And one of, paprika, actually, sweet peppers for paprika are mentioned in, on the second page, item 1.2, where they say, the underlying certified organic raw material may exist, but they are crops that have far more value in the market fresh, either whole, cut or diced, than as raw materials for color extraction.

That generally, things that get used for color extraction are end products, leftover pulp, things that have no value. So if the market grabs up all of the organic product and uses it for fresh applications, there is nothing
left over from which to make color, from which to make color.
I mean, there may be, we may have additional questions about that comment, but that was the additional information that the petitioner gave about why there is no pulp material on the -- organic pulp material on the market available, even though there is lots of organic red pepper.

Kevin.

MR. ENGELBERT: Could you explain briefly why the annotation for organic oil was dropped?

MS. WEISMAN: Andrea.

MS. CAROE: The listing of these materials on the national list are for nonorganic materials. These are nonorganic colors. They are not produced in organic facilities. They are not within the control of this regulation. Including organic oil into the production of these is imposing organic regulations on nonorganic products.

Annotations restrict the use of materials that come in a variety of ways to the ones which are acceptable to be used in organic production. It is not used to designate how things get produced. Oil, organic oil crossed that line.

If you wanted to say oil production as opposed to water production, both of those are available, and if you were narrowing in on one that's acceptable, that's appropriate, but this is imposing organic regulations on a nonorganic world. And it crossed the line, and I opposed it.
And also we had some commentors that opposed it as well.

MR. ENGELBERT: Okay. Thank you. I just wanted to be clear that that's what was the reasoning behind that.

MS. WEISMAN: Tracy.

MS. MIEDEMA: I'm going to go ahead and bring this up now because it's going to apply to several of these colors. The additional evidence that you just presented was, similar evidence was present in many of these color petitions. And it was very uneven, the evidence presented.

And I felt that there probably was not enough guidance given to petitioners what our expectation was, because some people really had a slam dunk case where they had six letters, maybe even a dozen from suppliers around the world clearly documenting they had given it this amazing shot.

Whereas other people said one sentence about, most of it is getting taken up by fresh market. We can't get any. And it was just very hard to draw the line of what, you know, what is proof. So maybe someone on the Handling Committee could further clarify that.

MS. WEISMAN: I'll take that one. I actually, I thank you very much, Tracy, for bringing that up. That should have been something that was in my initial presentation.

I think that is absolutely a factor. The timing
with which the industry was presented with the commercial availability criteria, and what the process was going to be for this new category of petitioned products on 606 was, I mean, even though everyone was working as fast as they possibly could, I believe that that was first published in December. And about four weeks, including Christmastime, and the holidays, four weeks ahead of what we had put out as our soft deadline for when we had to have these petitions in order to consider them at the March meeting. And I don't know if I've said anything that makes anyone from the program want to respond. I hope not. Okay.

But so I think that's a very, I think it's very important. And I ask the entire Board to please keep that in mind, that there was a wide variety in the depth of information that got presented. And it kind of depended a little bit on, you know, which petitioners are better connected to this process, and which ones are just newly trying to figure out how to do this.

And I want people to take that into consideration, and not be overly punitive of the people that are newer to the process and trying to get on board. Dan.

MR. GIACOMINI: Just for clarification on that, if we vote to reject an item significantly based on insufficient information, is there a process for petitioner to supply that information for us without having to go back to square one?
That might be a question --

MS. WEISMAN: You mean, if they supply --

MR. GIACOMINI: -- that might be a question for Bob, I don't know.

MS. WEISMAN: Okay. I mean, there was -- we posted our, 30 days ago we posted our decision. So there's been the last 30 days when it would have been hoped that they would have come forward with the additional information.

So you are asking, what happens if after this meeting there wasn't enough to change that recommendation. Is that what you are asking?

MR. GIACOMINI: Right. Granted, it won't be acted on until fall --

MS. WEISMAN: Right.

MR. GIACOMINI: -- but would they have to go through the entire process of resubmitting a petition and doing all that, just for clarification?

MS. WEISMAN: No. Kim, can I ask -- okay, Bob.

MR. POOLER: Yeah, Bob Pooler, National Organic Program. If the Board decides that there is insufficient information to evaluate these petitions, they have the option of notifying the petitioner, and indicating that there is insufficient material, and the petitioner will have the opportunity to provide more information. And the petition can be deferred until the fall.
MS. WEISMAN: Okay. So I guess the answer is, don't, let's not reject. Let's defer, rather than reject it, if that's what it comes down to.

MR. GIACOMINI: It's a different motion.

MS. WEISMAN: Right. Okay, so, with that being said, I'm going to talk about the color materials that were rejected, other than annatto and the paprika.

And they basically, they all fell, they all fell into the same category. Basically, they were petitions. I might go out on a limb here, even, and say that they all were on, they all came from the same petitioner who, the assertion was that there were very general comments made about all of these ingredients.

And if you look down the list, for instance, okay, we don't -- all right. Saffron is one that got rejected. And that's actually, this petitioner submitted a comment last week, and in the same paragraph where they discussed sweet peppers for paprika, they have also mentioned -- well, I guess can I read it?

While there is an abundance of domestically grown grapes, for instance, and while some of this crop is now certified organic, the crop is more valuable in the production of wine than as a raw material for color extraction. This is true for organic certified tomatoes from which lycopene is extracted, for carrots from which beta-
carotin is derived, for the sweet peppers which we just
discussed, and most certainly saffron.

So I'm -- that's the additional information that I
have to offer at this point. And I don't know -- that's the
additional information that I have to offer on the saffron.
And that's also for the grape.

Now, we have -- you know, I'm kind of going to
apologize that we don't have a list to put up, you know, for
the public. But I'm assuming the fact that everybody on the
Board has this list in front of them, it's okay. All right.

These are the items that were rejected colors for
insufficient data. Turmeric, saffron, grape juice extract
and grape skin extract, blueberry juice, cherry juice,
hibiscus juice, carrot juice, pumpkin juice, tomato juice
extract, purple potato juice, lycopene, and beta carotin.

Now, we have heard public comment today that
mentions some of these items, and on the basis of that, some
of these ongoing, there are, some of these items on this list
that I'm going to suggest now that the handling committee
change its recommendation. Is that -- I'm looking for -- is
that appropriate to do?

MS. CAROE: No, you can't do committee work at this
table.

MS. WEISMAN: Okay. Based on what's mentioned in
this second comment from petitioner, I would put, I would put
turmeric in this category. We did hear evidence in public comment on a lack of supply. We also heard a commentor this morning mentioned cherry juice and carrot juice.

We have a public comment that was not made into, read in to the record, but was received in writing that I just read from, and that one listed lycopene and beta carotin and tomato juice, so -- and the grape, and the grapes in general, grape juice and grape skin, which were referred to.

So it basically, of the list that I just read, it leaves blueberry juice, hibiscus, and purple potato, for which no additional information has been given since the Handling Committee voted to reject it.

MR. GIACOMINI: Pumpkin.

MS. WEISMAN: Oh, and you know what, I'm sorry, that didn't -- yes, and pumpkin. Yes, Andrea?

MS. CAROE: At this time, if we're to consider these for a vote tomorrow, which we all intend on doing, the Handling Committee cannot meet and forward a different recommendation. The recommendation is to reject. However, the Board does not have to vote with the committee recommendation.

Based on the new information, these are identified and will go to full Board vote. That's what I would suggest. Dan's asking --

MS. WEISMAN: Okay.
MR. GIACOMINI: The important point on this is that these have all been presented in a positive to accept motion. So it would, all we are, the Handling Committee is merely recommending a yes vote rather than a no vote. And that allows us to do that without having to change the motion, in order to get a passing. All we would need is a two-thirds vote of the motion to accept, to pass it, which is the same as it would be before. You are just now suggesting a yes instead of a no.

MS. WEISMAN: That's right. Thank you for that clarification, Dan. You are actually -- thank you for doing my work for me. I was supposed to say that. So yes, that's absolutely true. We don't have to change the recommendation. The full Board is welcome to vote differently than the Handling Committee. That's the way it works. Andrea.

MS. CAROE: I just want to let everybody know, but by design, all of these motions were made to list, even if they weren't going to pass committee, they were all voted to list for several reasons.

One, like I said, this was an atypical situation. We wanted these all to be posted to elicit public comment where we didn't have it. But also, knowing that we were going to have so many votes for the Board, we wanted all the motions to be in the same format, so at no time does a Board member not know what they are voting for.
So just, it looks a little bit strange on paper, but there is a method to the madness, I hope.

MS. WEISMAN: Bea.

MS. JAMES: Could you just read the rejected ones one more time? I'm sorry.

MS. WEISMAN: Blueberry -- you mean the ones that are still rejected --

MS. JAMES: Yes.

MS. WEISMAN: -- because there is no new information?

MS. JAMES: Right.

MS. WEISMAN: Yes. Blueberry, hibiscus, pumpkin juice, and purple potato juice.

MS. JAMES: Okay. Thank you.

MS. WEISMAN: Any other? I had, I think, one other matter that was -- one other thing I wanted to throw out to the rest of the Board.

That, of course, we don't know what -- we don't know exactly what the timing of the full meeting is going to be, and we've just, it's been clarified for us that if we, if we decide to defer these materials, it is important to note that although the 606 deadline is in June, colors is a sunset material, and it actually does not sunset until October of this year.

So manufacturers can, theoretically, can
technically use these materials until they actually sunset.

And I suppose there is a possibility that we might meet before that sunset. But you know, the way this thing -- but it wouldn't make it in the Federal Register, obviously, in time for sunset, but I did want to point that out.

And I guess the second statement that I wanted to throw out is, I feel a responsibility to represent my constituency, which is the processing community. And I would encourage the Board, having said everything I said about which materials we got, no additional information.

Ultimately, you know, there is an additional step in this. Because something gets onto, is listed on 606, it does not mean that a handler can use it. It does not mean that a food manufacturer can use it.

All it means is that it's something that's eligible for the certifier to consider letting them use; that the onus will still be, there's still going to be an additional filter to get through. There's another hoop to jump through. It isn't enough to have it listed on 606.

And because of the difficulties of timing, of getting the information out to manufacturers, some of whom are more or are sometimes are less savvy about how the organic industry and this process works, I would really encourage the Board to err on the side of listing.

I know we've also had some public comment that
goes, you know, that's been the other way. But I, it is not clear to me how severe the impact will be from not listing. And putting things on the list does not mean that they get to be used. So I wanted to remind everybody of that.

Any other discussion about this? Wow. Okay. All right. The next category, or the next group of materials that are going to be presented will be spices that were accepted by the Handling Committee, and Steve Demure is going to talk about those.

MR. DEMURE: Okay. We've got a group of five spices that were submitted for inclusion on 606 that the Handling Committee went through. They are lemon grass, frozen, galangal, frozen, Turkish bay leaves, red pepper, dried, crushed, and celery powder.

The lemon grass, the galangal and the Turkish bay leaves all passed, five yes, zero no. The red pepper was the same. The celery powder passed four yes, no no votes and one absent vote.

You'll notice in the, on the website, that the red pepper and the celery powder both have three-year annotations. And as several people have mentioned, we have decided to remove those and make these five year annotations or five year listings, so you can disregard those.

All of these substances were considered by the Handling Committee to be recommended for listing.
MS. WEISMAN: Any discussion? Okay. Now we're going to move on. There were a couple of spice petitioners that were rejected. The first one we are going to talk about is dill weed oil which Andrea is going to discuss.

MS. CAROE: As we broke down into these groups, dill weed oil kind of became one of those materials that was a little bit more challenging for us. There was one major piece of information that was missing from this petition. There was quite a bit of information about how good this product is, and how available it is, and information about the quality of this product as compared to organic dill weed oil. But there was no information about why dill weed oil was needed.

And I don't say it's not essential. That's really not the argument here. But why dill isn't used, because this is for pickles. And so we were hoping that we would elicit more information about that.

However, since whether the product is essential for organic production as a processing aide requirement, and not an ingredient argument, it's touchy. This is close. But the Board, the committee had voted to reject this on that principal, that there was really no information why dill weed oil, that form is necessary for the flavor, the flavor representation for this product. Any discussion? Tracy.

MS. MIEDEMA: That question seems out of the
purview of the Board. It's something like a flavor formulation decision.

MS. CAROE: Yes and no, I agree with you. If we had somebody that came to us and wanted to use, you know, it was speculating to the point where they can use a nonorganic, you would question it. You would question it. If they said that they needed orange rind dried in milk to, you know, you could spec things down to the point where they are not available.

What we didn't get from this is why it's -- you know, they never gave us any information about whether their processing technique takes this -- this makes their technique work, or whether there is pathogen issues with using the fresh herb or the dried herb or, you know, we didn't really get a feel for why this form, this particular spec was what they needed. And without that, you can't really tell if they are speculating for a particular product.

That was the issue. And like I said, it is close. And you know, you can see it either way, but it was just never explained at all. It was missing from this petition. They did not come back.

MS. HEINEZ: This is a comment, not a question. I just wanted to point out for the Board that, or for the rest of the Board, this petitioner provided ample evidence that the dill weed oil was not commercially available in organic
form. Our vote was more a reflection of, was there an alternate substance, fresh dill, that they could have used. So when you make your decision, that's the point that we would recommend that you consider.

MS. CAROE: And actually, I wanted to add that that was a factor in some of the other spices that were accepted, that specifically, every single one of those that was excepted, where there were two that were in frozen form, and those petitioners specifically addressed and gave, you know, industry information why the fresh form isn't available in the quantity or at the times that we need it, and the dried form, only the frozen can substitute, not the dried. Those other petitioners that were accepted were very, very clear about why the other forms were not, were not either available or not usable for them. Dan.

MR. GIACOMINI: I'm a little confused. And maybe the committee can, or the subcommittee can enlighten me a little bit here. But just looking at the petition on number eight, justification statement, it says, no form of dill is currently available in the organic form. We're working with our suppliers to grow organic dill, but the earliest available will be October 2007.

Given the date of June 2007, when all the organic ingredients not on the national list must be organic, they are asking for this. Do we know something contrary to the
availability of organic dill in any form?

MS. CAROE: No, actually the petition, you're reading off the checklist, the quotation?

MR. GIACOMINI: I'm reading off the petition.

MS. CAROE: Okay. I thought the petition specifically referenced dill oil?

MR. GIACOMINI: It does say dill oil, but it says, no form of dill is currently available in organic form.

MS. CAROE: I thought it said, I thought it said that it was dill oil that was not available in organic form.

MR. GIACOMINI: Number eight, justification statement on page two if somebody wants to look that up.

MS. WEISMAN: I don't have the --

MS. CAROE: It will take me a while to get it up, but I truthfully, Dan, there's so many materials in my head, I can't remember all the details about this.

MR. GIACOMINI: Oh, I know. I know.

MS. CAROE: But I do know that specifically we looked for that in the petition, and we felt it was insufficient. I have to pull up the petition and look at it again. Like I said, we felt that they made a very good argument as far as dill weed oil, but there wasn't a whole lot addressed as far as the rest. Tracy.

MS. MIEDEMA: So if what you are saying is they made the case for dill weed oil, I'm confused of why we are
even talking about dill weed. Because it seems like the oil
and fresh form are so different, we know of all the
constraints. We're aware of the challenges of taking a minor
ingredient and extracting, you know, something from that.
And I just, if they made their case, then it seems like we
should move on.

MS. CAROE: We need to revisit this. And I can
report back tomorrow before we do the vote on this, but we
did not feel that they did do what you said that they did. I
mean, again, we were looking at this and seeing, you know,
there was no explanation of the specification of this
product. None. None.

And so, all we wanted, we felt it was a very short
answer that we needed from them, to tell us that, you know,
the concentration of a flavor is, you know, they need to have
this level of concentration. They can only get that through
the oil component. Or that the equipment can only add it in
a liquid form, or that, you know, there is too many pathogens
in the fresh or the dried product. Any of that.

We just wanted that explanation just to verify that
they weren't specking out the organic product. So that's
kind of where we were. But I have to, I will revisit the
petition, and again, I apologizes, but I just cannot remember
all the details. Jeff.

MR. MOYER: Andrea, my recollection of that
conversations, also, was that for this particular pickle manufacturer, dill is not a minor ingredient in dill pickles. There was a discussion about that as well, too. I don't remember exactly where.

MS. CAROE: No, I don't think we could be considering the nonorganic -- we couldn't even be discussing that if it was not a minor ingredient. We're only discussing ingredients that are nonorganic, and therefore are limited to 5 percent of the finished product.

MS. WEISMAN: I know what it was.

MS. CAROE: The issue that, and it wasn't an issue for our deliberation on this, but if they use a nonorganic dill oil, they will not be able to label the product as organic dill pickles, because it's not organic dill. But that was a different issue.

MS. WEISMAN: Katrina. Katrina.

MS. HEINEZ: I thought it might help. We have listed on our recommendation checklist, the petitioner did do a search for an organic form of the dill weed oil. So this is from the petition, page two, item nine. The petitioner states that one of their manufacturers is willing to contract with the petitioner to product an organic dill weed oil, but that crop would not be available until October of 2007, at the very earliest. So that there was information about the commercial availability of the organic form of the oil.
And underneath that, we asked the question, is there another practice that would make the substance unnecessary? We wrote, while fresh dill is a possible alternative, information was not provided by the petitioner as to the viability of this option.

So that the petition is specifically for dill weed oil, and they did provide information that they are unable, today, to find an organic form.

MS. WEISMAN: I also, the difference between this petition and the color petitions that didn't pass is that I believe that the recommendation at committee level, at subcommittee committee level was to reject. So the yes votes were yes to reject. So if this were going to be changed, I'm reading from the -- the subcommittee motion was to reject, five nothing, and the committee vote -- am I reading the wrong line here?

MS. HEINEZ: Julie?

MS. WEISMAN: That's correct. So this is different than the colors that didn't pass. They were recommended and they didn't pass. This was actually, the recommendation was not to list. So this would require -- from the subcommittee. Oh -- okay. All right. I'm sorry. I didn't mean to confuse it.

Then the vote to clarify, this is, this is the same as the colors. So in other words, the recommendation was to
list. So the Board, the full Board does have, anybody on the Board has the opportunity to vote for listing, because that is the recommendation on the table when it comes to tomorrow. Any other? Anymore on dill weed oil? Okay.

The other spice petition that did not pass, there was a petition that was received for dried spices as a group. And this had to be rejected because only single materials can be petitioned.

And we were prepared to debate about this, but we had it on pretty good authority that even if we voted to accept it, legally it was not going to make its way through all of the hoops that it would have to get through in USDA and OGC and all of those. So that's why that petition did not pass.

MR. GIACOMINI: Julie?

MS. WEISMAN: Dan.

MR. GIACOMINI: I would just like to note on that, that in NOP passing that onto us, NOP specifically went to this petitioner and said, these need to be individually. We'd like you to break them down. They said, no. Put it through in that, we want you to put it through in that form.

And interestingly, it is the same petitioner that did submit a couple of other of the spaces, individually, and those have passed. So they are, the petitioner is the one who insisted that it go through this way, even after we, the
NOP asked them to break it down.

MS. WEISMAN: Yes, that is my recollection as well.

Now, we are, we're moving to a new category of a number of materials not for color, petitioned for 606, that are the Handling Committee did vote to accept. And these are going to be presented by a few of us.

So the first, I'll read off the list of materials, of all the materials in this category. They are gellan gum, fish oils, whey protein concentrate, hops, jalapeno and chipotle peppers, poblano peppers, salvia hispanica, which is Spanish sage, sweet potato starch, rice starch, fish gelatin, natural pork casings, and seaweed otherwise known as wakame undaria.

So the first material, gellan gum, I think Katrina.

MR. SMILLIE: Julie?

MS. WEISMAN: Yes.

MR. SMILLIE: You said these are all 606? Gellan gum is 605.

MS. WEISMAN: Thank you. Yes. That's actually a very important distinction.

MR. SMILLIE: B.

MS. WEISMAN: Is there anything else that anybody can think of that I misclassified here? These were materials petitioned for 605 or 606 that were accepted. And yes, the first one, gellan gum is a 605 B material, which is the
1 synthetic part of the list. Katrina.

   MS. HEINEZ: Okay. So we reviewed gellan gum
2 petition for addition to the national list on 605 B,
3 synthetic allowed materials. Just a brief background, we did
4 have a tap review that was completed in February 2006.
5 Gellan gum is used as a thickening agent at low levels.
6 There are similar materials already on the list. 605 A has
7 agar and carrageenan, 605 B has pectin and xanthan gum.
8
9 Gellan gum, in the petition, they describe that
10 this provides different functionality, or is used in
11 different applications than the similar materials already on
12 the list.
13
14 It's produced, just as background for the rest of
15 the Board, by microbial culture. The gum is separated from
16 the fermentation began through solvent extraction. The TAP
17 identifies that isopropyl alcohol is that solvent, but the
18 TAP did not reveal any adverse effects on humans or the
19 environment. As a note, the residual solvent is at less than
20 .1 percent after the process.
21
22 We voted to recommend inclusion of gellan gum on
23 national list 205.606 E, and the vote was five for, zero
24 opposed. Any discussion or questions?
25
26 MS. WEISMAN: I just, I want to make one brief
27 comment here. I do encourage my fellow Board members, if
28 there are any questions at all, not that I want to make us
stay here any longer tonight, but tomorrow it will be very,
we will barely have enough time to vote. So it's pretty
important to, as much as humanly possible, to get all
discussion out of the way today. So if you even think you
have a question, do not be shy about asking it.

All right. Sounds like we are ready to move on.

MS. HEINEZ: Okay. The next material that we
reviewed was fish oil, so again some background. It's an
ingredient typically used to increase omega-3 fatty acid in
food stuffs. The manufacturing typically involves an alkali
refining process, filtration, bleaching, and deodorization.

The typical fish sources cited in the petition were
anchovies or sardines. And the petition did provide evidence
that the fish oil is produced in a manner consistent with
organic production.

I think it is obvious to everyone that given all
our discussions this morning on aquaculture, that clearly
organic fish are not currently commercially available as an
input to making this fish oil. So based on that, the
handling committee recommended inclusion on 205.606 of fish
oil. And the vote was five for, zero opposed.

MS. WEISMAN: Dan.

MR. GIACOMINI: There was discussion in the
subcommittee on the possibility of an annotation that this
contain, that this have, be with a natural preservative. I
don't remember how that came out of subcommittee on a vote, but would that be considered too conscriptive just as the organic oil would be, or --

MS. WEISMAN: I'll take a stab at this. I don't think so. I mean, you're saying, this is being petitioned as an agricultural ingredient, and you're a nonorganic agricultural ingredient. Asking that the preservative be natural is not the same thing as petitioning a nonorganic ingredient, and saying that one of the components has to be organic. Andrea.

MS. CAROE: I guess it would depend on, you know, are these products typically made with natural preservatives. And then the second question is, what is a natural preservative? Is that clear? I mean, if I was a certifier and saw an annotation like that, it's a rat's nest. I mean, it's just, what is a natural preservative.

If it's defined by FDA, I'm great with that. But if it's not, I don't know. I think that it might not mean anything. And if nobody is using that, and if it means that they are going to have to, you know, try to designate new production to meet an organic market, then it's just as bad as imposing an organic regulation on them.

MR. GIACOMINI: Well, it just seems that allowing nonorganic agricultural products is one step, allowing into the food stream for organic consumers, all owing ethoxyquin
in is another step, which is essentially what we would be
doing.

MS. CAROE: Kim, if I can call you to the podium to
talk, I mean, I know we had this whole fish argument, and I
can't remember how it all went. If you can give us some
history.

MS. DIETZ: I'll try. Kim Dietz, past NOSB
Materials Chair, regulatory manager for Smucker Quality
Beverage. In the past, as we've reviewed materials, your
role is to review them as they are and as they are
manufactured, okay. And that includes all processes and all
processing aides, and all products, anything it takes to make
a material. You are reviewing it for inclusion on the
national list.

Typically, if that includes a processing agent, a
ph adjuster, anything that is included in that, you don't
necessary put that in an annotation. You are accepting that
material as a whole. So annotations make things very touch
and sticky when you get to using them on the national list.

As far as fish goes, you know, we were talking
about the gelatin, and that's a separate material that you
are reviewing, so, and I don't know. Maybe that's good --
Rich Theuer, are you still there? Is there any such thing as
a natural preservative? I don't know as it --

AUDIENCE: Tocopherol.
MS. DIETZ: Okay. Tocopherol. Okay. So, you know, you may need to take this back and discuss it and talk about it.

AUDIENCE: There is also rosemary --

MS. DIETZ: Okay. Okay. So you can limit that annotation. But typically, in the past, we've -- you've put materials on as is including all manufacturing processes.

MS. WEISMAN: I am reminded that the petition specifically said that tocopherol was what was being used.

MR. GIACOMINI: Again, 55 petitions run amuck in my brain.

MS. WEISMAN: Yes, okay. So this one is, and in fact, the petitioner is in the room. So if we would like to --

PETITIONER: I'm open to questions.

MS. WEISMAN: Okay. Do we need that at this point, or was that -- I think we just reminded ourselves of what we had to remember.

MR. GIACOMINI: I think maybe the debate came up on the possibility of the fact, putting it on, you know, we're putting on fish oil. We're not putting on the fish oil from this petition. It still is a potential problem.

MS. WEISMAN: Right. Yes. Andrea.

MS. CAROE: Knowing that there is a product out there that is made with a natural preservative, you can put
the annotation. I would suggest not using the word natural, because I really feel it's undefined, but you might want to use tocopherol only, or you know, you might want to come up with different terminology for that annotation.

And again, it's not imposing organic regulations on the nonorganic world. It's being specifically about what you accept into the organic world. Does that make sense?

MS. WEISMAN: Sounds good to me. Katrina. All right, what do we want to do with it? I think that, let's -- I know we try to avoid the annotations as much as possible, but I think it might be appropriate here. So I think we would need a motion to amend the recommendation.

MS. CAROE: You don't need it.

MS. WEISMAN: Okay.

MS. CAROE: What I suggest doing is, we can have -- during this discussion, we can talk about an annotation. When the motion gets put on the table tomorrow, then accept a motion to amend to add an annotation. But let's discuss it here so that we're aware of it, so that, you know, we're making notice of it right now, unless you want to take it to committee, reconsider, and then come back, which I would suggest not.

I would say, let's leave the motion, the recommendation from the committee as it stands. When the motion gets made tomorrow, if somebody wants to amend that
motion to add an annotation, that would be the appropriate place to do it.

    MS. WEISMAN: I do suggest that we, that we discuss now exactly what the wording of that annotation will be. Joe.

    MR. SMILLIE: With preserves allowed under the NOP regulation, or something to that effect. Allowed, not natural.

    MS. WEISMAN: Okay, so state it the way you think it would read.

    MR. SMILLIE: Oh boy. Where it is? Substance to be voted as allowed on the national list, 205.606 with annotation in accordance with all NOP regulations, including, but not limited to allow preservatives.

    MS. WEISMAN: What?

    MR. SMILLIE: What I just read. This is English.

    MR. GIACOMINI: Canadian English.

    MS. WEISMAN: Yes.

    MR. SMILLIE: Et tu en Francais? Substance to be allowed, to be added as allowed on national list 205.606 with -- to be allowed on 205.606 in accordance with all NOP regulations including but not limited to allowed preservatives.

    MR. GIACOMINI: Preservatives allowed on the national list.
MR. SMILLIE: Well, okay, preservatives allowed.

Ball park. Ball park.

MS. WEISMAN: Okay. Ball park. All right. I'm just trying to avoid problems tomorrow. I'd rather have problems today.

MR. SMILLIE: Okay, what's problematic about that?

MS. WEISMAN: It sounds a little wordy.

MS. CAROE: Can I make a suggestion?

MR. SMILLIE: Please.

MS. CAROE: Can we just say, only natural -- only preservatives listed on the national -- oh, now I'm getting --

MR. SMILLIE: No. See, you're --

MS. CAROE: It turns around.

MR. SMILLIE: I'll try that again.

MS. CAROE: Allowed preservatives only.

MS. WEISMAN: Okay.

MR. SMILLIE: Okay.

MR. MOYER: How is that different from putting an organic standard on this that we just said we couldn't do? What's the difference? I'm sure there is. Just explain it to me.

MS. CAROE: All right. The difference between this an annatto oil extracted and being made with organic oil is,
right now, nobody is making annatto extracted with organic oil and made with other oil, and letting you choose which one you purchase. In this case, there is available through the conventional supplies products that have preservatives that are tocopherol or rosemary oil or whatever, using those. They are available in the conventional market. In this case, we're setting an annotation that narrows in on what's acceptable to bring in.

In the case where you're saying organic oil, you're forcing manufacturers to have their venders remake their product specifically for their allowance. And that's different. That's impending regulation down. You see, you see the difference?

MS. WEISMAN: In other words, product that complies with this is already in the marketplace. So we're just closing the door and saying, that's it. This is what's going to be allowed. Nothing that meets less than this standard.

MR. SMILLIE: And again, the historical reason for this, for Board members not up to it is that fish meal, in the past, that was allowed in organic products, contained ethoxyquin. It was a standard preservative in fish meal. And we just want to be really clear that we're allowing fish oils, but we're not allowing fish oils with ethoxyquin.

And again, the petitioner in this case, you know, was very clear that was alpha tocopherol -- mixed tocopherols
that were being used as an allowable natural preservative.

MS. WEISMAN: Okay. Are we good with fish oils?

Okay. Whey protein concentrate.

MS. HEINEZ: Are you ready?

MS. WEISMAN: Yes.

MS. HEINEZ: Okay. The Handling Committee reviewed three petitions for whey protein materials. Just as a reminder, whey protein isolate has been withdrawn by the petitioner. The other two petitions were for whey protein concentrate, 35 percent and 80 percent.

Whey protein concentrate is used in dairy products for texture and consistency. It's manufactured from whey byproducts, mostly from cheese production. It goes through an ultra-filtration process that removes a large portion of the lactose and the minerals in the water. The process does not involve use of chemical, and then it's spray-dried and sold as a dry ingredient.

The petitioner provided great deal on why they've been unable to source organic whey protein concentrate. So just to summarize that for the rest of the Board, it really has to do with the fact that the economics are such that it is better for the producers of the whey byproduct to produce whey powder versus whey protein concentrate. They have better yields, the runs are larger, and there is a market for all that whey powder. So why go to the extra expense of
creating the whey protein concentrate, when you have a market
for the whey powder that's cheaper to produce.

So because of that, there just is not any whey
protein concentrate available for purchase. It's a very
short summary. If you have more questions about it, there's
a lot of detail in the petition.

There are two companies in the U.S. that collect
the majority of the whey from organic cheese processing. One
occasionally will provide whey protein concentrate, but will
not guarantee a supply. The other one has just said, they
have no interest in producing it.

A last point of note here, our posted
recommendations for the whey protein concentrate 80 percent
is a recommendation not to list it. Subsequent information
from public comment was received that provided evidence that
the process for whey protein concentrate 80 percent was
identical to that for the 35 percent, and did not involve the
use of chemicals.

So at our meeting last night, the Handling
Committee voted to reconsider our recommendation, and voted
to recommend listing whey protein concentrate 80 on 606. So
our recommendations are to list both on 606 and the votes
were both five for and zero opposed.

MS. WEISMAN: Any discussion? Questions? Kevin?
MR. ENGELBERT: Just one. What's the future look
like for whey protein concentrate? Is there going to be any
organic on the marketplace if this is allowed on 606?

MS. WEISMAN: Can I please answer that? Kevin, I
think you probably know the answer to that question better
than anybody. It depends on the supply of organic milk.

MR. ENGELBERT: Okay.

MS. WEISMAN: It depends on the supply of organic
-- okay, Andrea has more.

MS. CAROE: We are not doing away with commercial
availability. It's still there. If it becomes available, it
has to be used. This permits a certifier to consider a
manufacturer that's using a nonorganic form. It does not
give them carte blanch. They still have to prove that it's
not available. Okay. So listing on 606 does not prevent the
development. It should incite the development of these
organic products.

MS. WEISMAN: I'm debating whether I want to take
this moment, because it's relevant, to -- there has been,
there has been public comment on both, you know, on two
different strains about -- there are some -- I think Jim
talked about the lumpers and the splitters yesterday. Well,
we have kind of a similar breakdown of categories on the
listing issue.

There are those who think that as few things as
possible should be listed on 606, and the reason that's given
is that it will inhibit the development of organic
ingredients. And I do, I also want to point out that we're
-- all these, all the ingredients that we're talking about
right now are all minor ingredients. They're all used less
than 5 percent. And that up until the Harvey lawsuit,
anyone, theoretically, you could use an agricultural product
if your certifier approved, that was not organic in your 5
percent.

So if being able to use those products was an
inhibitor to the development, it becomes very difficult to
explain the fact that in the last, since the rule became
effective in 2002, there were -- I mean, and I'll ask, you
know, think, all you manufacturers out there, think about how
many minor ingredients were available in 2002 compared to
now.

The facts in the field are that despite the fact
that there is an allowance to use agricultural ingredients,
if they are not available organically, many, many, many,
many minor ingredients have been brought to market, for reasons
that were mentioned by many commentors in the last two days.

There are many, many companies who were not, I
certainly would not be in the organic business. I make a
minor ingredient. And it was my customer who pushed me to
make it organically. They didn't have to, but they did. And
many, many manufacturers, many manufacturers do that.
I am not saying that there aren't people out there who do try and push the envelop and take advantage. But the facts in the field are that the ability to use, have access to nonorganic agricultural ingredients has not so far proven to be an impediment to the development of organic minor ingredients. That's my spiel. Thanks.

Okay. The chairman informs me that we're due for a break.

MS. CAROE: Yes, if we could take a 10-minute break, 10 minutes, just 10 minutes. Okay.

(Recess.)
AFTERNOON SESSION

MS. CAROE: Okay, Board. The next material is hops which Joe Smillie is going to be handling. He's not in the room right now. So, we're going to go slightly out of order and, Julie, I'm taking over for you.

(Discussion off the record)

MS. WEISMAN: The next material on our list is hops which Joe Smillie is going to discuss.

MR. SMILLIE: Even though hops are somnorific I hope everybody's awake. What Julie said at the end, before a break, I won't repeat. You've heard it eighteen times already which is that hops is another one of those categories which simply because it's placed on the list does not mean that one can use it. One has to justify to one certifier that organic and farm quality quantity is not available.

So, again, with that as the bedrock that we start from, we looked at the hops petition and quickly determined that unlike perhaps other products hops are simply not hops. There are many different varieties of hops and there's a very long, long tradition. The Reinheitsgebot in Germany and other traditions where different hops are used to create different identities of beer, so, beer is not beer, it's AL lager, pilsner, you have all these different things. They all rely on different hops produced in two different ways, either boiled with the water or added as fresh after and
that's simplifying, you know, a very long brewing process.

So, basically, in reviewing the petition we had to look at a wide variety of different types of hops produced under different regimes and while there are organic hops available and possibly in the near future in sufficient quantity, they would be of a specific type of form and quality that while useful for some beers is not useful for all.

And we went through the petition. The petition went into great detail with the different types of variety, growing methodologies and that, and the very strong possibility that as this industry grows that more and more of these hops would be available as organic. Again, quality, quantity, and form were all issues in the availability and the fragility of supply.

Once again, like a lot of modern agriculture there used to be, you know, small scale production all over the place and unfortunately it's been, you know, centralized production in only certain areas now have the infrastructure, certain agricultural areas, one in the U.S. in particular have an infrastructure that will support the growing of hops.

So, in reviewing the document we decided that it was acceptable; that it be placed on 606 without any annotations or restrictions.

MS. WEISMAN: Any discussion or questions. Andrea?
MS. CAROE: I actually just want to make a comment. When we first approached the 606 process the materials committee and Dan created a process by which we would be reviewing these new category of materials and after that process was established we took two diverse materials that we received petitions for and did a beta test where we ran this review process engaging the board and this was one of those two products that we used for that beta test. The other one was poblano peppers.

So, they had two separate issues, two separate sets of issues, I should say, and this one, you know, was actually a model for what we expected to see in a petition. So, I just wanted to make that very clear that actually it's more than the handling committee that's seen this. The whole board hasn't seen this as part of that exercise.

MS. WEISMAN: Okay. We're going to move on. We have a group of materials, three, that Steve DeMuri is going to present, jalapeno, chipolte peppers, poblano peppers and salvia hispanica.

MR. DEMURI: In the interest of time I'll take the jalapeno, chipolte, and poblano peppers kind of as a little mini group of this three set group. We reviewed the petitions for these pepper ingredients. As Andrea mentioned, the poblano is one that we had looked at before the rest and used it as kind of a model for future petition discussions
and to begin with we didn't have the information that we wanted or needed to accept this one, but, in the meantime since we looked at it again we received some more information from the petitioner on availability and all these, all three of these peppers, jalapeno, chipolte, and poblano did pass.

The jalapeno, chipolte peppers was voted 5 yes, zero no votes, and originally did have a three annotation and that will be removed. The poblano peppers, 4 yes and one no. And, so, we felt all of these pepper ingredients may be criteria for form, quantity, and quality to be listed on 606.

The third one is salva hispanica, also known as Spanish sage. For those on the board that don't know, it's used in quite a few snack foods as a nutritional additive to products that provide soluble and insoluble dietary fiber, omega 3 fatty acids and a few other things. The petitioner did make a case for it not being available as organic and the handling committee carefully reviewed that petition as well as the sub-committee and it was voted 5 yes and zero no votes to list that on 606.

So, any discussion on any of those three items?

MR. POOLER: I don't have any comment on the specific materials, but, I do want to make a general comment about 606 materials. I would like everybody to know that after the commercial availability criteria was established by
the NOSB in October that information was distributed to all
the petitioners that are on this list and they were given
ample opportunity to provide commercial availability
information.

We also distributed this information to any
potential petitioner that contacted us. We also provided
this information to any person or any industry member who was
interested in the petition process specifically for 606. So,
what everybody needs to know is that the commercial
availability information was put out there prior to being
published in the Federal Register so many petitioners, and
these petitioners here and other petitioners or potential
petitioners were provided the opportunity to respond to
commercial availability information. Thank you.

MS. WEISMAN: Thanks, Bob. We know that the
program worked as fast as they possibly could and to get this
out in as many ways as they could think of, you know, and
there's also, unfortunately, you know, a big gap in terms of
what is -- there's a big gap in what's required to reach some
parts of the industry as opposed to other parts of the
industry and there's just no way we have been getting around
that.

So, everybody did the best they could. It's
agreed. Yes?

MR. GIACOMINI: I just want to throw in one thing.
In regard to the NOSB's effort on this I think I got close to 20 petitions passed on to me over one weekend so they were putting in extra hours on above and beyond just like all the rest of us were.

MS. WEISMAN: Yeah, that's for sure. The next two items in this category actually are three now that I'm going to present, sweet potato starch, rice starch, and fish gelatin. What I will -- I'm going to present the sweet potato starch and the rice starch also as a little bit of the mini group because they are both products that are used in -- used for purposes of texture in organic processed food products. They are both made from starch, one coming from sweet potatoes, the other coming from rice.

There are no synthetic substances used in the processing of these. Sweet potato starch is commonly on the market as bean thread. Some people know it as cellophane noodles and is essential to create a certain -- a very specific texture in authentic Asian cuisine.

The petitioner of the sweet potato starch had first of all had communicated with the major producers of these cellophane noodles who are all located in Korea and none of them are producing this in an organic form. In addition, they considered other products which are made from other kinds of starches which are available organically such as they looked at wheat and soy, organic soy starch and neither
of them gave this authentic Asian texture that people expect in these type of products.

In the case of rice starch it's used to create a texture in dairy products such as yogurts. I believe it's necessary to keep it from liquefying for things like squeeze yogurts so that I don't know how many of you have kids, but, in other words, without the rice starch if you opened up the squeeze yogurt it would just fall down your kids' shirt and then you'd get a call that you have to pick them up and bring them clothes and it would be really a mess.

So, we saw nothing in either of these petitions that would make it at all questionable and compatible and we felt that both petitioners -- one more thing. In the case of rice starch, there are certainly organic forms. This is organic rice on the market but this particular, the rice starch for this particular use comes from sticky rice and although there are organic varieties being developed I think the brand is under conversion is I think what the petitioner said, it's still a year or two away from being available for use and I think there's also some R&D that would still have to be done.

It's not determined that once the organic variety is being grown that it actually is going to work for this purpose. But, that's the trajectory so we felt that due diligence was being done on that as well. The one difference
between these two is that there is going to be the recommendation for rice starch is the one item that still is going to have an annotation about the length of time that it's going to be listed and that's for the reason I mentioned in my earlier presentation that the petition ended up being posted for less than the 30 day period and, therefore, we felt it should have a smaller window of listing. But, it can certainly be re-petitioned before that time.

And I'll just say that the committee votes on the rice starch were 4 yes, zero no and on the sweet potato starch was the same.

The next item is the fish gelatin.

MR. GIACOMINI: Do you want to comment on these as a group?

MS. WEISMAN: Yeah, I'm sorry, thank you. It's getting late. Thank you for keeping me on track. Is there any discussion about the starches?

MR. GIACOMINI: Yes.

MR. GIACOMINI: The petition for the sweet potato starch almost gives the impression that it is the main ingredient in the bean thread noodles. It's very difficult to extract out of there that it's an ingredient of less than 5 percent. Do we know anything more about that?

MS. WEISMAN: Yes.
MR. GIACOMINI: Or are they going to be looking at final recipes?

MS. WEISMAN: No, no. It's actually -- the bean thread noodle is not the final product. Rice potato starch is the name by which they're petitioning bean thread noodles. Bean thread noodles are a minor ingredient in Asian potstickers. They are less than 5 percent. Is that the question you were asking?

MR. GIACOMINI: Is that the only -- is that the main place that it's used or is there any place where it --

MS. WEISMAN: That's the only place that this petitioner -- I mean, that's what it's being petitioned for.

MR. GIACOMINI: Okay.

MS. WEISMAN: Andrea?

MS. CAROE: As far as whether it's over 5 percent in the product, that's kind of irrelevant to this conversation.

MR. GIACOMINI: Right.

MS. CAROE: It's elsewhere in the regulation.

MR. GIACOMINI: Right. Okay.

MS. WEISMAN: Any other questions? Okay. We need to move on to the fish gelatin. I have to tell you, I volunteered for this one, but, I wasn't on a sub-committee so I might need a little help from somebody that was. The fish gelatin was being petitioned for micro encapsulation.
Does anybody have the petition in front of them? It's the same as the fish oils. I didn't know that. Okay. Thank you for helping me.

UNIDENTIFIED SPEAKER: What do you want me to do with the petition once I have it?

MS. WEISMAN: Joe can help.

MR. SMILLIE: It was petitioned for use as the micro encapsulation of the fish oil by the same petitioner and it basically just physically encases the fish oil and it's fish gelatin and it follows through with all the other petition reasons of fish oils as available as organic for obvious reasons and it poses no other significant, negative effects in 606 criteria, so, it meets all the criteria.

It doesn't seem to be controversial in any way, shape, or form.

MS. WEISMAN: Right. Now, part of what made this one more complicated, why I took it on also is because after we -- after the handling committee voted to recommend this material it was brought to the attention of the committee that there had been a past recommendation and I'm actually going to pass copies out now to the rest of my fellow board members.

So it only affects how we're going to list it. If it were not for this it would just be seen as fish gelatin. However, at the May 2002 meeting of the NOSB in Austin, Texas
there was a final recommendation on gelatin and that particular gelatin was being used primarily as a processing aid to clarify tea but it was also used as a fining agent in wine, as a stabilizer, a thickener, a texturizer, so, there are a number of gelatins.

So, this particular gelatin was approved. In addition, the recommendation was that gelatin in general be listed on 606. And that would include the fish gelatin that's being petitioned today. The reason why it wasn't listed -- the only reason why it wasn't listed was because at that time the general interpretation was that materials not organically produced agricultural products did not need to be listed on 606.

Obviously that has changed. Our world has changed since then. And it might even have been appropriate at the time that the announcement was made that konjac flour and the shellac and one other thing were now going to be added to 606 that this gelatin, you know, should have been included in that group, but we're here now talking about it.

So, the recommendation for this item is going to be for gelatins to be listed, for gelatin to be listed on 606 because that's the way it was petitioned in 2002. And, so, now it's time to add it that way and fish gelatin will be among those gelatins.

There may be questions though, so, Dan?
MR. GIACOMINI: part of this petition was specific dealing with either banning the fish gelatin over other animal sources for kosher and vegetarian reasons. It seemed the sub-committee to be a significant distinction. And I'm a little leery of just throwing it in with the other prior petition. It's the same general category but it certainly has some very different specifics.

MS. WEISMAN: Let me restate it. We actually don't have a choice. This is a past board decision and it should - - there is a past board decision for the recommendation of gelatin. Maybe is that too strong? Okay. There is a past board decision. And it has always been our -- I mean that has been a guiding principle here that we do -- that we abide by past board decisions. It was only maybe nearly like -- it took a little while for the light bulb to go off in everyone's head, oh, we made a decision about this in 2002 and now we do have to list things on 606 so this needs to be on 606.

MR. SMILLIE: I don't think it will create a problem because fish gelatin will be a part of the gelatin listing and the manufacturer can specify, you know, suitable for vegetarians or kosher or which other, you know, which is what they need which is why they needed fish gelatin specifically.

MR. GIACOMINI: Do we need to vote on this at all
to reinforce the prior decision or will that just pass
through as a 606 recommendation?

MS. WEISMAN: Andrea?

MS. CAROE: We don't have to vote on it. It's been voted on. In order to change this we have to vote to rescind a prior board recommendation and I would strongly suggest we don't do that. I'd like to recognize Kim Dietz.

MS. DIETZ: I am Kim Dietz. That recommendation you have in front of you I'm not sure if you actually printed out the whole recommendation but we discussed in detail the fish oil, the fish gelatin as part of the gelatin recommendation so that was included in our petition but the original petition that was included in our recommendation. We blanketed -- we looked at all of them as a whole because they all have different forms and functionalities and different products.

MS. WEISMAN: Jeff.

MR. MOYER: That sort of begs the question, are there any other outstanding votes that were made that aren't in front of us that we don't have to act on or should have acted on?

MS. WEISMAN: Bob, help.

MR. POOLER: No, there are no outstanding decisions or recommendations on 606 that have come from the NOSB. There's only these three materials, shellac, gelatin, and
konjac flour.

MR. GIACOMINI: And those are considered viable and active or whatever petition -- I mean recommendations without us needing to do anything else?

MR. POOLER: That is correct.

MR. GIACOMINI: So do we need to move on this petition then at all?

MS. WEISMAN: I guess not. We won't be voting on this one. Bob?

MR. POOLER: Would it be necessary for the board to say we include this petition to be incorporated in the prior recommendation?

MR. GIACOMINI: It already is.

MS. WEISMAN: Andrea.

MS. CAROE: I don't think so. From a recommendation standpoint it's encompassed in that prior recommendation. There's no further action. For record keeping purposes if you want to include the documents together we can do that, but, there's absolutely -- it doesn't gain us anything.

MR. SMILLIE: Basically, very sound petitions presented. Met all of our considerations. We looked at them both very carefully. There are a couple -- you know -- a
couple of minor issues with the casings. Again, the question was asked, you know, why can't animal -- vegetarians may want to leave at this point in time, but, why can't animal intestines be used, you know, from organic animals and the petitioners, of which the three collaborated, I think there was three, three or four collaborated, and basically made the case that the concentration of animal slaughter houses wasn't sufficient at this point in time to yield enough intestines for the casings for the sausage products and that was backed up with data and we, once again, by listing this we see that in the future this will hopefully change as organic meat production surges and perhaps there's more specialized companies start looking for this market.

But, we will see them emerge and at that point in time we can have the petition to withdraw casings from the national list or certifiers will enforce the fact that there are organic casings available. We also looked at the option of no casing type sausages and found out that just wasn't culturally acceptable in many sausage eating communities and that other forms of non-animal casings were also unacceptable so basically the petition was solid and we approved it 5 to zero.

The seaweed was a different item. Basically the issue came down to that there is certified organic sea vegetable species available and it got down to a species
argument of which type of seaweed was appropriate for the use and the petitioner was very -- gives a very comprehensive petition that outlined why this particular species is used in a particular Asian formulation such as soups and why the current existing wakame, Atlantic wakame, which is available as organic wasn't acceptable for use commercially.

Also, it met every other criteria for 606 and once again it may be possible that this material starts to become available organically, but, at this point it isn't available and, again, it's followed the other conditions and so it was also approved unanimously. Does it say SPP? I can't read that, but, it should be -- again, it's very specific to one particular strain of wakame undaria spp.

Any questions from the board on those two?

MS. WEISMAN: Bob?

MR. POOLER: Yes. Joe, the materials, petition materials database indicates that the petitioner for natural casings submit a petition for natural casings. Why was the recommendation specified for pork?

MR. SMILLIE: Good point. The petition -- you're absolutely right. The petition is for natural casings, not natural pork casings. And we did look at all of the different -- yeah, that's a typo.

MS. WEISMAN: That must have been me. I made up this list last night. So, it must have been me.
MR. SMILLIE: Yeah, the petition for natural casings.

MS. WEISMAN: Not pork.

MR. SMILLIE: Well, including pork. But, not specific to.

MS. WEISMAN: But, not limited. Not limited, yes. Thank you.

MR. SMILLIE: Thank you.

MS. WEISMAN: Any other comments or discussion about the casings or the seaweed? Bea?

MS. JAMES: Could I just get some clarification on the word natural casings?

MR. SMILLIE: Yes.

MS. JAMES: So, just thinking of, you know, the whole situation with Harvey and whatnot, could it be --

MR. SMILLIE: No, very specific to animal intestines.

MS. JAMES: From cloned animals though and could be from --

MR. SMILLIE: That came up yesterday. We didn't -- we didn't want to get to that, but, that would be from the progeny of cloned animals.

MS. JONES: It concerns me a little bit using that word natural in there because, you know, it's --

MR. SMILLIE: Well, it means not synthetic.
MS. WEISMAN: Can we say animal derived casings?

MR. SMILLIE: Well, it's not --

MS. WEISMAN: Tracy.

MS. MIEDERMA: They use the word natural casings as an industry standard term and it's to designate it between peelable, cellulose casings, and eatable collagen casings and natural casings are that a known industry term.

MS. JAMES: Right, but, it's also very confusing to use that term so within the --

UNIDENTIFIED SPEAKER: How about people making sausage?

MR. SMILLIE: Yeah, within the meat industry that's the term.

MS. WEISMAN: Bob?

MR. POOLER: Yes. The term natural as it applies to meat products is regulated by the USDA FSIS and so any term of the use natural with pork casings or whatever natural casings would probably be applicable or regulated by USDA Food Safety Inspection Service.

MS. JAMES: So, where does the current FDA definition of natural as it pertains to --

MR. POOLER: The USDA and FSIS has a definition of what is natural and it's part of their regulations. I'm not sure where it is but they control, they regulate natural labeling of meat products and this probably falls under their
Mr. Smillie: Bea, what's the issue? I don't understand your concern?

Ms. James: It's just a red flag.

Ms. Weisman: Can I try. I think I know where you're uncomfortable. We have been avoiding the use of the word natural, Joe. We are conditioned here to avoid the use of the word natural. That's the problem. Bob?

Mr. Pooler: Yeah. I just received information that the word natural under FSIS means minimally processed, no additives.

Mr. Bradley: The minimally processed, no added ingredients but usually with natural casings it's an identity factor that distinguishes it from collagen casings or something like that.

Ms. Weisman: So it is a standard of identity?

Mr. Bradley: I can't speak to standard identify but that gets into a very technical definition that I can't speak to.

Ms. Weisman: Tracy?

Ms. Miederma: The petition does go into the specifics of the terminology and they cite scientific research. You know, for instance, the anti-microbial properties used for the preservation of natural casings that's, you know, peer reviewed journal article. It seems to
be used throughout the petition in a very standard of identity sort of way.

MS. WEISMAN: Bea, this is addressing your concerns?

MS. JAMES: It's, you know, it is what it is. I don't --

MS. WEISMAN: Are you concerned that even though we understand where it comes from that once it's out in the field and certifiers are having to use it that it may be -- so we need to think maybe of some language to add to this descriptor that's going to specify? Katrina?

MS. HEINZE: The petition on page 3 states that the common name for this is natural casings, the processed intestines of hogs, cattle, and sheep.

MS. WEISMAN: What do you think, guys? I mean, you don't want to add that?

MR. SMILLIE: No.

MS. MIEDERMA: Here's the FSIS language. Natural casings are regulated by the FSIS of USDA under 9 CFR Parts 317 and 338(I) so it looks like the term is part of FSIS.

MS. WEISMAN: Can we say natural casings as defined -- okay, it's inferred. I guess that becomes part of certifier training. That actual -- that concludes this category.

We now have a general category of materials that
were rejected. The first two on this list, yeast and whey we
do not need to discuss because as I mentioned earlier the
petitioners have already withdrew those petitions. So, the
next item on the list is carrot fiber which is, I guess,
Joe's got the next three.

MR. SMILLIE: Right. The carrot fiber was a
petition that basically the petition made a -- gave us
comprehensive information about the use of carrot fiber and
it was very much about one company petition. They had the
only process that would create this carrot fiber. The
arguments for the use of carrot fiber were very strong but
the company did not present a sound argument. In fact, for
the fact that they couldn't create organic carrots create
this organic fiber and they basically said, you know, we're
basically declared that we're not going to make an effort to
get organic carrots, it's just much too difficult, and we
consulted with our vegetable producers and they said that,
you know, that there's a number of firms out there willing to
produce organic carrots for this and that we felt that the
company really owed it to us in order to get carrot fiber on
606 to give us a good reason of why they couldn't work to
locate organic carrots for their process at their facility
and so we rejected it unanimously and have not received any
response to that rejection so that's where we sit on that
one.
What's next?

MS. WEISMAN: The next item is the milled flax seed.

MR. SMILLIE: Oh, flax seed, okay. I don't have that one right in front of me but the recollection is that the company made an effort to point out the importance of milled flax seed as essential which we had no trouble with. The argument for not using flax seed, which basically didn't buy. Basically, we felt that it was almost as much organic flax seed as there is conventional flax seed produced and that there certainly wasn't a shortage of organic flax seed. Their issue was that the organic had more defects than the conventional which, you know, that was what they said and we happened to have knowledge, you know, that there are machines, those little air machines that kick out seeds that spot defects and that perhaps, you know, we needed to invest in that machine in order to get the quality they wanted of flax seed.

So, we thought that was rightly or wrongly we thought they were overspecing in order to be able to use conventional flax seed and so we rejected it and we were more than happy to receive their response which we did not receive so the committee rejection stands on that one.

MS. WEISMAN: Should we be stopping in between for discussions because we didn't have any discussion.
MR. SMILLIE: Oh, I'm sorry.

MS. WEISMAN: Yeah, we didn't have any discussion on carrot fiber. Were there any questions or any discussion that we needed to have on that?

MR. ENGELBERT: Just real quick I also wanted to point out that the fiber is also obtained from peelings, not just whole carrots, and the company was unwilling to source them either.

MS. WEISMAN: And any discussion that needs to happen on the milled flax seed? Okay. Can we move on to the instant non-fat dry milk?

MR. SMILLIE: Yeah. I really want to point out there's been a couple of mistakes within the committee that this is not non-fat dry milk, this is instant non-fat dry milk. This is a more complicated one and it was, as Tracy will back me up on, we spent a lot of time on this one and went through in great detail.

The issue is here is that the milk supply is our first challenge but we don't think it's fragile so, therefore, the milk is there. It's all about the process. The process for non-fat dry milk is in place and organic is available. The process for instant non-fat dry milk, however, is a much more limited process and if anybody has any more information I'd be glad to listen to it.

But, basically, it was determined that indeed
instant non-fat dry milk would be available organically if
the order was 40,000 lbs. And the petitioner was a small
bakery that makes granola. Again, this material is used
primarily in baking from what we were able to read from the
petition and they said that it's just -- you know -- it's
impossible for them to make that order.

We debated in the committee as to whether this
really, you know, created a fragility of supply and
eventually the majority opinion was that even though it may
be impossible for small users to obtain the material that we
felt that it was possible for either trading companies or
larger users to make the commitment to that 40,000 lb. order
and then it could become available.

So, after much debate and with a split opinion it
was rejected at that point and we have not heard anything
back from the petitioner.

Dan, you have the minority opinion on this.

MR. GIACOMINI: Well, I had the minority opinion
and then I think Tracy had the moving opinion. But, I don't
know where it is right now, so, I just viewed this petition
as a processing petition. We have a number of processing
petitions. We have the wakame seaweed. They were looking for
a particular type of seaweed to go into their misco soup.

We had lemon grass frozen. We had some other
frozen gilango. We had red pepper dried crushed. All of
these, to me, seemed like processed petitions. Now, they went out -- granted, they went out to their petitions and to their suppliers and all the suppliers said no. Well, this -- the one that made this one different, number one, I think is because it was dealing with milk, which I think it had a bias that there was milk and there shouldn't be any fragility supply to consider there, but, also the fact that they had one supplier that essentially said, and I am paraphrasing, yeah, we can do it if your order has this many zeros and the implication then of course is the check is going to have this many zeros.

To me, it seemed like -- it seems to be an unfair additional burden we're placing on this petitioner simply because their suppliers just don't -- they don't want to cooperate. They don't want to make this ingredient. They don't want to make in an organic form. They make it in their regular form. And they're only going to do it if it's worth -- you know -- if they make up for their inconvenience.

It's the way it seemed to read, so, I could do it just the same way as I did the other processing ones and I voted to put it on. Tracy, did you want to also speak to this?

MS. MIEDERMA: Okay. Yeah, I flipped flopped big time on this and finally just made an extension vote because I had too many open-ended questions. A couple of things that
haven't been raised. One gets back to your point earlier, Andrea, about companies expecting things so fanatically that they just force themselves to get to an organic version.

And the other particular case a company had been using non-fat instant milk for about 20 years and decided to organic in 2003 and switched to the available form of organic dry milk which was non-instant and that was back in 2003 and now here in 2007 they're petitioning saying our sales are down, R&D has told us we've go to back to instant.

MR. GIACOMINI: They went back. They went back because it was not an acceptable product.

MS. MIEDERMA: Well, they're in the process of going back because there is no instant organic and, so, on one side of the coin maybe this is one of those spec questions. I don't now their hearts and minds and my advice would be to think best intentions but the complicating thing to me is the president's just said that if manufacturers know what's being petitioned they can cover the flag that says, yes, we've got this even though they don't really have it yet.

This company is saying they can make the instant non-fat organic dry milk powder having actually made it yet. And that gives unscrupulous companies the power to say they can do something they haven't done yet and hold against the head of buyers and I am concerned about the precedent there.
MS. WEISMAN: So, oh, Rigoberto, I'm sorry.

MR. DELGADO: I think it's important those are to consider the intent of the company. I know we have the same discussions with, what was it chipolte peppers and dry peppers, but, it was clear in the petition that some of those companies were actually making the effort of going out and contracting with farmers to get the raw material.

I wonder if in this petition there was any indication that this company or this petitioner was eventually going out to try to find other possible sources of dry milk that had fewer zeros attached to it or the limitation.

MR. GIACOMINI: This petition included a number of letters from dry milk processors that said they would not make an instant. There was only one company that currently made an instant conventional and they said that we will make an instant organic for this minimum worth.

MR. DELGADO: So, we're taking about a case where you're probably never going to have that material available in organic form, correct?

MR. GIACOMINI: No. Other companies could decide to make it or a larger company could buy that order and make available to different users. The question is whether there are enough users or not. One of the companies listed that they used as a reference was Morroquin International.
Morroquin International I assume would be somebody who possibly could buy that 40,000 lbs. if they thought there were enough users to sell it in a six month period.

MS. WEISMAN: Wait, wait. I would like to not have back and forth because we're way behind schedule and we're pretty close to the end and, you know, on the one hand, you know, we're here for robust discussion and on the other hand it's going to get to a point that we're so punchy that whatever discussion we have is going to be worthless. It's going to be less than robust, thank you.

The difficulty -- so it sounds like there is some sentiment that we may want to have a new recommendation for tomorrow?

MR. GIACOMINI: No, the recommendation is set. You're just voting no.

MS. WEISMAN: Well, the recommendation was -- was this recommendation -- so we have the opportunity tomorrow then for everyone to vote yes, correct?

MR. GIACOMINI: I believe so.

MS. WEISMAN: All right. All of these we made an effort to post all of these petitions in the positive so in other words the original, the recommendation for the handling committee was to list non-fat dry milk instant and the committee voted no and I'm sorry it was misleading that I called this category rejected, but, it was not phrased that
way so this is, once again, a positively worded
recommendation and tomorrow when the full board votes
everyone has the opportunity to vote differently than the
handling committee voted previously. We can vote yes.

There are no changes in the recommendation
necessary.

MR. GIACOMINI: I didn't meant to put Morroquin
International on the spot. It was just an example from the
petition. Nothing intended or implied.

MS. WEISMAN: I'm going to take comment on this,
Tracy.

MS. MIEDERMA: Yes, I'll be brief here. This is
just to clarify availability and what quantity means. If
it's hypothetically available then that means available and
I'm asking my colleagues on my board and if there's too much
of it does that mean quantity is not available?

MS. WEISMAN: Available only means available if
your certifier says it's available. You know, you can look
at this that there's no jeopardy in listing because
ultimately if some -- if Grace goes out and buys orders for
40,000 lbs. then the certifier is then not going to agree for
that to be used anymore as non-organic.

MS. CAROE: Let me make this point over and over
again. Just because it's listed does not mean you can use
it. You're still going to have to show the certifier it's
not available so if it gets listed then Grace can buy the 40,000 lbs. of dry milk and tell Joe that it's available so his processor doesn't use the non-organic form.

MS. WEISMAN: Let's tighten it up here, troops. We're almost there. We're almost there, okay.

MR. ENGELBERT: One quick comment, please.

MS. WEISMAN: Yes, Kevin.

MR. ENGELBERT: If it's not approved wouldn't the same thing happen? I mean, I'm concerned about the precedent of saying that there's too much, I can't afford it. Then there's no incentive for a smaller company to try to develop and there's no incentive for anyone to purchase it and if this company has success with a product using an organic ingredient at any level other companies will follow suit and the demand will be created.

MS. WEISMAN: Andrea?

MS. CAROE: Kevin, you got to understand if it doesn't get listed manufactures that are making products are not going to formulate products using that ingredient. And if they formulate the products using that ingredient they're not going to buy that ingredient. There's no incentive to create an organic ingredient.

MS. WEISMAN: Anything else on non-fat dry milk?

MR. SMILLIE: Is everyone clear on that issue? I think it's a key issue. In other words, what Andrea just
said. Let's take that. I just really want to make that point. The baker's there, they're making a granola, the need instant non-fat dry milk. If it goes on 606, okay, and they can prove to their certifier that they can't get organic instant non-fat dry milk then the certifier may allow you to use conventional. The product continues. The demand is created. And someone or some manufacturer then makes it available and it comes off the list and it's an incentivizing process to put it on 606.

If we don't put it on 606 then basically that small baker cannot formulate that product with instant organic and they'll either stop making organic granola or they'll reformulate and then there's no demand created for an organic instant milk. That's my interpretation. I just want to make sure everybody sees it the same way.

MR. MOYER: Well, I just take offense to the thing that we all have to see it. I understand what you're saying.

MS. WEISMAN: That's all, he just wants to be understood. He just wants to be understood. I think that's from my past career as a social worker.

MS. JAMES: Julie, I don't want to beat a dead horse but I think that, Jeff, you should state your point of view.

MR. MOYER: Well, boy, I haven't thought of it well enough to state it at the moment, but, I think that in many
cases, look at the seed industry for example, we have said that, you know, farmers need to use organic seed, yet, we just heard yesterday that less than one percent of the vegetable seed that's being used is actually certified organic even though it is available and everyone knows it's available. They just spec around it. And, so, we have to be careful how we do this and just the rush should not be to list everything on 606 in my opinion and I realize Joe disagrees with that.

MR. SMILLIE: For example, not on this issue.

MS. WEISMAN: Okay. I would really like to move on. We have natamycin and I think I'm going to try to, if I'm may I'd like to try and get the short story on this. Basically when this was looked at in February it was looked at -- it was being considered as a synthetic. And the rules are very clear that -- and it was being looked at as a synthetic and the petition was very clear that it was going to be used as a preservative. And it did not meet the criteria to be used. Sole use as a preservative is not a reason for a synthetic to be listed on the national list.

So, we voted against listing natamycin at that time. However, I think we heard -- I believe that we've heard -- on the handling committee I think we've heard pretty compelling public comment yesterday and today and I think we are persuaded that natamycin is not in fact not synthetic and
so the prohibition for listing something for the purpose of being using as a preservative does not apply to a non-synthetic. So, I think that the recommendation will be to list -- no, I guess, help, it's getting late.

This is not something that the handling committee voted on like some of the other things I mentioned earlier.

Yeah, but, I think Andrea's going to help me out here.

MS. CAROE: Right now the petition that -- the recommendation from the committee is not to list. The motion was to list in the sales. However, the same motion will stand and go to the board and based on new information it is not unlikely that the board will vote different than the committee and list.

MS. WEISMAN: Okay. Now, there's a second issue which we did get some very good scientific information about the natamycin would be needed on specifically on English Muffins as opposed to other baked products and the board may tomorrow may want to entertain a recommendation for an annotation that -- you want to finish my thought?

MS. CAROE: Well, I want to suggest language for an annotation before we get to tomorrow and that annotation would be for use in baked goods with moisture levels of greater than 40 percent.

MS. WEISMAN: Will 40 percent do it or does it have to be above 39? I forget what the threshold is.
MS. CAROE: Well, the commentor that gave us all that wonderful comment everything was over 40 percent.

MS. WEISMAN: Okay. I'm good with that. Dan?

MR. GIACOMINI: I believe first we would need to deal with an amendment to change this motion to 605-A unless that's already been done but you didn't say that it had been done.

MS. CAROE: Okay. Like I said, we're not going to change the motion now. We're not going into committee. So, tomorrow the motion will be put on the floor as is for 605-B. At that time we can entertain an amendment to 605-A as well as entertaining an amendment for an added annotation for baked goods with greater than 40 percent moisture. So, that's kind of how I see it done at this point based on the fact that we're in the 11th hour, but, I defer to any other board member that has a procedure that we feel that we can do this with transparency.

MS. WEISMAN: Any other questions on this time on natamycin? Okay. Koji mold.

MS. CAROE: Okay. That was mine. I'm going to read the recommendation from the sub-committee which was then accepted by the handling committee. The handling committee recommends -- this is so small -- the handling committee recommends the petition that Koji mold is already listed -- I'm sorry -- to the petitioner that Koji mold is already
listed on 205.605-A under the listing micro organisms, any
food grade bacteria, fungi, and other micro organisms. The
petition is for inclusion on 205.606. The handling committee
recommends continued including on 205.605 instead an
acknowledgement that OFPA does not provide for production
practices or standards for this type of production. That's
considered as agricultural.

Evidence to this is found in the regulation where
the definition of non-agricultural includes bacteria. This
contradicts considering non-plant life as agricultural
included in the livestock definition so we have heard the
argument that livestock includes all non-plant life.
However, we also see in the definition of non-agricultural
bacteria is included.

So, we consider that Congress did not intend for
these types of products to be included in this regulation,
and, therefore, we don't consider it agricultural. We do
consider it appropriately listed as 205.605-A and that was
voted on by the handling committee and there is a minority
opinion.

MR. SMILLIE: Yeah. I think the shoiu, miso, tenta
and associated products are protected by the listing in 605-
A. However, I think that eventually this material needs to
move to 606. If it doesn't move this session hopefully we'll
have another round at it after we have created our ag/non ag
definition document.

   My belief is that the bacteria issue doesn't talk
about aspergillus cryzae. That is the micro organism, if you
want to call it that, that leads to Koji mold. Koji mold is
an agriculture. It is the culturing of soy beans in the
presence of aspergillus cryzae and is a very traditional
culture that's been going on for centuries in Japan and other
countries and I believe it's a form of agriculture and will
be proven as such eventually.

   However, the industry that creates these products
is protected under 605-A. There's no encouragement to that
industry to start to use organic methodologies as similar to
what the yeast industry has done in creating organic
substrates and methodologies without the use of chemicals to
create yeast products. And I think the Koji culture people
will also eventually start to create organic Koji cultures
and hopefully at that point in time the NOSB will see the
wisdom of traditional Japanese production methodologies and
move it on to 606.

   MS. WEISMAN: Any questions or comments? Okay.

   Now the next two items are the list I think are going to
require some discussion. Those are FOS and NON and I just
want to note that there are four items that come afterwards
which are I think quite non-controversial and I wonder if we
should not close off first before we do the FOS.
There is a category. There is one item that was deferred. There was one material deferred. We had a petition for pectin, non-annotated which is currently covered on 605-B. The petitioner wanted to make a distinction between non-annotated and annotated lone antitoxin pectin and asked that the non-annotated be moved to 606 and we looked at the petition. There may be merit in it but we felt for this meeting that is a product that is already covered and available for use and it has a home elsewhere on the list and we felt like our time at this meeting really had to be devoted to looking at times for 606 that didn't have any other home and that will be lost for use after June.

So, we decided to defer. It's a well-written petition and it has merit and we are going to look at it in the fall.

Any questions or discussion about that? Okay. We also had three items that we voted to not consider and I think Andrea will speak to those.

MS. CAROE: As you might recall, the sub-committee that I worked with got some of the more complex materials for a petition so this was one of the ones that my sub-committee looked at and they're the handling committee looked at. I would like to read what we wrote because it codifies our thinking.

The petitioner requests consideration of the
principal components of sea salt for allowance in organic production. The four principal components are sodium chloride, potassium chloride, magnesium chloride, and magnesium sulfate. Sodium chloride is designated as exempt as in the regulation as salt. This was further clarified by the NOP at a later date.

Magnesium chloride and magnesium sulfate are currently permitted through their listed on 205.605-A as non-synthetic non-agricultural materials allowed for organic production. The petitioner further requests that magnesium chloride presently listed on 205.605-B of the synthetic material be moved to 205.605-A as a non-synthetic.

This request was made in order to ensure the allowance of this material after the court order action. The petitioner was concerned that due to the court order synthetic materials would not be allowed in organic production. This was one of those materials caught in an in-between time between the court order and some further clarification of changes made so I think there might have been some misunderstanding.

Upon review of the original TAC this material was deemed synthetic due a bleaching process that is used for extracting sea water. Further the Federal Register Notice of 5 June 2006 clarifies that an amendment to the statute made after the court order negated the issue of synthetics allowed
in organic production. Therefore, items listed on 605-B continue to be allowed for inclusion in organic products. For this reason, moving the material is unnecessary. The committee recognizes that may desire the listing of sea salt on the national list of allowed. In order to accommodate this the petitioner must provide a detailed petition that addresses all the criteria for the instructions of the NOP website. A TAC review must be done and evaluated to assess the manufacturing process as well as the health and environmental impact and all of the contents as is the procedure.

This must include all possible contaminants, both principal and minor. So, for this reason, this material is not being considered for listing. It is deemed unnecessary. The handling committee did vote on this and the vote was -- yeah, the recommendation was not to consider it and handle it through a vote which was 5 to zero. So, that was a unanimous decision on that.

Any discussions on sea salt? Next is processing technologies.

MR. GIACOMINI: Julie, while you're processing that, I think it would just be worth noting that there wasn't an error on the recommendation listing on sea salt bond, it was on the internet. It was listed as a 5-5 vote and it was actually 0-5. That was corrected like a week before the
meeting, so, it's just worth noting that if people have
looked they'd have seen that.

MS. WEisman: Is it possible that there was no
document for this?

MS. FRANCES: There was a document, I think. There
should be a document in your meeting book.

MS. WEisman: We can find it. Not for processing
type technology.

MS. CAROE: Oh, for processing. I think we ended
up pulling it all together.

MS. WEisman: Let me just talk about that. There
was a petition received for processing technologies and
listed were five or six technologies such as freeze-drying,
indicating that these were a limiting factor in supply and to
each of these technologies there's a long list of materials
that may use this technology and become available in a
specific form.

Unfortunately, the national list is not a list of
methods, it's a list of materials, and in order to apply the
national list process to this we would have had to look at
each of the individual materials so it wold have been, you
know, sage, free dried, you know, time freeze dried, each of
those individually and the petition that we received did not
include all of our criteria for 606 being that it didn't
include any of the information on those independent,
individual materials.

Therefore, this petition was voted not to consider and sent back to the petitioner who can then, you know, resubmit individual materials.

Any discussion?

MS. CAROE: I'd did want to note -- I'm sorry, I was confusing that with something else. There was nothing further from that petitioner. So, the next item is carbon dioxide not to consider and I will read the recommendation off the covering sheet.

The committee recommends that the petition does not need to be considered so carbon dioxide is already listed on 205.605-B. Further, the Federal Register notice of 5 June 2006 clarifies that an amendment to this statute made after the court's order negated the issue of synthetics allowed in organic production and therefore items listed on 205.605-V continue to be allowed for inclusion in organic production. For this reason moving this items unnecessarily.

Again, this was one of those materials that the manufacturer was concerned it was listed 205/605-B, that it was a synthetic, that it would not be allowed os they were asking for it to be moved over as a non-synthetic. It's not necessary. It can be used as a non-synthetic since it is listed. So, it becomes unnecessary.

Obviously there are available forms of CO2 that
floats around in the air, but, it often is manufacturers that
sell commercially so listing it where it is is is appropriate.

Comments? Okay. It looks like we're all okay with
that or else we're --

MS. WEISMAN: So, these should be removed from our
lists for tomorrow. We won't even be addressing these at all.

MS. CAROE: That is correct.

MS. WEISMAN: The last two materials that we need
to discuss are FOS and inulin about which we have heard much
comment in the last two days. Andrea, why don't you take
this one.

MS. CAROE: Okay. Well, bear in mind that this was
a unique situation and things don't always go well but we
looked at these two materials. FOS, there were several
concerns of the sub-committee level. One is that we had a
TAC on this material and the TAC does recognize that there
can be side effects to this material. We don't know to what
extent those side effects are possible, whether they're
remote or at a significant level.

So, when it came to human health impact we did have
concerns there that we indicated. The other criteria that we
felt needed more information was on whether this material was
essential and we have heard plenty of comment today about why
that is essential and yesterday for that matter. The sub-
committee voted against this material. However, with the new
information that we've received this is another motion that may be made tomorrow where the board votes against -- let me step back.

The sub-committee voted against it. Originally the handling committee voted with the sub-committee. Last night there was a vote to reconsider this material at the handling committee level. The handling committee did indeed pass that we should consider that the recommendations should be for listing. I'm still hearing some concern from the board on this.

So, it may not be a straight vote either way but I do believe that we received compelling information here, whether it's enough compelling information to take us to a positive vote, I'm not quite sure, but, I would like to open it up for discussion. Katrina.

MS. HEINZE: I wanted to add to that that part of our reverted to, I'm not going to use the right language here, reconsider our recommendation and then we amended it to move the recommendation from 605 to 606. That was based on public comments that we had received.

When we reviewed this in sub-committee and then in the handling committee the nature of the number of things we're looking at we misclassified it as something on 605. I can't remember whether it was synthetic or not. Given new information we received in public comment and then additional
public comment this morning the handling committee felt that it was more appropriately an agricultural product.

Given that, we have different criteria that we use to consider its listing. For 605 synthetic you would consider essential. That is not something you would consider for 606. So, a point of clarification on what we did.

MS. CAROE: This is a very messy one, unfortunately, and when this motion comes up tomorrow I expect that we may be considering some amendments especially on which list is appropriate. Clearly we heard a lot of information that says it's non-synthetic. However, is it agricultural or is it non-agricultural. Is it 606 or is it 605-A? That may be a point of amendment tomorrow.

Other information on this? Questions, concerns?

MS. WEISMAN: I'm just trying to look. Jeff?

MR. MOYER: According to our initial recommendation this is still being considered a value added material, not necessarily essential for final product.

MS. CAROE: I want to remind that if a product is either non-synthetic or it is agricultural that is not -- that's only criteria that has to be met for synthetics to be listed as allowed, not for agricultural products or non-synthetics.

MS. WEISMAN: The heading is for 605, 600-B-6. B-6 is for essential for organic production. B says non-
MR. MOYER: Right now it's not in any listing.

MS. WEISMAN: She's not saying which section number it's with. She's saying where in the rule it says the criteria. The criteria only is for synthetics. This criteria needs to be met for synthetics and she's quoting. It's 205600B6.

MS. JAMES: So my question is could you explain some of the compelling information that led you to believe that FOS was essential as a processing aid?

MS. CAROE: No, it doesn't have to be essential.

MS. WEISMAN: It's not a processing aid, it's an ingredient.

MS. CAROE: It's an ingredient.

MS. JAMES: Okay. Let me rephrase my question then. Can you give me some information on the testimony that you heard yesterday and today that led you to believe that FOS had compelling information to change your position?

MS. WEISMAN: yeah. We had pretty thorough descriptions of the production methods which clarified the confusion we had back in February as to whether it was -- there was a question in February. We couldn't tell from what we had at that point whether this was synthetic or non-synthetic. I believe that the tissue wasn't even clear. It
was like for 606 or 605. They weren't sure. And, so, at the
time we said, well, we're going to need a TAC review to
figure out whether this should be on A or B.

But, we feel convinced. As of last night we felt
convinced by what we had heard yesterday. The handling
committee felt convinced but the board obviously, everyone
makes their own decision about what's been heard, but, as of
last night we agreed that we had been convinced, that, okay,
this is not synthetic.

Joe?

MR. SMILLIE: Yeah, that's what I was going to say
that we're convinced that it's not synthetic. Whether it's a
605-A or whether it's 606 is the issue that without a non-ag
criteria document my leaning right now would be 606, but,
we're going to have to decide that. Andrea.

MS. CAROE: I do want to say if you wanted to ask
specifically what compelled me to believe that it's non-
synthetic is the description of the enzyme fermentation which
when we read it in the document that we received looked to be
a very aggressive chemical treatment whereas we're finding
out and what we're finding from the petitioners is that
something that is a very natural occurring process and, yet,
there is a chemical change but it's a chemical change by a
natural process as opposed to that.

You know, I think the language was maybe not as
descriptive as it should have been and more technical and the
leaving of that group off which we kind of cringed at. Would
it be appropriate now to recognize the petitioner? Are you
asking to be recognized?

We recognize Nancy Hershberg, petitioner on this to
come up.

MS. HERSHBERG: I realize that A, this is so complex
and B it's very late but you're mixing up FOS with the NUN
but what you got in the document last night was the NUN, not
the FOS made by different ways. And it's really complex. I
know there's a presentation coming and there's an idea. I'll
just leave it at that.

MS. CAROE: Okay. And also Kelly, another
petitioner. Kelly Shay.

MS. SHAY: You do also actually also receive
information on the process for the creation of short chain
FOS showing it to be a 606 product using the board's own
ag/ag-non determination and also the rules you've received.

MS. JAMES: Were you able to review the potential
side effects that are sometimes with FOS? Was that
information made available?

MS. CAROE: Well let me say that that was never a
compelling reason for me to vote against this material and
there was information that we saw in the TAC and it's like
reading an MSDS sheet for aspirin. You think the stuff is,
you know, nuclear waste. I never found it compelling in the TAC so it may not have been addressed thoroughly in the comments that we received, but, I'm still willing to vote for this material.

Kelly?

MS. SHAY: Kelly Shay. I really appreciate what Bea is referencing and I would like to remind this board that we've had a history of the imperfect TAC reviews provided to the board. The product short chain FOS has been determined to be grasped by FDA since 2002. It's being used in a lot of products. We would never put anything in a product that would hurt a customer and I think that there are many places in the TAC where they colored outside the lines and I think after the TAC you received follow up documentation from the manufacturer that addressed all the incorrect points in the TAC and we continue in our industry to struggle with not having perfect TAC reviewers yet.

MS. WEISMAN: Do we need any further discussion at this time on the FOS? Okay. Andrea, you want to move on?

MS. CAROE: All right. Now, inulin which is even worse. And the reason I say it's worse is this. When we had our working handling committee meeting in February we looked at this material which we received a 606 petition on. We looked at it and the information in regards to how it was produced indicated to us that it was non-agricultural which
meant we needed a TAC.

For that reason our comments were cut short and we requested that it be considered for 605 and be sent for TAC. In that we had a lot of other things to do and we weren't looking to invent work for ourselves. The checklist for this material was not completed. It will be completed tonight. Come hell or high water it will be completed tonight. We have received a tremendous amount of information.

We did read the entire petition in the information and we did consider it. We just did not complete our paperwork on this one. I believe that we've gotten quite a bit of information, very good information here at the meeting. We appreciate the petitioner. We appreciate all the other comments that we received on this and there will be a motion tomorrow on this product for listing and handling committee vote on it before it is put forward.

However, that's not today, it's tomorrow, and for that reason I don't have a checklist to put in front of you, although I can tell you that anything in FOS seemed to parallel quite a bit so I suspect that they'll be somewhat similar. Is there any comments on that? Is anyone capable of making comments at this point? Kelly Shay?

MS. SHAY: This is Kelly Shay. I know you're getting tired. I just want to throw out you will remember in during the public comment period the comments that were due
by March 16th. You had gotten comments from members of the industry saying it's Jim's kind of lumping and splitting things though they're not identical. There is a precedence on the national list for putting categories of products together and though you do have a couple of organic companies represented here that use these if you look at the comments there's quite a few organic companies that use these type of OFF products that are not represented here.

And as you know, some people and especially in smaller companies just really aren't aware of what's going on on the board and these different things. So, we've tried to reach out to a few of them but you'll find there are company names and their products in some public comment that you have.

MS. CAROE: Thank you, Kelly. The comments that we received in writing will be considered as we put this together.

That concludes the discussion on materials for 605 and 606 from the handling committee. Okay. We're going to take a ten minute break. We're only three and three quarters hours behind. And we've got 35 public comments, 37 public comments.

If there is anybody that's willing to volunteer that they move off the list for today's public comment and make public comment tomorrow we'd be really appreciative of
that. And, also, we won't limit you past five minutes, but, you can summarize your comments or if somebody's made your comments and you can just acknowledge that you're supporting that comment that would be appreciated.

So, for now, a ten minute break, ten short minutes.

(Whereupon, a brief recess was taken)

MS. CAROE: Board members, please, please. I still don't have a quorum. I need ten for a quorum. I think I've got it now. Okay. All right. We do have a quorum now, ten. We've got ten. Let's just go. All right. First on the list, Tom Hutcheson. Tom, I'm going to ask you if you wouldn't mind being on desk. Urvashi is signed up but she's much later on the list and she's not feeling well.

MR. HUTCHESON: That's great.

MS. CAROE: Okay. So, I'm going to ask you to be on deck. Urvashi Rankin.

MS. RANKIN: I actually appreciate it. It's actually a sick baby I've got to get back to and a flight I need to catch so I appreciate it. My name is urvashi Rankin. I'm an environmental health scientist at Consumers Union. We're the non-profit publisher of Consumer Reports Magazine and I really appreciate being here today and hearing the deliberations. There's a lot of really great discussion going on.

And I want to talk about two specific issues. One
about the use of progeny of cloned animals and maybe I can
provide a fix for you all on the language to get that moving
because we think it's a really important issue that the
progeny of cloned animals is also prohibited and I think
without the asexual reproduction as well at the end of that
statement and just restricting it to semeiotics on nuclear
transfer that would be adequate in our minds to take care of
the problems associated with the progeny of cloned animals.

I brought in a lot of peer review studies for you
that I'm going to submit to you for your review but they
essentially document how as CNT actually specifically can
cause genetic alterations in the progeny of cloned animals,
including nuclear DNA, myocondrial DNA, two areas which are
at the end of the DNA's and histones which help control genes
turning on and off.

Those problems are largely not associated with
embryo transfer systems and really don't apply to those.
These would be genetic problems very specific to semiotic
cell nuclear transfer. In addition to that, the offspring of
these cloned animals through SCNT can exhibit an intended
physiological differences compared to their non-cloned
counterparts.

One study found that offspring from a cloned bull
showed lower heart rates, lower body temperatures, and other
studies have shown two links can be altered which can perhaps
affect life span of the animal as well. So, we would strongly encourage you to please include progeny of cloned animals in the ban at this time and if you restrict it to SCNT at this time and consider other forms of asexual reproduction later that would suffice in terms of dealing with the problems associated with the progeny of cloned animals.

The next thing I'd like to comment on is the agriculture standards. Actually, we're very pleased to see the progress that's been made on these standards. I know it's been a very long and arduous task and Consumers Union has been very leery of the fact that organic fish at this time is being sold in the market. Consumers don't know whether it's USDA certified or not. It's incredibly misleading to consumers. States like California and Georgia have gone the extra mile because they consider it to be a deceptive and illegal business practice.

We strongly urge you and the USDA to please prohibit that label until we get these standards straight. It simply doesn't do anything to help the market today and it's not going to help the market once these standards are established. Consumer Reports continues to advise our 6.5 million subscribers not to pay more for organic fish at this time and that it just doesn't mean anything more.

We strongly support the comments of the Pure Salmon
Campaign, including the exclusion of open net pens, and also the use of wild fish meal. That's particularly important at this time because with that exclusion we don't get into the problem with the contaminants in fish production. That's been a big concern for Consumers Union, for consumers who are purchasing organic fish who consider it to be cleaner, contain less contaminants like mercury or poly chlorinated bifennels. By prohibiting the use of wild fish you literally get around that issue. If wild fish meal is considered at a future point we are going to ask for contaminant testing of the end product so that consumers are assured that these products that they buy do not contain contaminants.

Along a similar line with the fish oil you discussed today and the fish oil supplements, if that comes from wild fish you're running into the same issues again with contaminants and we really think if that is going to be approved that we also address the testing of contaminants in this fish oil supplements.

Thank you. I appreciate it.

MS. CAROE: Thank you, Urashi. Any questions?

Thank you so much.

MS. RANKIN: I'm going to submit these papers and also my colleague, Dr. Michael Hanson, who is an expert in cloning and other genetic matters can also be contacted at Consumers Union. Thank you.
MS. CAROE: Before I call Tom up we've had a
filming crew that's been going around. I was hoping that you
could identify yourselves since we have commentors coming up.
So, if you would just identify who you are and I think our
public comment folks would appreciate knowing who you are and
what you're doing that.

MS. ROGERS: My name is Shelly Rogers. I'm a
student at NYU. And I have started this project as a masters
thesis but it has since grown to become a full fledged
documentary project and, so, it's called What's Organic About
Organic and it's following the stories of farmers trying to
help consumers understand exactly what organic means.

MS. CAROE: Thank you. Okay. Tom Hutcheson,
you're up and next we have Neil Simms. Neil, are you in the
room? Very good.

MR. HUTCHESON: Thank you all and thanks, of
course, for all your work. I extend -- I'm Tom Hutcheson
from the Organic Trade Association. And we extend our
welcome also to the new members for the board, even if we
know you've already been working for the past several months
very hard so we also recognize you're not new.

Some brief comments and then perhaps a little bit
of an extended comment on 606. First, on the topic of
flavors, OTA appreciates your attention so far and notes that
further board consideration is needed. We'd be happy to work
with you to identify issues and approaches.

On cloning, OTA supports the position of no progeny, recognizing the current recommendation may need further refinement for practical or regulatory purposes. OTA agrees with those board members who feel that it is important to move forward at this meeting and requests the board to craft a simple statement of intent expressing the sense of the board even if a final recommendation is deferred.

On aquaculture, the excellent foundation NOSB has provided will expedite the development of recommendations for carnivorous fish, shell fish, and mollusks. Such species represent a significant portion of the conventional aquaculture industry and the opportunity to include a certified organic product of this type would benefit both consumers and the environment.

OTA suggests that the issue of net pens can be addressed by considering specific criteria for stocking density and nutrient management. We are confident that these criteria can be set so as to support responsible ecological management and the health of the species being cultivated in addition to expanding the options for consumers seeking high quality organically produced seafood.

Now, on 606. OTA commends the NOSB for its diligence in reviewing the numerous petitions for inclusion of substances on section 205.606. We would also reiterate a
fundamental point. Petitions for 606 do not need to
demonstrate that the substance is currently commercially
unavailable in order for the NOSB to recommend that it be
added to the national list. Commercial availability
determinations are quite properly the job of an accredited
certification agent.

OTA urges the board not to be overly exactly in
requiring evidence of unforeseen and perhaps unforeseeable
supply disruptions. Instead, the board should err on the
side of including ingredients whose steady availability is
especially important as the industry expands. There are many
uncertainties at this stage and new product development is
already risky.

The previous allowance of non-organic agricultural
ingredients in the five percent of an organic product not
required to be sourced organically led directly to the
current strength in the organic spice trade. Again, please
give 606 petitioners the benefit of doubt so that 606 may
indeed be a list of entrepreneurial ideas and not an
unnecessarily difficult hurdle to jump. Thank you.

MS. CAROE: Thank you, Tom. Any comments for Tom?
Thank you so much. Next up is Neil Simms followed by Barbara
Glenn. Barbara, are you here?

DR. GLENN: I'm here.

MS. CAROE: Okay. If you could please check with
Valerie. Valerie, wave your hand so they can see you. Thank you.

MR. HUTCHESON: Did I have 30 seconds left?

MS. CAROE: You have 30 seconds. Go for it.

MR. HUTCHESON: Thank you. I did also want to support the inclusion of both inulin and the saccharites on section 606. I think we've demonstrated here today that they are agricultural products. If there's any chance that that does not happen we've included in the handout a suggestion for dealing with it in a regulatory way so that the trade can continue forward as if you require a TAC review, as that happens.

I hope that that's not the case. I hope that you do recognize its agricultural nature for both of those products and that construction of the solution can move forward.

MR. SIMMS: I'm Neil Anthony Simms. I'm the co-founder and president of Kona Blue Water Farms. Kona Blue is the first integrated open ocean fish farm and marine fish hatchery in the United States and operations are in waters over 200 feet deep out off shore in Hawaii. We're now producing over 12,000 of shishina grade kampachi every week in an operation that has negligible almost immeasurable
environmental impacts.

Our company was founded by marine biologists who are committed to environmentally sound agriculture. We use all submersible cages and we are aspiring to more sustainable feeds. We culture an 80's species kona kampachi. There is no commercial fishery for the species and all of our stock is hatchery produced.

We have very high feed conversion, a highly efficient feed conversion ratios, no detectable mercury in our product, very high in omega 3 fatty acids. It's a super soshini and also very versatile as a cooked product.

I want to reiterate my invitation to the board to please come to Kona at your leisure and visit our farm. I also want to share with you here as we scroll through some of the pages of our operation to help dispel some of the misapprehensions that some would you have labor under.

You'll see no plumes of sewage or piles of uneaten fish feed. Organic fish farming need not be the future cesspool that some would paint it as. We can do this right. We just need the opportunity and the incentive.

So, while I commend and thank the livestock committee for the work to date I believe further recommendations on fishery and fish oil and the use of net pin culture was a lost opportunity. This deferral means a fish farm does not have the prospect of an organic premium as
an incentive to improve their farming methods.  

Because of this, our oceans are somewhat the poorer. And a deferral also means that Americans will not yet have organic seafood products that they can consume with confidence. Their diet is therefore somewhat poorer for this. Organic standards for marine fin fish could have encouraged better farm practices and improve national health. Instead, it seems that the emotional arguments of a small minority are vocal opponents to set a net pin culture have held sway, but, that notion should not be a basis for decision-making.

Rather, we should address the issues at hand based on their merits. If we must have rigorous and exacting standards then so be it. We want to see organic agriculture respected and organic seafood sought after. Americans need to eat more fish. The health foundation is suffering from over-consumption of fat laden animals. Heart disease is a national epidemic. And seafood is part of the solution.

Yet, consumers are confused by the barrage of misinformation that such as you've heard here this afternoon about contaminants in farm seafood. Organic seafood standards can begin to rectify this by providing increased consumer confidence in organic seafood sufficient for some Americans to increase their seafood consumption. Organic standards will, therefore, save lives.
You have an opportunity and an obligation. Let's please address the specifics and not the emotion. It makes more sense and is more productive for us all instead of preventing any and all fish farms from being organic, let's impose a rigorous, exacting standards for organic operations. As some farms aspire towards organic status, then these more wholesome practices might then become more widely integrated throughout the conventional system. This is the very same exemplary manner in which organic agriculture has helped to improve conventional agriculture systems. It is proper and appropriate.

Please act expediently to establish net pin standards however so as you see fit to allow fish to be farmed in the sea where they belong. The exclusion of the culture for fin fish production is perhaps analogous to excluding fences from terrestrial agriculture production, It's simply a production method. If the opponents of net pins have specific concerns then we need to be able to hear them and discuss them, yet, there being no simply outright opposition. Are they not citing guidelines that might make organic net pin culture acceptable? We haven't heard from them.

Are there not restrictions on which species might be cultivated organic net pin systems, why are these not being proposed? Are there not standards for affluent water
quality or impacts that would be considered appropriate for organic fish farms? Then why haven't we not heard these. Let us please address the issues and not the emotion and let us please establish some standards. Our oceans and there are consumers who will thank you for it and I thank you.

MS. CAROE: Comments? Yes, Joe?

MR. SMILLIE: Do you have any -- I appreciate your comments on the aquaculture and the fish mill culture and again we will consider it down the road. Do you have any specific comments on the current recommendations that are now before this board?

MR. SIMMS: Yes, I do. I don't want to distract from the main thrust but I support the fish mill and fish oil from organic sources. That's a very good start. I also would like to put forward the suggestion that poultry sort of by-products should be considered if they're perhaps from organic poultry sources and I'd also like to suggest that if I had the choice between electrocution and falling asleep in the snow I'd choose falling asleep in the snow.

And, so, I don't think that concussion and electrocution should immediately be embraced as the most humane method for slaughtering warm water species. When you come to Kona and visit our operation, our fish farm operation, and you see how we harvest our fish into -- it's
very humane. It's the analogy of falling asleep in the snow is the best one that I can find.

MS. CAROE: Dan.

MR. GIACOMINI: Testimony was given yesterday regarding a very poor feed efficiency. I believe the gave for Kona Blue they gave the number 50 lbs. of harvested fish or it was 50 to 1. I don't remember the exact for your output. You've just said you had a very high efficiency. Would you like to state for the record what your -- what the range of what your efficiency is?

MR. SIMMS: Yes, I'd be very curious as to where that information had come from yesterday. Was the source for that cited?

MR. GIACOMINI: The hallway.

MR. SIMMS: I'm sorry?

MR. GIACOMINI: The hallway. I just heard it in the hallways.

MS. CAROE: It was presented.

MR. GIACOMINI: It wasn't presented here but he said I just heard it a minute ago. That was his reference.

MR. SIMMS: Okay. I'm a little displeased and distressed that people have impugned our reputation so liberally here at this podium. In land-based chiles where they have species leaving we got feed ratios down to 1 to 1. Now, please understand that's with the dried pellet feed. So,
we use about 50 percent fish meal and fish oil in that dried pellet feed.

If you're going to go and take that back out then as to how many poundage of wild fish goes into that there's about five pounds of wet fish that needs to go to make one pound of fish meal so it works out to be about 2.5 to 1 in our land based systems where we can have better regulation of the feed. Out of offshore, because of the open ocean system and there still are some challenges there, putting the pieces in place to make this work efficiently our feed conversion ratio using the dry pellet is about 1.7, 1.8 to 1.

MS. CAROE: Okay. Well, I just want to correct something you said. It wasn't Kona Blue. It was Kona kampachi, wasn't it?

MR. SIMMS: We have the trademark Kona kampachi. That's the fish.

MS. CAROE: I know. It's a company name, isn't it?

Kona Blue --

MR. SIMMS: Kona Blue is the company name. Kona kampachi is our trademark.

MS. CAROE: It was the fish that was being -- okay. Jeff or is it Kevin.

MR. ENGELBERT: Kevin. I was going to ask how much do you feed to get a pound of yield.

MS. CAROE: No, no, he said how much wet fish.
Five pounds of wet fish make one pound of fish meal that then gets fed to the kampachi.

MR. SIMMS: Right.

MS. CAROE: How many pounds of food does that -- how many pounds of kampachi does the fish meal for whatever it eats?

MR. SIMMS: We're doing it where we can push feed where we have better control and we can get the feed conversion ratio of 1 to 1. So, that's 1 to 1 of dried feet to one pound of Kona kampachi. Then the wet fishing, the wet fish out, which is really as a fishing biologist that's the major that I want to look at, that 2.5 to 1 and offshore it's closer to 5 to 1.

MS. CAROE: Okay. Got it.

MR. SIMMS: When we go toward -- we can very quickly move towards something like 1 to 1 by using by-products in there. This is what I was talking about, the incentive and using these incentives. We can go and use pollack or salmon by-products which at the moment are being dumped. We can use those and we get down to a ratio of wet fish in/wet fish out of 1 to 1 and I think when you're looking at this that's something that everybody, even those people who testified here yesterday with this misinformation, if you told them that we had a wet fish in and a wet fish out of 1 to 1 they may --
MS. CAROE: I just want to say that this is something -- this is the type of thing that we want to investigate and so I don't -- although I know the board has a lot of questions on this stuff I do want to point out the fact that there will be another time and a place and I'm really hoping in your -- I can get a unanimous vote on that recommendation from the board. I'm just saying.

Did you have a question, Bea?

MR. JAMES: And I know that Gerald has made it very clear that we will be discussing that at another point in time and I look forward to that. But, in the interim to kind of help me think about some of the things are know are going to be coming up, can you address -- I've heard a lot of comment about the impact to wild species if over-fishing happens on the food supply.

Can you give me any kind of -- you know -- how you perceive that statement that's been made.

MR. SIMMS: The fishing of?

MS. JAMES: For feed.

MR. SIMMS: Oh, the reduction fisheries such as proven in anchovies. Proven anchovies, when I went through the marine biology back 20-25 years ago even back then the proven anchovy fishery was used as a model for a beautifully managed fishery and it still is to this day. We recognize it though. We as a company recognize it even though it's very
stable and it's sustainable in its stability, it's not sustainable in its salability and that's why we as a company already are trying to push the envelope for more sustainable feeds.

That's why we originally feeding our fish an organic feed based on European standards that that was primarily a proven anchovy and that didn't hold water as we were concerned about trying to hold ourselves out to be sustainable and that's why we've pushed the envelope down to 50 percent fish meal and fish oil and using more agricultural grains.

One of my concerns going forward is that if we're going to do an organic farm there may not be -- the limitation may not be fish meal or fish oil. The limitation may be the availability of agricultural products to go into the feed, the cannola, the organic cannola, the organic soy. That's going to be a limitation as well.

MS. CAROE: Anymore questions from the board? Thank you so much for your comments.

MR. SIMMS: Thank you all very much.

MS. CAROE: On deck we have Sean Taylor. Sean, are you in the room?

MR. TAYLOR: Yes.

MS. CAROE: Can you please check in with Valerie. Mrs. Barbara Glenn.
DR. GLENN: Good evening to members of the National Organic Standards Board. First, please indulge my voice, I apologize. My name is Dr. Barbara Glenn and I'm managing director of animal biotechnology for the Biotechnology Industry Organization in Washington, D.C.

Thank you for providing the opportunity to testify today on the current recommendation before the board. We respect that today you've actually taken an action to defer on this recommendation. Today, however, I'd like to summarize some of the written comments that were submitted on March 16th which respectfully opposes the recommendation.

Biotech Industry Organization's members provide cloning technology for agricultural animals and are leaders in the production of livestock clones to provide solutions for issues important to human kind, including hunger and health. An animal clone is a genetically identical twin to a donor animal that has been recognized as naturally possessing desirable traits that the breeder would like to replicate.

There is recombinant DNA technology involved in the process of cloning. No genes are inserted or changed. Cloning simply produces a genetic twin. In fact, animal cloning allows farmers and ranchers to produce healthy productive animals and healthful foods for human consumption.

Animal cloning allows for rapid distribution of the best genetics for proven animals to provide consistent, healthful,
and safe food for human consumption.

Animal cloning is a safe assisted reproductive technology. There is no human health nor food safety reason to exclude animal clones from organic production. Following exhaustive food safety reviews by the U.S. Food and Drug Administration they have stated in a science-based draft assessment that edible products from healthy clones and progeny of clones pose no additional food consumption risks relative to corresponding products from other animals.

In this conclusion the FDA agrees with the National Academy of Sciences who concluded similarly in 2002.

Moreover, animal cloning is simply another step along the continuum of assisted reproductive technologies or ART's which are high technology breeding methods used today in animal agriculture and including organic agriculture.

Somatic cell nuclear transfer or SCNT has been recognized as an ART by FDA. Other ART's include artificial insemination and transfer and in vitro fertilization, all of which are allowed to be used in organic production in the NOP. Indeed, the proposal currently before the board would specifically allow the use of artificial insemination in organic production where the regulations have previously been silent.

Any distinction made among these different types of ART's that deny or give producers the benefits of these
technologies should be supported by science and reasonable
argument. The value of these breeding tools is undeniable
both within and outside the organic community. For example,
it's estimated that 75 percent of the milk and 80 percent of
the pork is produced through the use of artificial
insemination which includes milk and pork labels under the
National Organic Program.

There is nothing in the Organic Food Production Act
of 1990 that speaks directly to animal cloning. Organic
livestock producers should have the option to select the best
genetics, select the reproductive technology to allow them to
raise high quality livestock in a manner that's consistent
with the NOP. Animal clone progeny are not produced using
SCNT. The progeny or offspring of clones are not clones
themselves. These animals are sexually produced from the
mating of a clone with another animal after undergoing the
normal gestation period and birthing process.

Without prejudice to our position, the cloning
should be allowed under the NOP. It's even more the case for
progeny. The NOP should certainly allow the progeny clones
to be used in organic production. As discussed above,
livestock clones, because of their highly desirable traits
and genetic mirror will be the superior farm animals.
Organic livestock producers should have the opportunity to
take advantage of those superior breeding stock.
Furthermore, the progeny of clones are produced under normal conditions of livestock breeding and production and are compatible with organic production. These naturally born offspring which may be raised according to the statute or the regs should be allowed under the NOP to produce animal feed products to be labeled according to the NOP.

Importantly, attempting to force a ban on progeny clones and organic production will actually impose significant burdens on organic livestock producers. As mentioned earlier, livestock clones and progeny are indistinguishable from livestock produced using natural mating or other ART's. There's no test, chemical or otherwise, that can be conducted to identify that an animal is actually the offspring of a clone. Therefore, there would be no practical process in organic production to allow absolute certainty that an organic livestock producer isn't purchasing or doesn't have a progeny of a clone.

In fact, that problem is likely to be magnified because there will be thousands of progeny in the future and, indeed, today there are several dating several generations to the 1980's when cloning was actually used.

MS. CAROE: Thank you.

DR. GLENN: Thank you for allowing me to make comments.

MS. CAROE: Any comments from the board? Thank you
DR. GLENN: We'd be happy to work with you if you need assistance.

MR. TAYLOR: Good afternoon. I'm Sean Taylor. I'm the scientific director of the International Association of Color Manufacturers. I'm going to limit my comments today primarily to talking a little bit about annatto and support of annatto very briefly and talk a little bit about commercial availability.

I have written proxy to talk tomorrow morning and I'll talk a little bit more about some of the anthosianic contained colors. But, you're welcome to ask any questions that you want obviously.

What I'd like to say is that first of all we'd like to thank you for the chance to comment on recommendations of the NOSB that are slated for discussion and final vote at this meeting. My association, the International Association of Color Manufacturers is the trade association that represents manufacturers and end users of coloring substances that are used in foods, including those colors that are used in products labeled organic and made with organic.

We've already supplied some written comments to the
NOSB. What we'd like to do with these public comments is provide some additional information concerning the recommendations of the NOSB handling committee with regards to petitions received for both annatto and paprika colors. Our association felt one of the two petitioners received for paprika and we found the only petition received for paprika oil resin or paprika oil extracted as it's now being called.

As far as annatto goes, I'll keep it very briefly. We support strongly today's recommendation for annatto color. And I don't think I'll go beyond that considering the time. What I'll say as far as paprika goes, as within annatto, the current handling committee recommendation is to separate paprika, water-extracted paprika, oil extracted, I should say, on the national 205.606 and to the annotations concerning material listed for three years from the date of publication and organic oil must be used for the oil extraction.

Again, we strongly support these recommendations now from the handling committee to remove these annotations and to separate the two materials. The one thing I would like to suggest, however, is you may want to consider remaking paprika water extracted for maybe something like paprika color because as it turns out paprika is really not water extracted. It's really just taking sort of the dried
pepper and grinding it. So, paprika water extract is a little bit of a misnomer I would say. So, please take that under consideration.

Finally, in our view of the petition the handling committee recommendation we feel that the paprika petition is dealing with both forms of paprika have met all of the critical criteria for getting on the national list but we'd like to provide some additional comments with regards to the commercial availability of certified organic paprika or raw material alternatives.

In our original petitions for paprika color and paprika oil resin which is now referred to as paprika oil extracted we provided evidence in our petitions of pepper crop went outside of the United States and is currently in transition to certified organic. Specifically, there's crops plants in South America which is, as it turns out, a major source for the sweet peppers that are used in the production of paprika colors.

We anticipate, I should say, some of our member companies anticipate that this crop land will eventually produce sufficient raw materials for certified organic process for what you might want to call paprika color and paprika oil extracted color. However, we expect that initial reduction so real conventional crops will occur. We had some concerns that the supply chain may be initially inconsistent
after the transition is first complete.

Additionally, the certified organic paprika pepper farm lands will require crop rotation to ensure consistent yields, maintain quality of the soil, and prevent disease. We believe this will necessitate the development and coordination of companion organic product to be grown in the same land and while members of our association are working with the growers to find a suitable companion crop this work is still very much in progress.

We feel that these factors alone require the listings of paprika color and paprika oil extracted colors of the natural west. We'd also like to provide some additional comments in the sourcing of peppers for paprika used as a color, whether it's paprika or paprika oil extracted.

In the handling committee's recommendation the question was raised as to the importance of Hungary, the country Hungary, as a supplier. One of the member companies, and specifically it's a company called Cowset, which is one of the major producers of paprika color and paprika oil extracted for use as a color has indicated to me that Hungary does not supply substantial amounts of raw materials for paprika used as a color.

That's not to say that Hungary produces no peppers for paprika. What it really says is that Hungary is a relative source of paprika used as a flavor and spice agent.
and so there's a distinction between paprika use as a color
and that used as a flavor and spice agent.

In addition to that, some of the specific varieties
of peppers that are used to make paprika colors, those that
have been selected over time due to, say, increased pigment
content, are not generally grown in Europe but primarily in
South America and in the United States to a lesser extent.

We expect that within five years, and we hope this,
when the use of these materials occurs members will have
certified organic processes in place and sufficient certified
organic raw materials to fulfill our customers' requirements.

Our member companies are fully committed to developing
certified organic paprika color and paprika oil extracted
colors and some of the members already have some sort of
organic processes and materials in place and we're going to
continue to work towards that.

So, thank you very much.

MS. CAROE: Thank you. Comments? Thank you so

MR. CAERS: In the sake of time and perhaps in the
sake of a general level of fatigue I have a proxy for Steve
Abrams, but, if my presentation is clear enough I will offer
not to give the presentations from Professor Abrams but just
give you the handouts and if there are any questions I'm
available for answers.
MS. CAROE: I appreciate that.

MR. CAERS: So I am Wim Caers. I am regulatory support manager for RFT. We are a medium to small sized company from Belgium but we are the leading producers of inulin worldwide and our presentation today is in support of the Stoney Field petition and just to make it clear for the record I would like to point out that the petition product is not just any standards inulin but it's all different enriched inulins which is a particular type of compound.

On the next slide you will see a relative distribution, a comparison relative distribution of inulins coming from different sources and you'll see immediately that there is a large difference in the overall composition of these different inulins.

The next slide will show you a number of potential sources that contain inulin to different levels and it's safe to say that despite the high number of potential sources today more than 95 percent of all the inulin which is produced to be used in foods is coming from the chicory root and this is a very conservative assumption I should say.

The next slide really shows you how inulin looks like and it's important to say that each different amount is represented by a singular peak and it's also very important to remember that the general profile and compositions of these types of ingredients are really crucial for both the
technological properties while using in the food product and its metabolic fate and nutritional benefits after ingestion in your body through any type of fruit matrix.

The next slide really summarizes what happens in the plant. So, the seeds are planted in spring and then the plant really grows throughout summer and during the summer the plant or the root produces the high levels of inulin which reaches a peak in September when normally our company starts harvesting.

But, at the same time there is a second process that the plant does which we call the endogenous hydrolysis from inulin back into oligofructose and this is triggered by temperature and weather conditions. And if you look on the next slide what you will see is that the first column really gives you an idea about timing. The second column gives you the general level of the chain links and you see a steep decrease starting at September going down to the end of December.

But, at the same time you do not see a steep decrease of percentage of inulin type fructan which basically means that all the hydrolysis that's taking place is used to form again these phototype type of quantities.

This is most demonstrated by research done by people from the University of Ghent in Belgium and in the next slide you will see on top, and they used chicory inulin
as a model to demonstrate the whole concept. You will see on
the top side, this is inulin measured from September and then
compared to inulin measured in January and the next slide
will show you that indeed there is a high — an increased
level of presence of these oleofactoral type of modalities
and are those are reproduced in the plants.

And these are published results by other people.
The next slide will show you how this looks without inulin
and the next slide will show you that this process already
starts in September when we actually harvest the ingredient,
but the next slide shows you how these levels genetically
increase if you just wait long enough that when the plant
matures and you go into much colder conditions in wintertime.

The next slide really shows you the general
composition of inulin coming from chicory in this corner
compared to similar type of inulins coming from other sources
which I believe are organically available on the market in
very small quantities.

But, you will see immediately a clear difference in
the general compositions of chicory inulin and then, of
course, compared to the one from blue agave and irusin an
aftershock represented right there.

And then the next slide shows you how the profile
looks from the petitioned product which is the oligofructose
enriched chicory inulin with a concentration of shorter ones
combined to the long ones and you will see as an example a
very clear distinction with the profile from the short chain
FOS that has been discussed also today and which is part of
different petition.

But, you can clearly see the difference between the
two products. So, as a general conclusion I would like to
state that indeed we would support the inclusion of this
oligofructose inulin as an agricultural product based upon,
first of all, latest originated agriculture product, the
chicory root. Secondly, the change in the chemical structure
is identical to the process which invariably takes place in
the plant when it matures.

The identity of this oligofructose enriched inulin
is clearly recognizable in the overall pattern from the
chicory root and even it's safe to say that only the chicory
root can be used as a raw material for this type of
ingredient and it's very unique in it's very unique in its
composition and its nutritional properties. And as such,
today, there is no organic variety available to replace it.

Thank you very much for your attention.

MS. CAROE: Thank you. Joe?

MR. SMILLIE: What do you think in the future could
be the possibility of organically produced chicory being used
as your base for production?

MR. CAERS: Well, since the organic interest is
gaining momentum both in the U.S. and in Europe we've only
lost months. We've discussed this with the Belgium
Federation of Organic Processing Companies and what they're
trying to do is to see how we need to adapt our process, but,
of course, if the problem starts with starting from organic
material.

And the chicory plant is not the easiest one to
grow because it's a rotating crop and you can only use the
same field every fourth year and that in combination, of
course, with the organic requirements, at least in Europe,
where you need to produce four years of organically type of
crop harvesting, so we need to do that first.

And then, secondly, we need to adjust our process
because, as you can imagine, the chicory has some remaining
bitterness that we need to be able to separate from the rest
and still staying within organically allowed type of process
technology and this is something that we are looking at this
moment but it will take quite some time to get there.

MS. CAROE: Katrina?

MS. HEINZE: Thank you for your comments today. We
received several public comments after our recommendation
with the public recommending that we list fructans as a broad
category on 606. I'd be interested in your thoughts on
whether that's a reasonable solution and if there are any
hurdles to doing that or ramifications that we may not be
thinking about.

MR. CAERS: I think if you really go into the chemistry, fructans really cover a number of quite different types materials. It goes from the inulin type, from the oligofructose short chain first type. It includes levans who have a totally different chemical structure.

So, having said that I also believe that the different members within the fructans have very different, let's say technical qualities and also physiological qualities after ingestion, and, as such, I believe it would be fair to look at the different members within the fructan family and to judge them based upon their own merits for inclusion in 606 lists or not because I think that the difference in potential behavior and characteristics is too wide to really look at them as one group.

MS. HEINZE: Thank you.

MS. CAROE: Any other questions? Thank you for your comment. Next up, I didn't have anybody on deck. Jorge Gaskins, are you here? You're up and on deck is Tony Moore. Are you in the room, Tony?

MR. MOORE: Yes.

MS. CAROE: Excellent. Check in with Valerie.

MR. GASKINS: Good evening. My name is Jorge Gaskins. I'm the managing director of HC, the Organic Seafood Company. And I'd like to thank you for the
opportunity of sharing with you our views on the progress to
date on the agricultural standards and also thank you for the
amount of effort that has gone into producing the work to
date, historically and the actual effort. It's notable, it's
admirable, and it's commendable.

And having said that, let me go into a few things
that we think should also focus your attention. HC is a
vertically integrated producer of certified organic tilapia
and shrimp and polychocho, both organisms in the same pond.
We're certified organic by Natural Land from Germany. And
we're a pioneer in the Western Hemisphere of organic talapia
production. We actually have 925 acres of fresh water ponds
in production in southwest Brazil and Panama State, just
north of the great waterfalls of Equasoux along the Parana
River.

I'd like to also suggest a visit which would
probably be educational, interesting, maybe not quite the
same competition as Hawaii, but, worthy. We employ over 125
persons and contract over 80 organic grain farmers and 60
organic talapia producers. And our parts have been in the
North American and European markets for over a year.

Talapia is a well domesticated fish species, an
omnivore. The relationship with man is even depicted in the
hieroglyphics on the pyramid walls. We have submitted
written comments for the record but we have traveled here to
underline and bring into focus certain points of concern in
the proposed regulations, one of which, of course fish meal,
fish oil, and agricultural feed rations.

And I say this because, one, we are perhaps the
largest producer at the present time of certified fish meal
and fish oil and we are beginning to raise fish only for fish
meal production. Two. We use micro allergy production
extensively in our ponds as an essential part of our fish
nutrition during the first six to eight months of life. We
are now doing research and development to harvest these
biolipids producing algae and incorporate them into the diet
of the shrimp and fish, more directly into the feed rations
to better address the diets of the adult talapia.

We are most encouraged with the results to date and
together with other research and development in the industry
we look forward to a more diversified diet for organic,
aquatic animals in the future. And, three, finally, we are
working with major soy processors in Brazil to remove the
complex sugars in soy meal; some 20 percent of the soy's rate
and possibly 10 percent of aquatic feeds that do not
contribute to the fish nutrition but they do add to the waste
in the water systems.

So, we see that the soy used in agriculture feeds
can be improved. Micro algae can produce a more natural
source of biolipids and protein for fish and shrimp rations
and the sources of organic fish meal and oil do exist and
will increase. However, at the moment these food
alternatives lack far behind the actual production of organic
fish and shrimp to be found on the North American market
today.

And these alternatives will not fuel the supply to
meet the identified demand for organic seafood as well
described in the New Jersey comments on the website of
consumer interest. It is for this reason that although we
feel we are part of the long-term solution for organic feed
we endorse the use of fish meal and fish oil from trimmings
of wild catch from identified sustainable fisheries until
such time as these other alternatives can mature.

In another area of the market the retail buyers,
the food service operators, consumers, and even chefs
expressed their interest in having a broad selection of
seafood. Commercially having organic talapia and possibly
organic catfish at some time in the future and a much more
limited supply of shrimp and not having cod, salmon, kobia,
sea bass, seabring to choose from, is going to dampen if not
cripple the growth of the organic seafood industry.

MS. CAROE: Thank you. Board comments? Thank you
for your comments. Oh, wait. Joe?

MR. SMILLIE: Yeah. The current recommendation,
for example, for which your company qualified under those
MR. GASKINS: Our company definitely would qualify under those standards and we support the timeliness of producing a standard and it's a part that I couldn't quite get to. A lot of capital decisions are being held in abeyance all over the industry as NOP process grinds on. And the industry definitely needs more stability. The standards as you have referred to them up-to-date, the draft, we can support.

We don't think that they're the standards that the industry needs to propel itself into a better market position. But, we do support the standards and approving standards as early as possible.

MS. CAROE: Any more questions from the board or comments? Thank you so much.

MR. GASKINS: Thank you.

MS. CAROE: Up next is Tony Moore and on deck is Brian Baker for Dave DeCou.

MR. MOORE: Tony Moore, Moore Ingredients. I'll make this really short. Thanks to all you folks for all the work you're doing. I can't imagine. I'm getting tired just sitting here. I can't imagine what you guys have put into it.

Really simply put I guess I would like to request a further appeal on the current state of organic flavors. I
was sent a notice the NOP sent out that was attempting to clarify organic flavors and I just have a couple of points on that. I'm going to assume that some of the language used that refer to simplicity and also not consumer acceptability and of these flavors was more simplistic flavors like some of the dill weeds that we spoke to and that was a whole different class of flavors that exist and those are complex flavors that are used in beverages and a lot of other --

(Discussion off the record)

MR. MOORE: I was comparing some of the language of the NOP's clarification on flavors hoping to refer to more simple things like spices and some of the dill weed we spoke of earlier but I'm also saying there's a whole different class of flavors that exist and neither complex flavors that are used by the commercial consumer, beverages, and that our company manufactures these. We make most of our livelihood doing that and if you're an organic consumer chances are you probably consume these products with these complex flavors.

There are also blends of both organic -- I'm sorry, both agriculture and non-agricultural products so they really don't meet all of the classification that we are currently going under. Some of the other issues, just by using natural flavors we talked about some of the things not imposing organic regulations on a non-organic industry which is a comment I think we talked about but rather what are we
introducing into the organic industry from non-organic products and that's something that we should really take into consideration by products that are just called natural flavors.

That's the gist of it so I guess I'm officially asking for a further review on the possibility of organic flavors in the current state of organic flavors.

MS. CAROE: Comments? Julie, you want to comment?

MS. WEISMAN: I'm going to make a confession. I was trying to make sense of your handout so can I -- so, pardon me if I misunderstood something, but, did you take from the last clarification, do you think that there is an implication that there should be no organic flavors? Is that what you --

MR. MOORE: No. I took the position that saying that they thought the current flavors, the 1 to 1 don't exist in organic flavors and that the current flavors being organic are simplistic and not acceptable for consumers. That's what I think. Did I misunderstand that?

MS. WEISMAN: Okay. All right. So, you are saying that organic -- can I rephrase it? That whole organic flavors, to say that they are not complex is not accurate, that they are also complex. To say that they are not acceptable to consumers?

MR. MOORE: I think a more accurate way to say it is
the flavors is too broad of an issue to simply call it flavors and I think we need to look at that as a class and explain exactly what they are. You know, if we're going to keep referring to the CFR it's a pretty broad swatch of what they're calling natural flavors. Spices fall under that, sweeteners fall under that. However, there's also a class of flavors that are blends of, again, non-ag. They're going to contain solvents of alcohol. They're going to contain fruit juices. They're going to contain sweeteners, acidulants and so forth and all those have their own little issues which makes those kinds of flavors very complex issues and I guess I'm encouraging doing whatever would mean to encourage these organic flavors because by doing that you're encouraging the use of other organic products.

You're encouraging the use of organic alcohol. You're encouraging the use of organic fruits and berries. You're encouraging the use of organic sweeteners and the list goes on and on. By just simply allowing natural flavors are so-called organic component you're not encouraging that and you're not encouraging all the businesses that want to sell these products and manufacture those products.

And, also, by just simply following within the current CFR for natural flavors you're inadvertently introducing a lot of non-organic things into organic products and there's a lot that goes into that so I guess I'm offering
up a really honest discussion about that.

MR. SMILLIE: As you know, we will be working on our ag/non-ag definition and I believe that that will be the key for us as a board to go back to the NOP and give them advice as to how to come up with a guideline of which flavors do really belong on 605 and which belong on 606 and encourage, you know, the growth of 606, you know, and organic flavors as much as possible rather than allowing occurring to the latest recommendation that, you know, just having FDA define it for our industry.

MR. MOORE: Yeah, I agree.

MR. SMILLIE: And, so, we'll look forward to your contributions as we try to create this document but what we're going to be down to pretty quickly is what we saw in the previous flavor presentation that was put out there. When does an organic essence stop being agricultural, after how many cuts and splits. You know, where do we draw a line and so we'll be looking for industry expertise such as yours to help us determine when does something stop being agricultural and become non-agricultural through the distillation process.

MR. MOORE: Sure. I will assist any way that I can, anyway you'd like to. One really fast comment though i that a lot of these lines need to be simplified because all we're doing is finding ways to encourage use of non-organic
products when a lot of these can be made organically. The raw materials are available. The technology is not that difficult when it comes down to it.

MR. SMILLIE: Great. Thanks.

MS. CAROE: Do you want to comment?

MS. HEINZE: I can't help but notice in your handout that you have a hibiscus certified organic color.

MR. MOORE: We do. I chose not to confuse the issue, but, we do have two organic colors.

MS. HEINZE: We are looking for commercial availability information on hibiscus. I was wondering if you could speak to that a little bit.

MR. MOORE: Oh, certainly. When we first manufacture it's a very simple product. It's a hydro extract meaning that we take certified organic hibiscus and extract that with organic alcohol and water. We first manufactured the flavor not for color but in using it in finished product. It's actually been commercially used in five different consumer products that are labeled as organic right now.

We found a wonderful color so using that as a color that led us into making into an extract which is also being manufactured right now and is being sold in some different confections. It's manufactured in the same process so using organic tumeric, organic alcohol and water.

MS. HEINZE: Are you able to find enough certified
organic hibiscus to make enough to meet your customers' needs?

MR. MOORE: We've had no issues and, in fact, as we posed the question to our suppliers for hibiscus our suppliers for tumeric and we're currently we're not complete to all the suppliers asking about commercial availability and our hope is they're saying bring it on. So, they're saying there is no commercial, but, -- sorry.

MS. CAROE: Jeff.

MR. MOYER: My question would be, I'm trying to understand it. Are you inferring that by placing items on 606 it encourages the use of organic or are you inferring that keeping things off the list is encouraging people to develop more organic?

MR. MOORE: I guess you could take that either way. I guess I'm saying that by not being really encouraging the use of organic flavors. In other words, right now as it stands, because of ag versus non-ag you can use simply natural flavors in the product. There's no legal requirement to use organic flavor. Am I correct about that? By doing that -- I'm sorry, go ahead, Julie.

MS. WEISMAN: Sure. Yeah, I think the other issue here is that natural flavors are elsewhere. In other words, it is already a problem whether -- it's not about what gets listed on -- part of it is not about what gets listed on 606.
Part of it is the fact that natural flavors is a broad category on 605-A and there's very broad interpretation about what is a natural flavor and I think part of what Tony is arguing is like let's look at what's in natural flavors because there are -- and let's look at what called a natural flavor that may really be a natural ingredient or composed solely agricultural ingredients that are available as organic.

MR. MOORE: There's mixtures of ag and non-ag just like a lot of consumer products are because at the end of the day you look at the components of an organic flavor they exactly mimic let's just say an organic beverage. You've got solvents, you've got water, you've got sweeteners, you've got fruits, you've got acidulants, and you've got flavor so, in other words, that's another choice but it's not the same classifications and we need to really address that because, like Julie said, they're called natural flavors it just really confuses the issues and I think it causes a lot of confusion in people and customers, people like myself who formulate them for a living.

And, as well, like I said, my bigger interest though is just encouraging the use of all the organic ingredients that we can to further a trait.

MS. CAROE: Julie?

MS. WEISMAN: I just have one more comment in
response to what you're asking for. You know, Joe addressed
one issue, one aspect of how we will be responding which is
going to be throwing work onto the ag/non-ag recommendation,
but, I think that you're not the first person in the last two
days that has called for a more rigorous look at flavors in
general and, so, I think we're going to, you know, have to
have some conversations with the program about what other
forms might be crated and that to include participation, you
know, of people outside just the board. And we will probably
want you to -- we may contact you when that time comes.

MR. MOORE: Anyone in my organization is happy to
help in any way that we can.

MS. CAROE: Any other comments or questions from
the board? Thank you, Tony.

MR. MOORE: You're welcome.

MS. CAROE: Next up, Brian Baker for Dave DeCou and
then following is John Jantos. John, are you in the room?
How about Will Fantle for Mark Kastel? Will.

MR. BAKER: Thank you very much. I'm not Dave
DeCou. I'm Brian Baker, research director of OMRI and I have
been asked to speak on his behalf and not say anything he
wouldn't say so do that and that should make things even
briefer.

I just wanted to touch briefly on TAC reviews and
what Kim said earlier today is very helpful and very true.
We use TAC reviews and petitions to try and understand the standards of identity and what we're talking about here, cast numbers, INS numbers, 21 CFR references, those are all very important for us to establish what it is we're talking about when we're working with certifiers, when we're working with suppliers and manufacturers to help them understand what's going on here and what the regulations mean and navigate that.

We need to know and be all on the same page when the TAC reviews are not posted and the petitions are not clear. That makes our job more difficult and it makes the job of certifiers and inspectors and processors more difficult as well.

So, several of the petitions, a couple of the petitions were not posted, TAC reviews were not done on 606 materials and there's some ambiguity about what we're talking about here. Also, on the subject of TAC reviews and petitions, the board needs to seriously consider all alternatives.

One alternative not discussed very much has been the option to make a product with a process product with a made with claim that a non-organic ingredient is used. That's not to say that it's the only option but it is an option and should be considered by the board. OMRI wants to see the result to see organic strengthened and that's a very
clear consensus message.

On the issue of cloning, briefly, OMRI is in line with what's been said to ban clones and their progeny. We've received a lot of questions on the subject. We understand the devil is in the detail. There are a number of other excluded method questions that are being sent our way. We have a whole lot of related issues. I mean, look, we put meat and bone meal on our list. Does that mean meat and bone meal from cloned animals can't be used as a fertilizer, things like that.

We want to know what the implications downstream are and need to seriously consider what the implications are of what that means. So, we want to see the NOSB go ahead. We want to see a standard that is clear and enforceable and meaningful and doesn't leave people in funny situations.

Thank you.

MS. CAROE: Any questions for Brian, for Dave?

MR. BAKER: I'll take them back to Dave if you don't want hear from me now.

MS. CAROE: Thanks, Brian.

MR. BAKER: Thank you.

MS. CAROE: Next up is Will Fantle. Do we have John Jantos in the room yet? Has he arrived? How about Jeff Racherty?

MR. FANTLE: Hello, again, I'm Will Fantle for the
Cornucopia Institute. I am its research director and I will try and say things that Mark Kastel would want heard here today.

We want to thank the livestock committee for its move to try and bring the progeny of cloning into the consideration before this board. We think it's very important. It's our hope that this board will make it very clear that the progeny are not allowed. It's also our desire to see our favorite color removed from the organic regulations as much as possible and that color is gray so what that crystal clear for people to know and understand.

I have a comment about the web page and its usage. I've used it for two other non-NOP uses, one with FDA and one with USDA on another matter. Very difficult to navigate and very user-unfriendly. I've been involved in some web page development myself. I think there's probably better ways to approach this and I hope you'll do that and I want to take -- I hope you take that as a sincere request on our part. It's very important for the public to be able to use this and to comment and to provide you with feedback and input on the issues that you were considering. The web page does not need some upgrading.

Next, I want to address just your meeting process. I am an elected official in Wisconsin, a local elected official. I understand what the open meeting process is
about. I'm a little disappointed that the NOP and the NOSB have been encouraging the use of the most recently closed meetings.

We have very distinct criteria for what we use as an elected official in Wisconsin. Contract negotiations, labor negotiations, consideration of legal strategies. I'm not sure that those are the types of things that have been taking place during your closed sessions. I understand fully the need for you to have compressed meetings and schedules and try and be efficient and effective in what you're doing but I hope that you will consider that sunshine and transparency go together and try to be involved and keep the public aware of what you're doing.

It only leads people to be suspicious of what's taking place behind closed doors if those processes are not fully open. Lastly, a matter that I know you can't do anything about but I have to comment on, pasture, and the regulation that the lay of the regulation once more.

This board in August of 2005 made a recommendation that was rejected by the National Organic Program. They decided instead to try and refine the language that this board approved. We're now into 2007. We're told that maybe at the end of this year -- well, actually I don't know that it is the end of this year. We were told at the end of the year. We weren't told what year that would be that this
pasture regulation will come out.

Our members, our family farm members really want to see this resolved and I know, again, that you have little control over the process, but, whatever you can do to try and push that out the door we would fully appreciate. It's our contention, our continued contention that the current regs are enforceable. They're not being done. That's not being taken, that action by the National Organic Program.

We think that confinement, farm operators that are speeding down the highway that are violating the regs and something should be done about that. Perhaps you can find some ways to encourage enforcement activities.

With that, thank you and I hope the rest of your evening goes quickly.

MS. CAROE: Comments for Will? Thank you so much. Jeff, you're up next. After that, Zea, you're on deck. I saw her somewhere in the back. Is Zea here? She might have fallen asleep. Yeah, there's a lot of that going around.

MR. RACHERTY: Hello, everybody. Jeff Racherty, Moore Ingredients. You've heard earlier from Tony Moore who is the technical director and I'm more on the sales and marketing side so I'm going to kind of be a little more basic. I just wanted to thank everybody on both sides of this know that there's been -- it's clear that flavors have to be that more closely and I think we're all heading in that
direction with the discussions that we all have had.

I just want to make a couple of comments about a few things. Moore Ingredients, as numerous other flavor manufacturers, it has been clearly established that certified organic flavors are indeed available. So, I guess with some of the earlier commentary today as it pertains to that, adding the fact that that natural non-organic flavors that are in compliance are on the allowed list and some of the comment, I guess the exact verbiage may have been it just means that it is available, not that it is a given or a definite.

So, I guess I have a question and I'll ask if someone wants to answer it now that would be great and if that is the case. What is the criteria that the certifier is using to evaluate a given flavor to be accepted under that parameter or not or challenged?

MS. CAROE: Well, we'll let a certifier answer that.

MR. RACHERTY: I was looking right at -- sorry, Joe.

MR. SMILLIE: Let me start by saying that I'm accredited by the USDA. When I'm given guidelines, I've got a law, a regulation, guidelines, current thoughts, and a number of different inputs from my accreditor as to how I will deal with different issues and unlike Will who wants to
see the color gray go away it ain't go away in my lifetime
and there's a lot of things that are gray out there.

Our personal company, and I cannot speak for all
certifiers, and it's hard to, because there's a variety of
opinion on this, but, we took the position early on on the
fact that we felt that natural flavors are what's called, you
know, NOP compliant that are allowed under 605-A. You know,
we allow them. We saw that clearly they were natural but
non-agricultural, okay.

So, that was fairly simple. They're allowed as long
as they don't have propylene glycolin or other solvents.
They're allowed. There's also a whole world of flavors out
there that are, we thought in our estimation that were
agricultural, you know, essential oils, extracts, vanilla,
you know, and, so, we said, hey, if those are agriculture
they've got to be organic or under 606.

And, so, that's the way we were operating. Then
the first guideline that we received was that anything,
anything that even smacks of agriculture has got to be on 606
and I was like whoa, that is we fell a little far to the side
of the way we were interpreting it. And then we moved
forward and we have a lot of clients that are really working
hard to use a lot of certified organic flavors and a lot of
flavor companies that are producing certified organic flavors
and our business is certification so we see it.
You know, we have to work with flavor companies. It's one of the hardest questions to answer is a flavor company will phone us and say what's the deal here and you have to take a long deep breath and try and walk them through, you know, the mine field in explaining how you certify a flavor. And, so, we usually get through it and the companies struggle with it and then they sort of get it and then they start to move and that's our job, to encourage production of organic flavors and that's our role.

And, so, I thought we were doing fairly well moving along that, quite frankly, the latest guideline which went back to like the FEMA stuff and, you know, I, personally, I'll be honest, was disappointed with that guideline, but, again, it's a guideline and, again, NOSB's just is to come up with their response to that guideline and to give advice to the USDA on how we all consistently among certifiers, you know, interpret that.

And, so, it's very difficult for me to give you an across the board answer for other certifiers because it's a complicated situation. Each certification organization works their way through the issues different, but, from our position we think very clearly that some flavors -- you know -- we're certifying organic flavors. We know it's possible. We know you can do it. And then for those that aren't possible as agricultural they need to be put on 606 if
they're extracts.

That's clear. How far you go --

(Discussion off the record)

MR. SMILLIE: I was directed to answer your question. Anyhow, and, so, once again, it's, you know, we're working on it and I'm actually -- on the flavors issue I'm pretty confident that we'll get to a reasonable solution.

MR. RACHERTY: And just to comment on that comment, you know, for QAI, who Joe works for is very good at it and they really have -- I think they're taking the right stance. I won't go into that because it's my five minutes, but, the one other question on this and it's actually just a statement.

In almost every guideline, clarification, conversation that a certifier has with a processing company, there is never the common -- I shouldn't say never -- there is a very infrequently the commentary of if it is commercially available, the commercially available certified version should be used and I think that all the bodies involved, the certifiers, the NOSB, the NOP, USDA, I think when they clarify and they give guidance and guidelines they should always finish it, start it, wherever, with the fact that if there is a commercially available version it should be used. And that we as an organic industry should strive for that.
So, that's just a comment. And then just one comment I want to make and Joe mentioned it too and I kind of think several people have had problems with it, is pertaining to the NOP's guidance for certifiers, the documents that they produced on 2/16 of this year. Towards the bottom of that document in the last paragraph, and I'm quoting right from it, it says, however, these flavors, and they're talking about certified organic flavors, are more simplistic and may not deliver complex flavors and profiles demanded by consumers.

So, I just want to make a comment that I think as a flavor supplier this was an extremely inaccurate and irresponsible statement from the point of view of the processor who might buy that flavor from me and use it in their product. That's an insult to their product that has a complex flavor and it's also on the bottom of that rung, which is not the bottom because it's really the top, is the consumer who eats it, drinks it, or whatever and enjoys it and their statement basically said that we have no taste.

So, I am finished so I don't even need that minute, but, I just want to really, you know, say that that we all in the organic business really kind of took offense to that comment and we'd hope there would be a retraction on it and I thank you all for the time.

MS. CAROE: I just want to address a couple of your

MS. CAROE: Very quickly. We did put out a recommendation on how certifiers -- what certifiers' role is and what their due diligence needs to be in order to review an organic systems plan that includes a non-organic agricultural ingredient and if it is listed on 606. So, there is a guideline from this board to certifiers on what that process needs to be and what they need to do in order to verify that there is a non-availability of that organic form.

And as far as further development, I don't know if it was very clear, the board is going to take up a recommendation on flavors in clarifying that the flavors word is a whole universe and try to tear that apart and as Julie indicated we're going to outreach to do that. We're going to bring the community in and come up with a more comprehensive and well vetted recommendation.

We will collaborate as well with the program as we do that so that it can be implemented. So, I can say that, you know, it is on the work plan. It's going to be developed. It's going to happen. It's not here at this meeting just because of time constraints.

MR. RACHERTY: Thank you. Thank you very much everybody.
MS. CAROE: Thank you for your comments. Is there anybody else that had any comments? Sorry. Next up, Zea, and then I have L. Monge. Are you here? Are you going to be giving comment? You are. Okay. You're up next then.

MS. SONNEBRAND: Before we start, Andrea, Eric Sidemen signed up also and I have his proxy. I am willing to do that tomorrow morning as long as it's not before 8:30. Well, we can stay the night and do it if you'd like. Eric Sidemen. He's somewhere. I signed him up today. So, that's fine for tomorrow. I do have a proxy from Eric but that's not the comments I'm giving right now. I'll do those tomorrow.

Okay. I am Zea Sonnebrand from California Certified Organic Farmers. Thank you for the opportunity to address you and welcome to the new board members. I've been working with NOSB since pretty much the beginning of the materials review process. Also sometimes I'm known as the materials girl and I've helped the board deliberate on many of the issues over the past and as such I'm one of the people who knows quite a bit about history and what things have come up in the histories and what decisions might have been made so feel free to ask me about that.

As one of the oldest and largest certifiers in the United States we have several issues that we're concerned about today. Like Harriet Behar's comments we're still
waiting for the program manual to come out from the
department that has specific instructions on what we're
supposed to abide by. We feel like we really need clear and
consistent communication from the department and when new
policies or implementation details change we need plenty of
advanced notice with clear start and end dates.

We don't like hearing things in a certifier
training that don't have a clear date of implementation,
except as of that moment, and we don't like the same things
posted on the website in an adverse decision on a case that
we suddenly have to abide by. We like an announcement saying
please start this as of this date and it takes -- our clients
do not read websites every day. So, we figure it takes about
six months to get a full notice out to all of our clients.

And that's a number of cases recently of suddenly
things are different and we're supposed to do things
different without appropriate notice. We also have some
things to say about materials. We were the petitioner for
the carbon dioxide and I've submitted the letter to Valerie
to withdraw the petition. We're perfectly comfortable with
you not taking it up at this time. We are trying to be
proactive in case the Harvey situation did not get
overturned.

We do, however, have problems with future decisions
when we don't have a clarity on synthetic/non-synthetic
document and the ag/non-ag determination document. We also have a great deal of concern over this whole issue of changing the annotations in subset and you can imagine our confusion. You board members, I'm sure, are thoroughly confused, but, we've been trying for any number of years to change the annotation for aquatic plant products.

We would like to see this annotation change. We've gotten told that it needs a petition. Well, we do not have a commercial interest in any product. However, one of the commercial interests did petition and the petition did get swallowed up in the black hole of the NOP and so now we can't get it changed because it's part of restructuring the national list.

And restructuring the national list is sometimes it's in your court and sometimes it's in their court and we need to change some of these annotations. Some of these annotations date from 1994 and 95 and things have changed since then and some of the things, and the crops list in particular, because processing almost always has commercial interests that want to change things, but, with grower-based things a grower does not know enough information to file a petition and often we have a hard time representing what might be in the best interest of all the certifiers.

So, we urge you please to keep -- somehow figure out a process so annotations can be changed without it only
having to be the commercial interest. And please finish your
work on the synthetic and non-synthetic document.

We want to support that you take up the cloning
issue at this meeting and please try and have a vote. If you
have to take out one paragraph don't let it hold up the whole
thing. We thoroughly support the comments against cloning
and we feel like you are so close you should be able to vote
on something tomorrow instead of tabling it.

And I wanted to point out one teeny thing about the
research proposal which is that you have a thing in that
research proposal saying that parcels for research have to be
on your certificates. Therefore, it has kicked into the
certificate problem which does not have parcels on it right
now and so that part probably needs to be changed.

And, lastly, for someone on the board yesterday
expressed support of the organic seed variations on the
websites for certifiers. Since certifiers don't customarily
put the information into computers that would create a
tremendous workload for certifiers that doesn't exist and we
do oppose such a proposal while we encourage more use of
organic seed if we can figure something out.

MS. CAROE: Thank you, Zea. Comments for Zea?

MR. DAVIS: I have a question.

MS. CAROE: Gerry.

MR. DAVIS: Zea, on the aquatic plant extraction
they had a change. What specifically did you mean by that?

MS. SONNEBRAND: Well, right now I don't have it in front of me because it's not on your agenda today, but, it's worded to allow a certain amount of extraction from basis but it doesn't cover all of the points that you'd want to have in, you know, a thorough annotation of what types of organic plant aquatic plant products are out there and when we do take it up, when it is able to be on the agenda, we'll be happy to provide you with some wording.

The petition that is being ignored is to put the stabilizing materials directly onto the national list as a stand alone item so, therefore, the aquatic plant product would not necessarily need to be on its own and that's one way of doing it, it's not the only way of doing it, but, that's why that got held up for the restructuring.

MS. CAROE: Thank you, Zea. Okay. Katrina?

MS. HEINZE: Is it possible to take a quick break sometime in the next half an hour?

MS. CAROE: Okay. One more and then we'll take a five minute, ten minute quick minute break. We have L. Monge.

MR. MONGE: It's L. Monge. The final "g" changes and sounds like an "h". It's M-O-N-G-E, Monge. That's fine. Well, thanks for the opportunity to submit this public comment. Again, my name is L. Monge and I work with Dole
Fruit International. I live in Costa Rica and I made the trip from Costa Rica to Washington to speak on behalf of 1,500 small banana farmers from Northern Peru. As you may know, organic culturing in developing countries is often associated with the small farmers. Primary organic crops produced by the small growers include coffee, cocoa, tea, fishes, and tropical fruits.

In America, many of the small growers started farming their own land after the agrarian reforms in the 60's and 70's. Before that they were farming the same land as workers of the landlord large estate. With the agrarian reforms the large farm was divided in 1,000 of small plots and run by the new owners who continued farming the same crops in a more genius farming systems. It was the old landlord large farm became the small grower groups growing that we see today.

In Northern Peru, the provinces of Plura and Tumbes, there about 5,000 hectares of organic certified bananas, most of them grown by the small farmers with farms from 0.17 hectares to up to 20 hectares on an average of one hectare per farm or plot. Before the organic banana production there were no real options for the small farmers and their families and there was no hope and there was no future for them.

After the year 2000 the first organically certified
banana exports to international markets the farmers started receiving better prices for the product and their livelihoods started to improve. Today, their quality of life has improved tremendously. There are new and better schools. They can build new houses. They are getting access to things that only they see in their dreams.

The organic certified banana grower is being a major development drive in Northern Peru. The small growers are organizing groups under one management and marketing system. These groups market their products collectively. Their members belong to the same geographical area. Their farms are one continuous orchard and their farming systems are very similar.

In many cases, all these micro farms used to be one single farms just four years ago. The grower groups's education concept plays an important role in the organic banana production in Northern Peru. Just to give an example, an extension of 20 hectares it's possible to find 20 or even more different farms with 20 or more different owners. This is how in 5,000 hectares of organic certified bananas in Plura and Tumbes it is possible to find 5,000 small farmers.

Five thousand small farmers plant hundreds of inspection days per year which are currently conducted and recorded by the internal control system of the organization. The NOP certification bodies are inspecting each small grower
group as outlined for the certification of grower groups by the NOSB recommendation as of October 20, 2002.

Policies and procedures are in place for determining how many smart growers must receive an annual inspection by the certifying agent, documenting in each case in order to get the number of growers to be inspected, taking into account the number of operations in the grower group, the size of the average operation in the grower group, the degree of uniformity between the growers group operation, the complexity of the group production system and the management and structure of the group's internal control system.

Now, that recently the NOP has pronounced itself requesting the inspection of 100 percent of the plots of the small grower groups. This will imply a significant increase in the number of available certified inspected small grower groups, in the certification cost, and will reduce the importance of the internal control system.

This interpretation from the NOP substantially affects the operations of thousands of non-grower groups in Africa, Asia, and Latin America and substantially affects the viability of the supply of organic group certification and the supply of the organic goods produced by such groups.

Therefore, hereby, we from Dole ask the NOSB to insist that the NOSB adopts its recommendation from October 20, 2002 regarding the criteria for certification of grower
groups in order to avoid a situation where thousands of the
small farmers in the tropics will be affected by regulation
and may assist only for large farms.

And, finally, I have three questions. Number one
is why hasn't the NOSB recommendation been adopted by the NOP
yet? Number two is, when we can expect that this
recommendation will be adopted, and number three, what kind
of actions we, the growers in the tropics, can perform or we
can be doing in order to support your job as the NOSB in
order to get this done? Thank you.

MS. CAROE: Thank you. Comments from the board?

Joe.

MR. SMILLIE: We will -- this will be on the work
plan of current certification, accreditation, and compliance
committee. I can't answer the first two questions. Those
would have to be asked to the NOP. The third question as to
what you can do, I think one of the real challenges here, I
mean, it's ironic that we're supporting a return to the
Astoncia system. It is not the way we thought this was going
to go and we don't want it to go that way so I think the NOP
is enforcing 205.403 and they have good regulatory ground to
do so because there has been abuses.

I think what we all have to do is show how these
abuses will be corrected with the NOSB recommendations. So,
whatever documentation you have on the effectiveness of the
internal control system is probably going to be the most help.

Now, whether this is going to be a regulatory battle, I don't think so because the NOP is enforcing their interpretation which is a correct interpretation of 205.403. That doesn't mean it's the only correct interpretation but theirs is correct so they're not wrong and it's not new. It's come to their attention because of the fact that it has been abused and there's no question of that and now we need to correct that abuse with another correct interpretation of 205.403 as my personal belief and our committee will take it up and as a committee recommend it to the board.

We already have an NOSB recommendation that is also the practice of the NOSB to honor previous NOSB recommendations so I would imagine, although it's not my prerogative but we will be asking those two questions that you asked of the NOP ourselves. Of course, the NOP, we're always open for any comment they might have.

MS. CAROE: Kevin, did you have a question? Rigo?

MR. DELGADO: Waiting for Marks' response to the first two questions from the gentleman from Peru.

MR. BRADLEY: It's awfully quiet in here. As we've discussed this with the board at length and the regulations, we are required to enforce the regulations. The program has not responded to that portion of the group's recommendation
because it does conflict with the regulations as they exist but we will work with the board to clarify what the requirements are and we've worked with certifiers in the training sessions on what options are available on this, how they can meet the requirements of the regulations and still have the grower groups enjoy the advantages, the timings of scale that are important for small developing countries so there will be lots of talk on this and we're looking forward to working with the board on it.

MR. DELGADO: Madam Chair, I have one question. I'm trying to imagine your producers, small scale, one hectare which is about two acres. It's very small. Are you as Dole charging those farmers for the actual certification of their land or how does that work?

MR. MONGE: It's a mixed system. There are groups that are organized by themselves. They pursue their own certification so they pay for their certification and there is also a members of farmers that are organized with us so we pay for their certification too so it's a combination of two systems. And you can see them at Doleorganic.com and you go to Peru and then you can see them or Google it. It's nice.

MR. DELGADO: Thank you.

MS. CAROE: Any other comments? One more?

MR. SMILLIE: I just wanted to point out to Rigo, as a certification person, the person who pays for the
certification owns the certification so, again, the
independence of these growers in paying for their own
certification means they can sell anybody. Otherwise it's
back to the old 1950's and area fruit company.

MR. DELGADO: I was just curious to see if Dole was
working with these farmers and there was some kind of
incentive to bring them over and promote it. That's all.

MR. MONGE: And, in fact, we helped them to develop
their own control systems.

MS. CAROE: I hope you found your five minutes
satisfying for that trip from Peru.

MR. MONGE: Absolutely.

MS. CAROE: Thank you for coming. And stay tuned
for more information on that. It is on our list.

MR. MONGE: I will. Thank you.

MS. CAROE: So, at this point I'm calling for a ten
minute break and before I go is David Guggenheim here?

David, you will be next up. I don't think I have anybody on
deck. Let me just make sure. We've got twenty more. Just
relax yourself.

So, David, you will be next. And then Marty Mesh
is on deck.

(Whereupon, a brief recess was taken)

MR. GUGGENHEIM: Good evening and thanks for
staying late and thanks for this opportunity to provide
public comment. For the record, my name is Dr. David Guggenheim. I am an independent consultant based here in Washington and project consultant for Aquaculture Development. It's a Pittsburgh-based aquaculture company dedicated to sustainable aquaculture and the development of closed recirculating systems in the Americas.

For four years I served as vice-president for conservation policy at the Ocean Conservancy, the leading U.S. NGO indicated exclusively to ocean conservation and during my tenure there it became very clear that over-fishing and destructive fishing practices ranked among the gravest threats to ocean ecosystems.

And at one meeting I was asked why we in the conservation community were seemingly always opposed to aquaculture. Well, aquaculture potentially can represent one of the more important solutions to the problems of over-fishing on wild fish populations and, you know, I really took that question to heart and, in fact, much of what we did was policing rather than promoting aquaculture.

So, two years ago I left the Ocean Conservancy and I've been dedicating my career to solutions in ocean conservation, especially in aquaculture. And I also came to the conclusion that closed recirculating systems are by far the most sustainable of aquaculture practices. I've recently returned from extensive travel overseas, including Malaysia
and Denmark to see firsthand state-of-the-art recirculating systems in action used by our technology partners, namely Uni-Aqua in Denmark and Fish Protech in Australia. And these systems are impressive. They really, in my opinion, afforded me a glimpse of the future of truly sustainable and scalable, profitable closed land-based systems that are sustainable.

So, it's with this background and perspective that I respectfully offer my comments today very briefly on three points. The first being on the topic of closed systems. Because of the level of control that you achieve in closed systems we believe that they are in the best position to fulfill organic requirements both from an environmental and from a human health perspective. Closed systems have clear and dramatic advantage over other forms of aquaculture in addressing the majority of environmental concerns.

They can completely address the problems of water pollution, coastal habitat alteration, disease and escapement and further properly managed systems never need the use of antibiotics, chemicals, or hormones. But, all forms of aquaculture, including closed systems, have one great challenge and that is the use of fish meal for raising omnivorous species.

But, closed systems do have a profound advantage in this venue as well and that is tremendous efficiency because, again, because of the level of control over their
environment. Our technology partners are demonstrating food
conversion efficiencies more than ten times higher than
comparable open systems meaning that less than one-tenth of
the feed and, therefore, less than one-tenth of that wild
fish component is required per unit of fish grown.

Conversion ratios of less than .8 have been
demonstrated in real world conditions for baramundi and
halibut among other species in climates ranging from tropical
to more than temperate. Closed systems have many other
advantages as well, but, I don't have time to talk about.

Second point relates to feed. I've lost track of
where the board is on feed since I wasn't here yesterday,
but, we do support the use of wild feed over a period of time
during a phaseout. The closed systems, even the most
advanced ones, haven't cracked that just yet on how to have -
- not use wild feed and fish meal, but, we do believe that
efficiency is a key metric that the task force and board
should use.

And, finally, on the point of stocking density.
The current draft language refers to the natural behavioral
characteristics of the species and while they're acceptable
and understood metrics for determining physical health of
those species we see that natural behavioral characteristics
is more problematic so we ask you to take another look at
that.
Sorry, I went over.

MS. CAROE: Thank you. Kevin.

MR. ENGELBERT: Very quickly, could you go over your closed system as opposed to an open one.

DR. GUGGENHEIM: I'm sorry. A closed system is a system that recirculates its affluence so the systems that we're working with are closed to the outside environment. They're land-based, often land-locked, nowhere near a coast, and recirculate between 97 and 99 percent of the water and other compounds within that facility.

MR. ENGELBERT: Thank you.

MS. CAROE: Jeff and those Joe.

MR. MOYER: Those facilities are often indoors, is that correct?

DR. GUGGENHEIM: Yes. I mean, they are completely enclosed with a roof.

MR. SMILLIE: Are the fish species raised there speciferous?

DR. GUGGENHEIM: Yes. Yes.

MS. CAROE: Any other comments, questions?

DR. GUGGENHEIM: They don't have to be. I mean, it's both. You can raise talapia indoors in these systems as well as speciferous but these are market driven decisions to raise those fish.

MR. ENGELBERT: How many years have you been
accomplishing this, raising these fish like that? How many years experience do you have doing this?

DR. GUGGENHEIM: I'm fairly new to aquaculture. As I've mentioned, I come from the conservation business myself; spent a decade in various -- the Ocean Conservancy and other NGO's. But, this technology has existed for more than 15 years in commercial operation, especially in Australia, and has been commercially successful for a long time. So, there's a long track record of this sort of technology.

MR. ENGELBERG: Thank you.

DR. GUGGENHEIM: Thank you.

MS. CAROE: Any other comments or questions from the board? Thank you. Marty, you're up and on deck, Steve Gilman, are you here? Steve? Steve Gilman?

(Discussion off the record)

MS. CAROE: Steve is not doing. Marty is tomorrow. Julianne Mayo, are you here?

MS. MAYO: Yes, I'm here.

MS. CAROE: Julianne, you're up. And Richard Martin, are you here? Richard, you're on deck.

MS. MAYO: Hopefully I won't even take the five minutes. I'm Julianne Mayo, for those of you who don't know, from Ocean Nutrition Canada and in the regulatory affairs department there and am visiting Washington from Nova Scotia. I'm from the other coast of Canada.
Basically, you guys talked about fish oil today and the recommendation on the fish gelatin so I just wanted to put it very quickly into context for the board members or the public who might not know where that petition kind of came from and offer the chance for any questions that you might have.

Basically, Ocean Nutrition has only been operating in the organic sector for about a year, year and a half, so, we're relative novices to this arena and I've got to say we're having fun. It's been a really busy year, year and a half for that part of our business. So, about a year and a half ago we reformulated a fish oil product so that it could be compliant in the five percent non-organic portion of certified organic products.

In that process we consulted from the very early stages with the NOP. We worked very closely with QAI and with Stoney Field to reformulate a product that would be fully compliant and meet the needs of customers that were operating organically. So, that's kind of the context of where we came from.

With the changes in the regulations, obviously we needed to get fish oil and fish gelatin on 606 as agriculture ingredients when we didn't need that when we started a year ago. So, Ocean Nutrition Canada, Ltd. is a manufacturer of fish oil for human consumption and uses fish gelatin in a
processing of certain fish oil powder products. ONC would like to take this opportunity to thank the NOSB's handling and materials committees for their recommendations to add fish oil and fish gelatin to Section 205.606 of the national list of allowed and prohibitive substances.

I was very excited that Dave was tracking the website hourly to see what the recommendations would be. So, thank you for making my day, my year, it was great.

Just a couple of very quick comments. The handouts were made this morning before the recent chat so a lot of the comments are a little bit redundant now. Fish oils used in handling organic and agricultural products. It's an ingredient that serves to increase the omega-3 contents, specially EPA and DHA of organic products. Fish oil from ONC is not an organic product itself, as you guys will be well aware, it is food grain, grass, and intended for human consumption. Fish oil is not commercially available in organic form as we know because there are no current standards.

Also, as everybody's been pointing out, this is like the change in the future. We're moving towards that. Fish oil derives from fish. Ours actually comes from the by-product of the Peruvian fish meal industry. So, no fish are harvested for the purpose of creating the oil. It's simply the by-product from the fish meal.
Definitions, of course, have started to come out more focused towards the aquatic systems as a result of the aquaculture working groups so we are very excited to see that. It more clearly defines fish as agricultural products. Fish oil for human consumption is typically manufactured using alcohol refining which is sodium hydroxide based, filtration, bleaching, which is plain carbon and deodorization. It's a very mechanical process. There's no chemical change to the oil.

Fish oil can be derived -- delivered in its liquid oil form or can be made into a fine powder product using gelatin. It's high omega-3 polyunsaturated fatty acids. Many international health authorities have agreed on the beneficial effects of fish. The use of fish oil in organic products is necessary in order to deliver the health benefits provided by fish oil to organic consumers, particularly in the absence of a current organic fish standard.

Further, the addition of fish oil to 606 allows the continued use in organic products which will allow organic products to maintain a competitive position as similar conventional products, many of which are fortified with fish oil omega-3 ingredients.

So, for the fish gelatin I only had one question. I just wanted to forego the rest of the comments on that. Do I have it clear that fish gelatin would fall under the
previous recommendation for gelatin and as such there won't be a vote tomorrow? Is that how that works? I just wanted to say thanks and it's absolutely lovely to see regulations that keep pace with innovation and it's something we fight in our industry and you guys did a great job on this one and we're very pleased to see that.

MS. CAROE: As far as just a point of procedure, we do have a recommendation that encompasses fish gelatin as gelatin overall and like Kim Deitz pointed out that fish gelatin as well bovine were all considered in that so that recommendation is going to move forward to the program just like all of the rest of our recommendations will.

MS. MAYO: So the actual vote.

MS. CAROE: The actual vote. It's voted and passed already, but, you know, it does have to go through channels at that point so we'll watch it.

MS. MAYO: That's great.

MS. CAROE: Any other questions or comments from the board? Thank you for your comments.

MS. MAYO: Thanks guys.

MS. CAROE: We have Richard Martin up next and then John Cardoux. John, are you here?

MR. CARDOUX: Yes. I'm going to go tomorrow.

MS. CAROE: Tomorrow. You deserve a cookie. How about Barbara Blakistone, are you here? Barbara? She's not
here. How about Buffy Bauman? Buffy, are you here?

MS. BAUMAN: I'll go tomorrow.

MS. CAROE: We're winning. M.J. Marshall. She's gone. All right. Will Fantle, are you still here, Will?

You spoke for a proxy. Okay. So he's not here. Liana, are you here? Marty, are you going to find her for us? Okay.

MR. MARTIN: I'll make this as fast as I can. I'll beat your timer. I'll really go. I need to catch a plane as well. Richard Martin. I hold a degree in marine biology. And I own Martin International Corporation and Export Company. I've been involved with aquaculture for 27 years and I thank the board for hearing me out. I'll be as quickly as I can.

Neil Simms kind of said everything I was going to say. He and I should have consulted before I made the trip down because he's stole my thunder so I'll just hit a few points, especially about the livestock recommendations and as they're stated now which I think is a key important discussion to make.

I recognize the livestock recommendations is a positive step forward but a step and they're not yet really comprehensive with the two exemptions but if you do delay moving on fish meal, oil, and net pens until October let's use those six months in the most effective way we can, as Neil said, not in an emotional manner, but, let's get to some
science, let's make some visitations or have a symposium
that's really, really essential.

I'll cite two of the livestock proposals that you
had included very quickly, the standard 205.2.2, paragraph C,
aquatic animals must be provided with their natural foods.
Also cite paragraph E, non-synthetic and synthetic substances
allowed under 205.603 may be used as feed additives in
supplements and additionally standard 205.253, 1 and 2, the
producer of an organic aquatic animal shall not provide feed
supplements or additives in amounts above those needed for
adequate nutrition and health maintenance to species at a
specific stage of life. All of these kind of allude to or
looks as though they allow the use of fish meal and oil or
move in that direction.

I'm speculating that livestock committee's
confusion over the inability to differentiate between wild
fish and organic feed is as simple as the influential
understanding of the basic difference between a product claim
and a processed claim. The livestock committee should not
consider or identify fish meal as wild substance unless it
also considers inclusion of wild vegetable matter such as
grass, weeds, seeds, or insects in terrestrial organisms.

The livestock committee should prescribe a separate
rule for feed which defines an organic process by which the
feed components are obtained and processed and, secondly,
considered the process by which the actual creature is raised utilizing that feed. In the EU, that's what they've done. They separated out the two. They certified the process for feed, they certified the process for growing the animal.

In terms of inherent organic principles the use of fish meal and oil are also in compliance with the base principle or the preservation of biological capital and the recycling of highly valuable omega-3 equity. A lot of their adversarial positions say this is a net deficit in the conventional system it is. In the organic system we're using recycled fishery waste products is 100 percent gain. These products would be thrown away or utilized as pet food, fertilizer, other extenders, and they're not used for human food so to take recycling of fish waste and turn it into a human food that's very, very good for human beings is 100 percent gain.

I know that I won't get into the ocean closures. That's for October. I'd just make the comment that the committee's proposal failed to address three of the most important points that differentiate between organic and conventional aquaculture. Those are density which relates to net culture, but, nonetheless stocking densities is a key issue in reducing parasite movement, in reducing environmental impact, and reducing or improving the overall health of the system.
Also, site-specific regulations. Location, location, location is so important that you don't put farms just anywhere. There are places where there's more sea life than others. There's places where there's more predators than others. So, when you're certifying a farm where it resides is as much part of — it should be part of the standard as what it's doing.

The third is single year class crop locations, base based principle for those who are in agriculture it's the same principle. You don't keep farming the same spot year after year after year after year. The EU principle is requiring single year class crop rotation. That also mitigates parasite transfer, disease, environmental impact, it reduces the overall footprint. Those were not in the standards that I read and I think they should be heavily considered going forward.

Ocean culture is not exclusively open or more open than the terrestrial culture. All farmed animal culture is open. Avian flu and hoof and mouth disease are clear examples of just open terrestrial culture is and I say actually that our kind of culture provides a barrier for a lot of human transfer that is not available in terrestrial but it's not exclusively open whereas land-based is not.

Thank you very much. Have a good evening, everyone.

MS. CAROE: Questions? Bea?
MS. JAMES: Could you explain the advantages of having separate certification of feed and process? I mean, how do you see that as being a better process?

MR. MARTIN: I don't think it's a better process. I think it brings you to the point of the discussion. Remember, we're discussing organic principles and I'm talking the way people outside the industry and they say what is an organic product and I go through this discussion of what a process is.

What they've done in the EU is to describe a process by which the food is realized or recognized as an organic feed. That then becomes a part of the process of raising the animal. You can't raise an organic fish without an organic feed but what constitutes organic feed and they have a whole list of principals such as recycling of fish trimmings, 100 percent certified vegetable binders, pigments that are natural. They use all those components to create a process by which the feed is described.

MS. JAMES: And you don't feel that that was accomplished in the recommendation?

MR. MARTIN: No. Well, fish meal and oil was pushed forward for future consideration, but, I'm saying in the future consideration breaking that out is a separate process would be recommended.

MS. CAROE: Joe?
MR. SMILLIE: Do we have your comments in writing?

MR. MARTIN: Yes.

MS. FRANCES: They're in your book, your main book.

MR. SMILLIE: Okay. Great. The points that you make on the differences I think that that's one thing that we, you know, we're going to move forward with the recommendation as it stands now but I think in the future we would want to incorporate that because one of the real issues coming up will be what is the difference between organic aquaculture as it's being proposed and conventional because a lot of the criticisms we hear are really directed against conventional agricultural and not with some of the issues that you brought up and I think that that's what the whole purpose of the next round of discussion's going to be is to get down to those differences.

MS. CAROE: Any comments or questions? I have a couple of quick things to say. For you folks in the aquaculture that are coming into organic you don't get the full history of where we are with feed in this regulation. This is a regulation that is a marketing regulation and it considers public policy in its development. We've had situations where there has been suggestions that leniency on feed requirements would stimulate the industry's growth.

It brought about quite a bit of very passionate helpful comment. So, this is an area that is very tricky for
this industry to deal with because we've heard the public say
to us when it comes to organic, organic feed is necessary.
The only reason that it was even considered to offer
something in this situation was this is a new component to
this industry and it was only for a temporary allowance.

So, anyway, so it's not that we don't understand
what you're saying. It's just that there's more to the
picture than what's here and now and it really is kind of the
last ten years which you don't have the ability to really be
part of. And, just another little clarification. The
recommendation does not disallow the use of fish meal and
fish oil, just disallows the use at this time of non-organic
fish meal and fish oil.

MR. MARTIN: I understand. I think it's also safe
to point out or good to point out that at least in the world
of aquaculture that industry is coming to a close in terms of
expansion. It's hit a plateau. And that's important to
note. It's not just ever expanding and going crazy, it's
not. It's coming to an end and part of that is feed.

You can't produce more feed, you can't grow more
fish. So, the technology will come and pick up behind.

Competition creates good technology and innovation. That's
going to happen. We'll find solutions to that. But, also, in
the meantime the world population is growing. The demand is
growing hand over fist. There's not enough already and we
have to find ways to create systems that improve what we have
going forward to give to humanity as well as the system
itself.

MS. CAROE: Dan.

MR. GIACOMINI: I think I remember from a prior
testimony you gave before us where you were describing that
essentially you can't feed corn oil to fish.

MR. MARTIN: Right.

MR. GIACOMINI: With the current recommendation we
have and we even had one grower, one aquaculture person today
say that they're growing their fish for feed, the type of
fish that you would see qualifying under regulations that we
have used and ground and used as feed, and we're not getting
into the environmental footprint that that might have, would
they be of a high enough grade, for lack of a better term, to
be a meal and oil source for some of the other species we're
looking at?

MR. MARTIN: Oh, absolutely. The question, Dan, is
when can you get there. When will that industry be growing
enough to make the feed for the next step in the industry and
on a commercially viable scale. I think that the commercial
viability is going to happen before the practical, you know,
application can bring, for example, talapia grown to the
extent that you can create the kind of fish meal you're going
to require for just the existing industry as it stands.
I think it's something that it really has to be facilitated. It's an absolute necessity, not as an exclusive source, but, as another source where we're growing feed to grow fish. Absolutely.

MS. CAROE: Any other questions from the board. Thank you again.

MR. MARTIN: Thank you very much.

MS. CAROE: All right. Going backwards a little bit.

(Discussion off the record)

MS. CAROE: Okay. Bob Smiley. Bob, are you here? Okay. All right. How about Steven Craig, are you here? You are the last commentor for today.

MR. CRAIG: Well, I won't say the usual say, saving the best for last, but, my name is Steven Craig. I'm a fish nutritionist from Virginia Tech Aquaculture Center. So, I'm kind of the guy that steps into the breach with all this fish meal, fish oil discussions. I'd like to thank George Lockwood and the other people at the task force. They did a marvelous job trying to get something to you guys.

I think it's important that we have some movement that was discussed this morning. The industry needs it. We need to see something moving forward mainly so that we can protect the notion of organic aquaculture. It's the wild west out there and until we have something moving on the USDA
level it's just going to go out of control and I've got to worry about the protection of the notion of true organic aquaculture.

So, I think, you know, you basically side-stepped the two really controversial elements of the proposal so I think certainly it deserves a positive recommendation side-stepping those events for a little bit. But, as Neil said very eloquently earlier, you know, we need movement, we need to solve these problems. We can solve these problems.

We've grown shrimp, marine shrimp for the last three years on a commercial level with no fish meal, no fish oil in these diets using certified organic protein sources. Just last month out of my lab we produced the first kobia which is carnivore pisovore equal to the salmon on a total fish meal, fish oil free diet. We can do these things, but, we need to protect the notion of organic while we're catching up.

Another point I'd like to make it's all about sustainability. Traditional aquaculture is moving away from fish meal because of sustainable issues. Now, if you factor in the organic aspects of that, to me it makes sense to move away from the relaxed all fish meal, it's certainly a big part of our program at Virginia Tech is alternate protein and research in high level marine carnivores. One final thing I would like to say is, you know, the salmon guys, they're an
easy whipping boy, they dd a lot of bad things for a long time, they've gotten a lot better. They've reduced their fish meal and fish oil consumption quite dramatically over the last fifteen years. What I'm worried about is seeing other carnivores suffer because of the salmon reputation. And by that I mean the fish I work with, so I'm urging you not to make these regulations for herbivores or omnivores but not carnivores, I would say if the fish can get in under granulation studies, no matter what it is, it shouldn't be certified organic and so with that, I would love to buy you all a cocktail, but I have to get home, so I appreciate your time.

(Discussion off the record.)

I certainly appreciate your effort you guys put forth, I thought academics like me would put you all at rest. And I'll take any questions if you have them.

MS. CAROE: Thank you for your comments. Are there any comments from the board? Joe?

MR. SMILLIE: Yes, the topia is a piscovorous fish used on an experimental basis on feeding a non-fish meal, non-fish oil, where did the omega-3 come from?

MR. CRAIG: We're working with a U.K. company called Sea Bay, they're growing myriad worms, un-organic certification by the British Coral Association, it's a Marine protein source that supplies the EPA-DHA. The technology is
still moving, I mean the Malvoso Group may be a nice organic food certified for the EPA-DHA, so there are other sources out there, it coming, it's going to get there, you know, it should be hard to do an organic marine carnivore, I mean, don't make it easy, you don't want everybody doing it, and it's going to be costly, but don't shut the door on them because the research is trying to catch up.

MR. SMILLIE: Before we table one or two of the contentious sections, one of the compromises we were working on, unfinished business, we wanted to talk about your work, you know, a drop dead date for the period of use of fish meal and fish oil. As a specified crop, you know, for the industry a few times. Maybe we'll bring that back to the table once we get to something

MR. CRAIG: Please do something out there us, it's hard to keep people invigorated, again George and his group does a fantastic job, incredible amount of hours put into this, so we just need to move forward for us, so we can keep the momentum going.

MS. CAROE: Thank you for your comments. We appreciate it and the commission needed to hear that information. Do you have that in writing, or contact information?

MR. CRAIG: No I haven't, I'm on the no-Ag, but I can be -- I did not make a public comment on it. Who would I
send that to?

UNIDENTIFIED SPEAKER: The more help we get the better.

MR. CRAIG: Thank you very much.

MS. CAROE: Any further comments or questions? I want to remind the board before we recess for the day that Committee Chairs need to make sure that your recommendations are complete and are there for tomorrow, you need to make a vote. We have a vote for tomorrow, so -- Any other business, is that it for now? All right, we're in recess until 8:00am. (Whereupon the proceedings were suspended.)
ELECTRONIC CERTIFICATE

DEPOSITION SERVICES, INC., hereby certifies that the attached pages represent an accurate transcript of the electronic sound recording of the proceedings before the United States Department of Agriculture:

NATIONAL ORGANIC STANDARDS BOARD MEETING - DAY 2

By:

Teresa S. Hinds, Transcriber
UNITED STATES DEPARTMENT OF AGRICULTURE
WASHINGTON, D.C.

---

A meeting in the above-entitled matter was held on

Thursday, March 29, 2007, commencing at 8:00 a.m., at The

Washington Plaza Hotel, Ten Thomas Circle, Washington, D.C.

before:

Andrea Caroe, Chairperson
APPARENCES

USDA STAFF:

Mark Bradley
Bob Pooler
Valerie Frances

BOARD MEMBERS:

Steve DeMuri
Jennifer Hall
Katerina Heinze
Gerald Davis
Rigoberto Delgado
Bea James
Julie Weisman
Joseph Smillie
Jeffrey Moyer
Kevin Engelbert
Tracy Miederma
Daniel Giacomini

PRESENTERS:

Tim Redmond 4
Sean Taylor 7
John Cadoux 16
Kelly Shea 18
Emily Brown-Rosen 19
Pat Kane 24
Ram 26
Dave Carter 33
Alexis Baden-Mayer 36
Steffan Scheide 37
Nicole Dehne 47
Kim Dietz 52
Harriet Behar 56
Dave Engel 59
Amelie Hayte 64
Adrianna Natsoulas 71
George Lockwood 74
Rob Mayo 77
Sebastian Bell 79
Stephen Walker 89
Luke Zuzmierski 93
Zea Sonnebrand 93
Marty Mesh 98
Rich Theuer 109
MS. CAROE: Good morning. We will start this morning with a public comment and again I'll just do a quick refresher on the NOSB policy for public comment at NOSB meetings. All persons wishing to comment at NOSB meetings during public comment period must sign in in advance. We are full up for this morning so if you haven't signed up submit your comments in writing.

Persons will be called upon to speak in the order they sign up. Unless otherwise indicated by the Chair each person will be given five minutes to speak. Persons must give their name and affiliation for the record. A person may submit a written proxy to the NOP or NOSB requesting that another person speak on his or her behalf.

No person will be allowed to speak during the public comment period for more than ten minutes. Individuals providing public comment will refrain from any personal attacks or remarks that otherwise impugn the character of any individual.

All right. First up, actually I'm going to break on policy a little bit because we do have a public commentor that has an appointment that I hope everybody would be all right with him speaking first. So, I'm going to be calling Tim Redmond first and then John Martin. Are you here? You're going to speak for John. You're on deck. Okay. Tim,
are you ready?

MR. REDMOND: Good morning. First off, I want to thank all of you. I know you've been working hard to uphold the USDA organic standard, the symbol that goes on organic food packaging and I know you've all been working hard at that and staying up late and I appreciate that. You know, as somebody who has been in this industry for a long time I really do appreciate that. You all know Joe Smillie here. I've been dealing with organic foods just about as long as he has. I was one of the founders of a company called Eaton Foods back in the late 60's, early 70's.

My name is Tim Redmond and I'm the president of Blue Horizon Organic Seafood Company. We just introduced a couple of new items into the market at the Expo West Show out in California and the International Seafood Show. One is skillet meals made with organic shrimp and organic pasta and so on and so forth and the other is breaded shrimp made with certified organic shrimp and organic breading and organic oil.

On the packaging we don't call them organic items. I mean, we don't say organic skillet meals. We don't say organic breaded shrimp because there's no USDA standard for it for aquaculture yet. So, my main purpose in standing here and saying what I have to say is to encourage you to move through, you know, the issues that you have to deal with and
do the recommendation that you're set to do and I know that there are unresolved issues that you're going to defer to work on later regarding net pens and fish oil and fish meal and so on, but, I think it's important also to get through those issues and I think it is possible and I hope that you do that, you know, in as quick order as you can.

But, I hope that you hope that you move forward with the recommendation that I think that you're set to do. I think it's very important for the public to not be confused about what is organic in the seafood area. I was part of the early -- I was part of the group that formed the soy milk standards for the USA and the issues for that were removing public confusion which is typical for standards and that's what we need in the marketplace in the USA.

Also, there's an international issue that I'm sure you're aware of, but, you know, American companies need to be able to compete in the world at large and the U.S. seafood standards are important for that.

So, with that said, I think that's all I need to say right now. If anybody would like to ask me a question.

MS. CAROE: Thank you. Joe.

MR. SMILLIE: You're currently involved with organic shrimp production?

MR. REDMOND: Yes.

MR. SMILLIE: Do you think that your current
production meets the recommendation that the NOSB is coming 
out with now because I've been told that it covers 
herbivorous fish and there's always mention made in shrimp 
also, but, I've never heard conclusively that shrimp could 
comply with the recommendation that we're currently putting 
on the table.

MR. REDMOND: Yeah, these are certified according 
to Natureland Standards. If you've been to Germany, I'm sure 
you're all aware of who they are. I think they are a good 
set of respective standards. They do probably the standards 
probably come in fourth that I hope we'll see will require 
some changes in those Natureland, perhaps layer on top, and 
you know, I think that's very valid. So, I think we'll have 
to do a little work with, you know, the European certifiers 
standards to, you know, comply with what we're going to come 
up with.

Did I answer you, Joe?

MR. SMILLIE: Not -- not precisely, but, in other 
words, what I would urge your company to do is look at what 
we've created as far as a set of recommendations and see what 
the gap with the current certification program for your 
shrimp and see if your shrimp --

MR. REDMOND: Mostly centering around feed issues.

MR. SMILLIE: Yeah, and, again, we've pulled out 
the fish meal so I'm not sure what the fish meal component
for your operation as far as the shrimp feed is or not and
whether -- if this recommendation became a regulation would
your current production comply, I guess is the question.

MR. REDMOND: Well, we deal with more one farm and,
you know, we will be dealing with the farmers directly and
we're in on that.

MS. CAROE: Any other questions from the board?
Thank you.

MR. REDMOND: Thank you.

MS. CAROE: So, John Martin is up or the proxy for
John Martin and on deck is John Cadoux. John, are you here?
Okay. If you could check in with Valerie, please.

MR. TAYLOR: Well, good morning. My name is Sean
Taylor. I'm the scientific director of the International
Association of Color Manufacturers. I spoke yesterday. This
morning I'm speaking as a proxy for John Martin who is the
regulatory affairs manager for Wild Flavors, which despite
the name, is also a color company based in Kentucky.

First of all, again, I'd like to thank you for your
hard work on this entire petition process. There's been a
lot of work on our side. It's probably been even more work
on your side because of the number of petitions.

This morning what I'd like to do is describe what I
think are sort of the challenges with colors that we continue
to face in continuing to develop and certify organic colors;
some of the plans that we have and some of the specific
issues related to variety of color, raw materials and
technical challenges.

Our association has filed a number of petitions, as
you're probably aware. These include petitions for grape
juice, grape extract, red radish extract with cabbage
extract, purple and black carrot juice, beet juice,
blackberry and fruit juice, chokeberry juice, appleberry
juice, and paprika and paprika oil extractant. We've already
provided some written comments, but, like I said, I just want
to underscore some specific issues here.

First of all, in drafting our petitions our member
companies attempted to source certified organic materials. In
some cases we found evidence that certified organic oil
material might be available but we encountered great
difficulty in finding sufficient quantities or in some cases
the right variety.

Now, this is the same challenge that one of our
companies has faced after completing the certification on it.
I should point out that two of our companies have
certification as organic certified handlers, processors, and
manufacturers. One of these just received certification in
the last quarter of 2006. That company sent me a
communication and I quote. " Once we completed the organic
certification audit our next task was to establish a
dependable organic certified raw material supply chain to
meet our volume requirements and our customer needs to
produce both 100 percent and 95 percent organic certified
products.

Our recent experience has proven this to be more
difficult than expected. We found far fewer organic certified
food additive ingredients than expected that can meet our
requirements for lead time deliveries, volumes, and
microbiological specifications. Our supply chain in R&D
spent hundreds of man hours searching the internet, industry
publications, and other data bases to identify dependable
quality suppliers of organic certified ingredients”.

As this quote indicates, we still face significant
hurdles we feel that prohibit the easy development of
processes to make certified organic colors. As another one of
our companies and, again, one that is already through the
organic certification process for a specific product they say
that specifically that we found that anthocyanin crops such
as purple carrot, red cabbage, and red radish are often grown
strictly for color, primarily for color.

These crops are grown internationally and on small
farms where it can be challenging to obtain conventional
material and adequate supply, not to mention coordination of
NOP compliant organic certification at the multiple
international farm locations that would be necessary to
achieve adequate supply. Similarly, although other anthocyanin crops such as aronia, black current and elderberry may have limited alternative applications other than color, they, too, present the challenges of being grown internationally in small farms and requiring the significant coordination efforts to ensure that they start certified organic and end certified organic.

There’s also some technical challenges. Could you back to the second slide; one more back. Yeah. Just pointing out a few of these issues we have originally or I had originally felt with what if certified organic fruit juice was available, could that be used as a color. The issue with that is that many of the heating and processing that are used to create color juices, what actually destroy the color content in more traditional fruit juices are certified organic.

For anthocyanin containing colors, grape colors, red cabbage extract, black current, and others, the anthocyanin containing colors must really go through a very specific and rapid isolation process. You have to isolate the anthocyanin complexes. You have to remove the sugar, other water-soluble components. Once you have it, then you have a form that's suitable for uses of food color. But, as I said, this has to be very quickly after harvesting.

And, finally, increased concentrations of color
pigments due to the use of a specific variety can also reduce
heat processing based losses and changes. And I'll just give
a couple of quick examples on the next slide.

For instance, unique grape colors. One specific
variety is mega natural red and purple grape concentrates
that are unique grape concentrate that are used to color a
variety of different fruit preparations. They're very high
in color strength. They're very high anthocyanin
concentrations relative to more traditional grape varieties.
They're in some ways similar to the grape extract in ochinina
type products that are used to make very high concentrated
colors.

Next slide, please. They're too astringent to
drink by themselves. Their concentrations are very low
concentrations, but, so far there isn't a certified organic
process available for these. That's not say it won't be
under development at some point, but, it's not there yet.

MS. CAROE: Thank you. Any questions from the
board?

MR. SMILLIE: Could you give another example?

MR. TAYLOR: Sure. Next slide, please. I should
point out, this was not coordinated. Another example of beet
colors. Just think about the sort of three standard type of
beets. Sugar beets have no color at all. They're sort of a
gray or brown color. The more traditional eating beets that
everybody thinks about are sort of pickled beet that a lot of people really enjoy, myself included. The color concentration, the main color component concentration is about three fold less than that variety of beets that are primarily used for color and this is a betanin pigment that's really providing the color.

Now, as I pointed out previously, these differences in betanin concentration are really critical once you consider processing, formulation, incorporation into different sorts of products. And, so, if you're losing color along the way you want to start with the highest possible pigment concentration that you can. And at the same time, the higher your pigment concentration in many cases the lower the value of these things as an eating product, the less incentive there initially is for these products to be grown in fields.

And, so, by putting these things onto the national list initially we think that there's going to be a market that's going to develop for these colors that will eventually allow the transition over to a certified organic product. And I could give similar examples for many of the colors that we're talking about and actually probably even for many of the colors that we didn't file petitions for, tomato juice or lycopene. I think we could talk about saffron and turmeric similarly.
The other thing -- I'm sorry, go ahead.

MS. CAROE:  Gerry?

MR. DAVIS:  I work for a farm in California that grows organic carrots, purple carrots, red cabbage, red beets. And we also grow on contract a lot of vegetable items for processors. What would be the hurdles of a color manufacturer contracting ahead of time with a company such as the one I work for to produce the specific varieties of purple carrots, orange carrots, red cabbage, so forth that would meet the needs for color?

MR. TAYLOR:  In terms of, you know, hurdles right now, I think primarily right now it's just an issue of time in that we don't have sufficient time between now and October when color and non-synthetic sources only comes off on the national list for us to develop a certified organic color product alternative. And, so, our manufacturers are really headed in that direction and, you know, some of them in particular make contacts with companies that -- I should say farms that do grow these products, but, it's going to take some time.

MR. DAVIS:  Is there, for example, using the California example, is there -- when you mention there are a lot of times the anthocyanin component has to be removed from the sugars and so forth, is that done prior to it being made into juice or after like carrots are pressed into juice?
MR. TAYLOR: To some extent it really depends upon the specific product that we're talking about, but, generally the time between harvesting and conversion into a juice for color is very, very fast. And, so, in many cases I think somebody pointed out yesterday many times the sort of source, harvest, and production facilities are very closely spaced in terms of physical location to ensure that very little color is lost between the time that something comes off the field and the time that it goes into a vial for color processing. So, that is to some extent another hurdle. I don't think it's by any means something that can't be overcome with sufficient planning.

MR. DAVIS: So, a company such as Grimmway Farms that has their own juicing facility, they have their own freezing facility, they can do a variety of things for a customer. Are these color manufacturers somewhere other than U.S. located that distance is a problem with, you know, contracting for a specific type juice pressed a certain way of these materials?

MR. TAYLOR: Yes and no. Many of our manufacturers are located in the United States. We also have manufacturers in Japan. We've got some European manufacturers as well. In most cases though I think that the majority of the people or the companies that are interested in making a certified organic product right now are U.S. based.
The primary obstacle that we found, and I think grapes are a great example because when somebody first said, well, we really need to petition for grape juice and grape extract I almost laughed because I know that there are certified organic grapes out there. I'm sure I've drank a bottle of certified organic wine at some point. The fact I can't remember means I may have drunk many of them at some point.

But, the challenge is that the color application is not the primary reason that these things are being grown as a certified organic crop, okay. Grapes are a really nice example because the majority of certified organic grapes are going to be used for table grapes or they're going to be used to make wine. We can't get our hands on those grapes at this point. It doesn't mean it won't happen, it just means at this point there's not quite enough supply for there to sort of be the types of, for lack of a better word, maybe leftovers I would say for us to buy those products, convert them into color applications.

It's much more lucrative for a farmer, and we completely understand, it's much more lucrative for a farmer to sell these products directly in the food supply as either a raw vegetable crop, something that's relatively minimally processed, than it would be for them to sell it to us to convert it through several steps into a color material.
MS. CAROE: More questions? Thank you very much.
MR. TAYLOR: Thank you.
MS. CAROE: John Cadoux and on deck Kelly Shay but I think Kelly switched with somebody from yesterday. So, are you going to give comment? Okay.
MR. CADOUX: Hi, I'm John Cadoux. I'm the president of Peak Organic Growing Company. Thanks for having me here today. I really appreciate it. Joe really laid out the argument in a very articulate way yesterday. I appreciate that. And, really, I didn't want to come up and repeat what Joe said, but, when it comes to hops all I wanted to come and tell you guy is in terms of two row malted barley which is pretty much 99 percent of our batch ingredients as the organic beer category I started to grow and grow we've seen wonderful advancements there.

Hops have been a little bit more difficult. It's a much smaller percentage of our batch ingredients but I think as this category continues to grow, organic beer that is, we're going to see more and more people from the farmer standpoint, the co-op standpoint, the distributor standpoint become more and more interested in supplying these things for organic beer companies, both ours which are growing and new ones that are going to come in.

And we've already heard this so far, so, I just wanted to say that and that's something that, you know, on
our side, the industry side, we're going to be very committed to.

MS. CAROE: Thank you. Questions for John?

MR. SMILLIE: Yeah.

MS. CAROE: Joe, Dan, and then Gerry.

MR. SMILLIE: Yeah. I can't remember if it was in the petition or not, but, how many different types of hops do you currently buy?

MR. CADOUX: We currently buy about nine. We are abnormal for a brewing company because we in all of our beers we use one hop type. It's called a New Zealand Hallertaul Hop which is the one that we can find grown organically in abundance. Most beer companies would rarely use one hop type in all three or all four, however many beers that they have, but since we are committed to that, we do use that one hop type in all of our beers.

We're also a new company and as we expand -- if you look at a bigger brewing company like a Sam Adams that number might even get up into 15-20 different hop varieties.

MS. CAROE: Dan.

MR. GIACOMINI: You were here for yesterday's testimony? I mean, you heard yesterday's speakers?

MR. CADOUX: Some of them.

MR. GIACOMINI: Okay. Yesterday one of the speakers brought some samples. I was just wondering maybe --

MR. CADOUX: Thank you.

MS. CAROE: Kelly Shea and then on deck Emily Brown-Rosen. Emily, are you in the room? Is there Emily there? Great.

MS. SHEA: Kelly Shea with Silk Soy Milk, Tofu Town, and Horizon Organic. Good morning to you guys. On the issue of cloning, it's really crucial. I know yesterday it was deferred and the board had a quite comprehensive paper on it, but, you deferred it and you can pick it back up again and you really should not get on the plane to go home without the board at least passing a sentence as simple as clones and their progeny are prohibited in organic and then you can really figure out all of the details of your recommendation later, but, please don't leave without the board passing that once sentence, okay?

The issue of materials, I spoke to you yesterday about four colors that are very important to us. Turmeric, annatto, black, purple carrot, and red cabbage, and we had some great conversations with different people here yesterday. They are starting to be available. They are not yet available in sufficient quantities. As I noted, we can do some of our seasonal products with them, but, not a full line. We are absolutely committed to getting there, but
meanwhile they're not there, okay. That's very important.

And then when it comes to the other product with
the long name, the short chain FOS, that is a product that we
have used in our yogurts and smoothies for almost four years.
It is an agricultural product. It can be made organically.
It is safe. It is GRAS. And there have been two companies
here at the board meeting talking about these type of
products but there are more companies out there with these
type of products in their certified organic products and I
just want you to keep that in mind.

And we will be in the room. I'm not going to take
my whole five minutes, but, when it comes time to vote if you
have any questions, if you're not settled on any of those
issues because you have questions please let us know so that
we can help you work through this because I would hate if you
voted without all the information that you need to vote,
okay. That's all.

MS. CAROE: Thank you. Any questions for Kelly?

Thank you, Kelly. Emily, you're up now and Pat Kane. Is Pat
in the room? Pat, you're up next.

MS. BROWN-ROSEN: Hi, I'm Emily Brown Rosen,
Pennsylvania Certified Organic.

MS. CAROE: Excuse me, the camera is blocking our
members' view. Thank you.

MS. BROWN-ROSEN: Hi. Okay. Thanks for -- there
are just a couple of things I wanted to touch on to follow up from yesterday. First of all, on cloning. The second one Kelly just said. It's important to get something done here. I refer you to the FDA draft risk assessment which is their PFI which I can hand you on a disk if you don't have it, page 37, 38, and 42. They talk about clearly just, you know, the different types of assisted reproductive techniques which they call ART and they clearly distinguish to change some of the historical things people have done like artificial insemination up through a number of processes, including embryo transfer, and then they talk about cloning which is somatic embryo transfer. So, there are two different things and somatic embryo transfer is not cloning in FDA's speech and they do consider, however, the embryo transfer of an asexual reproduction technique. So, that's all you have to do is cross out that other asexual reproductive techniques in your language and it's fine what you have written. It's fine.

And FDA has done all that work for us and you can just refer to that, so, I mean, if you want to go that way, that would be my recommendation. I think the reason people wanted that language was because down the road we don't know what cloning technology is going to be like and people are going to calling other things cloning too, but, we can cross that bridge when we get there. Right now, this would be very
clear. It would be very consistent with what FDA is already saying. So, that's my recommendation.

On aquaculture, I'd like to thank you for taking my comments so seriously and going through them all. It was great. Couple of things I don't think you touched on so I'll just hit them once more and that was on this is on page 8 of the draft, 205.252E I think we need to add one word here where we need to add the word non-agricultural so it says agriculture feeds must be composed of feed ingredients that are certified except that non-agricultural, non-synthetic substances and synthetic substances on 603 may be used as feed additives in supplements because otherwise, the problem we're having with livestock feed, and otherwise people are going to argue that fish meal is non-synthetic and it's being used as a supplement and an additive and it's not actually feed, you know. There's lots of hairsplitting over that.

If we just clear it up now we won't have these continuing debates that we're currently having in livestock that NOP has very recently clarified for us on the livestock. So, I mean, work with NOP on that, but, to me, that's a one word fix there that would save a lot of problems down the line.

And then my other issue there was -- well, it's kind of like 252J. We talked about maybe putting manure or compost doesn't belong in the feed section. However, my real
issue is not where it is in the room. My question is, you know, regardless we're told even despite five years of compost, task force, working groups, and compost task force working groups and, you know, 25 page recommendations that have gotten revised like three times, that you can't put compost in water and spray it on your crops unless you have 90-120 days to harvest.

So, despite all this research and all this documentation and all this work by the board that's what the growers are stuck with right now. So, maybe it's perfectly fine to throw compost in water if you feed it to fish and harvest them within 30 days, but, where's the data? I mean, why is that allowed for fish? What's the packaging? I looked. I really didn't see packaging size or maybe there was more work done that I didn't now about but I'd just like to understand sort of from my equity point of view, is there a food safety issue, is there not, is there a justification for doing this? I mean, I think that you can just take that section out right now and then there can be more data and then it could be added in.

I don't really think it's essential for their -- my understanding is a lot of sugar producers -- most don't do this anyway. I think it's kind of an unusual practice. So, they could -- you know -- we could clarify the rules for everybody it would be better.
That's really it. I just want to make a final plug on flavors that we -- we've got stuff going now on 606, some of this is considered as a spice for one use but, you know, they could also be used as a flavor. So, we're going to need to clear up right away pronto some agreement, understanding, guidance as to when do we call it a flavor, when is it a spice, do we tell these people they have to get organic and most people can use it as a flavor.

So, we need some kind of meeting of the minds here. So, that's it. You're doing great work.

MS. CAROE: Thank you Emily. Questions for Emily? I've got a couple of comments. Again, your comments on aquaculture are very helpful. I will say one thing though. This is just a start of the process, you know, and we're going to find more little things that we missed and there is opportunities like the word non-agricultural being put in there. I don't think it substantively changes our intent. However, that may be something that would have been added later.

So, just a comfort language that there will be other opportunities for us to make these kind of adjustments just to make sure we plug the loopholes. As far as flavors, we agree with you completely and we're going to be working with the program and offering certain suggestions on how we can collaborate not only with them but with industry to come
up with that plan for taking this category of how materials are used -- I mean, we really have an issue with calling some flavors because it's about its intent for use, not what the material is.

MS. BROWN-ROSEN: It's a tiny percent.

MS. CAROE: Exactly. So, we're going to have to, you know, have those brain sessions where we just put it on the table and sort it out and, so, we will be doing that for sure. Thank you. Any other comments? Thank you, Emily.

Okay. So, I've got Pat Kane and then next on the list is Ram. Okay. If you could check in with Valerie.

MS. KANE: Good morning, I'm Pat Kane. I'm the coordinator of the Accreditors Certifiers Association. And I'm here to talk to you about the draft recommendation from the certification, accreditation, and compliance committee on standardized certificates. We have submitted detailed comments to the board and I think you have them all in your packet. We do support the inclusion of the class and products information, whatever crops and products are certified, and the inclusion of product categories for the processed products.

We also support the ability of certifiers to provide an addendum page to this certificate in order to provide additional information on crops and products that maybe certified. There does need to be a link between the
certificate and the addendum to indicate to folks that both exist.

We generally do not support the current Section C pertaining to the formatting of the certificate as it is too prescriptive. In our comments we did suggest some other mechanisms to deal with that and we also support the requirement that certificates be provided in English or a translation.

In our comments we did submit several samples of certificates, just basic information on there, so, we would encourage the committee to contact us and if we can be of any service when you get to doing any more work on that and we would thank you for all the work you do and all the late hours and that's all I have.

MS. CAROE: Thank you, Pat. Is there questions for Pat? Joe?

MR. SMILLIE: Well, not, but, I think we haven't met formally, but, we see what you've done and I think that there's pretty much general agreement that's the direction we're going to go.

MS. KANE: Thank you.

MS. CAROE: Any other comments? Thank you. Ram and then on deck, Dave Carter. Dave, are you here? Okay. Great.

RAM: Good morning to the board and the folks here.
My name is Ram. I'm the certification director for Quality Certification Services. Usually my personal policy and business policy is to resist from making public comments because you have a USDA and my job is not to be an advocacy involved in public comments. It's Marty's job to do that. But, this is a unique opportunity and I want to take an advantage because of the experience we have with aquaculture. And my comments are specific to the technical part of the recommendation just explaining a little bit more science to what the recommendation has been made; just explaining a little bit more of the process so that the board can understand and make a better recommendation.

To start with what was the first question what Joe asked this morning to Mr. Redmond, the answer is more cooperation would not qualify if the fish meal option is shut down. They will not meet the existing standards and other product standards that has been same allowance, 12 percent agent has been allowed mostly by most certifiers around the world as acceptable fish meal level.

I would like to start with the animal feed section. One of the recommendation of the board is to use up the new compost. The idea of land is that it would promote all the growth. Algae, aside from the conservation, so my A's are pronounced differently from what you guys are pronouncing here, nationally do occur in the system, in the water,
whatever you do apply. The idea behind them is to apply a nitrogen source that will help the organ to bloom. But, the question is the fish excretion itself normally in a pond is sufficient enough to make this algae to bloom or grow.

There is another issue related to that. If it is they're really looking at supply of nitrogen then there is other alternative sources like molasses that could be fed into the pond and that molasses can be certified organic in the way you make the systems better. The other related issue is the eutrophication so even if the fish feeds the algae they're going to supply some feed and what's going to happen is you need to end up putting a lot of paddles to make the oxygen supplies moving around causing more energy requirement as opposed to having molasses.

So, I just kind of wanted the board to consider the use of manure and compost as being used and recommended for the algal growth. There are viable substitutes. The other issue is pigments. I don't think, to my knowledge, I haven't seen any catfish that stays or tilapia that stays pigmented or shouldn't stay pigmented so, across the board, the salmon or other species that may require pigments.

The next question is about the festivities. There was a discussion about three years versus one year requirement. Most of the closed system, avoiding most of the open systems to my knowledge to which I have inspected in
different countries, has a line which is usually plastic. In other words, the water do not come in contact with the soil and that's a consensus I request the board to have one year transition time and there are some systems where the land comes in contact with the water to have three other requirements.

The next issue I want to touch base, this is purely information, is the 5 percent market weight allowance that has been allowed. This is the least challenge so far but I want to bring it to your attention. In case of shrimp, the 5 percent agent market weight, this is unknown origin, the 5 percent of market weight usually comes around the 15-18 days which is 15 person of a total lifetime an animal is going to be under non-organic management.

I'm also bringing another issue to the board is the algae multiplication. This procedure, it's been followed in Italy and all the aquaculture facilities. It's established and published by the name Guilla -- G-U-I-L-L-A -- Adeep in 1952 and subsequently in 1978 that there was a massive use of synthetic fertilizer for a mass duplication before it was being released into the farm. That is so.

My suggestion is the board to look carefully into the aquatic plant modifications or the aquatic plant production system. The board needs to create a separate list in my opinion for 603. For example, for farms -- several
farm have some Ph resistance like lime. I just at the time haven't seen it. It's not a synthetic. So, my recommendation to the board is to create a separate list and the postaros (phonetic sp.) issues, for example, in shrimp, it is harvested in ice water it immediately causes melanosis. Melanosis is kind of a pigmentation of the shrimp and that lacks the quality so people are fighting to find a viable and at least the uses of our clients to try and find there is something natural.

So, these are the issues that I'd like to address to the board. Any questions, please?

MS. CAROE: Thank you for comments. Questions?

MR. SMILLIE: Well, I think I'll just echo what Andrea said. Those are all very good inputs from someone who is familiar with both the European, the current situation, and our recommendation and it's going to be just too difficult for us to deal with them today, but, have you submitted these in writing also?

RAM: Well, I was trying to and I lost my --

MR. SMILLIE: You still have time and we'll get those in writing and then, again, as Andrea said, we'll be working on this document, I'm sure, for many years to come and we thank you for your input and look forward to making the changes as we get a chance to look at them.

RAM: I didn't want to bring up the fish and
Part of the reason is I wanted to have something more and I'm not opposed to what the board is trying to do. That's an efficiency in my feeling to start with something and just keep on adding as times passes by.

MR. SMILLIE: Thank you.

MS. CAROE: Joe, I think Jorge just passed out when you said many years to come. Anyway, Bea James.

MS. JAMES: I'd like to ask you what percentage of the farms that you believe have the plastic lining in the ponds?

RAM: It was all operations which is certified which is 100 percent of the operation. There's basically two groups you can classify or three groups. Intensive, semi-intensive, and wide -- In my opinion, most of the intensive and semi-intensive systems do have pond linings because that's an efficiency problem.

MS. CAROE: Any other questions. Rigo.

MR. DELGADO: This is directed to the other board members. Assuming that we pass this motion and the rules changes accepted, it goes into place, and then later on, three months, six months down the road, we find out that we need to do some changes, I mean quantitations, assuming we have problems with plastic and compost and so forth.

How soon can we implement those? And my question is based on the fact that we're not going to come up with a
perfect set of rulings, but, I'm sure we're going to have some changes and so forth, but, it will be nice to have at least an idea saying, yeah, we'll be reactive or able to correct this new rule.

MS. CAROE: Well, Kevin, do you want to address -- there is a certain amount of changes that are going to happen while this is at the program level and really what I was talking about was were any changes that could happen there that, you know, things have put it in conflict with the regulations or, you know, just there will be smithing that goes on at the program level and we'll be able to do that.

Substantive changes like prohibitions on certain practices will have to be further recommendations from the committee and then the board. And we expect there to be a series of them as we go along which is why we table them as too contentious. That will be another one. We'll have the shellfish addition. That'll be, you know, another as well. So, there will be several different add-ons.

It's a journey. It's not a destination. So, we'll continue to build on it. If we do know of a practice that right now is in what we're putting in that is contentious our options are to take it out now, to table it, which I don't think is a good action, or, to take it out later after the further recommendation that pulls it back out. So, that's the options on the table and the procedures that we have to
move forward.

MS. JAMES: I want to ask Ram, in your opinion the recommendation as it stands now, do you feel that it's adequate? I think we're all familiar with how long it takes when changes are imposed and then they actually manifest. So, in some cases it might be advantageous to pull back and submit something that is more in line with, you know, what the public really wants to have happen with aquaculture. I'm not saying that's what needs to happen, but, I know that changing recommendations after they've been submitted takes additional time.

So, I wanted to ask you, in your opinion do you think the recommendation is adequate as it stands?

RAM: Yes, it is for several species but it is not for species like shrimp and I'm not even going into the carnivores like salmon. Shrimp is something that you can provide in the vegetarian diet called fish diet, but, commercially what some people have tried is they've tried to produce tilapia, for example, and they make it as a fish meal instead of an organic tilapia they make it as a fish meal and they have been giving it as a source for shrimp.

And I have seen some shrimp operations that's been fed completely with wheat and soybean -- meat diet. I'm sorry. So, this regulation, the proposed recommendation is adequate for omnivores and I would really like to move
forward on that. It's not adequate for shrimp but it's still manageable. Thank you.

MR. CARTER: Good morning. Dave Carter with National Bison Association, Natural Pet Nutrition, Crystal Springs Consulting, and NOSB refugee. Three things, very quick. One number, Madam Chair, I want to compliment you on running a very tight meeting, very good meeting. I know that you're sitting in a difficult spot. You did a great job this meeting.

To the new members of the board, congratulations. I know after sitting through this meeting you're now sitting there this morning going let's see, I've got four years and nine months more of this.

Very quickly. The one issue that I want to talk about is cloning. And I was not signed up to speak until after I heard some of the discussion going on yesterday and I'm very concerned because I understand the role of the board. There are times when the board needs to sit down with the department and say, okay, let's, you know, find the thing that's absolutely the most enforceable that we can, you know, do to the letter of the law and there are times that I think the role of this board is to really push the envelope and to
really give the department some real leadership to say this
is what the organic community is demanding and I think
cloning is one of those issues.

We are at a particularly critical point in the food
system overall. Number one, I think it's egregious that the
FDA is not only saying that it's okay to use cloned animals,
have meat and dairy from cloned animals in the food system,
but, to say that you don't have to label it as that. The
consumer doesn't get to know.

Consumers are going to be looking for a safe haven
and organic needs to be that. This board needs to be very
clear and I think Kelly put it best, one sentence coming out
of this meeting saying no cloning, no progeny. Then I
compliment Mark yesterday when he essentially said hit us
with your best shot on this and then we'll sit down and
figure out how to get it done.

But, the consumers are really looking to organic to
put a flag in the ground and say this is where we stand on
cloning. Please do that. Thank you.

MS. CAROE: Thanks, Dave. Any questions? Don't go
anywhere.

MR. CARTER: No, I was being nice.

MS. CAROE: Now, I agree with completely with you
and I just want to state my opposition to the recommendation
or my concerns with the recommendation, not with its content,
but, it's method. As rules change we figured out how to do this. I don't think we figured out how to do this yet. I fully support the principle that cloning and progeny are clones and has no place in organic. So, I think that's where my issue has always been and I don't think anybody on this board disagrees that cloning and progeny of clones should not be considered organic in any way, shape, or, form. I think there's a subtlety though in how to present this and I appreciate the one sentence approach and actually that, to me, is a lot more palatable than trying to offer rule change, you know, which will become ineffectual and then, you know, we as a board aren't really advancing the cause.

So, I just wanted to explain to anybody that's here that the issue of cloning is not that we're in disagreement with it, it's just how to get there.

MR. CARTER: You bet. No, and I just say particularly at this stage in the process and the one statement that helps put the flag in the ground, but, you know, the history has shown whenever recommendations go up they usually don't come back saying something stronger. I mean, you start here and you kind of sand it down from there so don't sand down the edges too early.

MS. CAROE: Alexis and then on deck is Steffan Scheide.

MS. BADEN-MAYER: Hello, I'm Alexis Baden-Mayer and
with the Organic Consumers Association. I also want to speak
about cloning and second there were remarks that had been
made earlier. I think it would be great if the board cold
come out before the FDA process is finished. You are the
leaders of the sustainable and organic agriculture movement.
Your words on cloning mean a great deal. And I feel that the
FDA may extend the comment period 30 days.

So, if it doesn't happen today you may have time to
still do it before the FDA comment period is up. I also want
to talk about antibiotics briefly. Like cloning, antibiotics
are antithetical to the idea of organic. From the
presentation yesterday, natamycin, the use on English
Muffins, on spraying antibiotics on food to extend the shelf
life is not organic. Please do not approve that. It will be
rejected by organic consumers and it will have a damaging
effect on the impression organic consumers have of the
program.

I wanted to just say briefly that the Organic
Consumers Association supports the comments of the Pure
Salmon Campaign, Restaurant RM, The Humane Society, and Emily
Brown-Rosen on aquaculture. We also support the comments of
Jim Riddle and others on group certification. We support the
use of internal control systems by Safe Trait Cooperative.
That's all.

MS. CAROE: Thank you. Brief and to the point. I
love it. Comments from the board, questions? Thank you so much.

MS. BADEN-MAYER: Can I say that 60 percent of the consumers have already rejected the idea of cloning? Keep that in mind because that's not organic.

MS. CAROE: Thank you. Steffan Scheide and then Nicole -- I can't read the writing -- Nicole Dehne. I can't read the name, Nicole.

MS. DEHNE: Dehne.

MS. CAROE: Dehne. Okay. Thank you. You're on deck if you could check in with Valerie.

MR. SCHEIDE: Hi, good morning. I'm Steffan Scheide with Summit Hill Flavors. And I'm actually here to talk about colors but based on yesterday's session I just cannot avoid to make two comments, one on natural casings and the other one on flavors. I share the reservation on the word natural as it used with casings for three reasons. First of all, FDA does not recognize the USDA definition of natural. The only terminology of natural that the FDA recognizes are natural flavors.

Number two. How can certifiers apply the word -- how can certifiers evaluate commercial availability toward natural when USDA and FDA disagree. I think it's impossible for certifiers to do that. And, finally, there are actually natural casings out there which are edible, digestible,
collagens which are processed by processes which do not meet the definition of minimal processing which is currently defined as something that the housewife can do in her own kitchen and clearly there are no housewives which have industrial extruders in their kitchen.

So, I really would hope and we support casings to be listed under 606 based on the fall of Harvey because it clearly should be an ingredient allowed for the making of brats and those type of ingredients but I really would urge this board to reconsider the word natural.

That having been said, as a flavor manufacturer, I do not necessarily disagree with what was said yesterday regarding to flavors. However, we have been able to make somewhat slightly more complex organic de-certified flavors for the last seven years and only reason we did not petition agriculture flavors at this time was due to the public policy notice that came out in January. However, we have certainly petitions ready and that's why we would welcome to be part of the NOSB's effort to really discuss flavors and what necessarily would constitute an organic flavor.

Now, that brings me to really the reason why I'm here and I appeared before this board twice during Sunset for Colors and I had urged the board to keep colors on the list. We use organic certified caramel color and my question both to NOP and this board is, is it still allowed in organic?
You have allowed a prohibitive materials on the NOP. Does the removal of colors from the national list constitute a prohibition? And I think that's the reason I would like to have an answer. Colors were petitioned. They were not addressed and I would just like to know if I'm still able to use organic color after October.

MS. CAROE: Julie?

MS. WEISMAN: Yes. Steffan, I appreciate very much your comments about the casings. I also had similar concerns about the use of the word natural given the history of this industry and this board, a long history of avoiding the use of that word.

With regards to your question, there is never a prohibition against using an organic ingredient in an organic product. I don't know if anybody has any other thoughts about that.

MR. SMILLIE: Yeah. If, for example, caramel does not appear on 606 it means that you can't use conventional product. If you're currently accessing an organic re-certified color that use will continue.

MR. SCHEIDE: Personally, I do not disagree with that, but, color, like flavors and spices, are functional ingredients which are specific -- which undergo specific labeling requirements because they, in part, color on food. So, I cannot just call it caramel, which happens to impart
color. It is actually a color which is regulated by the FDA. And, so, the problem, the dilemma we've had is by eliminating colors from the national list, can they still be used? I mean, I'm very happy if there is a guidance document there that's saying, yes, if it's certifiable organic it can be used, then that's fine by me. But, that's the dilemma we're facing.

If colors were removed, I am using a color. Does the removal of the color constitute a prohibition?

MS. CAROE: No, nonorganic colors. Non-organic synthetic -- I mean, non-organic, non-agricultural colors have been removed from the list. That is true. Organic colors, organic anything is always allowed in organic products, okay. We are considering several colors that are agricultural to be added that would be allowed in non-organic forms if the organic form is not available. But, organic colors are always, always allowed.

Now, the non-organic, non-agricultural, yes. Those have been prohibited unless they get added back into the list.

MR. SCHEIDE: And if this organic certified color becomes unavailable, then I'm obligated now to petition under 606?

MS. CAROE: That is correct.

MR. SCHEIDE: Thank you.
MS. CAROE: Bea and then Joe.

MS. JAMES: Do you have the suggestion on the terminology to replace natural?

MR. SCHEIDE: Well, I think it was given yesterday and I don't have the exact verbiage but as the intestines of sheep, swine, and something else and I would say that because then you can apply organic -- then you can apply commercial availability to it. And I think that's what the petitioners had intended.

MS. CAROE: Joe.

MR. SMILLIE: Yeah. Again, I grew up in the organic industry and the natural foods industry and I've been to Codex meetings where the last gasp for declaring a regulation for natural died and I've never supported the word natural, but, in this case, I think it's being used colloquially as an industry expression for that particular material. I don't think it's -- I don't think our recommendation to allow it is enshrining a new definition for natural, but, if enough people are concerned about it I guess we should take that under advisement and if we had that other definition, the intestines of pigs, goats, that was quoted yesterday, but, at this point in time I don't want to lose that vote or that recommendation for that material while we give it a new name.

That's what my only worry.
MS. CAROE: Julie?

MS. WEISMAN: I guess I have a question. Is there procedurally anything wrong with there being an amendment made prior to vote to change how we refer this product?

MS. CAROE: Your committee can put whatever you want up for a vote. After the motion's on the table it can be amended by members of the board. So, there are options for making the change. I have asked the board to minimize last minute changes for the reason of transparency and so that the public can fully comment on anything that's on the table.

However, minimized does not mean prohibit them.

Tracy?

MS. MIEDERMA: I just want to reiterate what I said yesterday and this is based on my reading of written testimony that's expert testimony. I just wanted to make sure since I'm hearing two different stories which are people at FSIS saying there is a term called natural casings and they cite some location of this word in their regulatory language and what you're basing denial of the word natural casings as having legal standing.

MR. SCHEIDE: It really is a very complex issue because the best way to explain it is which food products are regulated by the USDA and which food products are regulated by the FDA and normally we'd say meat, poultry, and egg
products are clearly USDA overseen by FSIS and everything is off the egg. However, it gets very complex and the best way to look at it at the last joint policy meeting was that open faced sandwiches where you have a sandwich where you have turkey breast on it is FDA; closed faced sandwiches are USDA.

MS. MIEDERMA: I'm talking very narrowly about the words natural casings. Those two words together. That's all.

MR. SCHEIDE: And I understand the petition but you also have to realize that casings also go into vegetarian products which by that definition really cannot be from animal-born sources.

MS. MIEDERMA: Right, and those would be the collagen and cellulose casings.

MR. SCHEIDE: That's right and, but, they would also fall under natural casings, right?

MS. MIEDERMA: No.

MR. SCHEIDE: They would not?

MS. MIEDERMA: They're not.

MS. CAROE: Just a point of information. Collagen is an animal derivative and would not be allowed for vegetarian diets.

MS. MIEDERMA: Okay. What about cellulose?

MS. CAROE: Cellulose is from plant material.

MS. MIEDERMA: Okay. So --
MS. CAROE: It's synthetic. Yeah, I mean, there are inherent inconsistencies between kosher, organic, and vegetarian and organic in certain places and this is one where it shows up. Rennet is another one that we've had issues with with kosher.

MS. MIEDERMA: I feel like we're just -- we are kind of taking a guess at something that is actually known and defined in a book of food terms and let's not just take a stab at it.

MS. CAROE: Katerina, then Julie.

MS. HEINZE: You bring up a very good point that I had not considered for meat containing products the term natural casings would be different by USDA. For vegetarian sausage, that definition would not apply because that would be an FDA regulated and considered that and said yesterday natural casings weren't. The definition from USDA would apply, but, it won't if it's a vegetarian sausage.

MS. CAROE: Julie?

MS. WEISMAN: Yeah. In response to Tracy's observation that, you know, that to take into account when the term has already a well-defined definition, sorry for the redundancy, in, you know, in federal regulations, we don't necessarily want to go there. And the flavors is a really excellent example. Flavors has a very complex set of federal definitions and there are different ones for oat flavors that
are differing and sometimes contrary to those that are for
people to put on their retail packages and for the purposes
of the organic program we're here for organic and a lot of
things in the definition of natural flavors are absolutely
inconsistent and incompatible with organic.

And that is why they went on 605A with the
annotation that they went on because there are things that
can be called natural flavors that are allowed to have
certain synthetic ingredients in them such as certain
carriers which we would not allow in organic.

So, we can't take other federal definitions as our
-- we have to look at them. But, I wouldn't necessarily want
to use them as our standard. We can't actually.

MS. CAROE: Dan.

MR. GIACOMINI: A question for the program. In
light of the fact that we have a petition and we've had this
debate if we just stayed with the natural casings terminology
or if -- and there was some problem with it could the program
use the petition and the debate that we've had to modify that
term in putting it on the list to make it correct? Is it
something that we really need to beat ourselves up about?

MS. CAROE: Mark.

MR. BRADLEY: Mark Bradley, National Organic
Program. As long as the petition conveys the intent and the
language is clear and we understand what you're wanting to do
with this material we can work it through the attorneys and check with any -- we'll have to check with FDA anyway to check conflicting regulations so, you know, we can work with what you give us on that.

MS. SHEA: Thank you.

MS. CAROE: Bea?

MR. BRADLEY: But, we have -- that's what this whole thing's about, I think, isn't it? Try to get it out by June. Kim said by June.

MS. CAROE: Bea?

MS. JAMES: What would be the -- what is the problem with changing it to what Tracy or what Katerina had mentioned yesterday; why would that be such an issue?

MS. CAROE: Any response?

MS. MIEDERMA: What was your wording, Katerina?

MS. HEINZE: Reading from the petition they said the common name is natural casings, the processed intestines of hogs, cattle, and sheep. So, we could just call it casings, the processed intestines of hogs, cattle, and sheep.

MS. CAROE: Response? Jeff?

MR. MOYER: Well, it sounds to me like that really, in fact, is what the petitioner is asking for. We're taking it right from their language and we're going to approve what the petitioner wanted, not what we want. That would make the most sense to me.
MS. CAROE: Any more comments? We figured it out.

Thank you.

MR. SCHEIDE: That you very much and thank you from all of us in the industry for all the hard work that you've put in all these wonderful matters. Thank you.

MS. CAROE: Thank you. Nicole, you're up and on deck, Kim Dietz.

MS. DEHNE: Okay. So, thank you for the opportunity to speak today. Welcome the new members and thank everyone for their hard work that they've been doing these past couple of days. My name is Nicole Dehne and I'm a certification administrator for Vermont Organic Farmers or VOF, which is a USDA certification agency. I'm speaking on behalf of 400 certified producers more than half of whom are dairy and livestock producers and there are just a few points I wanted to comment on today.

First, I wanted to address the livestock committee's recommendation on cloned animals. It's well-established and recognized by the board that a large percentage of consumers find cloning technologies to be offensive and are opposed to their use. It's clear that without organic standards that clearly and fully address these concerns to perceived integrity, sales of organic or livestock products in the marketplace will be negatively affected.
So, VOF endorses the committee's recommendations to the NOP that animals derived through the use of animal cloning methods be disallowed in organic production and that these methods be included in the definition of excluded methods and we commend the committee for including the progeny and the progeny of cloned animals to the prohibition in its revised recommendation.

And we do support comments made earlier by Jim and others that the language used to describe clones be as specific as possible to avoid confusion. So, my understanding of including the term somatic cell nuclear transfer was to accomplish what Dan was worried about yesterday which was to exclude the embryo splitting from the definition and, not being an expert on cloning, but, having read some of the FDA document that describes the somatic cell nuclear transfer, embryo splitting is not included as part of that definition.

It had the list of assisted technologies and it was included there but it may be described as asexual reproduction but it wasn't defined as somatic cell nuclear transfer. So, I thought to help clarify I'd recommend as others did using the language either cloning as defined by the FDA or just somatic cell nuclear transfer and leaving out the asexual reproduction part.

I also wanted to address one of the materials, natamycin, which I believe is being petitioned to added to
205.605A. One of our certified producers a few years ago looked into using natamycin. So, we just did some preliminary research on the product and it kept being described as an antibiotic in all the documents that we had looked at and so, obviously, food with antibiotics wouldn't be consistent with organic processing and I also believe that it was allowed only for cheese by the FDA.

So, I really encourage the board to look into this further before voting to add this material to the national list. And, finally, despite the fact that pasture and origin of livestock are not on the agenda at this meeting I still feel compelled to mention them and I appreciate that Mark mentioned that both of these issues are currently being worked on but they do remain huge concerns for our farmers and our farmers are still waiting to hear whether all organic producers will be held to the same standards for pasture and we still feel that 30 percent drive out intake is the best way to assure that all producers are on the same page and as far as origin of livestock the VOF believes that the allowance for conversion of non-organic dairy animals should be permitted only on a one-time -- as a one-time whole herd transition and that after the transition, all certified operations should be managing the animals organically starting from the last third of gestation.

So, without clarification on these two items,
organic livestock producers, big and small, across the United States are not playing on the same ball field which I know is the intent of the federal standards.

So, I mention these issues again just despite the fact that they're not on the agenda just so nobody thinks that we have forgotten about them. And we are still -- farmers are still waiting for standards or enforcement of the standards that establish consistency and fairness amongst producers which I think would strengthen the consumer trust in the organic label and return the integrity to the standards. Thank you.

MS. CAROE: Thank you. Questions? Julie?

MS. WEISMAN: Yeah. I have one question. Can you tell me what body or federal agency it is that mentions the use of natamycin only for cheese?

MS. DEHNE: Yeah. I was afraid that you were going to ask that and this is some of the research which we did three years ago. And, so, all I know is in looking it up kind of on the internet and asking other experts it came coming up as an antibiotic. And as far as -- and I would also say despite searches on the internet that it was the FDA approved for cheese. So, I don't know if that has changed, but, my comments were that I think you guys should look into that before, you know, allowing it.

MS. WEISMAN: Okay.
MS. DEHNE: So, I don't have the specific document.

MS. WEISMAN: So, it is possible that it is approved for use -- one of the approved uses is for cheese. There's not necessarily for cheese only. We don't know.

MS. DEHNE: It might be for cheese only. That was my thought that I would look into it.

MS. CAROE: Just for information for the board, if the board were to consider natamycin a good candidate for the list and vote it thorough, that would be caught. I mean, that's not going to end up on the list so certainly if that were exclusively for the use when FDA approved this thing they'd say no, it's not happening, correct? I get a nod from the program. That's as good as it gets.

Any other questions, comments? All right.

MS. DEHNE: Thank you so much.

MS. CAROE: Kim Dietz and on deck, Harriet Behar.

MS. DIETZ: Good morning. My name is Kim Dietz, regulatory compliance manager for Smucker Quality Beverages. I've been employed by them for 23 years, just about as long as I've been in the organic industry actually. I've been involved in the industry through OTA. I chaired the MPPL Committee to the American Organic Standards. I've also served on the California Organic Advisory Board and, as you know, I was on the NOSB for five years from 2000 to 2005. I chaired the materials committee and also acted as board
First, and most importantly, I want to thank you every one of you for your dedication. I know what it's like on those all-nighters. I feel for you. But, it's very, very important. I encourage you to take your role seriously and listen to all your sectors. All of us out here, we all have things to say. Take that in the whole, make the best judgment that you can, and we trust you on that.

At the same time, have fun and enjoy the relationships that you're going to find. They'll be lifelong, believe me. Smuckers doesn't really have any comments right now. On materials we don't have any issues on the table. We are looking at -- actually we just added a color to one of our new products, but, depending on what the board does with colors we're willing to leave them in, take them out, whatever it takes, so, my comments are my own today and don't reflect those of Smuckers or Smucker Quality Beverage.

So, why am I here? I'm here as an historian. I'm here as a mentor. My company has provided me at your service for many, many years so I'm here to help guide you if needed and as well as a lot of people here in the audience. I encourage you to use the guidance documents that the past boards have developed. As one of the first board members appointed to the USDA NOSB during the launch of the program
we set the foundation for what you guys are doing today. We put the meat on the bones, so to speak. Without that your job would be much tougher so you do have a very good foundation and use those documents and use those guidance papers.

I encourage you to take the time during your deliberations and don't rush through things, don't feel rushed. I know it's a frenzy up there to work through wording and that sort of thing but take your time and make sure you make the right decisions. I support the continued use of agon and non-agon and synthetic and non-synthetic. I think that's critical for you to move forward with materials. It's really confusing out here in the industry and on the board if you don't have those things defined.

I support your ability to have non-public working group meetings. I think you would never have gotten where you are at this meeting if you had not had that private session. Conference calls just wouldn't have done it. So, I do support you in that as needed. Annotations. Be really careful with annotations. And unless they're specific, achievable, and within legal guidelines, don't put them on there. If you don't know that the annotation is going to be right, don't do it, okay.

They are needed in some cases, you know, and if it's a matter of material getting voted on then that be it
but be very, very careful with annotations. And I specifically disagree with any term limits, like three years, two years, one year. That just muddies the water and we've had several instances where we've limited that from past posts and by the time it gets on the Federal Register that time limit's gone so some things take a long time so be careful with timing.

Follow the materials review process. Dan's done a great job and you're in good hands with him so follow those guidelines. Read the sunset material review process that's coming up again. It's a pretty detailed process. Flavors. I wasn't going to comment on flavors but I'm going to. I saw this coming three or four or five years ago and I think you're on the right track, form a task force. You have the ability to do that through your policy manual and you can ask for a task force industry representatives and yourselves involved in that.

Collaboration. As a key industry leader I get those phone calls and e-mails when the industry is in a frenzy and we've had a couple of those recently. So, I encourage you to collaborate with the NOP and the NOP to collaborate with you so we don't have any more frenzies. We don't have confused methods. It's really important that we try to limit that. And the sunset, I don't agree that annotations should be changed during sunset. You see the
frenzy that you've got with 606. Sunset's just as critical in that you have a very finite time.

If you start changing annotations during that time you're going to have TAP reports and it's going to delay the process. Okay. Questions?

MS. CAROE: Thank, you. Personally, I want to thank you for coming to this meeting and to be there as a resource and fill in those blanks which we seem to run across quite often. Joe, you have a question, comment?

MR. SMILLIE: Yes. You may not have been prepared for this but I'd like to hear some of your stories of how your company is anticipated having to come into compliance with the use of colors, flavors, and things like that. In other words, you say you have no issues here. You're not petitioning anything. You guys have a lot of different products. You use a lot of different colors and flavors. And I'd like to hear your company's story of how your company went about making sure that they were going to be in compliance and not get into the frenzy.

MS. DIETZ: Okay. Well, you know, being that I'm on the front lines with you, we have converted probably -- we have about 400 beverages certified organic. We've converted about 99 percent of them to organic flavors and it's taken a long time. It's taken many years to do that. A lot of product development with many different flavor companies and,
you know, we're treating colors the same way. I think the industry would just have to push. They'd have to do product development. They'd have to take it seriously and be prepared because any material on the national list can come off at any time. I guess that's our philosophy.

We want 100 percent organic if it at all possible and we just happen to have the mechanisms to be able to push the industry so we've just been due diligent in it.

MS. CAROE: Other comments, questions?

MS. DIETZ: Okay. Good job, good luck.

MS. CAROE: Thank you, Kim. Harriet, you're up.

On deck, Dave Engel.

MS. BEHAR: Hello, I'm Harriet Behar. How are you all doing this morning? Awake, I hope. I have just a few comments. I don't have anything written. One is on the natamycin. I think we need to be very careful with this product. It will appear on the label. It is known to be an antibiotic so we need to be careful about consumer feelings about clean labels and also even if the -- it might be caught and the FDA might not necessarily approve it afterwards. I think that you should have that information before you make the vote so I think you should defer on this product and not vote on it until you have more information and really given it more thought.

I also want to talk about non-fat dry milk
instantized because I think the problem with the petitioners is that they did not ask the right question. There's plenty of non-fat dry milk out there that is not instantized and typically the instantizing process or agglomeration that occurs happens as a separate process. So, what they need to ask is not can you make me agglomerated non-fat dry milk, but, can you agglomerate non-fat dry milk that I give to you as already as organic because that can be a much smaller one, typically 5,000 lbs. I think if you gave me an hour on the phone I'd be able to find the place that I could get maybe even just 1,000 lbs agglomerated.

The main issue in organic is that the agglomeration is a steam process so there would have to be a way to turn off any possible volatile chemicals with the steam, but, this is done very regularly with organic with not much problem. So, the 40,000 lb. minimum run I think is not true and they just very well could by the non-instantized non-fat dry milk and bring it to a custom processor who could agglomerate it for them at practically any level that they want.

So I don't think that that needs to be put on the label and I also agree that I'd like to see something today come out of here, a strong statement about cloning. I think the consumers want to see that. I think the producers want to see that. And I understand the need to want to have the perfect statement, but, I think you could come up with
something that would show your intent and that would be very
important.

And lastly, I just want to put forward again that
your guidance to the certifiers and to the certified entities
and to the public about what certifiers will be looking at
for commercial availability needs to be on the website. Be
very clear that this is a directive on how commercial
availability is being reviewed. I really want it up there, I
want it clear, I don't want there to be another kind of
inconsistency between certifiers and I think it's difficult
for certification agencies to work with clients when the NOP
hasn't come forward and made it very clear this is the
process to say that if it's not a mandated process by the
certifiers put out there by the NOP as a directive, your
recommendation, then you'll have certifiers doing lots of
different processes again in the commercial availability and
we're facing this very soon in June.

So, that's my comment. And Mark is smiling.

That's good.

MS. CAROE: Comments, questions from the board?

Fair enough. Thank you. Dave, you're up and then Amelie
Hayte, you're on deck. Amelie. I'm sorry. And after that
we're going to take a short break.

MR. ENGEL: Good morning. My name is Dave Engel.

I am a dairy farmer from Wisconsin since 1981 and in 1987-88
several of us got together and started the crop cooperative, better known today as Organic Valley. At that time, for better or worse, we decided that we were going to go organic with all of our products. So, we had to find a certification agency to work with and one thing led to another and we started a little CI chapter and I ended up being the program director for the chapter and since then I've worked with several certification agencies for the past 18 years in different capacities and, again, for better or worse, I consider myself fairly well versed on methods and materials in organic production both as a current farmer and as a current certification agency representative.

My concern today has to do with the process of how materials are decided upon to be acceptable for organic production. Mr. Giacomini provided an excellent review on Tuesday of the process, including Section 6517 and 18 of the OFPA and Section 205.600A of the rule. In fact, I would call these the twin rails upon which this process rides.

I have been attending NOSB meetings for seven years now and as a lay observer of the process I find that often times a material will make it through the different steps of the process referred to above only to find themselves faced with usually only a few board members who feel the material is non-essential or that there are alternatives available.

Examples at this meeting include, and some of the
comments just lately notwithstanding, I still would stand by these comments, pelargonic acid, natamycin, instant non-fat dry milk, various colors and flavors, short chain FOS, and perhaps others. And for better or worse then during the course of further discussion a decision is made to not allow this or that material primarily because it is deemed to be non-essential or it has alternatives.

I would encourage the board that when you reach this point, try to remember that for a farmer, for example, more tools are definitely better than fewer tools. Kevin and I both know what it is like to have to fix something that is broken and how quite often it is a special tool, a special piece of steel that in with sweat and cussing gets the job done and I would submit that pelargonic acid is or could be such a tool for example.

And we all know what it was like to have our mothers cook that special dish or recipe and how it was just one ingredient which made that food taste better. Perhaps it was instant non-fat dry milk. I appreciate Harriet's comments. Or, short chain FOS, probably not. But, you get my point. My further point is simple. The process of decision making for materials is quite involved. It requires a substantial twin rails and the rule and in toto it provides very adequate oversight.

So, when you reach a point in this substantive
process after the material has been through and ridden these rails that you think a material is non-essential or that there are alternatives available, remember, we don't want to be organic by neglect. We do want our farms to look good and food to be good.

Kevin and I want more tools in our toolbox; at least I do; not fewer tools. Mom and all of us want foods that taste good, look good, and provide a good eating experience and that aren't moldy, or colorless, or, flavorless or that drip when they should not drip. It is not shameful or weak or a threat to organics to have more materials approved for use than organic production. The twin rails of 6517 and 18 and 205.600A that you run on to decide the appropriateness of materials are good, strong rails which protect us all and service all.

But, I would you to think twice about disallowing the material. If your main concern is it's non-essentiality or that it has alternatives to whom is it non-essential and how many alternatives can't we have. Thank you.

MS. CAROE: Thank you, Dave. Questions? Kevin?

MR. ENGELBERT: I'd just like to go on record, Dave, and say that I prefer far fewer tools than you do in my toolbox.

MR. ENGEL: And frankly I tend to use just a hammer myself, but, I know when you have to reach down in to put on
a clip, for example, on a diesel line whose boot is leaking
it's a really special tool that you need and I still stand by
my comments that more tools are better than fewer tools in
organics. I mean, just in the human experience.

MS. CAROE: Jeff? No? Any other comments, questions? Thank you, Dave. Oops, wait. Dave, we've got
one more question.

MR. DELGADO: It's not a question, it's just a
comment that I don't think it's the number of tools, it's the
quality of the tools and the impact of the tools so you might
have several products out there that are good tools. It's
just the impact on the environment, on the sustainability of
your operation that makes a difference and I think that's
where we have to base and that's what the two rails of our
decision process want us to follow.

MR. ENGEL: When you reach the point though after
those two rails have taken you to the end and it is non-
essential, deemed to be non-essential or that there are
alternatives, those are two points that I personally would
take a moment, step back, and see what the larger community -
- this is an ecumenical process that the larger community
would like and if you think that you're protecting the
organic integrity by not having instant non-fat dry milk on
however that process brought it to that point in this case I
guess it's the 606, you know, there's different twists to
this when you reach that point.

What I'm trying to concentrate on most true criteria that are in 600, I believe, non-essentialness and alternatives. I assume it happened with this board so many times where you get a material, calcium oxide in 02 that was shot down, you know, these are tools that farmers could be using and yet they're not available because they're deemed to have an alternative. In that case there in 02 that was an alternative that people felt you could use calcium carbonate from limestone.

The quality is not being diminished.

MS. CAROE: Thank you, Dave. Any other comments?

Amelie. Did I say your name very badly?

MS. HAYTE: That's fine. A lot of people have trouble. So, good morning everyone and I'm Amelie Hayte with GNT and we are natural color producer and we specialize in colors that are made from fruits and vegetables and we now have over 30 years experience in producing fruit and vegetable juice for color.

We have petitioned 12 different colors to be included under 205.606 and we'd like to thank the board for reviewing our petition and for giving us the opportunity to speak today. So, we understand that the board has some questions regarding the commercial availability of organic material and we have tried to gather more information to try
to address these concerns.

We first tried to source the organic raw material, meaning like, for example, organic fresh pumpkin or organic fresh carrots and we'd like to remind you that these fruits and vegetables have to be a specific variety that has a required properties for color and, yeah, so we contacted several farmers and none of them were able to deliver the variety of pumpkin or variety of carrots that we were looking for and another point is also that all these raw materials are specifically grown for colors and specific know how and specific way to grow them and when we asked all those farmers if they were growing any fruits or vegetables for color purposes none of them were actually able to do that.

We're connected to the Department of Illinois which is one of the largest state producer of pumpkin and they referred to a professor at the University of Illinois who has done extensive research on pumpkin and squash, for example, and he told us there's a question of organic pumpkin came up two years ago and that it was really difficult to locate organic pumpkin for the industry -- for the process industry.

Now, since we're not able to find any organic raw material we also searched the OTS website for organic ingredient and we were able to find two sources of different organic. For example, carrot puree or pumpkin concentrate or blueberry juice or diced carrots or frozen carrots, but, we
were not able to search any organic fruits and vegetable juice that were specifically standardized for color.

Now, I would also like to add that all this organic matter has to be harvested at the maximum ripeness and that, therefore, the organic fruit and vegetable usually deteriorate by transportation and that most of the fields have to be located around the production plant.

And, for example, for pumpkin juice colorizer, there's only one that do color from pumpkin at this point, and I'm pretty sure that's located in the Netherlands so all the fields will have to be around the middle, for example, Germany or Belgium and I would just want to go over again the different challenges that we're facing. We're trying to organic raw material.

So, first, the demand for organic products has grown a lot and farmers now rather like to focus on growing organic material for the fresh market and, therefore, there is a needed surface available for organic product for the industry -- for the food industry. Also, if we wanted to convert our fields into organic fields that would require three years and there's no pesticides on those. Another point our country is facing is a shortage of pesticides for organic production.

Organic production has a more development of bacteria and therefore there were color quality needs so we
would have to grow more organic products, more organic raw
material. We're also facing a lot of workers and good
machinery and the most important point is that all these
farmers need to have a special know how and we will need to
train them on organic production methods.

GNT has been working for several years with
farmers. We grow our own raw material. We don't buy on the
market. And we've been working with the farmers and now want
to produce organic colors. The only thing is that we need a
few years to be able to guarantee that we would be able to
provide the volumes that are required by the food industry so
that's why we would like to see an organic -- no, pumpkin
juice color, carrot juice color, blueberry, purple potato,
and hibiscus juice for color to be included on the list so
that it gives us more time to do our work and to be able to
able to come into the right quantities for the industry.

MS. CAROE: Thank you. Joe.

MR. SMILLIE: Can you go through that list again?

MS. HAYTE: Pumpkin, carrot, blueberry, hibiscus,
and purple potato.

MR. SMILLIE: Purple potato?

MS. HAYTE: Yes.

MS. CAROE: Dan?

MR. GIACOMINI: You didn't mention any of the
details of your problems or search regarding hibiscus and
purple potato. Could you go give us a little bit of a little idea on those?

MS. HAYTE: Yeah. Well, given the short times we had to -- first, we are not used to sourcing raw material since we do everything ourselves so since importers have asked us that we started doing it and we have a short time so we focused mainly on pumpkin and carrot because we know that the two that we have the most challenges to process are organic and also we figured that it would be the easiest one to source as organic comes to market.

MS. CAROE: Gerry, Steve, Julie.

MR. DAVIS: Did I hear you correctly that you said you are working with growers in the Netherlands area by your production plant to get them to start producing organically produced pumpkin and carrot and all that?

MS. HAYTE: Well, actually, already producing.

MR. DAVIS: They already are.

MS. HAYTE: And we already have organic colors.

The only thing is that there is not enough fields. There is not enough farmers and we don't have enough organic material right now.

MR. DAVIS: Would you expect in the five year period that this board is considering to allow you to use non-organic materials that within that five year time your company would have the goal of being able to access 100
percent organic materials after that time?

MS. HAYTE: In five years we should be able to provide the industry with 100 percent organic colors.

MR. DAVIS: And are there of the colors that you make from these vegetable materials, are any of them items that do not need to be produced right next to your production facility and can be shipped from further distances?

MS. HAYTE: I don't know the deals about that, but, I know for carrot and pumpkin it has to be produced around the production plant and, if anything, we actually don't grow only in Europe, we grow all over the world so if it was possible we would do it.

MR. DAVIS: Okay. Thank you.

MS. CAROE: Steve?

MR. DEMURI: Were you here yesterday?

MS. HAYTE: In the afternoon, yes.

MR. DEMURI: Okay. Did you hear the fellow from one of the other flavor companies, color company? I think it was Moore Products. How would you respond to his contention that hibiscus, for example, is in good supply?

MS. HAYTE: A good supply of organic?

MR. DEMURI: Yes.

MS. HAYTE: I don't know.

MR. DEMURI: Do you agree with him or --

MS. HAYTE: Well, the thing is that we personally
for our -- I was not able to choose any organic hibiscus
color and our plant is not able to get organic from hibiscus.
That would have other properties for us to process.

MR. DEMURI: Is that one that has to be grown close
to your plant to process?

MS. HAYTE: Yes.

MR. DEMURI: Okay.

MS. WEISMAN: It's very helpful to hear, you know,
to hear in detail the fact that the way the production
methods work requires very quick processing of the materials
and so you perhaps have spoken a lot to the issue of
converting the growers who are in close proximity to your
facilities to those producing agricultural products
organically, but, I was also wondering if you could speak a
little to the production process and if there are any
challenges there to having the process -- to having the
processing of those materials into color down the line. Once
you have the organic raw materials are they going to be any
further challenges that have to be overcome on a side of
actually processing those ingredients?

MS. HAYTE: There is some challenges and I cannot
go into details about them, but, right, we have to overcome
that and because we grow organic only we would need -- we
need more raw material to overcome the challenges that we
face during processing so it feasible but it's really a
shortage of raw material right now.

MS. WEISMAN: Thank you.

MS. CAROE: Any other comments from the board?

Questions? Thank you so much.

MS. HAYTE: Thank you.

MS. CAROE: We will take a break right now but up right after the break will be Adrianna Natsoulas and then George Lockwood after that. So, it's right now about ten minutes of seven so -- California time, sorry -- ten minutes of ten. Ten o'clock we'll be back.

(Whereupon, a brief recess was taken)

MS. CAROE: Okay. Adrianna. Adrianna, are you here?

MS. NATSOULAS: Yes. Good morning and thank you very much for this opportunity to further comment on the development of the organic standards for seafood. My name is Andrianna Natsoulas and I am the campaign coordinator for Food & Water Watch Oceans Campaign. And we've been following this process and have submitted comments previously and again have submitted comments just today with more updated scientific evidence to support our position around organic standards for seafood.

And I have abbreviated those comments and you probably will hear me repeat some of the comments you've heard already from some of the other NGO's on governmental
organizations commenting and interested in the organic
process for farmed seafood. So, with public health and
environmental sustainability in mind, as I said, we are
supplementing these comments with updated scientific studies.

I'd like to say that I strongly support that the
direction that you’re going in in developing these standards.
We're really pleased where you're headed and we hope that
you continue down that same track and we're very pleased that
you have -- that you support the edit to the task force's
interim final report that net pen and cage culture must not
be considered for organic certification at this time and that
those standards only apply to closed systems again at this
time because there's not enough scientific evidence, there's
not enough development of other firm species to be able to
consider net pen and open cages for organic certification.

Furthermore, the land-based farms must adhere to
strong environmental standards to ensure zero emissions of
untreated ethylant and to the surrounding environment and
they also support that there's a three year transition period
to gain organic certification for these land-based closed
systems for farm raised seafood.

Food & Water strongly supports the committee's
edict that wild fish and their products must not be fed wild
fish feed. Feeding wild fish meal and fish oil to farm fish
is not a sustainable nor safe. In terms of sustainability
capturing and removing smaller species from the open oceans to use as feed for farm fish stresses larger wild fish populations because then they have less to eat and it turns off the balance of marine ecosystem.

This is not safe either for consumers. Many scientists have concluded that fish meal and fish oil produced from wild conk fish is likely the primary route of entry for cancer-causing contaminants into the farm fish and we've seen many studies with farm salmon to indicate such.

Therefore, it's critical that wild fish meal and fish oil not be used as feed for organic farm raised aquatic animals.

Lastly, and I'm going to make this brief. We strongly support the aquaculture's working groups prescription of the use of slaughter by-products in feed for organic fish. Food & Water Watch opposes the use of by-products from the slaughter of terrestrial animals in organic aquaculture feed. Such a practice, deception by omission, could potentially lead to consumer loss of confidence in the organic standards undermining its value to them, to producers, and to the USDA.

So, again, we appreciate this opportunity for further comment on the development of organic standards for farm seafood and, again, you have a full comment so I just wanted to abbreviate what we have submitted and, again, you've already heard some of these very similar concerns and
again you're going down the right track and we really support
the direction you're going in so thank you for this
opportunity.

Thank you, Adrianna. Any other comments or
questions from the board? Thank you so much for your
comments. George Lockwood and then Rob Mayo, you're on deck.

MR. LOCKWOOD: Madam Chair, my name is George
Lockwood. I'm Chairman of the Aquaculture Working Group.

Every now and then you wake up in the morning and you have a
feeling of satisfaction that perhaps you've done something or
in the middle of a process of doing something very good and
that's what's happened to me. I think that we're on the
brink of doing something good for humanity and for the planet
in what we're doing here today.

Something had struck me yesterday which was very
interesting. There's a number of people who are in this
business or in allied businesses who have already begun the
innovation process to comply with what we're proposing. We
heard this about omega-3 fatty acid and also from growers and
it came as a surprise to me that the innovation process is
beginning so soon.

At this time, the Aquaculture Working Group urges
that you do adopt the report that was amended yesterday and
that we all move ahead without further delay. We see nothing
to be gained by delays at this time. When the matter goes
into the National Organic Program there will be opportunities
for further public comment and perfection as it is necessary.

We also urge that you move ahead with addressing
the fish meal and oil and net pen issues. The issues in
opposition are well developed. You've heard them here. I
would also point out that in the report that you have from
the livestock committee on page 51 two pages of tables that
describe all the species in aquaculture and the impact of not
having fish meal on aquaculture and almost all of those
species except for tilapia and perhaps one or two others do
require fish meal and fish oil in their diets.

The question before all of us is not whether we're
going to see organically certified aquaculture products.
They're already on the market. The question is, which
label. Is it going to be a USDA label or is there going to
be Natureland, or, one of the many other certifiers around
the world. Salmon, shrimp, tilapia, three of the big ten
consumed fish species in the American diet, and at this time
there are certification processes under way or have them
under way for bringing those species into the market.

Aquaculture is at the same stage as agriculture was
ten years ago before the final rule was adopted and we think
it's time that the USDA label the available for aquaculture
products to save the consumer all the confusion that goes on.
You'll notice in our proposal, while I don't want to speak in depth to the fish meal and fish oil issues, we have heard a number of comments about excessive amounts of wild fish being required to produce a pound of farm fish. Our proposal is that no more than one pound of wild fish go under one pound of farm fish or that fish meal and oil be recovered from the wasted carcasses after filet has been taken off of them. And, in particular, in the Alaska pollock industry, which is the largest fishery in the United States, there's enormous waste. Carcasses are either thrown overboard or in the case of oil it's recovered, it's burned, mixed with diesel and fuel oil and burned in engines and in boilers.

This is viable omega-3 fatty acids which are being lost and our proposal gives an incentive for those sources to be developed, but, a lot of PCB's I'd point out some calculations on page 37 of the report where our proposal would reduce by 90 percent the amount of PCB's down to the level of 10 percent of conventional and this would put aquaculture grown salmon, for instance, amongst the lowest PCB's of all foods, including beef, pork, and poultry.

On the matter of bio-valve shellfish we continue to work. We had a meeting, telephone conference call last week and we have a conference call scheduled for Monday so it is a difficult matter because there are no precedents in organic
certification of bio-valves that we can use.

And, in conclusion, I particularly want to thank you, Madam Chair. You've been involved with us since the beginning of the rule writing. Kevin and Joe and Dan have also been very instrumental in getting us where we are. Jim Riddle and Mike Lacey in the past. It's been fun to be part of this creative process with you and for the entire board we also thank you for being a part of this very interesting journey. Thank you.

MS. CAROE: Thank you, George. Just a quick notice. I won't be on that call on Monday because I won't be home yet. Any comments from the board, questions for George?

Thank you, George.

MR. LOCKWOOD: Thank you.

MS. CAROE: Next up is Rob Mayo with Sebastian Bell on deck.

MR. MAYO: Hi. My name is Rob Mayo. I've been serving on the aquaculture task force. My company is Carolina Classics Catfish. We're a small niche supplier of farm raised catfish to great companies like Whole Foods Market. And I'm going to be really brief and just say to you that as a fish producer I really hope that we can go forward with organic aquaculture rules. Producers in the U.S. really need them. Thank you very much.

MS. CAROE: Thank you. Joe?
MR. SMILLIE: Finally a catfish producer. One of the things that we were told, and, again, I'd like to hear from you directly is that your particular production system would be able to move forward with an organic label under our current recommendation and I specifically would like to ask you if you could give us more information about the catfish aquaculture and does our current recommendation, how does it sit with you, as far as if it became a regulation. Would you have any issues in coming into compliance with it?

MR. MAYO: To try to make it brief and not too technical, we've been producing a product which for lack of a better term we've termed natural because we can't call it organic. I think it's going to be relatively straightforward for us to come into compliance with a lot of focus on feed production from where we are now in certified organic ingredients.

As far as our industry as a whole, it would take a commitment and, you know, a long-term commitment from somebody who's not focused in the area of organics to go that route but I think it's doable.

MR. SMILLIE: Just to follow up. Have you started to investigate -- I'm not sure which feed, you know, you're using and is the supply of organic feed of the kind that you need, is that available?

MR. MAYO: I've only made the most cursory
inquiries and I think the answer is yes and, of course, then it becomes at what cost and year-round availability or the seasonable availability. Catfish production is a warm month production. Can you get the corn at that time; can you get, you know, the various ingredients that you need to produce the feed. So, you know, I guess I found in what we've done so far in working with retailers like Whole Foods is where there's a will there's a way and you overcome the obstacles you think are -- and sometimes the things that you didn't think were going to be big obstacles become the big ones and the things that were the big ones aren't.

But, I think in general we can do it. We'll figure out a way.

MS. CAROE: Any other comments or questions? Thank you, Rob. Thank you for your continued working on the working group. Next up. Sebastian Bell. On deck is Stephen Walker. Stephen, are you in the room?

MR. WALKER: Yes.

MS. CAROE: Great.

MR. BELL: Good morning ladies and gentlemen. My name is Sebastian Bell. I work for a farmers trade association called The Main Aquaculture Association. We are the oldest state aquaculture association in the country and we've been in existence for over 30 years. I am also a member of Aquatic Animal Task Force or Aquaculture Task Force
and it's been a real education to be part of that process.

I want to take the opportunity to thank you as board members, and particularly the board members who have engaged on the conference calls. I think you guys have really helped us formulate our ideas and craft a tighter set of proposals to you and I thank you for your input and your time. I also want to thank the NOP staff who have been on those conference calls. I think they've really done a lot of hard work and helped us as well and also Valerie Frances, I think you've done tremendous work and spent a lot of time with us.

I also want to thank George Lockwood, our Chair. I think George deserves a great deal of credit for all the hard work and leadership that he's shown and he is often the mediator between guys like me who are pounding on the table on one side and gals like Becky Goldberg who's pounding on the table on the other side.

So, I don't envy his position. Our growers, and I'll give you a little bit of background, we grow about 15 different species in the State of Maine. We've been growing species in Maine for over 30 years as I said. Our farm gate sales on an average year are around 80-90 million dollars over the farms and we have about 500 people that we employ on the farms and there are about 140 farms.

We have 1,300 acres that are in production in the
state and we produce both freshwater and saltwater animals
and, yes, one of the things we produce is salmon. I've been
in this business for 30 years. Most of my career has
actually been overseas as a farmer and I farmed personally 15
different species in twelve different countries. I came back
to this country because I believe that aquaculture is
something we should be doing in this country and we shouldn't
be scared of the environmental issues around it. We should
tackle them and try and do it the right way.

I'm also a farmer of sick of being called things
that I'm not. And I'm going to speak just briefly about
that. What I am is a Cousteau kid who read a lot of stuff
while I was standing watch on commercial fishing boats in my
early years and the stuff I read was Rachel Carson, Jacques
Cousteau, Aldo Leopold, Wendell Berry. Those were the people
that formed the way I look at the world and I'm proud of that
and I'm not ashamed to be a fish farmer.

I left commercial fishing because I was not proud
of what I was doing as a commercial fisherman. We were doing
some stuff that was bad for the environment and it troubled
me. And, so, I left that and I went into aquaculture and it
is certainly an irony today that I stand before you being
vilified as an environmental villain after making that
change.

I want to support the comments that both Neil and
Jorge made yesterday about the standards. I think both of
their comments were insightful, thoughtful, and helped frame
some of the issues. I have to confess, I can't offer you
Hawaii or Brazil as places for your next visit, but, come to
Maine. Maine is a wonderful state. I love living there and
it is very beautiful and I would be more than happy to take
anybody on any of our farms and if any of you are divers and
would like to dive underneath our farms come dive underneath
our farms and see how they link to the environment in which
they're in.

I would like to encourage the board to move forward
with the recommendations that came from the task force. I
understand that you have made the decision to remove or will
make the decision likely to remove a number of components and
I think that's fair game. Thank you.

But, I also want to encourage you to move forward
with net pens and fish meal and fish oil issues and the
reason I want to do that is because we in Maine are
different. We used to have multi-national corporations
farming in Maine. We no longer do. We're locally owned,
regionally owned. Our salmon farm is owned by a father and
two brothers and they compete on a world market against folks
who produce in many or other countries with little or not
environmental regulation or oversight.

They compete in those markets and there is no way
to give them a reward for doing the right thing without some brands and standards out there so I would ask you, please to move forward with those areas as well.

Finally, I want to focus on two words that Neil used in his presentation yesterday, opportunity and incentive. That's what we as farmers need. We need the opportunity to be rewarded for doing the right thing and we need the incentive to move in that direction. And that's what I hope you as board members will think about as you go forward and come back hopefully to deal with the net pen issue and the fish meal and fish oil. Thank you.

MS. CAROE: Thank you, Sebastian. Is there any questions, comments? Kevin.

MR. ENGELBERT: Sebastian, we heard some powerful testimony over the last two days from people that think salmon should never, ever, ever be certified organic and could you just briefly give your thoughts on that, maybe not as powerfully but just your thoughts?

MR. BELL: You know, there are a lot of issues that are brought up and I would have brought up and I believe honestly that we went through all of those issues on the task force and tried to address the standards that were developed. There is clearly a feeling amongst some people in the environmental community that if you contain animals in a net pen that shouldn't be certified. It's not just salmon and I
think the irony of this is that, in fact, salmon is probably
the least issue.

If you look at the way aquaculture is going to
develop around the world it's going to be marine fin fish
that are going to be a large part, if not the major part, of
the production on the fin fish end of things. And those will
be likely be cultured in cages as well. So, people talk
about salmon but I think the bigger picture is as we begin to
transition to other species all of those species are going to
be growing in net pens.

The irony of rejection is there's no other
production method which is as linked to the environment as
net pen culture. If you think about it, we culture our
animals in a marine ecosystem. That culture system is linked
intimately to the environment in which it's embedded and, so,
yes, we can impact the environment. We can do bad things and
exceed the carrying capacity of that environment and that's
not the right way to farm.

But, unless you provide incentives to people to
change what they do, you're going to have that anyway and we
will end up with large amounts of bio mass being produced and
being produced in ways that may in fact harm the environment.

You can farm, in my opinion and it is my opinion and I do
have a vested interest obviously, but, you can farm net pens
in synergy with the environment.
If you go to one of my member's farms in Maine and look at the environment around it and look at how they're trying to respond to that environment and the way they're farming it they use a lot of methods that are used by terrestrial organic farmers right now. I mean, they use site rotation, fowling, a lot of different methods to try to farm in synergy with the local environment.

And, so, each of the technical issues that have been brought up, if you add four or five hours I would literally sit with you and walk through each of those issues and explain to you how I think they could be solved from a non-therapeutic organic proposal, but, it is very complicated for sure.

MS. CAROE:  Joe?

MR. SMILLIE:  I look forward to a symposium where we can sit down and really bring a lot of open minds to that discussion and come up with solutions because I thank you for your testimony. I think it's very enlightening and I think that's the direction that we want to head. We want to make sure that all of the participants that start to get into this debate come in with an open mind and not with, you know, preconceived ideas that they don't want to by abide by terms and I think we all can benefit from this discourse and I'm hoping that we can move this as forward as quickly as possible.
MR. BELL: Thank you.

MS. CAROE: Dan?

MR. GIACOMINI: Hi, Sebastian, good to finally meet you.

MR. BELL: Good to meet you too.

MR. GIACOMINI: Sort of I guess in light of Kevin's question could you give us your perspective of -- and I apologize that maybe I'm stretching into some of the things that we've eliminated, but, some of your perspectives since you're here, how high would be setting the bar with the recommendations that are the AWG has been coming forward with like with net pens and that? How high are we setting it? Is it something that would just, you know, a couple of tweaks or is it something that, you know, potentially maybe people we can't even do, but, it's the bar that we're setting and it's the target we're shooting for.

MR. BELL: I think -- and I think you may have been on some of the calls. I mean, it's pretty clear, I think, from my discussions on the calls that I've been saying all along I'm not exactly sure anybody can meet the standards as they were proposed in the fin fish end of things and the net pen fish end of things.

And I also was frankly worried about it from the shrimp point of view as well. I think there were some issues there that establish a very high bar. Having said that, and
put that in perspective coming from a guy who our belief in Maine is at least that every fish that's grown in Maine would qualify under European organic standards, the Natureland standards.

And, in fact, we had companies that were pursuing that certification and when this exercise started they stopped. They stopped pursuing Natureland because they were worried that they would invest in that and then have to re-tool or change what they were doing for USDA standards.

So, we have, I think, some of the most progressive farmers in the world in terms of net pens, but, you know, bars aren't a bad thing. Sometimes we as farmers need a little bit of a push to change what we do. We tend to be, believe it or not, a fairly conservative group of people. We look at farming methods and equipment and new ways of doing things often pretty skeptically because we know that we work in nature and Murphy's Rule, you know, reign supreme and things break and they don't work the way you want them to work.

So, sometimes we take a little convincing in terms of changing our methods. But, I do believe that with the exception perhaps of some of the issues surrounding fish meal and fish oil the standards that were proposed were probably achievable over a period of time. It wouldn't happen overnight. We would have to change quite radically some of
the things we do.

The challenge for us, I think, is going to be, you know, why do you do that, how do you do that if you're not convinced that that's actually where you're going to end up. And, so, if we -- you know -- I've got growers now. I met actually with a couple of growers up in Eastport, Maine the day before I came down here and they asked me, you know, where should we go, where are we headed, what should we do so that we're headed in that direction and I couldn't answer them because, you know, I didn't really know where things were headed.

But, I think the standard as proposed was high, very high. I think it's going to be a challenge to meet, but, that's not a bad thing.

MS. CAROE: Any other comments, questions? I'd just like to say that in this factfinding whatever quorum we take for these two issues I think that's when we'll find out how high the bar is. Between that and then, you know, once this thing gets going we're going to find out what we missed. I mean, you know, until things are in operation you really don't see that, so, but, thank you again, Sebastian. I know that we've gone head to head a couple of issues ourselves, but, --

MR. BELL: That's a good thing.

MS. CAROE: I think that what makes the standard
strong, so, I appreciate your work on that.

   MR. BELL: Thank you.

   MS. CAROE: Okay. Next up. Stephen Walker and on
dock I have a proxy from Eric Olson to Luke Zuzmierski so,
Luke, you're up next.

   MR. WALKER: Good morning. My name is Stephen
Walker. I'm the certification manager at the Midwest Organic
Services Association. MOSA certifies approximately 950
producers and processors primarily located in the upper
Midwest. Like most of the organic community we've been
growing at a rate of about 20 percent annually and each year
that means more to manage than the same 20 percent the year
before; more inspections, more grades, assorting to black and
white and more calls from the media and others asking our
expert opinion on the latest organic news.

   As a certifier, I do a lot of keeping my ear to the
ground to see what challenges are presenting to the organic
community so I can best inform our certified operators of
developments and ensure that our decisions are consistent
with other certifiers. I come to these meetings wearing a
reporter's hat more so than feeling a need to express a
stance on some issues where our diverse stakeholders,
farmers, processors, consumers may have varying opinions. We
walk the middle ground.

   But, all stakeholders agree that the public must
associate the organic label with a clear, strong standard.
I'm concerned with the current state of the public opinion with organics. Even informally I'm hearing a lot of questions about organic integrity. This past week the topic came up again in casual conversation and this time around the campfire. A friend says to me, she so appreciates and admires the work I do, upholding the standards, making sure organic means something and so forth.

She went on and on and pushed my humble comfort zone to the point of embarrassment. But, in the next breath she says I don't even care about buying organic anymore. It's too many corporate farms. I'd rather buy from a farmer I know and she went on and on. So much for my feeling like a hero.

Now, I tend to be rather reserved. I'm not inclined to get up on any organic soap box. So, I'm tired and irritated with feeling like I need to defend the NOP standard from public opinion. Clearly, some in the organic community have been very successful in getting out the word about challenges faced by organics. I'm confident that the various community mobilization and media notification efforts are well-intentioned to raise the floor set by the organic standards.

But, I'm very concerned that the full message is not getting out to the public. Many consumers seem to only
be hearing that organics needs fixing, that the pasture
standard needs enforcement, that there's corporate desire to
weaken the organic regulations. To echo Carlea Arnold's
comment from Tuesday, the longer the questions remain in the
minds of the consumers the more damage it's done to our
industry.

I appreciate NOP's responsiveness in providing
thoughtful recommendations in providing useful guidance to
certifiers. You're doing good work toward addressing
consumer confidence. I understand some of the reasons behind
delays in bringing NOSB recommendations into the NOP
regulation. Workload-based issues are real and I believe the
NOP is well-intentioned to moving as fast as the program 16
feet will allow.

But, our stakeholders made transparent
communication and action. Clearly, this program needs
funding in line with the expediential growth of the organic
industry to enable appropriate enforcement. I hear
repeatedly from most the producers and processors that they
want a strong standard. I find working through non-
compliance situations usually results in our building a
stronger relationship with our clients and their stronger
commitment to organics.

But, this is not the word on the street and that's
frustrating. Past year recommendations, materials issues and
so forth are moving forward, but, in the meantime we all must proactively engage in a good news campaign. At the Midwestern Organic Farming Conference in LaCrosse, I said briefly in a report about dialogue meetings toward developing a national organic action plan. The dialogue raised some 40 plus bullet points on what's right about NOP organics.

Items included increasing awareness and acceptance of organics in Congress, articulate organic farmers, university students wanting to farm, the moral, spiritual, cultural connection to organics and many, many other points. To these good points we can add hundreds of organic success stories and heart songs played out each day on certified organic operations.

As we work on the questions and the needed fixes let's all please be conscious of how the organic news is heard on the street and let's emphasize all that's right and well in this organic community. Consumer confidence depends on that good news.

MS. CAROE: Thank you, Steve. Comments, questions? Joe?

MR. SMILLIE: I just want to say well said, Stephen, well said.

MR. WALKER: Thank you.

MS. CAROE: Any others?

MR. ZUZMIERSKI: Hi. I'm here to make a few comments on short chain fructosaccharides or short chain FOS on Eric Olson's behalf. First of all, I would just like to say that short chain FOS is a safe product. It's made by a simple and natural process that processes enzymatic fermentation of sugar derived from a plant source. That said, short chain FOS is agricultural and it should be properly categorized under 205.606 on the national list.

And I'd just encourage the board if you have any questions about short chain FOS please address them to myself or Dr. Connie Francis who is also here from GGC and that's all I have.

MR. ZUZMIERSKI: Thanks.

MS. CAROE: Zea, you're up with Marty Mesh in the hold. Marty? Is Marty here?

MS. SONNENBRAND: Hi. I'm speaking as a proxy for Eric Sideman. We're going to let Marty have the last word. There's more after Marty. Well, he thinks he's the last on the list before the break. I'm not giving my own comments except one sentence at the end. The rest is Eric.

And I am reading Eric's letter in the I, but, the I
referred to here is Eric's I. Eric, as you know, as many of you know, is a former member of the NOSB, the scientist member, and he's from Maine Organic Farmers and Gardeners Association.

Although I want to offer my general support for the NOSB committee recommendation on aquaculture standards. I want to again stress my apprehension about the use of fish meal made from wild cut fish. The livestock committee itself recognized this concern; did not accept the task force recommendation for fish meal as a supplement. However, the livestock committee and I differ in that the committee suggests future rulemaking to add sections on fish meal after more discussion as they do for the use of net pens.

Although I support more discussion, especially with the conservation committee, I strongly feel that the livestock committee should recommend and state up front that after the discussion fish meal and net pens may not be recommended for organic production. The NOP final rule is a practiced-based regulation. The regulation describes practices used to produce organic aquatic livestock should meet the mandates of OFPA rather than trying to reinterpret OFPA to meet present day aquaculture production standards.

The livestock committee recommendation does a good job in recognizing this but I believe falls a bit short. Their recommendation needs to be very clear about the outcome
of discussions with the marine conservation committee and the grassroots organic community that states the use of fish meal may not meet the law of OFPA nor the historically high environmental standard of organic production.

Certified organic product must be based on sustainable production practice in the high list of production of fish meal may not be a sustainable practice. OFPA mandates that producers must provide organically produced animals with total feed ration composed of agricultural products that are organically produced. I'm comfortable with the potential for this to occur in aquaculture systems that are in designated areas where a producer is responsible for knowing about the feed that is brought in, moves into, or, grows in the area similar to terrestrial life that grows in designated areas under the management of a producer.

I am very uncomfortable giving an organic label to fish that live and move in and move out of un-designated areas and are not in the control of the producer or for that matter anyone else. However, hence, I do not believe that wild caught fish, although it is a product I hold in high esteem, should ever be labeled organic and fish meal made from wild caught fish also does not meet organic standards. This was the same conclusion by the first NOSB aquatic animal task force of which I was a member.
I support the exception of NOP final rule that non-synthetic substances and synthetic substances included on the national list may be included as feed additives to balance a feed but I think that clarification is needed as to what is a feed and what a feed supplement are additives. Also, it's very clear that feed must be organic and so I strongly believe that the basic feed groups approaching fat and carbohydrate must come from organic feed. OFPA does not provide for national sources of feed, only organic, so, as I read off the natural ingredients used as supplements must be limited to balancing specific nutritional needs perhaps within these feed groups but supplements may not be used to provide livestock with significant portion of feed unless the supplement is organic product.

I do not believe that fish meal made from wild caught fish can ever meet organic standards I think there needs to be a very tight regulation on its use as a supplement and it only be used to balance a specific nutritional need in very limited amount.

The second agriculture task force recommended allowing up to 12 percent fish meal and 12 percent fish oil to way beyond balancing nutritional need and clearly supplying a significant portion of the feed from non-organic source.

I'm pleased that the livestock committee recognized
this and held it out of their recommendation. I suggest that
the NOSB too recognize this and state clearly after further
discussion that there may be very tight limits on the use of
non-organic supplements in organic livestock production.

That's the conclusion of Eric's comments, but, Eric
and I, as you know, some of you, served on both the compost
task force and the compost tea task force that the NOSB has
had in the past and so I believe that Eric joins me in saying
to you that having a compost provision in your aquaculture
task force recommendation in which compost is recommended to
be added to water in fish bones is possible going to kill
your whole report because it will end up wallowing in the
morass of the USDA like the compost tea recommendations have.

So, I really think you're better off taking it out
of your report before you send it to the NOP so that you have
a chance of the rest of the report going through.

MS. CAROE: Thank you, Zea and Eric.

MR. SMILLIE: Was Eric speaking for himself or for
the Farmer and Gardeners Association?

MS. SONNEBRAND: Well, he has it on his letterhead
from MOSA and this proxy is MOSA letterhead too so I think.

MS. CAROE: Any other questions or comments for
Zea? Jennifer?

MS. HALL: As a member of the livestock committee
the retraction of both net pens and the fish meal I can
assure you was for a number of reasons and that the end of
those discussions remains quite open-ended. It is not a
known quantity at the end; that it was missing information,
differences of opinion. There's a lot of discussion still to
be held.

MS. CAROE: Clearly from the comments that we've
received over the last three days we have two ends of the
spectrum and not much in between on these two issues so our
work is cut out for us on whatever outreach or session that
we have in order to try to come to consensus. But, anyway,
moving along. Marty Mesh on desk and you are the anchorman
Rich.

MR. MESH: I'm currently on the national campaign
for aquaculture and I'll gently remind you of your comment
yesterday that if I gave up my seat I could take as much time
as I wanted.

MS. CAROE: I believe I offered you a cookie.

MR. MESH: Well, good morning. Unlike Kelly who
needed to focus her time on specific materials instead of
some more general comments let me take the other road. My
name is Marty Mesh. I want to chat with you for a few
minutes about some general things. A bit of an introduction
to give you a partial frame of reference of who I am.

In 1972 I first helped form a co-op to provide a
way to obtain organic foods while growing organically on a
small scale. In 1976 with Bellevue Gardens Organic Farm we
started farming several hundred acres and I still own
approximately 150 acres myself and my sister some other land.
In 1987 I helped form Florida Certified Organic Growers and
Consumers and later became executive director of a growing
consumer organization.

I've been an accredited inspector and have done
inspections internationally and nationally. I serve and will
make statements at times representing the seven sustainable
agriculture working group among the board. I've served as
past chair of the Organic Certifiers Council for the OTA for
two terms. I serve on the National Campaign for State
Agriculture Organic Steering Committee and since 2001 and
through currently I serve on the board of directors of the
Organic Trade Association although my comments should never
be interpreted as the official position of the Organic Trade
Association.

And I currently serve on the board of directors of
the Accredited Certifiers Association. For the record,
because of issues that have kept me from being able to attend
the last couple of meetings I want to personally thank the
past members for their work. I can't imagine any past
members wanting to read transcripts except maybe Jim, but, if
you're reading this we're appreciative and should probably
look to find some new light reading material at least for a
break.

I want to thank the existing board members for their hard work and dedication and welcome all the new members of the board. I think very few realize the huge time commitment each of you make and maybe you, yourselves, may not have been aware of that, and we are truly appreciative. We stand by not only to always tell you what you did wrong, but, to hopefully work together to get things right.

By the way, for those of us who have picked the right NOSB member in our pool yesterday to see who would be the first to fall asleep after the 10 hour meeting mark we are appreciative of your cooperation. You may or may not know who you are. Just kidding. I have always tried to provide a little humor when we all have a tendency to take ourselves so seriously.

I never mean any personal ill will. I want to thank the USDA program staff for my estimation of doing an outstanding job with inadequate resources managing a complex worldwide program across all agricultural production from sea to store shelf. They are trying as best they can to be responsive to what I refer to as a hyper-participatory industry, dedicated consumer base, with some folks who have the view that through expansion of organic food production global culture and environmental change could happen.

I should recognize that many times there are
divergent opinions on how to get to think how we want to be within our own community. So, again, thanks and good job to the USDA.

However, now that I've given the deserving, positive reinforcement to USDA, let me bring up just a couple of things. Aquaculture. Some additional history of USDA certified fish. Around April of 2002 the former USDA national program director stated publicly in a meeting that we invited him to with producers that shrimp could be labeled as USDA certified organic and then after considerable investment was made by some innovative aquaculturists a USDA reversal was done.

We on the behalf of the operations we have certified lodged a request for an expedited rulemaking many, many, many years ago. In the spirit of cooperation we and the producers we certified refrained from filing any lawsuits even after several years of little to no action. I am immensely grateful for the progress finally towards allowing shrimp, tilapia, catfish, etc. raised and managed organically to once again be sold as certified organic under the national organic program and hopefully have agreement in the community on the standards.

My hope is that a proposed rule or ANPR will be forthcoming in a truly expeditious time line and that any final tweak in certain production questions can be vetted
publicly. I'm having a little trouble with, and I do find it a bit ironic, to hear that fish oil is petitioned for inclusion on 606 without any testing for contaminants so that people can have non-organic fish oil but that a beginning aquaculture industry in its embryonic state will have to source non-existent organic fish oil to use in livestock feed.

Hopefully the final USDA regulation will achieve a balance on important aquaculture feed issues, including the possibility of a time limited opportunity to use leftover fish waste from processing fish for a reasonable small percentage as the industry gets a toehold after years of being held back by USDA.

Be it confident that you can set a high bar for shrimp, tilapia, catfish and that those who are truly serious about environmental stewardship and a different model for aquaculture production will meet the challenge and finally be rewarded in the marketplace for their efforts without having to compete with shrimp and other fish produced without any organic feed but sold on U.S. store shelves as organic.

The non for profits by NOP for certifiers. Harriet mentioned several items, most of which I agree with and if something really upsets the USDA I would like to reserve the right to possibly somewhat distance myself from being associated with that specific part. One additional point
might be that years ago it seemed to me that USDA published a proposal about issuing guidance despite a Federal Register notice many years ago I don't believe anything has ever happened. I point this out as an example because I think that if USDA can get back to square one and either intimate or on their behalf contract outside with an entity who can operate an internationally recognized and compliant accreditation program which would by definition have some of the tools which would have been lacking for consistent and competent implementation of the regulation it would solve many of the problems which have been brought to you and the program's attention.

Annotations. Following Zea's comments I want to add that annotations can be a problem with verification and I have in the past urged care in the use of annotations without regard to the challenge associated with the regulatory compliance end of the program. Use of annotations need to be able to be discussed and if needed, modified in a timely manner and not be able to address -- and to not be able to address CCR's concerns within 10 years is absurd.

Grower groups. The fact that the public comment has not been requested, yet, has never stopped me in the past on commenting nor will it stop me now. Careful consideration should be given before throwing the baby out with the bath water as others have referenced there's a 2002 NOSB
recommendation issued which may help the recently articulated concerns of the NOP.

There's a balance to be achieved between rigor and verification of a functioning internal control system and exclusion from the global marketplace for the overwhelmingly vast majority of the world's smallest scale producers and land holders for producing crops organically for markets and handlers eager to reward them for their environmental stewardship.

I'm asking the NOP, the NOSB, the industry, the ACA, and other concerned parties to work together, come up with a solution and do it in a timely manner where no damage is done to organic farmers or the trade. USDA's made a statement that affidavits cannot be the basis of certification. Although for our program this statement will not present a problem in the way we have carried our regulatory responsibility. The NOSB needs to work closely with the NOP and all certifiers need to be clear about what the program's expectations are of certifiers relating to the widespread use of affidavits.

More clarity from USDA is needed before such statements are given to limited certifiers at the training. Enforcement resources and the lack thereof. The need for a more USDA enforcement is clear and this was one of the main reasons why the program was supported by me personally and
many other organic farmers as well. It seems that the
important enforcement component of the program critical to
maintain consumer confidence needs strengthening.

Speaking of consumer confidence in the NOP we have
heard the program is stated that resolving the past issue is
one of the highest priorities. However, given that the NOSB
has issued recommendations for years to hear that this is
still a priority but we may not see resolution until 08 when
this is March of 07 seems woefully inadequate.

On behalf of the national campaign of sustainable
agriculture, me personally, and of the consumers I represent
after all the Florida growers and consumers I'd have to
comment on minimizing. I've always tried to look at the
health of the entire industry over the individual interest of
one company or foreign.

If natamycin is added to the list our certification
program, Quality Certification Services, will evaluate an OSP
and a product profile based solely upon the national list and
regulation. However, as an organic consumer and historical
organic farmer I in the national campaign am stunned of the
idea of putting an antibiotic on organic English Muffins. As
a farmer, should I be petitioning the synthetic fungicide to
slow down the natural process of a disease, in our case
siserian wilt that ultimately kills the watermelon plants so
the plants can rot just a little longer. How would that go
over?

As a parent who is sensitive to whether my kids get a prescription for antibiotics when they are borderline what do you think my decision will -- is that five? I'm almost done. I'm in the homestretch now, Andrea.

(Discussion off the record)

MR. MESH: When they are borderline what do you think my decision will be if I know that those organic English Muffins have just a little bit of antibiotics on the top even if the antibiotics are mainly used for livestock production or historically for eye infections.

By the way, I don't even believe this antimicrobial or antibodies has FDA approval for English Muffins. I believe it is for cheese. Should that be of consequences?

About the private meetings. I understand the need for boards to go into closed sessions but it seems to me that the prior meeting had been open with no public comment you would have not had many people and those people who may have been there could have a new recognition providing not only institutional memory but technical expertise which may have made your meeting not only more productive but avoid any appearance of behind closed doors.

In closing, in 1989 my partner and I differed in our support for a national organic program with him pointing out that I needed to give him an example of a USDA program
that was beneficial for small scale family farms while we are
growing watermelons. The silence was deafening on my part.

I promised him to try to fix things and make sure
the national organic program and the agriculture policy in
general can be less of a hinderance to the survival of
smaller scale and family farms. I remain hopeful that this
next farm bill and the continued improvement by the NOP will
move us every more toward that end. Thank you and thanks for
the time.

MS. CAROE: Okay. Any comments? Joe?

MR. SMILLIE: Yeah, Marty. In viewing your
history, I was a trainer at that session. Anyhow, but,
seriously, one of the issues that's really come up and really
disturbs me today is the wide gap in aquaculture. You're
operating an aquaculture certification program. Your
connections with the NGO is in that community is well known
and I would ask you to join us in trying to get the NGO's and
the aquaculture industry to sit down at the table and really
have an open and constructive dialogue. We've got a number
of comments signed by, you know, whole list of NGO's. It's
just basically are no, no, no, no, no, no way, Jose, and I'm
asking you as one of the people that moves between regulatory
world and the NGO world to give us your best efforts.

You don't have to answer this, but, you're
operating an aquaculture standard. We've got a
recombination. We've got to move forward and discuss net
pens and fish meal and so I'm looking for some leadership
from you and other people in your situation to help get this
rift over with and get everybody at the table and to work out
a consensus so we can move the aquaculture industry forward.

MR. MESH: I'm more than happy to help. It's no
problem. I do -- none of the NGO's or environmental groups
have said that, you know, to manage aquaculture for organic
shrimp, tilapia is not compatible with their perception.
It's more the net pen dilemma and I'm willing to help with
that, but, let's not hold up the shrimp, catfish, you know,
tilapia leg and get it out in the market.

MS. CAROE: Thank you. Any other comments? Bea?

MS. JAMES: I appreciate your comments on the
natamycin and I look forward to hearing from you again when
601 comes up for tetracycline and streptomycin.

MR. MESH: Yes, ma'am.

MS. CAROE: Anybody else? Rich Theuer. Thank you,
Marty.

MR. THEUER: I'd like to just answer some of the
questions or addresses some of the issues that came up this
morning on natamycin and just as a slight digress and get at
the point when I received a call two years ago from George
Weston Bakeries they said they were interested in natamycin
on English Muffins.
My first question was, a preservative? You're kidding. And, so, I checked the Merck index and it said it's non-synthetic and therefore 600B4 does not apply maybe and then I checked EFIS and said this stuff is only allowed on cheese. It's not allowed on English Muffins or baked goods or anything. Well, the background is that back in 1995 under the reinventing government where they hit all the regulations, we've tried to find nowadays and can't because they they're not published anymore, the FDA Modernization Act was passed that basically enabled manufacturers of materials to do self-affirmation of GRAS tests and that basically required them to pull together a panel of experts, toxicologists, food scientists to review literature, review applications and to make a self-affirmation of generally recognized as safe status.

There is the possibility of providing that GRAS report to FDA and FDA to issue a letter of non -- no problem basically. In fact, there are several materials that are being petitioned FOS. It went through that process because it had not been described before. There is a 21 CFR 172 155 reference to natamycin which is the cheese and there is also one for something in chicken feed.

So, the manufacturer, in this case, Nabisco USA pulled together its board -- its expert panel. They looked at it and extended the GRAS use to baked goods. And some
countries they don't have this procedure and I think in Australia this has been specifically petitioned to the government because they got to do it that way there. In the United States that's not required.

And that letter was included with the petition and there was some problem with the TAP review reflecting on it and we got a letter too. It should be in the file where we said there actually was a letter that said it did have the GRAS -- the technical committee review it.

Now, the question, it's called an antimitotic which means it kills mold or it keeps mold from growing. And are there other antibiotics on the national list and the answer is yes. There's lactic acid. Now, in the meat industry people are allowed to use lactic acid as a spray on hide carcasses, cold carcasses to reduce E. Coli standard plate count and salmonella. It's allowed in poultry as well as in beef. So, in a sense there is a precedent.

It doesn't have a bad name, a funny looking name, but, it's the same thing. And this is why I felt it was "morally good" to petition this in an attempt to get through. I always thought this was mission impossible. But, mold isn't good. It's a penicillium mold. If you let that mold grow you're going to get traces of penicillin and I think more people are sensitive to penicillin and mold than they are to natamycin.
And, finally, I'd raise the question. This is a non-synthetic material produced by soil, streptomyces metolensis. It's isolated from the earth, the ground, and it's using glucose type substrates. There's a foreseeable possibility that it could be produced organically and, so, it could be that in three years, five years, ten years there will be an English Muffin with nothing in it except at the end organic natamycin. Now, the question is, is it an antibiotic by some people's definition? It's a preservative obviously.

Question is, what happens then? You say you can't do that. So, that's the regulatory history on it. It's still confirmed as GRAS and the letter was included in the petition. Thanks.

MS. CAROE: Thank you, Rich. Comments? Bea?

MS. JAMES: I just to point out that when mold grows on a product it's kind of an alert to the consumer so that they know that it's there.

MR. THEUER: That's correct.

MS. JAMES: And that the natamycin will not be known by the consumer and I doubt it will be listed on the ingredient.

MR. THEUER: Oh, it must be listed. It is listed now in regular English Muffins. It must be listed on the ingredient declaration. It's not a processing aid in the
definition of processing aid. It touches and goes away. At
the point it's manufactured, at the point it's in
distribution, it's on the muffin. When it dissipates over
time, when it goes away, is when the mold happens so it will
be labeled.

MS. JAMES: And, you know, a lot of consumers don't
read ingredient lists but they do look at mold and they
recognize not to eat something when there's mold on it and I
just want to voice that I believe that most consumers
interested in organic products, if they fully understood that
that was sprayed on their English Muffin, that it wouldn't be
favorable response.

MR. THEUER: I hear you. And that's why I thought
it was mission impossible.

MS. JAMES: I give you credit for trying.

MS. CAROE: Tracy.

MS. MIEDERMA: When I first saw natamycin being
petitioned I was confused because as a mother I have
definitely put natamycin drops in my children's ears and
immediately associate it with as being a medical antibiotic
and, you know, I'm also an organic consumer and now an
organic consumer rep on the board and I just, you know, feel
that I would have been stunned if I turned over a package of
organic English Muffins and saw that an ear drop ingredient
listed and so I had to speak from that personal perspective
as well.

MS. CAROE: Any other comments or questions from the board? Thank you, Rich.

MR. THEUER: Thank you.

MS. CAROE: And that concludes public comment for this meeting. We will take a break. It's now just after 8:00 in California so 11:15 we will come back. We will be doing voting on policy issues, crops issues, and livestock issues before lunch.

(Whereupon, a brief recess was taken)

MS. CAROE: Okay. As soon as board members are in their seats we're going to start with policy and Rigo. Oh, wait a second, hold one second. Before we get started with the votes I would entertain the program manager to entertain you. If you want to -- do you want to come up to the podium?

MR. BRADLEY: I would.

(Discussion off the record)

MR. BRADLEY: We had some board members that we have new people on the board and this is something that we do every year. The Secretary of Agriculture, Mike Johanns, is very grateful for the commitment that the organic board, NOSB board members make. It's a huge commitment, as you all know.

The regulars at this meeting the 7:30 finish up that we had last night for the public comment is not unprecedented. Was it eight o'clock? Eight thirty. Oh, I
must have been on Virginia time. But, anyway, it's not uncommon for us to go to that level of extra effort, especially for people that are doing this in addition to their real jobs and all the extra things that they do in their families and we do appreciate that.

We recognize that when you come onto the board the Secretary has a very nice plaque that they award you with to hang in your office when you are actually there to see it, and a letter from the Secretary of Agriculture, and the plaque reads certificate of appointment presented to, your name, with appreciation for accepting the call to serve the nation and the United States Department of Agriculture as a member of the National Organic Standards Board. And this is signed by the Secretary of Agriculture.

So, it's unusual. Usually we do this at the first board meeting they become involved with because they -- but they have this secret meeting, this private meeting that was back in February. I was invited, I got to come, but, they kicked me out. So, no, they -- we wanted to do this at a public meeting so that the public could see that we do appreciate what they do and the commitment that they made and now that they are two days into the third day of the board meeting, the first real board meeting, the first public board meeting, and they have not left the room screaming and dodged off and gone to sleep that I've noticed, I didn't say anyone
napping, we do want to recognize them and thank them for accepting the call.

And so this is for Mr. Steve DeMuri, Ms. Tracy Miederma, and Dr. Katerina Heinze. We have a plaque for Tina Ellor when she recovers and comes and joins us for another public meeting. We'll recognize her at that time, but, thank you very much for enduring this and entertaining the option to come here.

MS. CAROE: All right. Back to business. We will go to policy committee for items of action. Rigo, if you want to present those items now.

MR. DELGADO: Thank you, Madam Chair. First item is the updates to the policy and procedures manual. We have, as you know, six changes. I would like to move that we accept -- I'm going to split the motion. So, I'm going to present first the first changes, the first five, and then I'll call separately for the sixth.

In that case, I move that we accept the following application to the policy and development -- policy and procedures manual which includes the clarification on procedures for counting abstentions found on page 12; flow chart illustrating the role of the NOSB Executive Director found on page 13; the description of the committee's chair's role in facilitating transition of committee chairs found on page 19; and the inclusion of a section on procedures for the
transition of committee chairs found on page 20 and, finally, the section on procedures to present committee recommendations found on page 21.

Do I have a second?

MS. JAMES: I second.

MR. DELGADO: Discussion? Madam Chair, I'm taking away your function.

MS. CAROE: Is there any discussion? Hearing none, we'll call the question. Let's restate the motion at this time is to accept changes, and I'll be even more brief, changes presented for page 12, page 13, page 19, page 20, and page 21 of the board policies and procedures manual.

And we will go to vote. Dan?

MR. GIACOMINI: Yes.

MS. CAROE: Tracy?

MS. MIEDERMA: Yes.

MS. CAROE: Kevin?

MR. ENGELBERT: Yes.

MS. CAROE: Jeff?

MR. MOYER: Yes.

MS. CAROE: Gerald?

MR. DAVIS: Yes.

MS. CAROE: Julie?

MS. WEISMAN: Yes.

MS. CAROE: Bea?
MS. JAMES: Yes.

MS. CAROE: Rigo?

MR. DELGADO: Yes.

MS. CAROE: Joe?

MR. SMILLIE: Yes.

MS. CAROE: Katerina?

MS. HEINZE: Yes.

MS. CAROE: Jennifer?

MS. HALL: Yes.

MS. CAROE: Steve?

MR. DEMURI: Yes.

MS. CAROE: And we have two absent and the Chair votes yes. Motion passes.

MR. DELGADO: Thank you. Next motion. I move that we include on the police and procedures manual the comment on exclusion of annotations to a sunset review found on page 52. So, it would read as follows. Annotations cannot be included in the recommendation during sunset review. Do I have a second?

MS. JAMES: I second.

MS. CAROE: Any discussion? Jeff?

MR. MOYER: I just want to be clear that what we are saying that annotations will not be on the table. Am I correct in that during sunset?

MR. DELGADO: During the sunset process, sunset
review, yes.

MR. MOYER: Thank you.

MS. CAROE: Gerald?

MR. DAVIS: I'd like to offer an addition to that wording of annotation changes cannot be included in the recommendation during sunset review to be more specific.

MS. CAROE: Are you offering an amendment?

MR. DAVIS: Yes.

MS. CAROE: Is the amendment accepted by the motion?

MR. DELGADO: Can you repeat, please, the suggestion?

MR. DAVIS: To simply add the word changes so it would be annotation changes cannot be included in recommendation during sunset review.

MR. DELGADO: Annotation changes.

MS. JAMES: I have a question. Is that redundant to say that? I mean, --

MS. CAROE: I have to look at it in context. Restate the section, Rigo, please.

MR. DELGADO: Annotations cannot be included in a recommendation during sunset review. The whole paragraph as it reads now is as follows. Since sunset is defined as the review of regulations to ensure the continued relevance and not the creation of new regulation all substance must be
renewed as listed. Annotations cannot be included in a recommendation during sunset review.

If there's a need to consider changing an annotation or moving a material from one list to another this may be accomplished through the existing procedures for petition.

MS. CAROE: Just for order. We have a motion for amendment on the table without a second. If we have a second we can discuss.

MS. HALL: I second.

MS. CAROE: Bea?

MS. JAMES: I am concerned about having the word changes in there because that might infer that we're talking about annotations that are in there and we're not going to change those annotations. That's how it reads to me a little better. And what we're saying is that the process of annotations is not a part of the sunset process and by putting changes in there it reads to me like there could be an annotation and we're talking about changing that annotation and that's not the intent of the motion.

MS. CAROE: Rigo, do you want to answer that? You know, from my standpoint, it encompasses not being able to change them, add them, drop them, anything. I mean, it's more than just change.

MR. DELGADO: That is correct, that change is just
a part of it and I would follow Bea's recommendation by
leaving it as it is. Annotations cannot be included in a
recommendation.

MS. CAROE: Is there any more discussion on the
amendment offered? Hearing none, let's vote on just the
amendment starting with Tracy for the amendment that's being
offered, the word change being added.

MS. MIEDERMA: I honestly am not seeing the
difference. I guess abstain.

MS. CAROE: Abstain.

MR. GIACOMINI: Madam Chairman, point of order.

MS. CAROE: Please.

MR. GIACOMINI: Can we just have the notice please
that the first vote -- that we did have does change our
absentee process and that that affects all votes from now on?

MS. CAROE: That is true. The changes that we just
voted in the first change, the policy and procedure manual,
means abstentions are blanks. They no longer are counted with
the majority so that does change how the results will be
looked at but it's kind of an aside but it's a good reminder.

Thank you for pointing that out. So, Tracy, do I have a
vote?

MS. MIEDERMA: Abstain.

MS. CAROE: Abstain. Kevin?

MR. ENGELBERT: No.
MS. CAROE: Jeff?

MR. MOYER: No.

MS. CAROE: Joe?

MR. GIACOMINI: No.

MS. CAROE: Julie?

MS. WEISMAN: No.

MS. CAROE: Bea?

MS. JAMES: No.

MS. CAROE: Rigo?

MR. DELGADO: No.

MS. CAROE: Gerald?

MR. DAVIS: No.

MS. CAROE: Katerina?

MS. HEINZE: No.

MS. CAROE: Jennifer?

MS. HALL: No.

MS. CAROE: Steve?

MR. DEMURI: No.

MS. CAROE: And I'm no as well so the amendment did not pass.

MR. GIACOMINI: Me too.

MS. CAROE: I'm sorry. I'm sorry, I forgot to go back to the beginning. So, you're a no?

MR. GIACOMINI: Yes.

MS. CAROE: I apologize.
MR. GIACOMINI: Yes, I am a no.

MS. CAROE: You are a no. Okay. So, the amendment does not pass. We have the original motion still on the table. Any discussion on the original motion? Tracy?

MS. MIEDERMA: A point of order here. Am I correct in saying that by voting yes we are simply codifying the status quo process that's in use? Or, are we making a change to our procedure?

MR. DELGADO: No, we're not. We're essentially formalizing the way we've been conducting business when it relates to evaluating materials during sunset review.

MS. MIEDERMA: Okay. Thank you.

MS. CAROE: Any further discussion on the motion? Seeing none, hearing none, we will vote starting with Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff, I'm sorry.

MR. MOYER: Yes.

MS. CAROE: Joe?

MR. SMILLIE: Yes.

MS. CAROE: Julie?

MS. WEISMAN: Yes.

MS. CAROE: Bea?

MS. JAMES: Yes.

MS. CAROE: Rigo?

MR. DELGADO: Yes.
MS. CAROE: Gerald?
MR. DAVIS: Yes.
MS. CAROE: Katerina?
MS. HEINZE: Yes.
MS. CAROE: Jennifer?
MS. HALL: Yes.
MS. CAROE: Steve?
MR. DEMURI: Yes.
MS. CAROE: Dan?
MR. GIACOMINI: Yes.
MS. CAROE: Tracy?
MS. MIEDERMA: Yes.
MS. CAROE: And the Chair votes yes. So, that's 13 yes, zero abstentions, and two absent.
Moving on.
MR. DELGADO: Okay. The third and last motion is to accept new members support guide as part of the wonderful tools that we have available here and as a compliment to the policy and procedures manual. Do I hear a second?
MS. JAMES: I second.
MS. CAROE: Any discussion? Discussion? Hearing none, seeing none, we will vote starting with Jeff.
MR. MOYER: Yes.
MS. CAROE: Joe?
MR. SMILLIE: Yes.
MS. CAROE: Julie?
MS. WEISMAN: Yes.
MS. CAROE: Bea?
MS. JAMES: Yes.
MS. CAROE: Rigo?
MR. DELGADO: Yes.
MS. CAROE: Gerald?
MR. DAVIS: Yes.
MS. CAROE: Katerina?
MS. HEINZE: Yes.
MS. CAROE: Jennifer?
MS. HALL: Yes.
MS. CAROE: Steve?
MR. DEMURI: Yes.
MS. CAROE: Dan?
MR. GIACOMINI: Yes.
MS. CAROE: Tracy?
MS. MIEDEMA: Yes.
MS. CAROE: Kevin?
MR. ENGELBERT: Yes.
MS. CAROE: Motion passes. I vote yes. Motion passes.
MR. GIACOMINI: Madam Chairman, we've had a request if you could more specifically announce yes votes, no votes, motion passes, motion fails when you're complete so we're
requesting that.

MS. CAROE: Okay. That was one zero no's, 13 yeses, zero abstentions, and two absent. Thank you for the work done on the policy committee. Any other action items at this time?

MR. DELGADO: No, Madam Chair, that concludes our recommendations.

MS. CAROE: Thank you so much.

MS. CAROE: Crops committee. Gerald, action items?

MR. DAVIS: We have two action items, both on materials. The first one is a soap based herbicide, ammonium source of higher fatty acids. Petition is to add it for agricultural crop uses in organic. We received a letter during the meeting from the petitioner and I'll read it. Please defer any action on this subject petition until further EPA ruling on this same subject. We will inform your office and request your further action once we've had a ruling from the EPA. Best regards, Joe Smillie, president of Falcon Lab.

So, I move that we defer this item to the next NOSB meeting.

MS. CAROE: Just for procedure, this board does not have to take any action if the petitioner has pulled the product off the -- the petition off the table. We're not
voting on it so it's no action of this board. Joe?

MR. SMILLIE: Point of order, Madam Chair. I just want to be really clear that we don't have to declare status of deferred on these.

MS. CAROE: The only time that we have to take action is if the board is deferring it, but, the board is not deferring, the petitioner has deferred it. So, this was for which material? This was for the --

MR. GIACOMINI: It's for ammonium sulfate fatty acids.

MS. CAROE: It's no action. So, moving onto your next item.

MR. DAVIS: The second material is pelargonic acid being petitioned for as to be considered a soap-based herbicide for use in non-crop farmstead usages and organic. I believe there's a representative, a petitioner here, who would like to make a statement on this.

MS. CAROE: The Chair recognizes the petitioner.

MS. GILBERT: Thank you. This is Kimberly Gilbert from Dow Agrisciences and on behalf of Dow Agrisciences we respectfully request that the crops committee defer their decision until the fall meeting on pelargonic acid.

MS. CAROE: Thank you. The material is then deferred. This board will take no action until the fall meeting.
MS. GILBERT: Thank you.

MR. DAVIS: And that is all the action items that the crop committee has.

MS. CAROE: Okay. Well, we're making up some time. Livestock. Okay. We're going to lose it. Kevin.

MR. ENGELBERT: Thank you, Madam Chair. This is not going to be this easy. We have one action item right now that's on the table and another one that we would like to bring back. The first was the aquaculture recommendation. I'd briefly like to read the introduction and then just go down through the changes we all agreed to yesterday.

The NOP and NOSB received correspondence and public comments requesting consideration of adoption of organic standards for aquatic species. To facilitate this mission the NOP created an animal task force composed of knowledgeable members of the aquaculture and organic communities. Upon receipt of the task force report the NOSB livestock committee recommends that the NOP implement rule changes to allow for the production of organic aquatic animals within the regulation.

Comprehensive restrictions on organic aquaculture production must be in place in order to comply with organic principles. To protect the environment and to maintain the organic integrity of products labeled as organic the task force report specifies practices to protect these principles.
Within the task force report there are several areas that the livestock committee would like further public comment. Specifically, the committee recommends further factfinding on sources of feed for aquatic animals that require a diet that includes fish. The task force recommended a temporary allowance for feed that would include wild caught organic feed but the committee believes the further input from the community, organic community, is required in order to determine if this practice is consistent with organic principles.

Likewise, the livestock committee would like more dialogue on the allowance of net pen operations for organic production. There appears to be conflicting opinion on whether this type of production is consistent with organic principles. These sections of the task force report are not included in the recommendation for rulemaking. However, the livestock committee intends to enter into further rulemaking to add these sections upon further completion of further dialogue in the aquatic industry and organic community.

Then the changes that we agreed to yesterday, the first one is on, I believe, it's on page 8. Yeah, excuse me, it's on page 6. And it's under 205.250 agriculture general. Number 9. Aquaculture facilities shall be designed, operated, and managed in a manner that seeks to maximize the welfare of cultured aquatic animals; minimizes the stress on
those animals; and prevents the spread of disease within the
facility and to all adjoining ecosystems and native fish
species.

The next one is on page 8. It's under 205.252, aquaculture feed. B. The use of aquatic animal feeds must minimize the environmental impacts on at least nutrients on receiving waters and adjoining ecosystems as documented in the organic system plan. Then under I. Nutritional pigment compounds that appear on 205.603 or are organically produced and allowed by the U.S. Food and Drug Administration for inclusion in agricultural feeds may be used.

The next is on page 12 under 205.254. Aquaculture living conditions. Under A-3, appropriate population or biomass densities that promote natural behaviors and limits aggressive and dominant behaviors from other aquatic animals was added. Page 16 under 205.255, aquaculture facilities, we changed under K production systems with soil water contact are allowed provided that a conversion period of 36 months from the date of the last application of a prohibited substance immediately preceding the harvest of aquatic animals occurs under organic management before production can be certified organic.

MS. WEISMAN: Excuse me, Kevin. Yeah, I just wanted to -- we're going back to the appropriate population biodensity. Very minor but you referred to it as under
Section 205.254A and you refer to it as 1-3 and I believe it is not the number three, it's iii. In other words, it's being added to Section A-2 as the third listing.

MR. ENGELBERT: Yeah, I apologize for that.

MS. WEISMAN: Just a clarification. You're doing great.

MS. CAROE: That was just a clarification.

MR. ENGELBERT: It's not actually number 3. It's two and it's iii.

MS. CAROE: Okay. Hold on. Wait one second. At this point we're trying to put the motion on the table. We can talk about if there's any changes that you're suggesting, Jeff.

MR. MOYER: No, it's not iii, it is the number 3.

MR. ENGELBERT: It is three.

MR. MOYER: No, it is not the roman numeral three. It is the number 3. If you look on the board you'll see it up there. Kevin had it right.

MS. CAROE: We can have discussion after we have a motion but let's let Kevin finish presenting the motion.

MR. ENGELBERT: Okay. Well, we'll leave that as presented then as a separate number 3 under A.

Yes, on page 16, under 205.259 under the letter D we have changed that to read fish should be held in high quality water for the duration of food deprivation prior to
transport and slaughter for a period not to exceed the time necessary to allow clearance of stomach and intestinal contents. The word fat and the letter "s" were deleted in there. It's basically just a grammatical correction.

Then under E-1-ii, we've added electrical stunning sufficient to achieve insentience immediately followed by the severing of the gill arches or decapitation. The committee vote on this was six in favor and one absent.

And our conclusion is the NOSB livestock committee recommends that the NOP implement rule changes to allow for certification of aquatic species and to engage the industry in the organic community and dialogue for further rule development.

MS. CAROE: Is there a second?

MR. SMILLIE: Second.

MS. CAROE: Any discussion? Rigo and then Joe.

MR. DELGADO: I just want to go back to page 12. Are we creating a third number? Can you just read that please.

MR. ENGELBERT: Yes, this is under 205.254, aquaculture living conditions. I'll read A. Aquaculture systems must establish and maintain living conditions as documented in the organic system plan that accommodates the health and natural behavior of the aquatic animals, including 1, 2, and then 3. We're adding in appropriate population or
biomass densities that promote natural behaviors and limit
aggressive and dominant behaviors from other aquatic animals.

MS. CAROE: Joe?

MR. SMILLIE: I think it's a small issue but I
think it should be iii and not 3 because it does come under -
it does, to me, come under that heading containment and
that's what iii should be referring to rather than a separate
number 3, but, it's not a big issue.

MS. CAROE: Are you offering an amendment?

MR. SMILLIE: Yes, I'd like to offer an amendment.

MS. CAROE: Is the amendment accepted by the
motioner?

MR. ENGELBERT: Yes.

MS. CAROE: And is it accepted by the second? Of
course. Okay. So, that amendment is made. George, did you
have something that you needed?

GEORGE LOCKWOOD: The proposal was the number 3 and
not three iii's.

MS. CAROE: Just for clarification, that was -- any
more discussion on this? Julie?

MS. WEISMAN: Marty I think wanted to speak.

MS. CAROE: Marty.

MARTY: I thought yesterday it was pigments that
are on the national list. That's what I thought we heard
yesterday. I'm not sure.

MS. CAROE: We'll go back to that, Marty. We've got to work on this issue first. So, as far as the format of this whether it's iii or the number 3. Julie?

MS. WEISMAN: I have one more question for George. Is there any significant detriment created by referring to this as iii instead of number 3?

MS. CAROE: You'll have to approach the podium to speak.

GEORGE LOCKWOOD: It has the same result.

MS. CAROE: George, George, I need you to approach the podium to speak since it's on the record and please give your name and affiliation.

GEORGE LOCKWOOD: Julie, could you repeat the question?

MS. CAROE: If it's listed as iii under 2 instead of as its own separate number 3 is that going to be detrimental at all the spirit of the intent?

GEORGE LOCKWOOD: No. You're dealing with --

MS. CAROE: George, you need to give your name and your affiliation.

GEORGE LOCKWOOD: George Lockwood. I'm chair of the Aquaculture Working Group. I don't think there's a significant difference. Our proposal was the letter 3. If you're going to put it iii's you want to take the and off the
first i and put it on the second i.

MS. CAROE: Okay. Thank you. Thank you, George.

Any further discussion from the board on this issue? So, right now as it stands we're looking at iii is how it's amended. Any discussion on other issues related to this? Joe and then Jeff.

MR. SMILLIE: I'm sorry, Madam Chair, related to this specific one?

MS. CAROE: This --

MR. SMILLIE: This iii?

MS. CAROE: This motion.

MR. SMILLIE: Oh, no.

MS. CAROE: No. So, everybody's okay with iii and there's no further discussion on this motion? Seeing none, hearing none, we're going to vote.

MR. GIACOMINI: Are we going to deal with the question on pigments on the national list?

MS. CAROE: Somebody's got to ask the question. Is there someone who wants to bring up the issue and talk about that? Jeff?

DR. MOYER: Just a point of order. Are we talking about other changes on here or simply that change?

MS. CAROE: We finished that change and I was looking for any other comments on the motion. Jeff and then Joe. Jeff and then Joe.
MR. MOYER: I did not hear being read on page 15 item 205.258, the change from one year to three years or 36 months, however we had it. And also the topping of item 205.605. I'm sorry, 603.

MR. ENGELBERT: We missed that. Let me read through the changes also on 205.258. We somehow skipped over that as we were going down through. Under A, that now reads aquatic plants may be grown in organic systems for feed for aquatic species that utilize algae for food. We provided that. We deleted human consumption and as out of that sentence. Then under 1, we've changed that to read any pond or containment vessel from which algae are intended to be represented must have had no prohibited substances applied for 36 months immediately preceding the harvest of the crop. And then as Jeff said down in 2 we had deleted where -- well, aquatic plants may be provided to solve macro nutrients and micro nutrients including trace minerals, chelating compounds and vitamins listed in 205.601. Then we deleted the 205.603. I apologize. Somehow I missed that change.

MS. CAROE: So that is part of the original motion?

MR. ENGELBERT: That's part of the original change, yes.

MS. CAROE: Is there any -- Joe?

MR. SMILLIE: I would suggest an amendment to page
8, 205.252, Section J to be deleted. Section J manure from organic terrestrial animals is accomplished with the plan in section 205.203 may be used to fertilize aquaculture product and organic production systems. Compost and manure must not be applied within 30 days of harvest of aquatic products for human consumption. Manure, whether compost or not, shall not be applied to aquaculture production systems other than ponds.

My amendment is to remove that section.

MS. CAROE: Is that amendment accepted by the motion?

MR. ENGELBERT: Yes, it is.

MS. CAROE: Okay. So, it's now part of the -- the motion is now amended to delete that section. Any other comments? Jeff?

MR. MOYER: Question on that latest change. If we accept that change do we then have to look at Section 205.258, item B, mentions manure from terrestrial animals may not be used to fertilize aquatic plants unless composted as provided under 205.252. I believe that should also be stricken.

MS. CAROE: You're offering another amendment?

MR. MOYER: I suppose I am.

MS. CAROE: Is that motion -- I mean, is that amendment accepted by the motioner?
MR. ENGELBERT: Just a minute, please.

MS. CAROE: Just a minute.

MR. ENGELBERT: Yes, it is accepted.

MS. CAROE: Okay. As the motion stands it's been amended again. Any other comments, questions?

MS. WEISMAN: Did we discuss the change on page 13 to 205.255K which also involves changing a one year period to a 36 month period? Because I think that we stopped at the iii thing and we skipped something when we went on.

MS. FRANCES: Can we go back to the prior change? I didn't get a chance to -- I just want to make sure I get it up here on the screens, the other -- did we not finish something on it? Is it accepted?

MS. CAROE: Slow down.

MS. FRANCES: I'm sorry.

MS. CAROE: Hold on. Jeff, can you restate which section needs to be removed?

MR. MOYER: Certainly, Valerie. It is found on page 15 under Section 250.258, item B, the entire item is going to be removed. My recommendation is to remove it.

MS. CAROE: Okay. That's been captured.

MR. MOYER: Thank you.

MS. CAROE: Okay. Now, Julie, back to your area.

MS. WEISMAN: When you get a chance, Valerie, can you please put up Section 205.255. That's page 13 and I want
to see Section K. Scroll down to Section K.

MR. ENGELBERT: Madam Chair, yes, I've apparently missed another change and I apologize for that again. This is under 205.255, aquaculture.

(Discussion off the record)

MR. ENGELBERT: Okay. I'll re-read that last amendment under K. Production systems with direct soil water contact are allowed provided that a conversion period of 36 months from the date of the last application of prohibited substance immediately preceding the high risk to aquatic animals occurs under organic management before production can be certified organic. That would change from one year to 36 months is the basic change there.

MS. CAROE: So that was a part of the changes made in the original motion voted on by the livestock committee.

MR. ENGELBERT: Yesterday, yes.

MS. CAROE: Are there any other discussion on the full motion? Dan?

MR. GIACOMINI: Just a note. There was some question regarding national pigment, a comment of it meaning to be on national list. The change that was made and I don't know if Kevin hit it or not was that nutritional pigment compounds that appear on 205.603 or organically produced was the change that was made for any question that was there and I'm assuming Kevin got that one.
MR. ENGELBERT: Yes, I did read that.

MS. CAROE: Any other discussion on this? Are we prepared to vote? No other discussion. Okay. We will start the votes -- this is tough -- with Joe. No, Jeff. Hold on.

All right. Joe.

Yes, before we vote is there any conflict of interest any board members to declare? The second was Joe Smillie. The amendment was accepted by the motion. There was no second. Okay. You want to restate the motion. It's in a summary form, Kevin, before we vote?

MR. ENGELBERT: I've already shifted gears but I will go back. I make a motion to accept the aquaculture recommendation as proposed.

MS. CAROE: And there was a second so we are prepared to vote at this point. Joe was the second.

Starting with Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie?

MS. WEISMAN: Yes.

MS. CAROE: Bea?

MS. JAMES: No.

MS. CAROE: Rigo?

MR. DELGADO: Yes.

MS. CAROE: Gerald?

MR. DAVIS: Yes.
MS. CAROE: Katerina?

MS. HEINZE: Yes.

MS. CAROE: Jennifer?

MS. HALL: Yes.

MS. CAROE: Steve?

MR. DEMURI: Yes.

MS. CAROE: Dan?

MR. GIACOMINI: Yes.

MS. CAROE: Tracy?

MS. MIEDERMA: Yes.

MS. CAROE: Kevin?

MR. ENGELBERT: Yes.

MS. CAROE: Jeff?

MR. MOYER: Yes.

MS. CAROE: And the Chair votes yes. The votes are 1, 13, zero, 2. Motion passes. All right. Moving on to your next item.

MR. ENGELBERT: We, the livestock committee, would like to bring the cloning recommendation back to the table and offer up some changes in language that we have agreed to. If Valerie can bring that up on the screen I'll go through what we are now proposing. On the first page under introduction we would like to add in the following, the last sentence.

Furthermore, the NOSB is very concerned with the
issues of progeny of animals that are derived using cloning technology. But, on page 3, under recommendation, we would like to propose that this reads the livestock committee recommends that the NOP recommend rule change to clarify that cloning technology including all progeny and succeeding generations of those progeny be excluded from organic production.

And down under 205.2, terms defined, the livestock committee recommends that read excluded methods. A variety of methods used to genetically modify organisms or influence their growth and development by means that are not possible under natural conditions or processes and are not considered compatible with organic production. Such methods include cell fusion, micro-encapsulation and macro-encapsulation, cloning, and recumbent DNA technology, including gene deletion, gene doubling, introducing a foreign gene, and changing the positions of genes when achieved by recumbent DNA technology.

Such methods do not include the use of traditional breeding, conjugation, fermentation, hybridization and in vitro fertilization, artificial insemination or tissue culture. The livestock committee also recommends the following addition to the regulation. Under 205.236, origin of livestock, under B, the following are prohibited, three livestock progeny and all succeeding generations from cloned
livestock, reproductive materials or any other products
derived from animals produced using animal cloning
technology. And the livestock committee and the NOSB will
work in collaboration with the NOP on further rulemaking
recommendations as additional issues are identified.

In conclusion, to strengthen and clarify the
existing rules, the NOSB livestock committee recommends that
the NOP amend the regulations to add the animal cloning
technology to the definition of excluded methods and that the
NOP update other sections of the rule to ensure that animal
cloning technologies excluded, including all generations of
progeny of cloned animals and a period and the last part of
that would be deleted.

MS. CAROE: Is there a second?
MR. MOYER: I'll second that.
MS. CAROE: Let's enter into discussion then. I
guess I'm going to start. I don't know the changes that have
been made, Kevin, from the position that was taken up
yesterday.

MR. ENGELBERT: Okay. I can go over them.
MS. JAMES: And, Kevin, would you mind starting at
the top of those changes?

MR. ENGELBERT: Yes, I will.
MS. JAMES: Thank you.
MR. ENGELBERT: The changes from yesterday are
under the second paragraph under introduction we want to add back in the very last sentence of that paragraph.

Furthermore, the NOSB is very concerned with the issues involving the progeny of animals that are derived using cloning technology period. The next change from yesterday --

MS. CAROE: Hold on, hold on. On that point, so, what you struck from that sentence that was in there yesterday is not showing up on here because there was more on that sentence yesterday but the strike out isn't shown.

MR. ENGELBERT: The rest of the sentence that was being struck, will work with the NOP on further rulemaking recommendations as issues are identified. We've moved that part of the sentence down to the end of the recommendation.

MS. JAMES: My question is for Valerie. Do we have the tracked changes that were made?

MS. FRANCES: He gave me a different document. I don't know. I mean, I could try to pull up the other document and how quickly I can do that.

MS. CAROE: That's okay. Continue on with the changes that were made, Kevin.

MR. ENGELBERT: Okay. The next change that was made is under for recommendation. We have eliminated the words and all its products from that first sentence so that it reads the livestock committee recommends that the NOP implement rule change to clarify the cloning technology
including all progeny and succeeding generations of those progeny be excluded from organic production.

The next change that we made from yesterday was under terms defined. We had originally proposed that the second sentence reads such methods include self fusion, micro-encapsulation, and macro-encapsulation, somatic cell nuclear transfer or other methods of animal cloning and that was also amended to read or other methods of asexual reproduction of animals.

We have replaced that entire phrase with the word cloning. The next change that differs from yesterday's proposal was under 205.236, origin of livestock, B-3. The original proposal yesterday said livestock progeny and all succeeding generations from cloned livestock, reproductive materials, or, any other products derived from animals produced using cloning technology and then in parentheses includes somatic cell, nuclear transfer, or other cloning methods and then an amendment was made to change that to methods of asexual reproduction of animals. And we've agreed to take out all those words that were included in the parentheses and stop it with a period after saying using animal cloning technology.

Then the final change that we agreed to was under the conclusion. We took out the last few words of that conclusion which stated and products derived from organisms
subjected to such technology be excluded.

MS. CAROE: Any discussion on this? Tracy?

MS. MIEDERMA: I'll just restate for the record something that has become very clear since the cloning issue has arisen which is that organic consumers, and, in fact, the entire organic community has spoken in a very crystal clear manner that cloned animals have no part of the organic system and I would just urge my colleagues to have a similar -- show a similar level of unanimity in supporting this motion.

MS. CAROE: Gerald.

MR. DAVIS: In listening to Kevin's verbal descriptions of what has been deleted I believe we still have not deleted the last part of that phrase that is highlighted right now and that products derived from organisms. He stated it but it hasn't been done up here. Is that correct, Kevin?

MR. ENGELBERT: Yes, that's true Gerald, that needs to be deleted and then we'll be current.

MR. DAVIS: Then cross-referencing. There's another statement that concerns products resulting from, I think it was in your origin livestock section. I'm not sure what number that is. We were just working what number that is, that last statement there, isn't that tied to what we just eliminated from a second ago? Or any other products derived from animals. Are they related or am I
misunderstanding it?

MR. ENGELBERT: The way we've interpreted that that is referring only to those products that would be used under before the origin of livestock. It wouldn't be products from those animals. There is a difference in that.

MR. DAVIS: Okay.

MS. CAROE: Bea?

MS. JAMES: I want to compliment and Kevin and Jeff on the changes that you've made to the recommendation and I know that yesterday I expressed some concern around really trying to make sure that we had clarity and I understand that the process of trying to really define how to audit progeny, I mean, that's going to be complicated no matter what the recommendation is and I support the -- I support your recommendation and I support telling the NOP that we on the NOSB do not support the idea of cloning and its progeny.

MS. CAROE: Is there other discussion? Dan?

MR. GIACOMINI: I just wanted to make note that we did hear a lot of debate or a lot of testimony regarding specificity of terms and that cloning was described in various ways. I think what we've pretty much came to was the fact that FDA created an entire document on the risk assessment of cloning. They defined cloning of what it is and what it isn't and that we didn't need to go into rehashing those terms in our document when we didn't have
control over it anyway.

MS. CAROE: Any other discussion? I find myself in a very difficult position with this recommendation. Although I am totally in favor, as I said on the record already with excluding cloning and progeny of clones, I feel that this origin of livestock section is unenforceable and may not be able to be implemented and I don't like the precedence it sets when board recommendations cannot be implemented.

The repercussions of that are dangerous. However, I feel that it is completely necessary and I believe as the one that initiated this action in the very beginning to make a statement about this, to make sure that the organic community understands that this is not a loose interpretation, this is indeed part of this regulation.

So, I'm not quite sure how I'm going to vote on this and it's not related to my desire to help this industry because -- go ahead, Kevin.

MR. ENGELBERT: Well, I'd just to explain briefly, Andrea, that when the rule was published cloning wasn't even on the horizon, let alone part of the agricultural scene and the livestock committee believes that whether it's implemented or not it should be and we need to make a strong statement and that's what we think and that's why we've proceeded ahead with that language.

It's a recommendation and we'll see where it goes
from there but we think this is the time to make that strong statement.

MS. CAROE: And I am not in disagreement with making strong statements. I am in disagreement with offering world change language that can't be implemented. Jeff and then Julie.

MR. MOYER: Andrea, I just want you to know that there are other members of the livestock committee like myself that share your concern and your opinion over the question of enforceability and that's been discussed on every one of our phone conversations and I think Kevin would attest to that that I've always had a real problem and issue making bold statements that aren't enforceable.

However, in this particular case with the way we've worded this I feel very comfortable with the language that we've chosen.

MS. CAROE: Bea?

MS. JAMES: I want to make sure that the livestock committee feels comfortable that with the revised recommendation that it puts us in a stronger position to deal with the fact that 6509B and OFPA mentions that breeder stock may be purchased from any source -- may be purchased from any source.

MS. CAROE: Kevin.

MR. ENGELBERT: That's a good point, Bea, and I
neglected to mention that's why, yes, we do, we believe that
strongly. That played in our decision making.

MS. CAROE: Any further discussion?

MR. DELGADO: I just want to highlight the fact
that it was included here that the NOSB would work closely
with the NOP in developing further this rulemaking. We all
understand that this is a new field, new issues are coming up
and it's not a done deal. We still will have to come back
and re-hash, work on the details and so forth.

MS. CAROE: Well, just in response to that from my
minority opinion on this. I have no issue with that. In
fact, I urge strong language about collaborating with the
program on rulemaking. However, you've not only done that
but you've offered rule change and that rule change, not
enforceability at this point, but, even implementation,
whether this is going to be -- whether the USDA can make this
rule change is questionable at best. And that's what
concerns me.

Bea?

MS. JAMES: I'd like to just ask you why you feel
that if the public and the NOSB is in a strong position to
say this is what we believe cloning means for organic that
you would not imagine that the NOP could not reinforce and
support that?

MS. CAROE: It would be like a lobbying pass that
you could not -- that nobody can enforce. I can't draw an
analogy to this but there is no -- but, let me just finish my
thought, Julie. There are indicators that can tell us about
the intangibles that we try to get to. What we've set here
right now is intangible. There is no identification
whatsoever. There's no pedigree program for these animals.
There's no physical markers. There's nothing to identify the
progeny and then the progeny and progeny of these animals.

So, there is absolutely no way to tell if this is
happening. If a farmer who goes through all the appropriate
channels and buys an animal that they have bought in good
faith from somebody who gives them information that it is
indeed, you know, non-product of cloning, they really --
there's really no way of them being guaranteed that. You
know, I mean, you're being held to something that you can't
do anything about.

That's like saying that, you know, you're not
buying a home on top of a, you know, 2,000 year old burial
site. You may not have that information. You know, it's --
I think that when it clears the program that there's going to
be big issues with being able to put this into regulation
when it cannot be and that's just in my opinion and it may be
when it gets through the program it can be put in there and
my suggestion from the very beginning that we enter into that
collaboration and then only put forward what can be done.
MS. JAMES: I just want to make comment on that and I appreciate what you're bringing up and I understand what you're saying but I believe that in lieu of what happened with Harvey that the NOP is probably a little bit more astute to making sure that the organic regulations and organic recommendations that get submitted to them based on what the industry, the public, and NOSB believes is truly what maintains the organic integrity according to OFPA they would be more inclined to make sure that they don't end up in a situation where they're not enforcing the right thing.

MS. CAROE: Just a quick response to that. I am not -- I can't seem to be able to express myself. I am not in any way, shape, or, form thinking that the program or anyone doesn't believe that this is good. I believe that the mechanism won't allow this to go through. And, so, it's not about what they want. I think the program asked us to address this.

I really feel that they want this on the books. However, it's the format and the mechanism that I have issue with and I think it's going to prevent this from moving forward and the actions of this board have an effect. So, that's -- I don't really want to say anymore on the subject because I understand where everybody's at and they understand that we don't have to beat this dead horse.

So, any other discussion? Hearing none, seeing
none, I will call for conflicts. Anybody have a conflict of interest that they need to express? Hearing none, seeing none, we will go to vote.

Starting with Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea?

MS. JAMES: Yes.

MS. CAROE: Rigo?

MR. DELGADO: Yes.

MS. CAROE: Joe?

MR. SMILLIE: Yes.

MS. CAROE: Katerina?

MS. HEINZE: Yes.

MS. CAROE: Jennifer?

MS. HALL: Yes.

MS. CAROE: Steve?

MR. DEMURI: Yes.

MS. CAROE: Dan?

MR. GIACOMINI: Yes.

MS. CAROE: Tracy?

MS. MIEDERMA: Yes.

MS. CAROE: Kevin?

MR. ENGELBERT: Yes.

MS. CAROE: Jeff?

MR. MOYER: Yes.
MS. CAROE:  Joe?

MR. SMILLIE:  Yes.

MS. CAROE:  And the Chair abstains.  Motion passes.

Zero nos, 12 yeses, one abstention, two absent.

We will take a recess for lunch.  It is now 12:20

so not to get too far behind 1:30 I think is reasonable, 1:30

sharp, not a minute later.

(Whereupon, a luncheon recess was taken at 12:24 p.m.)
AFTERNOON SESSION 1:33 p.m.

MS. CAROE: All right. We're going to get back to it. We'll be starting with handling materials. But, before we do I just wanted to kind of set the tone for these votes which this will be, you know, the first big batch of 606 votes we've ever had.

I want to remind the members to vote weighing the evidence that we have through the petition process, through the public comment, through the written comments that we've received and to make your decisions with prejudice, accepting the risk, and when I say risk you need to look at the risk not only to the organic integrity and ultimately the integrity of the organic label, but, the risk to the products that have a place in the market and how that risk balances with the other parts of this process that allows them to be used in organic products. So, with that said, I mean, I just wanted to make sure that everybody understands that this is about making that judgment as opposed to any principle or emotional reasons for wanting and not wanting a product but this is based on the evidence and information that we have on hand.

That said, I will turn over to Julie Weisman. However, just one note before Julie takes over I know that Katerina wanted to make a quick statement so let me recognize Katerina.
MS. HEINZE: I just wanted to declare a possible conflict in trust. I think most folks know that I work for Hamburg that produces a variety of organic consumer products. I do not participate in any of the sourcing or R&D decisions. And, frankly, I don't really know which of these we do use and we don't use. But, I just wanted to get it out there so my colleagues on the board were aware.

MS. CAROE: Thank you. Jennifer.

MS. HALL: I'd like to just add one more comment before we get into these materials and encourage all of us to look at these materials in an equitable manner and when you're considering commercial availability that that lens also includes what is considered reasonable access and that while we've talked a bit about large companies not having access to large enough quantities I think it's an equal measure on the other end to talk about these people that can really not accommodate potentially a huge quantity that only they can get access to and I would hate to see us further hit ourselves against -- not against, but, have conversation continue between local and organic and I think it's generally the small operations that are the local and that we do a great disservice to all of us to continue that conversation to continue that conversation in another way.

MS. CAROE: Thank you. With that, --

MR. DEMURI: Since Katerina did it I have to do it
now too. I also for a large CPG company and I do have influence over R&D decisions and part servicing but we do not use any of the items on the list to be voted on today. So, I just wanted to make sure everyone was aware of that on the board.

MS. CAROE: Thank you. Now, with that, I will turn it over to Julie for the handling committee to go through their action items.

MS. WEISMAN: Thank you, Madam Chair. I wanted to say a couple of general things and reminders as we kick off. One is although yesterday in discussion we were able to make presentations with items kind of lumped in categories, like things with like things. We are not free to vote that way. Most of that was because at the time the agenda had to be published I hadn't had a chance to organize how they should be grouped and so I gave an instruction to Valerie to do it alphabetically because that was the best that we could do at the time and since it got published that way I believe we are bound to vote on them in that order.

So, it may not make as much sense as yesterday. But, I will do everything that we can and I ask my fellow board members to help me do everything -- to help me keep this sensible and unconfused. The second thing I wanted to say is to just remind everyone that the recommendations that you see on the first page of section 7, the bold column that
says committee vote, those -- a lot of these are worded rejected and I wanted to remind everyone that rejected in that column doesn't mean that we voted -- not that we said the recommendation was to reject it. All of the recommendations for all of the handling materials that we're going to discuss today were worded in the positive. In other words, they were recommendations to list.

The handling committee may have voted to reject them, but, if we -- if any member of the board has been persuaded by what they've heard or read since that time we do not have to make any -- we don't have to make amendments in order to vote positively for listing. And then I think this is my -- finally, I also want to remind everyone of something that was discussed yesterday was that on Monday, after public comment, the handling committee did vote to change some of their recommendations and for those we have revised recommendations and those Valerie will put up on the screen and I'll just say briefly, mention briefly what they were.

We voted to remove all year limit annotations with the exception of rice starch. We voted to separate both annatto and paprika, each of those into two separate petitions, one for the water extracted version and one for the oil extracted version. And then we voted to change our recommendation on whey protein concentrate 80 percent because we received -- well, we voted to change it. I'll go into the
details when it comes up for vote.

Also, we voted to change in our recommendation for both inulin and FOS we voted to change our recommendation for listing on 606. This is not new information. This is not new information. This was all -- these were all mentioned yesterday in our discussions but I just wanted to remind everyone that there are some recommendations that were changed and people will get the chance to see as we go.

So, with that being said, the first item on our list, it looks like we're going to be going through the colors, all the colors in alphabetical order. Annatto extract is first and as I just mentioned that is now two separate petitions. So, we're going to do water first, water extracted first and then oil and these are very narrow lines.

So, the motion -- I motion that we -- the motion is that to recommend annatto, colors annatto water-extracted for listing on 606.

MR. SMILLIE: Second.

MS. CAROE: A motion by Julie and a second by Joe Smillie. Discussion? Bea?

MS. JAMES: Julie, I just want to make sure I understand. So, I guess vote means that we are voting to accept listing it?

MS. WEISMAN: Correct.
MS. CAROE: Board discussion? Hearing none, seeing none the votes will start with Bea.

MS. JAMES: Yes.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Gerald?

MR. DAVIS: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan?

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.
MS. CAROE: The Chair votes yes. That is zero abstentions, zero absent, zero no's -- two absent. I'm sorry, two absent. Try that again. Zero no, 13 yeses, zero abstentions, and two absent. Motion passes.

MS. WEISMAN: Okay. Next up is annatto, annatto colors oil extracted which I move -- the motion is recommendation for listing on 205.606. Do I have a second?

MR. DEMURI: Second.

MS. CAROE: Okay. The motion by Julie and the second by Steve. Any discussion? Hearing none, seeing none, the vote will start with Rigo.

MR. DELGADO: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.
MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: The Chair votes yes. Votes are zero against, 13 for, zero abstentions, two absent. Motion passes.

MS. WEISMAN: Going alphabetically the next on the list is beet juice, colors, beet juice. And the recommendation was and is still for listing on 606.

MR. SMILLIE: Second.

MS. CAROE: Motion by Julie, second by Joe Smillie. Any discussion? Hearing none, seeing none, the vote will start with Gerald.

MR. DAVIS: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.
MR. DEMURI: Yes.
MS. CAROE: Dan.
MR. GIACOMINI: Yes.
MS. CAROE: Tracy.
MS. MIEDERMA: Yes.
MS. CAROE: Kevin.
MR. ENGELBERT: Yes.
MS. CAROE: Jeff.
MR. MOYER: Yes.
MS. CAROE: Joe.
MR. SMILLIE: Yes.
MS. CAROE: Julie.
MS. WEISMAN: Yes.
MS. CAROE: Bea.
MS. JAMES: Yes.
MS. CAROE: Rigo.
MR. DELGADO: Yes.
MS. CAROE: The Chair votes yes. That is zero no's, 13 yeses, zero abstentions, two absent. Motion passes. Next.
MS. WEISMAN: Next we have colors betacarotene. Again, the recommendation was and continues to be for listing on 205.606.
MS. CAROE: Does anyone second?
MR. DEMURI: Yes, second.
MS. CAROE: Is there any discussion? What was the committee vote?

MS. WEISMAN: Okay. At the time the committee voted no 4 to 1 because there had not been compelling evidence at that time back in February. We didn't -- it didn't make sense -- betacarotene comes from carrots. We had knowledge that there's lots of organic carrots grown and we didn't understand it. We didn't have enough information explaining why this could not be obtained organically. We've heard a lot of comment since that time particularly in the last 24 hours addressing that question and I think that's what we're up to.

MS. CAROE: Okay. Is there any further discussion? Tracy?

MS. MIEDERMA: I work for a farm that's a large carrot processor and just wanted to find out whether that would warrant a conflict of interest.

MS. CAROE: Does your company have a financial interest on the outcome of this vote?

MS. MIEDERMA: There could be a future financial interest and there could be definitely the appearance of impropriety.

MS. CAROE: Does the board feel that Tracy is in conflict?

MS. JAMES: Conventional carrots?
MS. MIEDERMA: Conventional, organic, and sustainable.

MS. CAROE: Are you recusing yourself?

MS. MIEDERMA: I would prefer to.

MS. CAROE: We accept. Thank you.

MR. DAVIS: That would be a similar situation for me. I also work for a carrot processor growing organic carrots and the company could potentially stand to gain from growing organic carrots for someone wishing to make an organic color.

MS. CAROE: Does the board have any issues with Gerald? Somebody want to say something? Gerald, are you recusing yourself?

MR. DAVIS: I will recuse myself.

MS. CAROE: Gerald's recused.

MR. DAVIS: On all the carrots.

MS. CAROE: Any others?

MS. WEISMAN: You know, I would like to say, I'm not -- I have a little bit of hesitation about having people with expert knowledge not participating in the vote. What's the downside here if they don't recuse themselves?

MS. CAROE: If they don't recuse themselves it calls the credibility of the vote.

MS. WEISMAN: All right. Forget it.

MS. CAROE: They definitely have been part of the
participation in the discussions so I think we have the
benefit of their knowledge.

MS. WEISMAN: Okay.

MS. CAROE: I don't want to call that into
question. So, any further discussion? All right. Any
further discussion? Hearing none, seeing none, the vote will
start with Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy recuses. Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Rigo.
MR. DELGADO: Yes.

MS. CAROE: Gerald recuses. The Chair votes yes.

We have zero no's, we have 12 yeses, two absent. I'm sorry 11 yeses, two absent, and two recusals.

MS. WEISMAN: I think we need another section of the board policy manual.

MS. CAROE: Motion passes.

MS. WEISMAN: Next, black current juice. That passed handling committee back in February. The recommendation then was for listing on 606 and it still is for listing on 606.

MS. CAROE: Does anyone second?

MR. DEMURI: Second.

MS. CAROE: Okay. Motion has been made by Julie and seconded by Steve. Any discussion? Hearing none, seeing none the vote will start with -- is there any conflicts?

Okay. Hearing none, seeing none we'll start with Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.
MR. ENGELBERT: Yes.
MS. CAROE: Jeff.
MR. MOYER: Yes.
MS. CAROE: Joe.
MR. SMILLIE: Yes.
MS. CAROE: Julie.
MS. WEISMAN: Yes.
MS. CAROE: Bea.
MS. JAMES: Yes.
MS. CAROE: Rigo.
MR. DELGADO: Yes.
MS. CAROE: Gerald.
MR. DAVIS: Yes.
MS. CAROE: Katerina.
MS. HEINZE: Yes.
MS. CAROE: Chair votes yes. Zero no's, 13 yeses, zero abstentions, and two absent. Motion passes.
MS. WEISMAN: Next up is colors blueberry juice. This did not pass sub-committee. It was -- it failed 4 to 1.
And this was a similar situation to the betacarotene which is that at the time that we voted there was not felt to be sufficient data explaining why an agricultural product that everyone knew was being grown plentifully has organic was not available for this purpose and I'm probably not going to repeat the statement. I need some kind of shorthand to
remind everybody because there's going to be quite a few more like this.

But, anyway, again, we've heard much comment and much more additional information in the last 24 to 48 hours and so the recommendation was and is for listing on 606. Do I have a second?

MR. DEMURI: Second.

MS. CAROE: Motion was made by Julie and seconded by Steve. Any discussion? Any conflicts? Tracy.

MS. MIEDERMA: Again, Stahlbush is a large blueberry grower and processor and I am not organic on the blueberries.

MS. CAROE: Potentially would you be doing organic blueberries?

MS. MIEDERMA: No.

MS. CAROE: Potentially if you have -- potentially if this is listed and somebody's sourcing the convention you'd be able to supply?

MS. MIEDERMA: Exactly. So I would prefer to recuse.

MS. CAROE: We accept. I appreciate that. Any other conflicts? Any further discussion? Hearing none, seeing none, we will start the vote with Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.
MR. GIACOMINI: Yes.

MS. CAROE: Tracy recuses. Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Gerald.

MR. DAVIS: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: The Chair votes yes. Vote is zero no's, 12 yeses, zero abstentions, two absent and one recusal. Motion passes.

MS. WEISMAN: Next is colors form carrot juice.

This like blueberry and betacarotene before was a recommendation for listing which was rejected by the handling
committee because of a lack of information at that time. The recommendation was and still is for a listing on 606. Do I have a second?

MR. SMILLIE: Second.

MS. CAROE: Okay. So motion by Julie and seconded by Joe. Any conflicts for carrot juice?

MR. DAVIS: Can I recuse myself?

MS. CAROE: Gerald recuses.

MS. MIEDERMA: I'd like to recuse myself.

MS. CAROE: Tracy recuses. Any discussion?

Hearing none, seeing none we're back to the front. Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy recuses. Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Gerald recuses. Katerina.
MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: The Chair votes yes. Zero no's, 11 yeses, zero abstentions, two absent, and two recusals.

Motion passes.

MS. WEISMAN: Next from colors purple and black. This passed at the handling committee 5 to nothing. The recommendation was and is for listing on 606. Do I have a second?

MR. DEMURI: Second.

MS. CAROE: A motion has been made by Julie and seconded by Steve. Any discussion? Any conflicts?

MR. DAVIS: I'll recuse myself also.

MS. CAROE: Gerald recuses.

MR. DAVIS: My firm grows purple carrots.

MS. CAROE: Thank you for your recusal. Any others? Hearing none, seeing none, the vote will start with Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.
MR. MOYER: Yes.
MS. CAROE: Joe.
MR. SMILLIE: Yes.
MS. CAROE: Julie.
MS. WEISMAN: Yes.
MS. CAROE: Bea.
MS. JAMES: Yes.
MS. CAROE: Rigo.
MR. DELGADO: Yes.
MS. CAROE: Gerald recused. Katerina.
MS. HEINZE: Yes.
MS. CAROE: Jennifer.
MS. HALL: Yes.
MS. CAROE: Steve.
MR. DEMURI: Yes.
MS. CAROE: And Dan.
MR. GIACOMINI: Yes.
MS. CAROE: The chair votes yes. Zero no's, 12 yeses, zero abstentions, two absent, and one recusal. Motion passes.

MS. WEISMAN: Next. Colors, cherry juice. This is another one that was a recommendation for listing on 606 which did not pass which failed at the handling committee 4 to 1 for the reasons previously mentioned on the previous items that had also passed the handling committee. So, the
recommendation was and still is for listing on 606.

Does anyone second?

MR. DEMURI: Second.

MS. CAROE: Motion has been made by Julie and seconded by Steve. Do we have any cherry producers, any cherry conflict? Hearing none, discussion? Wait, Tracy?

MS. MIEDERMA: I have a discussion point. Did the cherry petitioner provide the additional data that supported an availability?

MS. WEISMAN: No, the additional data that we got since the petition was mostly coming from several manufactures who have spoken in the last three days who are unable to obtain purely organic.

MS. MIEDERMA: The change on the part of the handling committee was based on the verbal data that was given in the last two days?

MS. WEISMAN: Correct.

MS. MIEDERMA: Okay.

MS. CAROE: Any further discussion? Hearing none, seeing none.

MS. WEISMAN: Actually, I want to make sure that Tracy understands that we're not changing -- there's no change in recommendation. The recommendation always was for listing. It failed at handling committee because of lack of data. So, everyone here gets to decide whether you've heard
enough in the last few days to vote differently than the
handling committee voted on the basis of what information we
had at that time.

MS. CAROE: Okay. Any further discussion?

MR. ENGELBERT: One quick point. When did you --

MS. CAROE: Kevin?

MR. ENGELBERT: I have it listed as a rejected item. Had it included committee re-vote?

MS. WEISMAN: Okay. It's not -- rejected doesn't mean that the recommendation was to reject. The recommendation was for listing and that's the same for all the other ones that show up as rejected. It was for -- it was a bad choice of words. It was for listing, but, it failed.

MS. CAROE: Yes. That's really what I was going to say is it was poor choice. It should say failed. All of the motions are to list. Any of those that say rejected should say failed. Any further discussion? Is everybody clear on the motion and clear on the opinions of the handling committee on this? Go through the motion again.

MS. WEISMAN: Okay. The original recommendation was and still is for listing on 606.

MS. CAROE: Any further discussion? Okay. Now we're prepared to vote. Kevin.

MR. ENGELBERT: No.
MS. CAROE:  Jeff.
MR. MOYER:  Yes.
MS. CAROE:  Joe.
MR. SMILLIE:  Yes.
MS. CAROE:  Julie.
MS. WEISMAN:  Yes.
MS. CAROE:  Bea.
MS. JAMES:  Yes.
MS. CAROE:  Rigo.
MR. DELGADO:  Yes.
MS. CAROE:  Gerald.
MR. DAVIS:  No.
MS. CAROE:  Katerina.
MS. HEINZE:  Yes.
MS. CAROE:  Jennifer.
MS. HALL:  Yes.
MS. CAROE:  Steve.
MR. DEMURI:  Yes.
MS. CAROE:  Dan.
MR. GIACOMINI:  Yes.
MS. CAROE:  Tracy.
MS. MIEDERMA:  No.
MS. CAROE:  And the Chair votes yes. Three no's, 10 yeses, zero abstentions, two absent. Motion passes.
MS. WEISMAN:  Next, colors. Chokeberry/aronia
juice because those are considered the same thing, or, at least, well, they are the same thing, but, they were separate petitions by two different petitioners under different names but we realize it was the same material.

This was a recommendation for listing on 606 and it passed the handling committee, passed it 5 to 0. So, the recommendation was and still is for listing on 606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Any conflicts? Are there any conflicts? None. Discussion? Hearing none, seeing none, the vote will start will Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.
MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Chair votes yes. Zero no's, 13 yeses, zero abstain, two absent. Motion passes.

MS. WEISMAN: I just have a question for the new members before we get into the really meaty stuff later. Are we having fun?

BY ALL: Yes.

MS. WEISMAN: Okay. Next is colors, elderberry juice. This also was a recommendation for listing on 606 which passed, was passed by the handling committee 5 to 0. So, again, the recommendation was and still is for listing on 606.

MS. CAROE: Is there a second?

MR. SMILLIE: Second.

MS. CAROE: Any conflicts of interest? Seeing none. Any discussion? Hearing none, seeing none, the vote
will start with Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Gerald.

MR. DAVIS: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: And the Chair votes yes. Zero no's, 13
yeses, zero abstentions, two absent. Motion passes. Moving on to grape juice.

MS. WEISMAN: Grape juice. Juices are separate. Okay. Good. Grape colors, grape juice was a recommendation for listing on 606 which failed the handling committee by a vote of 4 no, 1 for because of insufficient data at that time. Everyone has heard quite a number of public commentors come up and discuss this material. So, the recommendation is for colors, grape juice, to be listed onto 205.606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Any conflicts with grape juice color? Seeing none. Any discussion?

MS. JAMES: I just wanted to ask. Originally, Julie, when you have a lack of information was that on the supply that you felt like you didn't have enough information that showed the availability of supply?

MS. WEISMAN: Exactly. In other words, we have knowledge on the -- you know -- on our committee that there are organic grapes and there was no information given in the petitions that we had in front of us that said why there are organic grapes. Is there a problem having organic grape juice color and we've heard from a number of manufacturers address that.

MS. CAROE: Gerald?
MR. DAVIS: Perhaps I missed that in the first day's proceedings of public comments. I don't specifically remember grapes being addressed by the speakers that I heard.

MS. CAROE: Julie.

MS. WEISMAN: It was actually addressed by the young woman from the Netherlands. Oh, also by Mr. Taylor from IACM, from the color manufacturer's trade association also addressed that.

MS. CAROE: Any other discussion? Hearing none, seeing none, the vote will start with Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Gerald.

MR. DAVIS: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.
MS. CAROE: Tracy.
MS. MIEDERMA: Yes.
MS. CAROE: Kevin.
MR. ENGELBERT: No.
MS. CAROE: Jeff.
MR. MOYER: Yes.
MS. CAROE: Joe.
MR. SMILLIE: Yes.
MS. CAROE: The Chair votes yes. The votes are 1, 12, 0, 2. One against, 12 for, zero abstained, two absent. Motion passes.
MS. WEISMAN: Next we have colors, grape skin extract and that's listed separately because it is a different process. It's a different fraction of the grape. That also was a recommendation for listing on 606 which failed at the handling committee because of a similar lack of information at that time. So, the recommendation was and still is for listing on 606.
MS. CAROE: Is there a second.
MR. DEMURI: Second.
MS. CAROE: Motion has made by Julie, seconded by Steve. Is there any conflicts with grape seed extract.
MS. WEISMAN: Skins.
MS. CAROE: Skin. Grape skin extract color. Any discussion? Hearing none, seeing none, the vote will start
with Bea James.

MS. JAMES: Yes.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Gerald.

MR. DAVIS: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: And the Chair votes yes. One against,
12 for, zero abstentions, two absent. Motion passes.

MS. WEISMAN: Next we have colors, hibiscus. This is a recommendation for listing which failed the handling committee 4 no's to 1 yes because of a similar lack of the data given on why the organic raw materials were not available.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Is there any conflict with hibiscus juice colors? Any discussion? Joe?

MR. SMILLIE: Yeah. This one we did have a manufacturer present documentation of the availability of organically certified hibiscus colors. I wished at the time I would have pursued, you know, the volume that they were offering to add but I missed it and, hence, I'm somewhat uncertain as to what the capability and the volume of that company is at this time so I have a bit of quandary on this one.

MS. CAROE: You have the option to amend the motion to defer. I would just remind the board that as opposed to rejecting, deferring is an option if you feel that you don't have the information for a positive vote.

Jennifer?

MS. HALL: It is my recollection that both the testimonies were given by producers and that the issue was
proximity of the product to processing so it was the same
issue that ones that might have had it more proximate to
actually make the color but the second person, same process,
did have it proximate to them. They were both producers of
the color, not a user and a producer.

MS. CAROE: Dan. Then Joe.

MR. GIACOMINI: If the organic product does exist
the certifier will not allow it to be used under 606.

MS. CAROE: Joe?

MR. SMILLIE: In principle, I agree. That's the
way I've always seen it. It's not a problem to list it.
It's a certifier's job. But, in some cases when you're
presented that the product is available listing may allow the
inconsistency of certifier applications to use it so I'd like
to make an amendment to defer hibiscus. That leaves the
industry time to resubmit for October meeting and there is
some -- there is definitely some available now so I'd like to
make that amendment.

MS. CAROE: Is it accepted by the motioner?

MS. WEISMAN: Yes. I accept the amendment.

MS. CAROE: Is it accepted by the second?

MR. DEMURI: Yes. Madam Chair, I don't think that
would be appropriate. This would be -- it's essentially a
motion to table. It would be appropriate for the maker of
the original motion to accept an amendment but this isn't an
amendment. This is to defer the vote.

MS. CAROE: The vote -- the motion right now is to accept. So, we have to vote to defer so it is an alteration of the motion.

MR. DEMURI: It's an overlying motion over the top. It's not changing it. It has no effect on the motion. It's to lay the entire discussion of the motion on the table until the next meeting.

MS. CAROE: Tracy.

MS. MIEDERMA: I would submit that we've got a little bit of an inconsistency here. I think you're referring to more ingredients. This was handed out yesterday, a list of organic flavors, one of them that's being shown here as being commercial available is blueberry which just a few minutes ago we voted as being --

MS. WEISMAN: That's a flavor.

MS. MIEDERMA: Flavors and colors. Thank you. All right. Thank you. Wrong list.

MS. WEISMAN: There is data on another sheet. It has hibiscus color on it.

MS. MIEDERMA: It's here and somebody has it.

MS. CAROE: In the past what this board has done has actually voted to defer. Substitute motion? The Chair recognizes Dave Carter. Please help me or shoot me, one or the other.
MR. CARTER: Just procedurally, Dan's right. This is different so it would be a substitute motion that would have to be made, seconded, and voted on separately so it's not an amendment.

MS. CAROE: Do I have to rescind the original?

MR. CARTER: Substitute motion takes precedent.

MS. CAROE: Okay. So, Joe, you've made a substitute motion and is there a second to that?

MR. DEMURI: Second.

MS. CAROE: Steve seconds it. Okay. Any discussion right now on to defer this material which was hibiscus juice color? Any discussion?

MR. DEMURI: How do we get word out to these folks who need information?

MS. CAROE: The result of this is going to be published and the deferred recommendation will include this information. Katerina?

MS. HEINZE: Just procedurally I have a question. The next vote we take will be to vote to defer, right? If it passes it defers. If that fails then we go back to the original motion?

MS. CAROE: Well, we can. I mean, we can make that motion, yes. Okay. But, right now we have on the table a motion to defer. Any further discussions on this motion?

Yes vote is to defer. It's not rejecting, it's deferring.
It will be taken up later. Is everybody clear? Any questions, any comments? Hearing none, seeing none, the vote will start with Rigo.

MR. DELGADO: Yes.

MS. CAROE: Gerald.

MR. DAVIS: Yes.

MS. CAROE: Katerina.

MS. HEINZE: No.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: No.

MS. CAROE: Tracy.

MS. MIEDEMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: No.

MS. CAROE: Bea.
MS. JAMES: Yes.

MS. CAROE: And the Chair votes no.

MR. GIACOMINI: Madam Chairman, would this be two-thirds or just a typical --

MS. CAROE: It made two-thirds. It's going to pass. It is going to pass. The votes are 4 against, 9 for, zero abstentions, two absent. Motion passes. 9 for 13. It just passes. Because of our new board policy and abstentions not going we just got to make sure we got this straight.

Lycopene.

MS. WEISMAN: Okay. The next item on the list is colors lycopene. Just to remind everybody that that comes from tomatoes. This also is a recommendation for listing which failed the handling committee for no votes to one yes vote so once again the recommendation is for listing on 606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Do you have a conflict?

MR. CADOUX: We are a large tomato processor. We do not produce lycopene from them. We don't sell tomatoes for lycopene. It's all used internally.

MS. CAROE: Okay. I just need to make sure because you seconded it that you have no conflict.

MR. CADOUX: I don't.

MS. CAROE: Does anybody on the board question
that? Okay.

MR. SMILLIE: He wants to get top dollar.

MS. CAROE: I'm sure he'd really like that on the

transcript.

MR. CADOUX: Thanks, Joe.

MS. CAROE: All right. Any discussion on lycopene

colors? Okay. So this motion is to list. Just a quick
discussion. Could you refresh my memory on what the
committee vote was on this?

MS. WEISMAN: Yeah, the handling committee rejected
it 4 no, 1 yes because we knew that there's organic tomatoes
and the petitions didn't include information about why those
weren't being processed into lycopene.

MS. CAROE: Okay. So, the motion failed at the
committee level?

MS. WEISMAN: The motion failed at the committee
level, yes, but, the motion is still for listing.

MS. CAROE: Any further discussion on lycopene
color? Katerina.

MS. HEINZE: I believe, but, would have to dig for
this, that we've received public comment as to the commercial
availability in one of the written comments. I can't exactly
put my hands on it right now. But, I believe we did get some
public comment on this.

MS. WEISMAN: Yes, I think you're right. One of
the petitioners that we asked to give additional information did send in written comment last week and lycopene was one of the -- I believe it's the March 23rd color maker comment and I believe that was -- lycopene was included in the category with other thing where the material that was obtained for -- that was used for color is a by-product and that most of the material was going to fresh market. Lycopene was one of those.

In other words, the organic tomato material that lycopene could be made from is more valuable on the fresh market and it never makes it into the color. There hasn't been any available for use as color.

MS. CAROE: Any further discussion? Joe?

MR. SMILLIE: Is that what you meant, Katerina? You said that you saw something that it was available.

MS. HEINZE: No, that's what I meant. I just wanted to bring it to the board's attention that we did receive some comment on this one.

MS. CAROE: Any further discussion on lycopene color? Hearing none, seeing none, the vote will begin with Gerald.

MR. DAVIS: No.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.
MS. HALL: Yes.
MS. CAROE: Steve.
MR. DEMURI: No.
MS. CAROE: Dan.
MR. GIACOMINI: Yes.
MS. CAROE: Tracy.
MS. MIEDERMA: No.
MS. CAROE: Kevin.
MR. ENGELBERT: No.
MS. CAROE: Jeff.
MR. MOYER: No.
MS. CAROE: Joe.
MR. SMILLIE: Yes.
MS. CAROE: Julie.
MS. WEISMAN: Yes.
MS. CAROE: Bea.
MS. JAMES: No.
MS. CAROE: Rigo.
MR. DELGADO: No.
MS. CAROE: The Chair votes not. This one is not going to pass. 8 against, 5 for, zero abstentions, and two absent. Motion fails. Paprika.
MS. WEISMAN: Okay. Paprika, like annatto was one that we separated into two petitions, one for the form that's manufactured by a water process and one that's manufactured
with an oil process. And the recommendation, the way it reads right now and the material, the way it reads to list right now, I think if Valerie is able to bring it up, what we will see is it's going to say colors, paprika water extracted. My colleague, Joe, just reminded me that a manufacturer advised us yesterday to just simply call it colors -- colored paprika for the version that's manufactured using water.

So, am I allowed to suggest an amendment to something?

MS. CAROE: Before you make the motion.

MS. WEISMAN: Okay. The motion -- the motion is for listing of paprika, for listing of colors, paprika water extracted on 205.606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MR. SMILLIE: I think it should be just listed as colors paprika, not water extracted. From what I understand it is not. It is not water extract.

MS. CAROE: Water soluble. That's not what he said either.

MR. GIACOMINI: I believe the petition was for water.
MS. CAROE: The Chair recognizes Sean Taylor.

MR. TAYLOR: Sean Taylor, ICAM. Paprika in general does not have a large amount of water soluble material in it. Some of it is a little bit water soluble but it's really the ground pepper pods, the ground pepper. So, it's more not paprika water extract. There's no water extraction.

MS. CAROE: Thank you for that clarification. So, it's color paprika. Are you offering an amendment? The mention is for paprika water extracted.

MR. SMILLIE: Yes. I'd like to amend the amendment to make it color paprika.

MS. CAROE: Is that accepted by the motioner?

MS. WEISMAN: Yes.

MS. CAROE: Is it accepted by the second?

MR. DEMURI: Yes.

MS. CAROE: Okay. Moving with the new motion to list paprika color on 606, 205.606. Any discussion? Hearing none, seeing none, the vote will start with Gerald. No, wait a minute, Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.
MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Gerald.

MR. DAVIS: Yes.

MS. CAROE: The Chair votes yes. Zero against, 13 for, zero abstentions; two absent. Motion passes.

MS. WEISMAN: Now, we have made a separate petition for colors, paprika oil extracted. The original petition had two annotations. One we voted on Monday night was for a two year listing. We have already voted to remove that annotation so the recommendation right now is for colors paprika, oil extracted. The annotation only organic oils is
still part of the recommendation at this time. So, that is
the motion. Is there a second?
MR. DEMURI: Second.
MS. CAROE: Is there any conflicts with oil
extracted paprika? Hearing none, is there any discussion?
Kevin?
MR. ENGELBERT: Julie, could you explain briefly
what your thoughts were on originally having it two year and
a two year annotation?
MS. WEISMAN: Yeah. Joe, your sub-committee that
handled it.
MR. SMILLIE: Yeah. I thought that at that point
in time we didn't feel we had enough information that the
color people had really done a global search for supply and
specifically mentioning, you know, traditional countries of
paprika production weren't mentioned in their search and they
obviously they need time to connect to those supplies so we
thought we'd shorten the year and since then we've received,
I think, fairly good public commentary about, you know, make
it five or not. You know, don't complicate issues by making
it shorter terms and we've also received information that
those traditional paprika producing companies really weren't
looking to sell to the color trade and it wasn't a good fit.
So, we reconsidered and moved it, dropped the
annotations.
MS. CAROE: Tracy.

MS. MIEDERMA: Just a point of clarification. Does the word color appear in the motion or does it say paprika oil extracted.

MS. WEISMAN: No, colors comes first, then paprika oil extracted.

MS. MIEDERMA: Thank you.

MS. WEISMAN: And there's still an annotation that only organic oil can be used in tint.

MS. CAROE: Actually, that was removed in the handling committee. Annotations were removed in the handling committee.

MS. CAROE: So, restate the motion.

MS. WEISMAN: Okay. So, the motion now is colors paprika oil extracted for listing on 606.

MS. CAROE: And the motion is --

MR. DEMURI: Second.

MS. CAROE: -- seconded. Okay. Any further discussion? Are we clear on the vote? Does everybody understand it's to list colors without an annotation. Any further discussion? Hearing none, seeing none, the vote will start with Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.
MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERG: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Gerald.

MR. DAVIS: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: The Chair votes yes. Zero against, 13 for, zero abstained, two absent. Motion passes.

MS. WEISMAN: Okay. The next color. Colors pumpkin juice. The recommendation is for listing on 205.606.
This is also -- this a recommendation that failed at the handling committee because of insufficient information at that time; insufficient data to show why organic pumpkins were not available or why they couldn't be processed into color and we have heard significant public comment since that time addressing that issue. So, the motion is for listing of colors, pumpkin juice on 205.606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Is there any conflicts? Tracy.

MS. MIEDERMA: I had flagged seven of these so, yes, I would like to recuse myself as a member of an organization that grows a lot of organic and conventional pumpkin.

MS. CAROE: Okay. Any others? Discussion? Hearing none, seeing none, the vote will start with Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy recuses. Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.
MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Gerald.

MR. DAVIS: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: The Chair votes yes. Zero against, 12 for, zero abstentions, two absent, one recusal. Motion passes.

MS. WEISMAN: Okay. Next up, I like the name of this one, not that that should have any influence on anyone. Colors, purple potato juice. This is a motion for listing on 606 which did not pass at the handling committee. It was rejected for no votes, one yes vote, because at the time there was not felt to be sufficient data to understand why it was not being grown organically or being processed into organic color so the motion is to recommend the listing of color purple potato juice on 205.606.

MS. CAROE: Is there a second?
MR. DEMURI: Second.

MS. CAROE: Is there any conflicts with purple potato juice color? Any discussion?

MR. DEMURI: I have a question for the board. I can't recall anybody coming up to us afterwards and telling us if that was available or not available.

MS. CAROE: Jennifer?

MS. HALL: Yeah. The gal from The Netherlands this morning, that was one of her --

MR. DEMURI: I don't recall her specifically mentioning that.

MS. WEISMAN: We asked her to make a -- I'm sorry.

MS. CAROE: Dan?

MR. GIACOMINI: I just wish I could see one before I voted on it. I feel a little bizarre on this one.

MS. CAROE: I'd like to see the hops but we'll go there later. Anybody else? Any discussion? Hearing none, seeing none, the vote will start with Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.
MS. CAROE: Joe.
MR. SMILLIE: Yes.
MS. CAROE: Julie.
MS. WEISMAN: Yes.
MS. CAROE: Bea.
MS. JAMES: Yes.
MS. CAROE: Rigo.
MR. DELGADO: Yes.
MS. CAROE: Gerald.
MR. DAVIS: Yes.
MS. CAROE: Katerina.
MS. HEINZE: Yes.
MS. CAROE: Jennifer.
MS. HALL: Yes.
MS. CAROE: Steve.
MR. DEMURI: Yes.
MS. CAROE: The Chair votes yes. Zero against, 13 for, zero abstained, two absent. The motion passes.
MS. WEISMAN: Next. Colors. Red cabbage extract. This was a recommendation for listing on 606 which passed 5 to 0 by the handling committee. So, the recommendation is for colors, red cabbage extract for listing on 205.606.
MS. CAROE: Is there a second?
MR. DEMURI: Second.
MS. CAROE: Is there any conflicts for red cabbage
extract colors?

MR. DAVIS: I work for a farm that grows red cabbage and could grow organically grown red cabbage for color.

MS. CAROE: Are you recusing yourself?

MR. DAVIS: Yes. I'm recusing myself.

MS. CAROE: Thank you. Any further conflicts? Any discussion? Hearing none, seeing none, the vote will start with Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Gerald recuses. Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.
MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: The Chair votes yes. So we have 1

against, 12 for's, zero abstained, two absent. No, 10 for,

one recusal. I'm so sorry. I'm sorry. Let me restate that.

One against, 11 for, zero abstained, two absent, one

recusal. Motion passes.

Now, just before you go any further, we're

scheduled right now for a break but I'd like to get through

this page of votes before if everybody is okay.

MS. WEISMAN: The whole page?

MS. CAROE: The colors.

MS. WEISMAN: Okay. I was going to go through the

page but I'll go through colors.

MS. CAROE: All right. Just go through the colors,

Julie.

MS. WEISMAN: The next color. Colors. Red radish

extract. This was a recommendation for listing on 606 which

passed the handling committee 5 to 0.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Is there any conflicts with red radish
extract color? Seeing none, is there any discussion on red radish extract color? Hearing none, seeing none, the vote will start with Kevin.

MR. ENGELBERT: Yes.
MS. CAROE: Jeff.
MR. MOYER: Yes.
MS. CAROE: Joe.
MR. SMILLIE: Yes.
MS. CAROE: Julie.
MS. WEISMAN: Yes.
MS. CAROE: Bea.
MS. JAMES: Yes.
MS. CAROE: Rigo.
MR. DELGADO: Yes.
MS. CAROE: Gerald.
MR. DAVIS: Yes.
MS. CAROE: Katerina.
MS. HEINZE: Yes.
MS. CAROE: Jennifer.
MS. HALL: Yes.
MS. CAROE: Steve.
MR. DEMURI: Yes.
MS. CAROE: Dan.
MR. GIACOMINI: Yes.
MS. CAROE: Tracy.
MS. MIEDERMA: Yes.

MS. CAROE: The Chair votes yes. That is zero against, 13 for, zero abstentions, two absent. Motion passes.

MS. WEISMAN: Colors. Saffron. This is a recommendation for listing on 606 that was rejected by the handling committee 4 no, 1 yes vote because at the time that decision was made the petitions were felt to contain insufficient data as to why it could not be obtained organically. I believe that this was a one item that was mentioned emphatically in the second color maker letter in terms of the material going to fresh market and never becoming available for use for color manufacturer.

MS. CAROE: Is there a second.

MR. SMILLIE: Second.

MS. CAROE: I'm going to give that one to Joe. It was close. It was a draw. Any conflicts for saffron colors? Hearing none, any discussion on colors saffron? Hearing none, seeing none, the vote will start with Jeff.

MR. MOYER: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: I'm sorry, Joe. There's too many J's around.

MR. SMILLIE: Yes.
MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Gerald.

MR. DAVIS: No.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: And the Chair votes yes. The vote is 2 against, 11 for, zero abstained, two absent. Motion passes.

MS. WEISMAN: Next is colors, tomato juice extract.

This was a recommendation for listing on 205.606 which failed the handling committee 4 no votes to 1 yes. As a
There was knowledge of much organic tomato that's grown and not enough information in the petition about why it wasn't being processed into color. And there has been public comment in the last three days which has addressed that. So, I'll restate the recommendation is for colors, tomato juice extract for listing on 205.606.

MS. CAROE: So, the motion is for listing tomato juice extract color on 205.606, right?

MR. DEMURI: Second.

MS. CAROE: Is there any conflicts with tomato juice extract color?

MR. DEMURI: I'll just mention again that we are a large tomato processor and we do organic tomatoes. We make our tomato juice, organic and conventional, but, we do not sell it to anybody. So, I wouldn't think there would be a conflict.

MS. CAROE: Okay. Any further conflicts?

MR. DEMURI: Let me rephrase that. We don't sell to anybody to make colors out of. We do sell it.

MS. CAROE: The Andy Warhol thing. That would be a highly unsustainable business.

MR. DEMURI: Exactly.

MS. CAROE: So, anyway, is there any discussion on tomato extract colors? Hearing none, seeing none, the vote
will start will chopped liver Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: Rigo.

MR. DELGADO: No.

MS. CAROE: Gerald.

MR. DAVIS: No.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: No.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: No.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: The Chair votes no. Okay. We have 8
against, 5 for, zero abstentions, two absent. Motion fails.

MS. WEISMAN: Next. Next item is colors, tumeric. It's incorrectly spelled in a lot of places. There's a little bit of controversy here. So, can we treat that as a typo?

MS. FRANCES: Is it spelled correctly?

MS. WEISMAN: It's probably not spelled correctly up there because I wrote it.

MR. BRADLEY: I think it's spelled more than one way.

MS. CAROE: Okay. Hold one. Make the motion. I do believe that this is a technical correction that we can make not from the program on this. Spelling errors, can we correct?

MR. BRADLEY: You're asking me can you correct them in your document?

MS. CAROE: I'm asking if they go forward with an incorrect spelling can it be corrected before it makes it into the Federal Register?

MR. BRADLEY: We would correct that, yes.

MS. CAROE: You would correct our English, our spelling?

MR. BRADLEY: Spelling, yes.

MS. CAROE: Okay. Thank you. They're from the government and they're here to help.
MS. WEISMAN: The recommendation is for colors, tumeric for listing on section 205.606.

MR. DEMURI: Second the motion.

MS. CAROE: I said she's moving, she's not recommending. You're moving.

MS. WEISMAN: Okay. I am -- but that's the way I've been saying it for the last -- okay. The motion is to recommend colors, tumeric, for listing on Section 205.606.

MS. CAROE: Is there a second?

MR. DEMURI: Second second.

MS. WEISMAN: Okay. This was also rejected by the handling committee. Usually I say that before we do all this stuff.

MS. CAROE: I haven't gotten there yet. Are there any conflicts? Tumeric, tamaric, or, any of those? None.

Is there any discussion? Julie, do you want to --

MS. WEISMAN: Yeah. This is a recommendation for listing which was rejected by the handling committee 3 no, 2 yes. And this is also -- I think this was not done by my sub-committee so I'm having trouble remembering. This is an odd vote. I think this was -- okay. It was rejected 3 to 2.

It is also an item that was mentioned in that written petition that we see -- we received a second comment from the petitioner.

UNIDENTIFIED SPEAKER: What was that again?
MS. WEISMAN: Tumeric. That it was not -- okay.
That it was another issue where whatever organic that was
available was not being made available for processing into
color.

MS. CAROE: Katerina and then Steve.

MS. WEISMAN: Okay. Actually, --

MS. CAROE: Katerina and Steve.

MS. HEINZE: I just wanted to remind the board and
all that testimony I think it's hard to keep track. We have
heard public comment that there are some handlers who do use
organic tumeric when it is available but it is not always
available for all the products that they are producing. Just
a reminder.

MS. CAROE: Steve?

MR. DEMURI: I just wanted to mention that like the
hibiscus it does show up on this sheet as well.

MR. SMILLIE: And I wanted to speak to that. I
think that one we did have a number of public comments that
even though it is available it's not available in the
quantities that the manufacturers need and that we -- you
know -- specifically reports from one manufacturer that they
use it in seasonal products and, but, there's not enough
available for the whole product.

MS. CAROE: Any other comments or discussion?
Hearing none, seeing none, we'll call the vote starting with
Jeff -- I'm sorry, Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Gerald.

MR. DAVIS: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: The Chair votes yes. That would be 2
against, 11 for, zero abstain, two absent. Motion passes.

It is now a quarter of three. Does the board need to take a break at this point or shall we continue? Okay. It's now a quarter of. We'll be back at five minutes to.

(Whereupon, a brief recess was taken)

MS. CAROE: Okay, Julie, get started.

MS. WEISMAN: Carbon dioxide is the next item. Okay. Next item on the list is carbon dioxide. This is one we discussed yesterday. This has been taken off the table by the petitioner. We do not need any further discussion about this material.

MS. CAROE: So, carbon dioxide as we heard in public testimony yesterday the petitioner, Zea Sonnebrand from CCOF, has pulled this petition so it will not be considered.

Moving onto the next item.

MS. WEISMAN: Carrot fiber. This was a recommendation for listing on 606 which was rejected by the handling committee 5 to 0. So, the recommendation is still for listing on 205.606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Steve. Okay. The motion is on the floor. Is there conflict?

MR. DAVIS: Yes.
MS. CAROE: Gerald?

MR. DAVIS: The company I work for grows organic carrot fiber and could supply organic carrot fiber.

MS. CAROE: And are you recusing yourself?

MR. DAVIS: Yes.

MS. CAROE: Thank you. Any other recusals? Joe, are you recusing yourself?

MR. SMILLIE: No.

MS. CAROE: Okay. Tracy?

MS. MIEDERMA: Yes, I'm recusing myself.

MS. CAROE: Thank you, Tracy. Any further conflict? Any discussion? Joe?

MR. SMILLIE: Yeah. I just wanted to remind everybody that this petition was for a specific process. It wasn't carrot fiber as a whole. It was for a specific process of carrot fiber that did not explore the use of organic carrot peelings for this fiber.

MS. CAROE: Any further discussion? Okay. Hearing none, seeing none, the vote will start with Bea James.

MS. JAMES: Abstain.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Recusal for Gerald so Katerina.

MS. HEINZE: No.

MS. CAROE: Jennifer.
MS. HALL: No.

MS. CAROE: Steve.

MR. DEMURI: No.

MS. CAROE: Dan.

MR. GIACOMINI: No.

MS. CAROE: Recusal for Tracy. Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: No.

MS. CAROE: Julie.

MS. WEISMAN: No.

MS. CAROE: And the Chair votes not. I think that one doesn't pass. We have 11 against, 1 for, 1 abstention, and two absent and two recusals. Oh, no, that's wrong. Sorry. Nine against, 1 for it, 1 abstention, two absent, two recusals, and a partridge in a pear tree. Motion fails.

MS. WEISMAN: Next item is celery powder. This was a recommendation for listing on 606 which passed the handling committee 4 to 0 with one absent. So, the recommendation once again is for listing of celery powder on 205.606.

MS. CAROE: Motion has been made, is there a second?

MR. DEMURI: Second.
MS. CAROE: Is there any conflicts? Gerald?

MR. DAVIS: I work a grower of celery. I'm not sure if it's in the form that this petitioner could use. I wasn't on this sub-committee. I didn't read the information.

MS. CAROE: Are you recusing yourself?

MR. DAVIS: I'd rather not, but, --

MS. CAROE: Okay. I don't see a reason for you to recuse. Is there anybody on the board that feels differently? Okay. Hearing none, I don't think you need to recuse. Thank you for the disclosure. Any other conflicts?

Tracy?

MS. MIEDERMA: The processing facility at our farm makes celery puree, much of which is turned into celery powder, so, I would like to recuse.

MS. CAROE: Tracy, you are recused. Okay.

Discussion? Hearing none, seeing none, the vote will start with Rigo.

MR. DELGADO: No.

MS. CAROE: Gerald.

MR. DAVIS: No.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.
MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy recuses. Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: And the Chair votes yes. We have 4 no's, 8 yeses, no abstentions -- I'm sorry, two absent, one recusal. Motion fails. I need nine positive votes for a pass. I've got eight positive votes.

MR. GIACOMINI: But, that's two-thirds.

MS. CAROE: I need a decisive vote.

MR. DEMURI: You need nine out of 13 but you have to counts the votes that are voted.

MS. WEISMAN: Okay. Next item on the list is dill
weed oil. This was recommended for listing on 205.606 and it was rejected by the handling committee 5 to 0. And we have had no further information given to us by either the petitioner or any other manufacturers. So, the motion once again is to recommend dill weed oil for listing on 205.606.

MR. DEMURI: Second.

MS. CAROE: Is there any conflict of interest?

MR. DAVIS: I work for growers fresh market dill weed. I would rather not recuse myself.

MS. CAROE: Is there anybody on the board that feels there's a conflict? Nor do I so recusal is not necessary. Any discussion? Katerina?

MS. HEINZE: I need some help with this one. Maybe some folks who were on the sub-committee or the handling committee can remind me. I believe this petitioner provided evidence on why they were unable to source dill weed oil. But, there's some question about whether they needed it or not. I need point of clarification. Are we supposed to consider whether it's essential or not for 606 items?

MS. CAROE: I can answer that question, I believe. The issue with this product was there was no explanation to the specification of this product and the concern was that this was being specked out of organic and that was never addressed. The petitioner was contacted after we did the review in February. There's been no response. Clearly we
felt that there was. We just wanted to have that information on record of why the oil was the appropriate form for this product and just to make sure that it wasn't a situation of specking out.

So, any further discussion? Dan?

MR. GIACOMINI: Gerald, do you guys do any organic dill?

MR. DAVIS: Yes.

MR. GIACOMINI: You do?

MR. DAVIS: Yes, that's all we do other than conventional carrots and potatoes.

MS. CAROE: Julie?

MS. WEISMAN: Yeah. I'm actually -- I just want to make sure -- I need a little reassurance. So, if the dill weed oil does not pass it means that this manufacturer may be forced to reformulate using fresh organic dill which Gerald does produce so I am not sure -- I think that that maybe a conflict of interest.

MS. CAROE: The votes can go either way or there can be a motion to defer. Tracy?

MS. MIEDERMA: I would like to make a substitute motion that we defer this petition to add dill weed oil to 606 in light of the fact that we did not hear back on the question of substitutability and I'm not sure that that was made explicitly clear that we're asking about the
substitutability or have we necessary held every other manufacturer to that same level of evidence.

MS. CAROE: Is there a second for the motion?

MR. SMILLIE: Second.

MS. CAROE: Joe seconded. So, the motion on the floor right now is to defer the listing, the consideration of dill weed oil until the fall meeting. Is there any discussion on the item. Katerina?

MS. HEINZE: My understanding is that after June 9th the petitioner would then not be able to use dill weed oil because we had deferred. Is that correct?

MS. CAROE: That is accurate.

MS. HEINZE: This petitioner had indicated that they have contracted with a supplier of organic dill weed oil but at the earliest that crop will be available in October. So, folks are aware of the position that the petitioner would be in.

MS. CAROE: Any further discussion? If I remember from the petition the cucumbers are harvested in August and the dill becomes available in September so that's the time. The pickles have to be made in August when the cucumbers are harvested but the dill doesn't have to become available until September.

MR. GIACOMINI: About the petition. Cucumbers are available in August, September; dill in October.
MS. CAROE: I was close.

MR. GIACOMINI: Yeah, you were. That was really good.

MS. CAROE: Any further discussion?

MR. DEMURI: Is that fresh dill or dill oil in October?

MS. WEISMAN: I believe that that was the oil. I believe that the manufacturer of the oil.

MS. CAROE: I know who the manufacturer is. It says harvested in.

MR. GIACOMINI: The very earliest in dill weed oil would be available would be October 2007.

MS. CAROE: I apologize. Any further discussion? All right. Hearing none, seeing none, the vote is to defer consideration of dill weed oil. The vote will start with Gerald.

MR. DAVIS: No.

MS. CAROE: Katerina.

MS. HEINZE: No.

MS. CAROE: Jennifer.

MS. HALL: No.

MS. CAROE: Steve.

MR. DEMURI: No.

MS. CAROE: Dan.

MR. GIACOMINI: No.
MS. CAROE: Tracy.

MS. MIEDERMA: No.

MS. CAROE: You could have withdrawn it and we could have stopped the vote. Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: Abstain.

MS. CAROE: Julie.

MS. WEISMAN: No.

MS. CAROE: Bea.

MS. JAMES: Abstain.

MS. CAROE: Rigo.

MR. DELGADO: No.

MS. CAROE: And the Chair votes no so it is 11 against, none in favor, two abstained, two absent. The motion fails. So, we can reconsider dill weed oils, first motion, --

MS. WEISMAN: The original motion is for listing of dill weed oil on 205.606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Any discussion? Tracy.

MS. MIEDERMA: I don't mean to get too wrapped...
around this but I feel like we're getting into kind of a murky territory when we go to a manufacturer that tells us dill weed oil is a very critical ingredient and we start questioning their formulations which is what we pushed back on.

MS. CAROE: I just want to respond to that before I open it up any further. I agree with you. We thought we were asking a very simple question and just never got responded to. But, the fact of the matter was, there was this question out there that we didn't get response on which kind of put us where we're at. Any further discussion? Julie?

MS. WEISMAN: I just wanted to once again remind everyone that there will be a further check. Putting it on the list does not mean that they automatically can use it. It means that their certifier will, you know, ask them to show that they couldn't source it organically. And it sounds like there's a pretty good chance that they're going to be able to source it organically pretty quickly.

MS. CAROE: Any further discussion? Katerina?

MS. HEINZE: I am not a gardener or grower by any stretch of the imagination. But, you know, they believe that they'll have it ready in October, but, we all know that crops are crops and they don't have it today, right. I mean, October, that crop could come in and not meet their needs.
MS. CAROE: I think we could say that about just about everything though. Further discussion? Okay. Hearing none, seeing none, the vote will start with Katerina. The vote is to add.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: No.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: Rigo.

MR. DELGADO: Yes.
MS. CAROE: Gerald.
MR. DAVIS: Yes.
MS. CAROE: The Chair votes yes. Okay. There's 4 against, 9 for, zero abstentions, two absent. Motion passes.
MS. WEISMAN: Yes. Okay. I will just briefly state that the next item which is fish gelatin. After we had spent quite a bit of time considering the petition it came to our attention that this had already been recommended by the NOSB in 2002 for listing on 606. So, therefore, it's already on 606 and we don't have to take any action. And we just encourage gelatin to be included and published soon.
MS. CAROE: Just a little further comment on that. The recommendation that did move -- that will move forward from the previous board recommendation was for the inclusion of gelatin at which time the board did consider fish gelatin as well as other gelatins. So, it is included in that. It was deliberated on and since we have an action completed on that there's no action to be taken by this board.
So, moving forward.
MS. WEISMAN: Okay. Next item. Short chain fructan olegofructose saccharides. Jumping the again. Sorry. Fish oils. This -- sorry about that. This was a recommendation for listing on 205.606 which passed the handling committee 5 yes, 0 no. There was concerns that were brought to light in the last few days during public comment
and our discussions yesterday and there was a concern that we limit the kind of stabilizers that can be used so the recommendations as it stands now is for listing of fish oils as is on 606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Okay. Any conflicts of interest of any fish oil people here? Okay. Discussion? Joe?

MR. SMILLIE: I think I'd like to make a friendly amendment to the effect that -- oh, boy, I've got to get the wording here.

MS. WEISMAN: I have it here. It's this first one right here.

MR. SMILLIE: Which would be an annotation.

MS. WEISMAN: This would be an annotation. Yes, this would be the dreaded annotation.

MR. SMILLIE: The dreaded annotation. The annotation would read stabilized using allowed ingredients on the national list.

MS. CAROE: Is the motion accepted?

MS. WEISMAN: Yes, I accept the amendment.

MS. CAROE: Second?

MR. DEMURI: Second.

MS. CAROE: Okay. So, we now have an amended motion on the table for fish oil with the annotation what?
MR. SMILLIE: Stabilized using only allowed ingredients on the national list.

MS. CAROE: Okay. Valerie, are you catching that?

MS. FRANCES: Yes.

MS. CAROE: Any discussions? Okay. Hearing none, seeing none, the vote will start with Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Abstain.

MS. CAROE: Rigo.

MR. DELGADO: Yes.
MS. CAROE: Gerald.

MR. DAVIS: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: The Chair votes yes. We have zero against, 12 for, one abstention, two absent. Motion passes.

MS. WEISMAN: Okay. Now, we can move on to short chain fructo-oligosaccharides. This was one of the items which the handling committee voted on Monday to amend the recommendation so it is now recommended for listing on 205.606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.
MR. MOYER: No.

MS. CAROE: Gerald.

MR. DAVIS: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: Rigo.

MR. DELGADO: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: No.

MS. CAROE: And the Chair votes yes. We have 3 against, 10 for, -- yeah, 3 against, 10 for, zero abstentions, two absent. Motion passes.

Mr. DAVIS: Madam Chair, I'm ready to inform you that due to a conflict of schedule we need to leave at this point.

MS. CAROE: Well, we appreciate all your hard work during this meeting and we still have a quorum. We still have 11 members. Thank you.

MS. WEISMAN: We're moving to the third page of our
spreadsheet. The next item is listed, is going to be listed as galangal frozen. This is a recommendation for listing on 205.606 which passed the handling committee 5 to 0. So, once again the motion is for listing of galangal frozen on 205.606.

MS. CAROE: Is there a second?
MR. DEMURI: Second.

MR. GIACOMINI: Yes.
MS. CAROE: Tracy.
MS. MIEDERMA: Yes.
MS. CAROE: Kevin.
MR. ENGELBERT: Yes.
MS. CAROE: Jeff.
MR. MOYER: Yes.
MS. CAROE: Joe.
MR. SMILLIE: Yes.
MS. CAROE: Julie.
MS. WEISMAN: Yes.
MS. CAROE: Bea.
MS. JAMES: No.
MS. CAROE: Absent. Katerina.
MS. HEINZE: Yes.
MS. CAROE: Jennifer.
MS. HALL: Yes.
MS. CAROE: Steve.
MR. DEMURI: Yes.
MS. CAROE: And the Chair votes yes. Did the court reporter get those votes now that we've lost numbers? Thank you. Okay. So we have 11 for, 4 absent, zero abstained, and zero no's and the motion passes.

MS. WEISMAN: Next item is gellan gum. This is recommended for listing on 205.606. This was passed by the handling committee --
MR. POOLER: Is the listing for 605B or 606, gellan gum?
MS. WEISMAN: You know, I'm pulling this out of my head so I'm sorry. Okay. Let me correct that. This is a recommendation for listing of gellan gum on 205.605A, right? B? Synthetic?
MR. GIACOMINI: Eight.
MS. FRANCES: 605B.
MS. WEISMAN: All right. Let's try this again. This is a recommendation of listing of gellan gum on 205.605B, synthetics.
MS. CAROE: Is there a second?
MR. DEMURI: Second.
MS. CAROE: Okay. Any conflicts with gellan gum?
Any discussion on gellan gum. Bea?

MS. JAMES: Yesterday Katerina mentioned some alternatives to gellan gum that are currently listed and I was wondering, not to put you on the spot, Katerina, if you remember what those were and I thought there were four possible substitutes.

MS. CAROE: Katerina?

MS. HEINZE: There are four similar substances that are on the list, agocarogenan, I believe on 605A, pectin low methoxy and xanthim gum on 605B. The petitioner provided evidence in the petition that while similar they don't have the same functionality; that all of these gums create unique thickening, unique other properties, so, it's another tool in the tool box of development.

I don't think it would be factual based on the petition to say that those are substitutes.

MS. CAROE: Bea.

MS. JAMES: However, those are ingredients that are traditionally also used as thickeners, correct? I know from my experience that, you know, those ingredients that are currently listed are also used as thickeners and that's not to say I'm not trying to jump to an assumption that the petitioner would be able to substitute the exact texture that they are looking for that they currently get with gellan gum and I was wondering also if anybody on the handling committee
or the sub-committee would remember if there was
documentation of the exact type of texture or results that
the petitioner was looking for with gellan gum.

    MS. CAROE: I can't remember the exact -- go ahead,
Katerina.

    MS. HEINZE: I have the petition if you'd like me
to look it up, Madam Chair.

    MS. CAROE: Well, we can do that. I'm wondering if
we should table this to a later vote today, but, just table
it so that we can look at that.

    MS. REMDINE: I am the petitioner.

    MS. CAROE: We should invite the petitioner up.

    It'll make it quick. Please, you're welcome to address.

    MS. REMDINE: Cheryl Remdine, CP Company,
petitioner for gellan gum, 205.605B. Could you ask the
specific question so that I can answer you?

    MS. JAMES: Could you tell me the type of products
that you're -- and the consistency that you're looking for
specifically with the gellan gum?

    MS. REMDINE: Okay. We've been working with
various beverage formulators and actually White Wave
presented comments about the stability that gellan gum
provides in beverages and it's not present with similar but
not the same type of additives. It provides the ability to
stabilize the nutrients and minerals in certain beverages
like soy beverages or milk beverages.

MS. JAMES: Are you currently making products without it that are okay?

MS. REMDINE: No, not organic but, they are in the like the chocolate milks and soy milks that are not organic at this time. Their organic industry asked us to move towards this petition, put this petition forth, for beverages at one point, but, gellan gum has some neat functionalities as xanthin gum wouldn't have.

It doesn't require protein to suspend. It has its own matrix so it has a better suspense system ending property set than some of the other gums. We currently make xanthin and I can speak for that.

MS. JAMES: Okay. Thank you.

MR. GIACOMINI: Okay. Wait, wait, wait. I have a question. The TAP review identifies as a permentation product which would normally be non-synthetic. You specifically requested listed on B which synthetic. Do you have justification for doing that?

MS. REMDINE: Well, at the time xanthin gum is on the 605B and we put it in the same place as xanthin. Xanthin is also fermentation derived.

MS. CAROE: If the information from the TAP reviewer can be pulled up the TAP reviewer should clarify appropriate listing.
UNIDENTIFIED SPEAKER: Give me a sec.

MS. CAROE: Shall we table this?

(Discussion off the record)

MS. CAROE: Just till -- this is not deferred, just tabled to later. I think that's appropriate and I don't believe that we can -- we have a motion on the table. Can you -- would you like to rescind your motion?

MS. WEISMAN: Yes, I would like to rescind my motion at this time.

MS. CAROE: Okay. Thank you. Then let's move on to hops.

MS. WEISMAN: We have a recommendation for listing of hops on 205.606. This is actually -- you'll see this listed on your sheet as vote previously cast because the handling committee voted on this even prior, back in December, prior to the February meeting. So, the handling committee vote at that time was unanimous for the listing of hops on 205.606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: I think he's closer so he got to my ear faster. Okay.

MR. DEMURI: Quick draw.

MS. CAROE: All right. Is there any conflict of interest with hops?
MS. WEISMAN: What, that we drink beer?

MS. CAROE: That's not a conflict. It's an enhancement. Is there any discussion regarding hops?

hearing none, seeing none, the vote will start with Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: And the Chair votes yes. And so we have 11, 4, 0 abstained, 4 absent, no recusals. Motion
passes.

MS. JAMES: Inulin, next item, yes, is inulin. I would like to ask Valerie to pull this document up. We came into this meeting with a recommendation for a TAP review at that time. And, therefore, there was no evaluation criteria. The check was the recommendation posted on the web. During this meeting we have heard a lot of comment and public presentation from both manufacturers who make this material and food manufacturers who use it and believe that we had enough information to handle in committee to make a recommendation on Monday to recommend this material for listing on 205.606. Oh, no, you're right it was Tuesday. I'm sorry. So, the recommendation is for inulin OFS to be listed on Section 205.606.

MR. DEMURI: Second.

MS. CAROE: Do I have a second? I've got it. Is there any conflicts? No conflicts. Any discussion? Katerina?

MS. HEINZE: Does anyone remember the commercial availability information on this?

MS. WEISMAN: I can answer that. I believe that there is development going on and maybe if I'm remembering this wrong someone in the room can correct me, but, I believe development is going on and that there is an expectation that at some point it will be available. It might be able to be
available as organic.

MS. CAROE: And there's nods from the audience saying that's accurate. Would you like to come address? The Chair recognizes Nancy Hirshberg.

MS. HIRSHBERG: Yes. This is made from chicory and in, in fact, they made some connections with some people here who might have some in South America and so forth so they've been researching it and they're working towards that.

MS. CAROE: Thank you.

MS. HIRSHBERG: I'm just blasted with a morass with materials at the moment.

MS. CAROE: That's the word of the week, morass. Is there any other discussion on inulin? Inulin OFS. Hearing none, seeing none, the vote will start with Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. WEISMAN: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: Katerina.

MS. HEINZE: Yes.
MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: The Chair votes yes. We have 2 against, 9 for, zero abstained, and four absent and the motion passes.

MS. WEISMAN: Okay. Next item are jalapeno/chipolte peppers. This was a recommendation for listing on 205.606. This passed the handling committee 5 to 0 so once again the motion is for the listing of jalapeno/chipolte peppers on 205.606.

MS. CAROE: Okay. Is there a second?

MR. DEMURI: Second.

MS. CAROE: Is there any conflicts with jalapeno/chipolte? I'm kind of allergic but I don't think that's a problem. Anyway, there's no conflict, so, discussion.

MR. MOYER: Yes. Julie, can you refresh my memory exactly how they were going to be -- it seems not to put a whole plant type on there, chipolte peppers, so, can you
explain to me again how they want to use it?

MS. WEISMAN: Actually, chipolte peppers isn't the plant type. All of those peppers are jalapenos and chipolte is a form of processing particularly authentic Mexican. Most of the processing is done in Mexico and those processes are not certified organic. So, it wasn't an issue of a lack of availability of organic jalapeno peppers, which is the agricultural product that it starts from, it was a lack of certified processors who understand this traditional method and will also certify organic.

MR. MOYER: And this will be used in a small quantity in some processed product?

MS. WEISMAN: Enchiladas or something like that.

MR. MOYER: So, less than 5 percent?

MS. WEISMAN: Yes, yes, yes, less than 5 percent.

MS. WEISMAN: Joe?

MR. SMILLIE: I can't remember the deliberation but wouldn't it be more probably called just chipolte because if we use jalapeno --

MS. CAROE: I can answer that.

MR. SMILLIE: -- there's an issue.

MS. CAROE: There was actually two petitions, one for jalapenos and one for chipolte which was to process jalapeno so it was put together because if jalapenos aren't available then, you know, chipoltes wouldn't be available
either.

MR. SMILLIE: They're not asking for a 606 listing for fresh jalapeno peppers.

MS. CAROE: It was one of the petitions was jalapeno.

MR. MOYER: That was a confusing part to me, Joe.

MS. CAROE: There was two petitions. One was for jalapenos, one was for chipolte peppers.

MR. MOYER: But, by voting --

MS. CAROE: You know, Dan, you were -- just as far as information this was one of the two materials that we used to beta test. I'm sorry, poblano, wrong pepper.

MR. GIACOMINI: Yeah.

MS. CAROE: Okay. I apologize. Shall we clarify this before we move on?

MR. MOYER: As a board member I'd appreciate it.

MS. WEISMAN: I think we need to look up both those petitions. I have a recollection that the jalapeno petition was being petitioned specifically for this use. It was not a petition for fresh jalapeno peppers to be on the list except for this use. We want to make chipoltes and if -- it was really for the same product but they were being called different things.

MS. CAROE: Katerina?

MS. HEINZE: I recommend we table this.
MS. CAROE: Okay. Is there agreement that we should table this and come back? I made the motion. You want to rescind the motion?

MS. WEISMAN: I will rescind the motion.

MS. CAROE: Okay.

MS. WEISMAN: So we have two items that we will return to. Moving on. The next item on the list is koji mold. This is a material that recommended for listing on 205.606. I mean, --

MS. CAROE: I'm on just the 606. It is being motioned to not consider.

MS. WEISMAN: Okay.

MS. CAROE: It was to not consider.

MS. WEISMAN: The motion, I am corrected. The motion for koji mold is not to consider. But, I believe that the issue is that we do not have standards for --

MS. CAROE: Well, let's get the motion.

MS. WEISMAN: All right. The motion is not to consider koji mold.

MS. CAROE: Is there a second.

MR. MOYER: I'll second that.

MS. CAROE: Okay. All right. So, is there any conflicts with koji mold? Except with the natamycin is bad. A mix of materials. But, anyway, okay, for discussion I'll jump in here. This is being considered -- this is being --
the motion is to not consider due to the fact that the
handling committee has deemed this unnecessary since micro
organisms appear on the list 205-605A and we find this
consistent with that listing and also considered as a non-
agricultural material based on the conflict in the regulation
between the livestock definition, including non-plant life,
and the non-synthetic definition, including bacteria.

So, this is being -- the motion is to not consider
this for listing. Dan? Joe?

MR. GIACOMINI: Just for a point of clarification.

What would be the next steps if this motion were to fail?

MS. CAROE: I think that we would have to decide
right here and now. We would have to -- we don't have any of
the evaluations completed in order to make a listing. It
would be deferred. Joe?

MR. SMILLIE: Well, I'm not going to move for
deferring but I am going to ask for a minority opinion to be
reflected. I don't believe koji mold is on 605A. I believe
the organism which creates koji mold is on 605A and I believe
that eventually koji mold and yeast will have to be on 606
because they are agricultures and I believe that we have a
number of examples of agricultures that don't have specific
regulations for them and this is just another one.

So, the people who create products that are made
with koji mold can go on creating them. There's no incentive
for them to create organic koji mold processes. And I believe that will eventually be needed but in the interest of not being a pain in the butt I won't ask for deferral but I do want to express that this will rise again.

MS. CAROE: You minority opinion is expressed in the recommendation as it stands. Any further discussion? Hearing none, seeing none, we will vote starting with Jeff. This is the motion to not consider.

MR. MOYER: I vote yes.

MS. CAROE: Joe.

MR. SMILLIE: No.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: No.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.
MS. CAROE: And the Chair votes yes. Oh, sorry, Kevin.

MR. ENGELBERT: The other chopped liver votes yes.

MS. CAROE: As long as it's a yes and you're voting with me it's not chopped liver.

MS. WEISMAN: How does the Chair vote?

MS. CAROE: I vote yes. Three against, 8 for, no abstentions, 4 absent. Motion passes. We will not consider.

MS. WEISMAN: Okay. Next item is lemongrass frozen. This is a recommendation for listing on 205.606 which passed the handling committee 5 to 0. So, recommendation is for the listing of lemongrass frozen on 205.606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Is there a conflict with lemongrass?

Seeing none, discussion? Hearing none, seeing none, the vote will start with Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Katerina.
MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: The Chair votes yes. Zero against, 11 for, zero abstentions, four absent. Motion passes.

MS. WEISMAN: The next recommendation is for the listing of milled flaxseed on 205.606. This was rejected by the handling committee 3 to 2. I'll leave the rest for discussion. It's a recommendation for listing of milled flaxseed on 205.606.

MS. CAROE: Is there a second?

MS. HALL: Second.

MR. DEMURI: Second.

MS. CAROE: Jennifer gets on the board. Is there any conflicts with milled flaxseed? Seeing none, any
discussion? Jeff?

MR. MOYER: My understanding yesterday was we had a commentor mention that there is just as much if not more organic flaxseed as there is conventional. Is that what I heard correctly?

MS. CAROE: You heard correctly, but, it wasn't from a commentor. Joe?

MR. SMILLIE: I was reporting the sub-committee deliberations on this.

MS. CAROE: Further discussion? Dan?

MR. GIACOMINI: Just as support of that, I don't know about right now, but, I know over the years we've had a tremendous amount of flaxseed and flaxseed meal to dairy cows over the years. Organic, yes.

MS. CAROE: Any further discussion? Okay. Hearing none, seeing none, motion is -- would you restate the motion?

MS. WEISMAN: Okay. The motion is for the listing of milled flaxseed on 205.606.

MS. CAROE: We start the votes with you, Julie.

MS. WEISMAN: I vote no.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: Katerina.

MS. HEINZE: No.

MS. CAROE: Jennifer.
MS. HALL: No.

MS. CAROE: Steve.

MR. DEMURI: No.

MS. CAROE: Dan.

MR. GIACOMINI: No.

MS. CAROE: Tracy.

MS. MIEDERMA: No.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: No.

MS. CAROE: And the Chair votes no. That's a unanimous against. 11, 0, 0, 4. Motion fails.

MS. WEISMAN: The next recommendation is a recommendation -- okay, got to get this right -- is for natamycin to be listed on 205.605A.

MS. CAROE: Is there a second?

MR. GIACOMINI: Second.

MS. CAROE: Any conflicts of interest with natamycin? Okay. Any discussion? Any discussion with natamycin? Katerina?

MS. HEINZE: I am perplexed by the commentor's comments this morning that it is possible that the process to
produce this could be certified organic and being a new member on the board I was wondering if someone more experienced than me could speak to that and how that might influence that process?

MS. CAROE: I can shed some light on that. Just because something is agriculturally created by agriculture doesn't necessarily make it something that would be consistent with organic principle. For example, nicotine is a prohibitive natural because it fits into a category is agriculture in nature but not necessarily consistent with organic principles so if that possibility comes up it will happen, but, at this point we don't have to allow the non-agricultural form.

MS. HEINZE: Thank you.

MS. CAROE: Does anybody further want to comment on that? Bea?

MS. JAMES: No, I just wanted to comment that I found it interesting that the petitioner recognized the difficulty in even submitting this item as being possibly listed so there's obvious conflicts in the petition so I just wanted to say that.

MS. CAROE: Any further discussion? Okay. Hearing none, seeing none, the vote starts with you, Bea.

MS. JAMES: No.

MS. CAROE: Katerina.
MS. HEINZE: No.

MS. CAROE: Jennifer.

MS. JAMES: No.

MS. CAROE: Steve.

MR. DEMURI: No.

MS. CAROE: Tracy.

MS. MIEDERMA: No.

MS. CAROE: I actually should say your name. Dan, no?

MR. GIACOMINI: No.

MS. CAROE: Tracy.

MS. MIEDERMA: No.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: No.

MS. CAROE: Julie.

MS. WEISMAN: No.

MS. CAROE: And the Chair votes no. 11 against, none for, none abstained, 4 absent. Motion fails.

MS. WEISMAN: The next item as it was recommended -

MS. CAROE: Hold it.
MS. WEISMAN: Sorry, sorry.

MS. CAROE: Recognize Bob Pooler.

MR. POOLER: Vote count, please.

MS. CAROE: The vote count for the --

MR. POOLER: The natamycin.

MS. CAROE: I'm sorry?

MR. POOLER: For natamycin, could you repeat the vote count?

MS. CAROE: The vote count was 11 against, zero for, zero abstained, and four absent. Okay. Continue.

MS. WEISMAN: The next item was originally recommended as natural casings for listing on 205.606. That's the recommendation that is before us right now.

MS. CAROE: Okay. And do I have a second?

MR. DEMURI: Second.

MS. CAROE: Is there any conflicts with natural pork casings?

MS. WEISMAN: Not pork.

MS. CAROE: Okay. Is there any conflicts with natural casings? Okay. Discussion?

MR. MOYER: Yes.

MS. CAROE: Jeff.

MR. MOYER: I think we need to make an addendum to that petition to strike the word natural and put in the word pork, beef, or sheep casings.
MS. CAROE: Is the amendment accepted by the motioner?

MS. WEISMAN: No.

MS. CAROE: Is there a second for the amendment as an unfriendly amendment?

MS. JAMES: I second.

MS. CAROE: Bea seconds. Discussion? Discussion on this amendment?

MS. WEISMAN: There as another suggestion of how to call this material as casings from processed intestines of sheep, pigs, and cattle. Oh, goats, sheep, pigs, and goats.

MS. CAROE: Dan, did you have something?

Discussion on this? Jeff, do you have?

MR. MOYER: I was just going to say as the person who made the motion for the amendment I would concede to that language change.

MS. CAROE: But we don't know the language change. Are we looking at the exact wording of it?

MS. WEISMAN: We noted the word natural wasn't going to be in it.

MR. MOYER: I was going to say processed intestine of pork, sheep, beef, goat.

MS. CAROE: Katerina?

MS. HEINZE: The petitioner says that the common name for this is natural casings, the processed intestines of
hogs, cattle, and sheep.

MS. CAROE: Is there any discussion? Dan?

MR. GIACOMINI: I don't understand why going to the petition for the specific wording why we're dropping one of the words. It has natural in its request.

MS. CAROE: Any further discussion?

MR. MOYER: Yeah. I think the reason we are dropping the word natural is because it has a lot of connotations and is very confusing across the industry outside of the sausage processing industry, the meat processing industry.

MS. CAROE: Bea?

MS. JAMES: No.

MS. CAROE: Julie?

MS. WEISMAN: No.

MS. CAROE: Okay. I do have -- casings are already on the national list under cellulose. There is an annotation for the cellulose listing for use as regenerative casings as an anti-caking agent non-chlorine bleach, and filter. So, casings from a cellulose material are already on the national list and gelatin is being put onto the national list which is also a material for casings so what I guess I'm getting at is you can be broad because all the kinds of things you're trying to exclude with your annotation are already on and allowed.
Does that make sense?

MS. HEINZE: Could you repeat where they're listed?

MS. CAROE: 205.605B, cellulose. Tracy?

MS. MIEDERMA: There is one more type of casing that we would potentially be approving, eatable collagen casings. They're synthetic and they would require separate petition.

MR. MOYER: But, they are considered natural, correct?

MS. MIEDERMA: No, absolutely not. Natural specifically refers to the intestine. That's the standard term. For instance, there's a North American Natural Casings Association. It's just a very accepted term out there and I understand the board's reticence to ever use the word natural, but, now that we've attached these particular three mammal intestines are we saying no, we're not going to allow votes. I think that we're wrapped around this word natural because of our innate, you know, reticence to ever use the word. It's just a standard industry term in this situation.

MS. CAROE: Julie?

MS. WEISMAN: I will rescind my recommendation.

MS. CAROE: Rescind the recommendation? There's a motion on the table for an amendment.

MS. WEISMAN: Okay. All right.

MS. CAROE: It's not your amendment.
MS. WEISMAN: Okay.

MS. CAROE: It's Jeff's.

MR. MOYER: But, Julie's did not accept it.

MS. CAROE: Correct. So what we have on the table is the amendment alone. It is not attached. We are just considering the amendment at this point. Because she did not accept it into her motion it's not -- we have an amended motion on the floor from -- we have an amendment on the floor.

MS. WEISMAN: Can I withdraw my non-acceptance?

MR. MOYER: Madam Chairperson, I think it's easier if I rescind my amendment and allow Julie.

MS. CAROE: So rescinded.

MR. MOYER: You need to ask her for a second if she's willing. I rescind my motion for the amendment.

MS. CAROE: Okay. Very good. And Julie?

MS. WEISMAN: Okay. I would like to amend my recommendation, if that's the proper procedure here, to read as a recommendation for the listing of natural casings from processed intestines of hog, sheep, and cattle on 205.606.

MR. SMILLIE: Second.

MS. CAROE: No, it has to be accepted by her second which was Steve.

MR. DEMURI: I accept it.

MS. CAROE: So now we have an amended motion on the
floor. Thank you.

MR. MOYER: Thank you.

MS. CAROE: Any further discussion on this? Kevin?

MR. ENGELBERT: Yes. I have a question for the board that I've been unable to find the answer to. Does anyone know now that the FDA has given an approval for cloned animals to be in the marketplace when that's actually going to happen? Is there a start date or has anybody heard any clarification on that, or, are we years away?

MS. CAROE: Let me just say it's completely irrelevant based on the motion that was made earlier today to include it as excluded methods. Whether it's an organic ingredient or non-organic ingredient you cannot use excluded methods, so, it would be not allowed for the non-organic casings.

Program. Bob Pooler.

MR. POOLER: This is Bob Pooler, National Organics Program. Is there any particular reason why you're limiting the annotation to be species that were mentioned? Why not goats?

MS. CAROE: Jeff.

MR. MOYER: That's what was petitioned in front of us.

MS. MIEDERMA: No, it wasn't.

MS. CAROE: Tracy.
MS. MIEDERMA: The petition explicitly calls for the inclusion of natural casings and later when they're citing the common name they further define it and cite those three animals. They don't say to the exclusion of every other mammal or anything like that though.

MS. CAROE: Further discussion? So, we have on the table a motion for, can you restate the motion?

MS. WEISMAN: Can I restate it differently than I said before?

MS. CAROE: Whatever gets us through it.

MS. WEISMAN: Okay. There is now a recommendation for the listing of natural casings from processed intestines for listing on 205.606.

MS. CAROE: Is that accepted by the second?

MR. DEMURI: Yes.

MS. CAROE: So now we have yet a new addition of this motion. Are there any further discussion on this? Bea?

MS. JAMES: So, I like can't keep track of this yo-yo. So, we're going back to natural casings.

MR. GIACOMINI: Their term.

MS. CAROE: Let me recognize Katerina first.

Katerina?

MS. HEINZE: I have a question that maybe the program could help us with. If -- so the term natural casings I believe would fall under the FSIS definition. In
the event that someone wanted to hypothetically create a potato, apple, bacon sausage that might not fall under FSIS jurisdiction but would instead fall under FDA jurisdiction does listing natural casings on 605B cause some ramifications that I can't think about right now or am not capable of thinking about right now?

MS. CAROE: Mark Bradley.

MR. BRADLEY: Are we looking at 606 right now?

MS. HEINZE: My mistake. Sorry.

MR. BRADLEY: Are you talking without the annotation of or the clarification from hogs, cattle, and sheep?

MS. HEINZE: I'm just worried that because FDA does not have a definition of natural that somehow this would cause some weird labeling issue that seems more complicated than I'm able to think about.

MR. BRADLEY: I really can't say at this time, but, there's going to be preamble language that's going to explain what this material is and what the discussion was and why you put it on and what it includes so if the language that you put in here, whether it's natural casings or natural casings from pigs, goats, and sheep, I don't know if that's going to be as big of a factor but the more that you put into the regulatory language that people will be looking at all the time it's usually, you know, more clear.
MS. HEINZE: Thank you.

MS. CAROE: I will say that if your concern is a vegetarian type sausage that's made, they're not going to use natural casings nor will they use anything but the cellulose which is the only non-meat.

MS. HEINZE: I'm not worried about vegetarian, but, some innovative thing that falls in this weird gray land between USDA and FDA. The example I used in the whole outside was, you know, corn dogs are regulated by USDA. Bagel dogs are regulated by FDA. And we could all argue that those are pretty similar products.

MS. CAROE: Jeff.

MR. MOYER: Would it be possible to still strike the word natural but just say casings from processed intestines?

MS. WEISMAN: I would accept that amendment.

MS. CAROE: Second?

MR. DEMURI: I accept it as well.

MS. CAROE: Discussion? Bea?

MS. JAMES: I mean would we need to say casings from animal intestines?

MS. CAROE: What else has intestines?

MS. WEISMAN: The recommendation now before is for the listing of casings from processed intestines on 205.606.

MS. CAROE: That is the motion. Any further
discussion? Dan?

MR. GIACOMINI: I think we should put livestock in there.

MS. CAROE: Really?

MR. GIACOMINI: You guys are cutting up over the use of natural when it's their industry term and we're looking at these not wanting to list particular species but I don't think we want to be getting too creative either.

MS. CAROE: Julie?

MS. WEISMAN: Would you want to exclude horse intestines? Because horse are specifically not excluded to be considered livestock.

MR. GIACOMINI: I don't think in the United States they would be legal.

MS. CAROE: All right. Call the question, please. All right. So, restate the motion as it stands right now.

MS. WEISMAN: As the motion stands right now the motion is for the listing of casings from processed intestines on 205.606.

MS. CAROE: Okay. Are we prepared to vote? The voting starts with Katerina.

MS. HEINZE: You said 606, right?

MS. CAROE: 606.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.
MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: And the Chair votes yes. Okay. So, we have 1 no, 10 yeses, no abstentions, four absent. And, painfully, that passes.

MS. WEISMAN: Okay. The next item on our list is a recommendation for the listing of non-fat dry milk instantized on 205.606.

MS. CAROE: Is there a second.

MS. HALL: Second.
MS. CAROE: Jennifer got it. Any conflicts with non-fat dry milk?

MS. WEISMAN: Instantized.

MS. CAROE: Instantized. Dan?

MR. GIACOMINI: I don't have any connection with the petitioner, the product, but, I did grow up in the area of the company that made the 40,000 lb. offer and in my expressing not objection to the fact that a company does this kind of a practice my objection to using it as a reason not to put something on 606 I was accused of having a bias against the company.

I may have a bias against the practice, but, I don't have a bias against the company. I just wanted to put that out for information, full disclosure.

MS. CAROE: Does anybody on the board feel this is a conflict? Nor do I, Dan. Julie?

MS. WEISMAN: No.

MS. CAROE: Okay. Any further conflicts? Discussion? Hearing none, seeing none, the vote will start with Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: No.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.
MS. CAROE: Tracy.

MS. MIEDERMA: No.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: No.

MS. CAROE: Julie.

MS. WEISMAN: No.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: And the Chair votes no. I'm sorry, Katerina. Katerina.

MS. HEINZE: I'm chopped liver.

MS. CAROE: Sorry.

MS. HEINZE: Yes.

MS. CAROE: So, what we have is 8 no's, 3 yeses, zero abstentions, four absent. Motion fails.

MS. WEISMAN: The next item on our list is monopoxy pectins, non-annotated which were being petitioned to be moved from 205.605B to 205.606. The recommendation at the handling committee was to defer this until the fall meeting as it is currently on the national list and is available for use.
MS. CAROE: I'm not sure an action is required for this.

MS. WEISMAN: The handling committee voted to defer.

MS. CAROE: Okay. Well, I don't think there's an action required. Just a standing item on the work plan.

MS. WEISMAN: Okay. Poblano peppers. This is a recommendation for the listing of poblano peppers on 205.606.

MR. DEMURI: Second.

MS. CAROE: Is there a second?

MS. WEISMAN: There is.

MS. CAROE: Okay. Is there any conflicts with poblano peppers? None. Any discussion? Julie?

MS. WEISMAN: I just wanted to review for the board that this passed the handling committee 4 to 1. This was a similar issue that what was being called into question there was an acknowledgement of the availability of organic peppers but this is an ethnically specific method of processing and there -- it's mostly done outside of this country by processors who are not certified organic.

MS. CAROE: Further discussion? Jeff?

MR. MOYER: Same question as with the other thing. You're saying we're certifying a process?

MS. WEISMAN: No, no, we're -- but, I'm making a
distinction. Organic poblano peppers are not available even though organic peppers are grown. There are no certified processors currently who can make those peppers into poblano peppers, organic poblano peppers. There are only conventional ones available.

MR. MOYER: Thank you.

MS. CAROE: Dan, you look confused.

MR. GIACOMINI: This was one of the trial balloon items. It was one that while it was a long time ago it was one that I worked through with the handling committee and the fact that I've connected with the process. I know originally you voted in the other way. You voted to reject it. I agreed with that vote then. I just seem to remember this more as a supply in processing.

MS. WEISMAN: I agree. Because this was one of the first things that we did that was back in December. In February, when we met as sub-committees we began to see a lot of petitions where there was no commercial availability as a product as organic, not because the organic material wasn't available, but, because it was -- there was no one available to process it organically into the form it was required for a -- you know -- a finished processed product.

And, so, we -- and we at that point had to revisit poblano because poblano fell in the same category. It would have made no sense to make a recommendation favorable to all
those other materials when it turned out in hindsight that poblano was the same exact issue.

MS. CAROE: Steve.

MR. DEMURI: The raw poblano peppers are available. It's a processing issue. They specifically petitioned for IQF, diced, roasted poblano peppers. They get the raw peppers. They can't find a processor for the dicing and roasting operations.

MS. WEISMAN: Thank you.

MS. CAROE: Further discussion? Okay. Are we prepared to vote? The vote will start with Katerina.

MS. HEINZE: Do we need to amend the recommendation to the IQF roasted whatever? I'm not saying I want to amend it, I'm just asking a process question.

MS. WEISMAN: Are you making an amendment?

MS. CAROE: Are you motioning to amend?

MS. HEINZE: No. Further questions, discussion? Bea?

MS. JAMES: Would you mind restating the motion?

MS. WEISMAN: Okay. The motion right now is for poblano peppers to be listed on 205.606. And I would also like to say that I would accept an amendment. You can amend it. Okay. I'll amend it myself. Then I will -- I amend this recommendation to read to be for the listing of poblano peppers, diced IQF. Oh, no, no, no, roasting, that's the
problem. No, never mind. It stands. I list it as is.

MS. CAROE: It's just poblano peppers. There's no amendment's been made. Further discussion? Okay. Bea, are you raising your hand?

MS. JAMES: I just want to make sure everybody's clear about the motion.

MS. CAROE: Once again, restate the motion.

MS. WEISMAN: The motion is for the listing of poblano peppers on 205.606.

MS. CAROE: Further discussion?

MR. DEMURI: Yeah. I know that there are poblano peppers organic available so we might be building ourselves up to allowing --

MS. CAROE: Yes, I agree.

MR. DEMURI: -- all kinds of poblano peppers when they are available. This particular form is not available.

MS. WEISMAN: Can I recommend that we table this, not that I want to add things to the bottom of the list, but, I also want to -- I'm hoping to feel more clear later. I don't know what makes me think that that will happen.

MS. CAROE: Okay. This issue is tabled. Let's move on. Processing technology.

MS. WEISMAN: This actually was a recommendation not to consider because raw materials can be recommended for listing, not a technology.
MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Is there a conflict with processing technology? How about discussion, any discussion on processing technology? Dan?

MR. GIACOMINI: I don't have it in front of me, but, just for clarification, this wasn't a petition for processing technology. It was about three to five different petitions, individual petitions for a particular technology, three. So, it's not like somebody just requested processing. That's our lumping.

MS. CAROE: Correct. Any further discussion? Okay. Let's go ahead and take a vote on that starting with Steve.

MR. DEMURI: Just to be clear this is to?

MS. CAROE: Not consider.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.
MS. CAROE: Joe.
MR. SMILLIE: Yes.
MS. CAROE: Julie.
MS. WEISMAN: Yes.
MS. CAROE: Bea.
MS. JAMES: Yes.
MS. CAROE: Katerina.
MS. HEINZE: Yes.
MS. CAROE: Jennifer.
MS. HALL: Yes.
MS. CAROE: The Chair votes yes. Zero, 11, zero, 4. It passed.
MS. WEISMAN: Okay. The next is a recommendation for the listing of red peppers, crushed and dried on 205.606.
MS. CAROE: Second?
MR. DEMURI: Second.
MS. CAROE: Okay. Conflicts with red peppers? Seeing none, discussion with red peppers? Jeff?
MR. MOYER: Same point of order as with the last two pepper items. Red peppers are most definitely available. The fact that they're not willing to pay a processor to do it is a totally different issue.
MS. WEISMAN: I believe that the petitioner acknowledged that there is organic crushed and dried. They have a very specific specification for their finished
product. It's also -- I think it's like a Mexican --

MR. MOYER: I understand that.

MS. WEISMAN: Okay. That's my recollection from

the petitioners.

MS. CAROE: Further discussion? Okay. Go ahead

and start the vote with Dan.

MR. GIACOMINI: No.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: And Steve.

MR. DEMURI: Yes.
MS. CAROE: And the Chair votes no. Votes are 5 no, 6 yes, zero abstain, 4 absent. Motion fails.

MS. WEISMAN: Okay. Next item is rice starch, non-modified. And this is a recommendation for the listing of rice starch, non-modified with the annotation that it will be listed for two years from the date of publication.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Is there conflict with rice starch, non-modified? Hearing none, discussion? Joe?

MR. SMILLIE: Yeah, this is one of those materials that's well along its way in the pipeline to becoming available organically but right now it's not and it is needed by industry for a number of applications. We looked at this one and actually went out and got industry opinion on it and they said basically that it's coming, it's almost here, but, it's not here yet. It certainly isn't here by the June deadline so that's why in this case we stuck with the two year annotation because we dropped that?

MS. CAROE: No.

MR. SMILLIE: Okay. Good. That's the way it should be.

MS. CAROE: Jennifer?

MS. HALL: I'd like to make an amendment to remove the two year annotation.
MS. CAROE: Motion?

MS. WEISMAN: Yeah, the two year -- I do not accept the amendment. And I would like to clarify, if I may. The reason for the two year listing for this item only is because it was not possible to post for the full 30 day comment and that was -- it was a compromise that was part of accepting a shorter public comment period that it would not be listed for the full -- it could not be a full five year listing.

MS. CAROE: Do you still want to pursue the amendment?

MS. HALL: I do.

MS. CAROE: Is there a second to the amendment? Hearing none, the motion dies for lack of second, so, the motion on the floor at this point is for the listing of rice starch, non-modified, for two years from date of publishing on 205.606, correct? Any discussion? Hearing none, seeing none, the vote will start with Tracy. Tracy?

MR. GIACOMINI: Clarification exactly. We were working on something else on another issue.

MS. CAROE: Okay. Restate the motion.

MS. WEISMAN: The motion is for the listing of rice starch, non-modified on 205.606 for a period of two years from the date of publication.

MS. MIEDERMA: Thank you. Yes.

MS. CAROE: Kevin.
MR. ENGELBERT: Yes.

MS. CAROE: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: And the Chair votes yes. Motion passes zero against, 11 for, zero abstained, 4 absent. Just really quickly, is the board okay with not breaking at this point? Is there some objection?

(Discussion off the record)

MS. CAROE: I'm just going to make a decision. Let's take a quick break to get a breath of fresh air. It's right now 4:25, ten minute break, 4:35.
(Whereupon, a brief recess was taken)

MS. WEISMAN: All right. The next item for recommendation is salvia hispanica also known as Spanish sage. This is a recommendation for listing of salvia hispanica on 205.606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Is there a conflict with salvia hispanica, Spanish sage? Seeing none, is there discussion on salvia hispanica?

MS. WEISMAN: I just want to let the board know that this was passed by the handling committee 5 to 0.

MS. CAROE: Further discussion? Comments?

Everybody clear on this material? Okay. We start with Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: Katerina.
MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: And the Chair votes yes. So we have 2 against -- I'm sorry, 3 against, 8 for, zero abstain, 4 absent. Motion passes. Next?

MS. WEISMAN: Next is sea salt which was a recommendation not to consider.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Is there a conflict with sea salt? Hearing none, discussion on sea salt? I will just fill everybody in again, this was for four components of sea salt, three of which are listed items, one of which is exempt. This item doesn't need to be listed nor is it appropriate to be listed. So, any further discussion? Bea?

MS. JAMES: So a yes vote means that we're not considering it?

MS. CAROE: That is correct. Further discussion?
Dan?

MR. GIACOMINI: I would just be a little contrary to the very last bit of what you just said. I think that listing sea salt would be great and I think one of the things we did there was request them to specifically petition that and go through TAP and everything else. It's just the way they petitioned it with the requesting four individual items just doesn't work, but, I would certainly support a full petition and a TAP.

MS. CAROE: And our recommendation did reflect that if they wanted a full listing that a TAP with all components of sea salt and contamination potential and environmental impact would also be considered. Any other discussion? Jeff? Hearing none, seeing none, the vote will start with Jeff.

MR. MOYER: Yes.

MS. CAROE: Again, this is a vote to not consider.

MR. MOYER: That's correct.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: Yes.

MS. CAROE: Katerina.
MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MS. CAROE: And the Chair votes yes. That would be zero, 11, zero, 4. Motion passes.

MS. WEISMAN: Next item is seaweed. Recommendation for seaweed wakame angaria for listing on 205.606.

MR. DEMURI: Second.

MS. CAROE: Second. Is there a conflict with seaweed? And I don't know how to say that so wakame.

Hearing none, discussion on the motion?

MS. WEISMAN: I just want to make the rest of the board aware that this was passed by the handling committee 5 nothing.

MS. CAROE: Further discussion? Okay. Hearing none, seeing none, the vote will start with Joe.

MR. SMILLIE: Yes.
MS. CAROE: Julie.
MS. WEISMAN: Yes.
MS. CAROE: Bea.
MS. JAMES: Yes.
MS. CAROE: Katerina.
MS. HEINZE: Yes.
MS. CAROE: Jennifer.
MS. HALL: Yes.
MS. CAROE: Steve.
MR. DEMURI: Yes.
MS. CAROE: Dan.
MR. GIACOMINI: Yes.
MS. CAROE: Tracy.
MS. MIEDERMA: Yes.
MS. CAROE: Kevin.
MR. ENGELBERT: Yes.
MS. CAROE: Jeff.
MR. MOYER: Yes.
MS. CAROE: And the Chair votes yes. Zero against, 11 for, zero abstained, 4 absent. Motion passes.
MS. WEISMAN: The next is a petition for spices, dried. This could not be considered.
MS. CAROE: It was actually not be considered.
MS. WEISMAN: It's not to be considered because only single materials can be considered. This is error,
these votes.
The next item is sweet potato starch for listing on 205.606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Is there a conflict with sweet potato starch? Hearing none, discussion on sweet potato starch?

Julie?

MS. WEISMAN: I just want to let the board know that this was passed by the handling committee 5 to zero.

MS. CAROE: Further discussion? Jeff?

MR. MOYER: I believe Steve had his hand up first.

MS. CAROE: I'm sorry. Steve.

MR. DEMURI: Okay. It's just for one specific form of the starch though. It's for the bean thread.

MS. WEISMAN: I would like to amend. I would like to amend this listing in that case. Sweet potato starch, bean thread for listing on 205.606.

MS. CAROE: Is it accepted by the second?

MR. DEMURI: Yes.

MS. CAROE: Jeff, did you have -- no? You got it? Any further discussion? We're of one mind. Okay. The vote starts with Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.
MS. JAMES: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: Yes.

MR. ENGELBERT: Jeff.

MR. MOYER: Yes.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: The Chair votes yes. Zero against, 11 for, zero abstained, 4 absent. Motion passes.

MS. WEISMAN: Next item is turkish bay leaves for listing on 205.606.

MS. CAROE: Is there a second.

MR. DEMURI: Second.

MS. CAROE: Any conflicts with turkish bay leaves?

Hearing none, any discussion on turkish bay leaves?
MS. WEISMAN: I just want to let the committee know that this passed -- rather let the board know that this was passed by the handling committee 5 to 0.

MS. CAROE: Jeff?

MR. MOYER: I'm just wondering if you could give me a little background information because this one is slipping my mind.

MS. WEISMAN: This is a particular flavor profile. The petitioner -- that specifically comes from bay leaves grown in a small region of the Mediterranean. There are challenges to having those be certified organic by an NOP accredited agency and also they are occasionally available organically but not on a consistent basis and it's very specific flavor profile and they submitted comments from chefs citing the differences and actually I think this is the one where they submitted a gas chromatography analysis that showed the differences in the different aromatic compounds in turkish bay leaves as opposed to other types of bay leaves.

MR. MOYER: Can you expound on what the challenges are to getting certified by an accredited certifier? Why is that not?

MS. WEISMAN: There weren't -- I guess there were not enough -- in other words, these are foreign certifiers that are operating and they were not necessarily accredited yet by the NOP.
MS. CAROE: Dan?

MR. GIACOMINI: I believe there was also reference to changes in profile based on freshness and leaf color and some of those issues and that even of the organic that they could find they didn't always meet their specification requirements.

MS. CAROE: Further discussion? Steve?

MR. DEMURI: The other issue is, this is a tree so it takes quite a while to develop an organic source. It's not like a row crop.

MS. CAROE: Further questions? Jeff?

MR. MOYER: To that end you can transition a tree just like you can a cow so you don't --

MS. CAROE: No, you can't.

MR. MOYER: You can transition apple trees. Of course you can.

MS. JAMES: Abstained.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.
MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: The Chair votes yes. I've got 2 no votes, 8 yes votes, one abstention and four absent. Motion passes.

MS. WEISMAN: Next is a recommendation. Okay. See if I can tighten this up. There are two separate recommendations as of Monday night, one for whey protein concentrate at 35 percent and one for whey protein concentrate at 80 percent. I would like to make a recommendation that we make one listing for whey protein concentrate.

MS. CAROE: Are you going to vote on them together?

MS. WEISMAN: I want to vote on them together.

MS. CAROE: It's your prerogative. Is there a
second for -- there is a second?

MR. DEMURI: Second.

MS. CAROE: Okay. There is a second. So, the motion at this time is voting on whey protein concentrate 35 percent; whey protein concentrate 80 percent for listing on 606, 205.606.

MS. WEISMAN: Correct.

MS. CAROE: Is there any conflicts with whey protein concentrate? Hearing none, discussion? Katerina?

MS. HEINZE: I thought we had discussed combining this into just one whey protein concentrate listing.

MS. CAROE: That's what we just did.

MS. WEISMAN: I know what you're saying. To not make any reference to the concentration level. Why limit that.

MS. CAROE: Because it was three materials that was listed. The motion is yours.

MS. WEISMAN: Okay. I'm going to amend my own motion. The motion is for the listing of whey protein concentrates on 205.606.

MS. CAROE: Does the seconder accept it?

MR. DEMURI: Yes.

MS. CAROE: Okay. Motion on the table is the listing of whey protein concentrate on 205.606. Is there any further discussion? Dan?
MR. GIACOMINI: Could I ask if that's a reasonable
to the petitioner?

MS. CAROE: For the record, the petitioner
responded that it was reasonable. Any further discussion or
questions? Valerie?

MS. FRANCES: This version I have from Julie has
annotation of three years.

MS. WEISMAN: No, that should have been -- that's
ancient. An artifact.

MS. CAROE: Any further discussion? Is the board
clear on the motion at this point? Okay. Are we prepared to
vote? Starting with Katerina.

MS. HEINZE: Yes.

MS. CAROE: Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.
MS. CAROE: Joe.
MR. SMILLIE: Yes.
MS. CAROE: Julie.
MS. WEISMAN: Yes.
MS. CAROE: Bea.
MS. JAMES: No.
MS. CAROE: And the Chair votes yes. Okay. I have 3 no votes, 8 yes votes, no abstentions, 4 absent. Motion passes.
MS. WEISMAN: The next item on our list, whey protein isolate has been withdrawn by the petitioner and the same is true of the material after that which is yeast.
MS. CAROE: Okay. So we'll turn to the tabled items which are --
MS. WEISMAN: Can I make a recommendation? Can we take these out of order because I think that the peppers, we have some recommended language that probably will help us vote on those quickly.
MS. CAROE: That's fine. So, we're doing the jalapeno peppers/chipoltes?
MS. WEISMAN: Right, and the recommendation is to drop jalapeno from the name. It turns out that that was a petition that was withdrawn -- that was sent back, I believe, so we never actually considered the jalapeno.
MS. CAROE: So, state the motion.
MS. WEISMAN: So, the motion is for the listing of chipotle chili peppers on 205.606.

MS. CAROE: Do I have a second?

MR. DEMURI: Second.

MS. CAROE: Okay. Discussion? Board satisfied with the listing at this point?

MR. DEMURI: Yes.

MS. CAROE: Okay. And, so, let's go for a vote starting with Jennifer.

MS. HALL: Yes.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.
MS. JAMES: Yes.

MS. CAROE: Katerina.

MS. HEINZE: Yes.

MS. CAROE: I think I've got everybody. Yes vote for the Chair. So, I have 2 no votes, 9 yes votes, zero abstained, 4 absent. The motion passes.

MS. WEISMAN: And the next tabled item is poblano peppers. And I have -- I would like to now recommend -- make a recommendation for the listing of IQF, which stands for individually quick frozen, roasted poblano peppers for listing on 205.606.

MS. CAROE: Is there a second?

MR. DEMURI: Second.

MS. CAROE: Discussion? I would like to offer a suggestion on poblano peppers and using IQF as the annotation, IQF only, or, individual quick frozen only. Because it is a selection of poblano peppers.

MS. WEISMAN: I accept the amendment.

MS. CAROE: Is the amendment accepted by the second?

MR. DEMURI: I accept it.

MS. CAROE: Okay. Further discussion? Katerina?

MS. HEINZE: Julie, could you read?

MS. WEISMAN: Yes, if course. So, the recommendation now is for the listing of roasted poblano
peppers on 205.606 with the annotation IQF only.

MS. CAROE: Further discussion? Seeing none, hearing none, the vote will start with Steve.

MR. DEMURI: Yes.

MS. CAROE: Dan.

MR. GIACOMINI: No.

MS. CAROE: Tracy.

MS. MIEDEMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: Katerina.

MS. HEINZE: No.

MS. CAROE: Jennifer.

MS. HALL: No.

MS. CAROE: The Chair votes yes. That's 6 no's, 5 yeses, zero abstained, 4 absent. The motion fails.

Okay. We have one item left and I'm sure you're
clear on it.

MS. WEISMAN: Oh, right. Okay. Everybody, we've got to help each other out here. Gellan gum and I believe we were trying to locate some information in a TAP. Is anyone on the internet? Can anybody pull up TAP?

MS. HEINZE: I have the TAP on my computer.

MS. WEISMAN: I have the tap on my computer.

MS. HEINZE: I could use a reminder of what we were looking for.

MS. WEISMAN: Gellan gum.

MS. HEINZE: I have the TAP for gellan gum on my computer. I just need a reminder of what I was looking for.

MS. MIEDERMA: Question.

MS. CAROE: Tracy?

MS. MIEDERMA: It seems that the question was around what consistency properties were imparted by this substance, ingredient.

MS. CAROE: I believe we had the petitioner up and answered that question.

MS. MIEDERMA: Yeah, and it didn't seem to satisfy the group at that moment.

MS. CAROE: Jennifer?

MS. HALL: The reason that we tabled it was to clarify why she applied under the category she did and she wasn't quite clear. She basically said she did so because
the other product they produced with similar properties fell under that category currently.

MS. CAROE: Right. And as I remember we were going to look at the TAP to see what the TAP contract said. Katerina?

MS. HEINZE: Evaluation question number one on the TAP, the question is, has the petitioner in some sense formulated or manufactured by a chemical process. The second paragraph they say it's produced by naturally occurring biological process and a chemical process is used to extract the gellan gum from the gelatation medium and to formulate the desired thickness of the gum. Then further down in evaluation question number 2 it says the formulation and manufacturing process involves partial removal of aceto groups which in turn affects the thickness and hardness of the gel.

I do remember now in sub-committee we had discussion about that which caused us to concur that it should be on 205B -- 205.605B.

MS. CAROE: Julie?

MS. WEISMAN: I also, in looking at the references to the TAP under evaluation criteria, I also see that the extraction solvent is isopropyl alcohol which is a synthetic which is further weight that this should be 205.605B.

MS. CAROE: Further discussion? So, can you
restate the motion, Julie, at this point? Or, we actually
don't have a motion because we tabled this.

MS. WEISMAN: The motion is for the listing of
gellan gum on 205.605B.

MR. DEMURI: Second.

MS. CAROE: Second. Okay. Discussion further?

We're kind of out of order, but, I'm a little confused at
this point. Anything further? Any conflicts? Hearing none,
seeing none for the last vote of the day. Dan.

MR. GIACOMINI: Yes.

MS. CAROE: Tracy.

MS. MIEDERMA: Yes.

MS. CAROE: Kevin.

MR. ENGELBERT: No.

MS. CAROE: Jeff.

MR. MOYER: No.

MS. CAROE: Joe.

MR. SMILLIE: Yes.

MS. CAROE: Julie.

MS. WEISMAN: Yes.

MS. CAROE: Bea.

MS. JAMES: No.

MS. CAROE: Katerina.

MS. HEINZE: Abstained.

MS. CAROE: Jennifer.
MS. HALL: No.

MS. CAROE: Steve.

MR. DEMURI: Yes.

MS. CAROE: And the Chair votes yes. I've got 4 no's, 6 yeses, 1 abstention, 4 absent. Motion fails.

And that is the end of a marathon vote. Unfortunately, we don't have any time to take a breath here so we will move into work plan. We don't have an order on this. Okay. Policy. I need your work plan.

MS. JAMES: The first item is to complete the guidance on temporary research variance with the livestock committee. And then updates to policy and procedure manual. We have four points under that. Developing a clarification deferral; updating appendix D on parliamentary procedures; helping to define table versus rescind motions; update on NOSB committee recommendation form to specify use of petition material, the NOSB petition form.

MS. CAROE: That's an NOP form, it's not an NOSB form. That's a program form that we use.

MS. JAMES: It's the committee recommendation form.

MS. CAROE: It's a program form so we can corroborate with the program. Go ahead to suggest changes.

MS. JAMES: Okay. In corroboration with the NOP, review the NOSB committee recommendation form to specify uses of petition; review overall flow of the policy and procedure
manual making sure that sections have adequate introduction.

And then on the new member guide we're going to add in the wonderful document that Valerie provided and work with Valerie on the staff changes. And we are going to look at the packet information that we received from Bob Pooler and see if there is a way to use some of that information in the new member guide.

Okay. This is going to be a recommendation that we're going to work on in collaboration with the NOP. We are going to work on the use and function of a document that would be accessible on the website that would show all outstanding prior recommendations.

And we are also going to clarify in the policy and procedure manual -- I'm sorry, I forgot to put this one in -- the policy and procedure manual in the election of committee chairs that the role of the board chair will be to officially make those recommendations of committee chairs annually and it's not listed that way currently in the policy and procedure manual.

MS. CAROE: Okay. It's not election.

MS. JAMES: Appointments. Appointments to have documentation of that being an annual process.

MS. CAROE: Okay. All right. Policy. Okay. So, now crops. We lost our crops chair.

MR. MOYER: Jeff, vice-chair for crops. We have
several petitioned substances that we're going to be working on throughout the next few months to get ready for the October meeting. They will be potassium silicate, sodium carbonate, peroxihydrate, sodiumfuric hydroxy EDTA, sorbitol octino-8, tetracycline.

And then we have five sunsetting substances we'll be working on, copper sulfate, ozone gas, pherocytic acid, EPA lists three inerts in passive pheromone dispensers, and calcium chloride. We'll be working on those substances.

Other items that we're going to be working on will continue to work in conjunction with the policy development committee on research variance and research operation documents and we'll be working with the NOP regarding implementation of the NOSB guidance recommendation concerning processed manures, pond compost, and compost T. That is our work plan for the next six months.

MS. CAROE: Thank you. Moving onto livestock. For your vice-chair. All the chairs left.

MR. ENGELBERT: Thank you, Andrea. The livestock committee work plan continues to be aquaculture. We continue to work on the issues that were deferred, namely the open net pens and the use of fish oil and fish meal. We will also with the AWG --

MS. CAROE: I need your mike up.

MR. ENGELBERT: Sorry. The aquaculture standards.
We will continue to work on the issues that were deferred, namely open net pens, the use of fish oil and fish meal and the use of compost, the composted manure in ponds. We're also going to work with the AWG on the development of standards for shellfish and bi-valves.

The livestock committee will continue to work in conjunction with the policy development and crop committees with regard to research variances. We also intend to get back to the pet food recommendation which was tabled until after this meeting and we're looking forward to working with the pet food task force.

Another item on our agenda is to work on a better definition of outdoor access for poultry. Mike Lacey, the former chair of the livestock committee was disappointed that this issue got pushed to the side by the pasture ANPR and we hope to get back at it.

And, lastly, at the present time we don't have any materials to consider, either petitioned items or sunset items. And that's pretty much our agenda for right now.

MS. CAROE: Just for clarification, that pet food task force work is in collaboration with the handling committee?

MR. ENGELBERT: Okay.

MS. CAROE: Okay. That's been a handling issue since it's not livestock feed, it's pet feed which actually
follows regulation for people feed.

MR. ENGELBERT: Okay.

MS. CAROE: People feed.

MS. FRANCES: As well as AAFCO.

MS. CAROE: Right. So, thank you for your work plan. Bea, did you have something?

MS. JAMES: I just was wondering if you were going to continue to track cloning and keep that on the work plan.

MR. ENGELBERT: Yeah. At least stated at the end of the recommendation on cloning we will help the NOP in any way we can if other issues continue or do come up regarding cloning.

MS. CAROE: Okay. Katerina.

MS. HEINZE: I believe one of the items that we just reviewed for the handling committee was also petitioned by the petitioner for livestock. Julie, can you help me on that? I think it was FOS, but, I'm not sure. It says under recommendation.

MS. WEISMAN: I can't remember. I approached livestock on this in February.

MS. HEINZE: Sorry.

MR. GIACOMINI: We'll review with that with the program and see where that stands.

MS. HEINZE: Thank you.

MS. CAROE: Okay. Any further questions for the
livestock on their work plan. Moving on. Handling.

Ms. Weisman: Still a long list even though we did a monumental task. For the fall, top of my list is clarification of agricultural versus none agricultural which will be done with the materials committee. Also, definition of synthetic and non-synthetic, also being done in collaboration with the materials committee.

Next I have on my work plan the pet food draft recommendations so I guess we'll all be working on that one. Petitioned materials. I think even as we speak that there are already petitions that have come in for the fall meeting. Leftover 606, okay, maybe I'm wrong, all right, but, there may be more 606 things by the fall.

Mr. Pooler: We didn't mean to take work from you regarding pet food. I apparently went back and went previous minutes of meetings to make sure that I was ready for this meeting and I obviously misread something.

Ms. Weisman: Okay. Materials for sunset review of which there are -- of which we have nine coming up. We have -- they are on 605A, auger auger, carrageenan, tartaric acid, animal enzymes, calcium sulfate, and glucono delta lactone. We also have three items coming up for sunset on 605B which are ethylene -- didn't we just do that -- okay, ethylene, cellulose, and potassium hydroxide.

Finally, there's been a lot of discussion about
flavors at this meeting and we are adding to our already full work plan, I guess what's sounding like the formation of a task force on flavor guidance.

MS. CAROE: Thank you. Go ahead.

MS. WEISMAN: That's all I got.

MS. CAROE: That's all you got.

MS. WEISMAN: I'm looking for more.

MS. CAROE: Any comments for Julie on the handling work plan? Okay. Moving on to materials.

MR. GIACOMINI: The work plan for materials, number one, collaborate with the handling committee regarding the definition of material document or the other two documents, however you want them referred to.

Number two. Stay in contact with the NOP to offer any support possible to help the program meet the June 9 court-ordered deadline for 606.

Three. Manage new petitions as they are received from the NOP.

Four. Manage 2008 sunset items in collaboration with the appropriate committees.

Five. Collaborate with the NOP and the handling committee -- sorry, Julie, I'm adding one more for you -- regarding guidelines for certifiers on issues related to determining commercial availability.

MS. CAROE: We have that guideline.
MS. WEISMAN: I just got commercial availability off my back. You're putting it back on?

MS. CAROE: We've done that. We have a recommendation.

MR. POOLER: That was Item C that was recommended.

MR. GIACOMINI: And, six, this is a working one and I would like everyone to let me get through it before jumping to any conclusions. Collaborate with the NOP regarding a process to have limited access to CBI version petitions to aid the NOSB in evaluating petitions regarding the placement of items on the national list with due consideration of maintaining confidentiality of that information.

MS. CAROE: Thank you, Dan. Any questions for Dan on the materials work plan? Last, but, certainly not least, Smillie's on.

MR. SMILLIE: The certification, accreditation, and compliance committee will have a recommendation on standardized certification for the October meeting and we will have a recommendation on, I hope -- I shouldn't say we will -- in all likelihood will have a recommendation on peer group review. We will also look at, and I'm not sure that's the right word because there already is a standing NOSB recommendation on grower group certification, but, we will re-look at that and see if there's anything we can do to
update it, if necessary.

And then press upon NOP, collaborate with NOP to give a solution to what's good for everyone.

MS. CAROE: You want the handler to help you collaborate?

MR. SMILLIE: Later.

MS. CAROE: Okay.

MR. SMILLIE: Corroborate.

MS. CAROE: Corroborate.

MR. SMILLIE: Although the hammer into the morass sometimes, you know. We were talking about tools earlier. When all you have as a tool is a hammer everything looks like a nail.

The fourth item on our list is a new one and Bea, my excellent vice-chair, has seen fit to add it onto our work list and that is to investigate, I would say, the enforcement of the organic seed requirement on organic seed commercial availability. We had one petition that I think it was one commentor that was, you know, put in front of us some interesting figures and I think that as the committee in charge of enforcement we should look into that and see why we're getting such low levels of compliance on that issue.

Bea.

MS. JAMES: Was there something that we also needed to do with the private label retailer growers or --
MR. SMILLIE:  No.

MS. JAMES:  -- we're just waiting.

MR. SMILLIE:  Anxiously awaiting the NOP response
to that document.

MS. CAROE:  Is that it, Joe?

MR. SMILLIE:  Yes.

MS. CAROE:  Kevin?

MR. ENGELBERT:   I just wanted to thank you,
Andrea, for extremely well-run meeting and your help getting
through this long process.

MS. CAROE:  You guys make me look good.

Housekeeping things.  I do need the committee chairs to send
me your work plans by e-mail please and if they bounce back
send them again.  I get issues with my e-mails.  I have
issues with my e-mail.

Also, I need all of the recommendations before I
can submit them to the program, so, all of those materials,
all of those recommendations have to come to me so I can
submit them.  I have to sign off on them and send them in,
okay.  That said, I will call for other business.

Is there any other business of this board?  Okay.

I would like to thank the program for your assistance through
this grueling process.  Valerie, you know, you're worth a
million helping us through this.  Dan, thank you for
orchestrating this fiasco and well-run machine and others
and, again, I'm embarrassed to take any accolades for this because the work was done by you folks and you just made me look really good so thank you so much.

With that, I would entertain -- Mark Bradley?

MR. BRADLEY: Yes, please. I'd like to embarrass you one more time on an incredibly well-run meeting. I know this was a team effort and to sit back and watch especially the new members and the newer members ganging in here it's not always this crazy but you guys have done a yeoman's job getting all these materials processed. You stuck with it and didn't go out of the room screaming, which I think, everyone, please.

And we appreciate all the frank comments that the program's received today and over the last couple of days and we do take them seriously, although, you know, progress is sometimes slow. The cloning, we particularly appreciate your prompt and timely response at that. A good recommendation is something that we can work with and we look forward to collaborating with you on finishing that out and getting something that we can take to the attorneys and say this is what we want to say and get a quick lesson with it so we can have a firm position that we can support.

And I'd also like to recognize our court reporter who is just demonstrated patience beyond patience in trials of adversity. That's all I have. Thank you very much.
MS. CAROE: Okay. With that, I will entertain a motion to adjourn.

MS. JAMES: I motion to adjourn.

MS. WEISMAN: Second.

MR. DEMURI: Second.

MS. CAROE: All those in favor say aye.

BY ALL: Aye.

MS. CAROE: Opposed, same sign. Hearing none, we are adjourned.

(Whereupon, at 5:20 p.m., the meeting was adjourned).
UNITED STATES DEPARTMENT OF AGRICULTURE

IN RE: NATIONAL ORGANIC STANDARDS BOARD MEETING

Meeting held on the 27th day of November, 2007

at 8:00 a.m.
Holiday Inn-National Airport
Shenandoah Ballroom
2650 Jefferson Davis Highway
Arlington, VA

TRANSCRIPT OF PROCEEDINGS

11-27-07 NOSB Meeting Participants

Chair: Andrea Caroe

NOSB Members: Gerald Davis
Rigoberto Delgado
Steve DeMuri

PROCEEDINGS

November 28, 2007

MS. ANDREA CAROE: –do work and create a draft standards, which they did after numerous hours of work and conference calls. I had the pleasure of being one of the liaisons for the board on that group so I was able to see the good work that they did and appreciate how hard an effort this was.

Once the aquaculture working group had finished with their work the board accepted their report and published it for public comment. At that time there were two issues that elicited a lot of comment and concern. The board, being not that we're technical experts in aquaculture, decided that we needed further understanding of these two issues before we moved forward. So I the March meeting of the NOSB we did pass an aquaculture standard that was void of these two particular issues, being that we wanted to go back and look at these a little bit further.

These two issues for today, we will explore. The livestock committee of the board has received papers on these subjects and selected presenters to give us some understanding of the depth of the issues that the board would be
prepared to make a decision on. And our livestock chair, Hue Karreman, will go into great detail about how that selection process happened.

At this time though, I would like to thank a couple of people that got us to where we are today. First I'd like to thank the secretary and the program for allowing us this working group, and this task force, and this symposium. With tight budgets this was a Herculean effort and we appreciate that. It's important for this industry to explore this issue so I thank the program and the secretary. I also thank wholeheartedly the aquaculture working group and George is in the audience, and the countless hours that these volunteers put into this we certainly respect the work that was done and we appreciate the work that was done. And then lastly I'd like to thank the livestock committee, who has done a lot of work for today's meeting and taking the work from the aquaculture group and implemented it well into the work plan of the NOSB and the work that you folks have done. So I appreciate that.

And with that, I will open up this Aquaculture Symposium. We will be hearing from these presenters. We have six presenters on the two separate issues, each. We will have a
presentation by the Aquaculture Working Group—give us a chance to understand the thought process that went into their presentation and their recommendation for these two issues so that we can understand the items that were discussed and why the working group came to the conclusions that they had. So with that I turn it over to Hue Karreman, the chair of the livestock committee of the NOSB.

MR. HUE KARREMAN: Thank you, Andrea.

Good morning and welcome to the Aquaculture Symposium. I just have a few notes that I want to go over about how we chose the panelists, and I certainly want to say that without the aquaculture working group having come forth with a really comprehensive set of standards we would not even be here to day as far as talking about aquaculture at any rate. So in March, the NOSB voted to recommend adding the AWG, aquaculture standards, to the regulation and that was based on being consistent with OFPA [phonetic] 2102.11 under livestock. So aquaculture does come under livestock.

I don’t know whose idea it was to have a symposium but it wasn't mine, I can't take credit, but I'm glad we're having this, and what we found
out from the March meeting is that there were two
issues of controversy, two broad issues. One
being the issue of net pens and the other one
being the issue of feeding fishmeal / fish oil to
agriculture livestock. And so what the livestock
committee did with numerous phone call conferences
was to basically come up with a set of questions
that we then put out to the public that we asked
to have answered with an abstract so that we could
choose the panelists for today. And so within the
topics like net pens, we were looking at
questions, or answers actually, and that's what we
want to hear today, get insight into the
ecological ramifications of net pens, the issue of
sea lice, possible escapes, the assimilation of
wastes, predators, and migratory issues. So that
when people were submitting their abstracts to
become a panelist for, let's say, net pens, we
were really looking for answers to those questions
and we hope to hear some today.

And then the other broad question was
about alternative nutritional technologies to the
proposed fish meal of 12 percent and fish oil of
12 percent, giving a 24 percent of the total feed
with those inputs, and are there possible
alternatives being developed, and what are the
prospects for research to decrease fish meal and
fish oil levels. Would these alternative type
feeds meet organic production principles? Would
these alternatives be considered to yield high
nutrition fish to the consumer? What is the feed
conversion rate of these different kind of
alternative feeds? And is utilization of wild
captured type fish for meal acceptable to the
organic community? And also would these, let's
say, wild caught fish be able to be segregated to
guarantee that they were from sustainably fished
species?

So they're the two broad questions with
the sub-categories that we are hoping to hear
about today. So we chose our presenters today
based on how they answered those questions as well
as giving priority to original research versus
basically reviews of synthesized previous
research. However that can be very important as
well, but we looked at the original research a
little bit more strongly. And then also we were
trying to get a balanced approach, discussing
various aquatic species. The aquaculture is
certainly not a one-issue type topic. We want to
hear about lots of different aquaculture species.

And then also please be aware, and I
think you can see over in the far side of the room
there are some posters being presented today of
people that did submit abstracts but then were not
selected as panelists but obviously they have very
meaningful input, and then also two people that
have posters today that I wanted to mention that
we didn't select, and as I said, we selected on
these questions I just went through, is Urvashi
Rangan [phonetic] from the Consumers Union and
Linda Odierno [phonetic] from the New Jersey
Department of Agriculture. I think it's really
worth mentioning, the whole national organic
program is under the agricultural marketing
service and so their two submissions were
basically looking at the marketing aspects and the
consumer aspects of aquaculture, organic
aquaculture. I just wanted to really point out
that we need to, as the National Organic Standards
Boards, maintain organic consumer confidence.
That is part of our mission, and a big part of it.
And so I would urge you to look at their input on
the posters because it really shows how the
consumers view what they want organic aquaculture
to look like, and we do need to take that into
account. And so we need to balance that with,
hopefully, a scientific basis in our decision
making and hopefully we will be able to vote on
these two issues at our spring meeting next year.
Thanks.

MS. VALERIE FRANCES: So just a simple
review then of what our process will be for today.
I'm Valerie Frances, I'm the Executive Director of
the National Organic Standards Board, and I've
spoken with many of the panelists or had email
exchanges, trying to help pull all this together.

If any of you went to the dairy
symposium, you'll recall we had panelists come up
and address various issues, and we did not take
public comment in the usual way. And we will be
having public comment tomorrow, Wednesday, the
first day of the business meeting, where I have
grouped a large number of aquaculture folks early
on to accommodate travel schedules and just sort
of force some coherency. But what we'll do today,
along with hearing from the panelists in their
presentations, first covering fish meal and then
in the afternoon covering the net pens, I'm going
to pass out index cards and little pencils, and
you are free as the audience to write out
questions as they come up, and help get them to
me, and I will give them to the livestock
committee, and they can move through those
questions, and help get different questions out there in case you've thought of things that the livestock committee and the board haven't thought of in the course of the presentations.

So I'm going to run through real quickly each of the panelists according to their panel. So in the beginning of each section I will introduce the panelists and then they will come up in the order that they have selected out of the cup. So it was a random selection. And am I covering everything? And then before each of the panelists, as well the actual panels, George Lockwood is going to present an overview of each section in terms of what the aquaculture working group came up with.

MALE VOICE: Valerie, we're going to try to seat the panelists along this seating that would normally be for the program, so we're going to yield six seats over here while they're in there in their panel mode, so they'll all be together. We'll move some microphones down there so that they can speak at that.

MS. FRANCES: Thanks for improvising. So I'm going to run through, real quickly, the panelists for the record and then George you are more than free to have the stage at that point, so
hang on a second.

Our first speaker is, I hope I get this right, Md. Shah Alam. I think that's right. He is with the University of North Carolina, Wilmington, the Center for Marine Research. His topic is replacement of menhaden fish meal by soy bean meal for the diet of juvenile black sea bass. He is a research assistant professor at the Center for Marine Science and has a PhD in aquaculture, nutrition, and feed technology from the Lab of Aquatic Animal Nutrition out of Kagoshima University in Japan.

Our next speaker will be Dr. Craig Browdy with the Marine Resources Institute, with the South Carolina Department of Natural Resources. His topic is alternative approaches for removing fish meal and oils from farmed shrimp using plant and poultry meals and marine algal products. He is the Senior Marine Scientist responsible for the development and execution of R & D programs on marine shrimp. He's doing research on the farming and husbandry of marine shrimp in South Carolina at the Waddell Mariculture Center in Bluffton, South Carolina.

Brad Hicks is next. He's the chair of the Pacific Organic Seafood Association, out of
Canada, British Columbia. His topic is feeding fish fish meal and fish oil, fulfill organic tenets? He has a background in fish and wildlife biology, veterinary medicine, and fish pathology, and is a certified fisheries scientist. Published a great deal. Just to remind me, make sure I'm covering everything.

Number four is Dr. Steven Craig from the Virginia / Maryland Regional College of Veterinary Medicine, out of Virginia Tech, my alma mater as well. Total replacement of fish meal and fish oil in diets for Nile tilapia, and the marine obligate carnivore, kobia. He has a doctorate in marine science from Texas A&M and is currently associate professor in the large animal clinic sciences and a joint appointment at the Department of Fisheries and Wildlife Sciences. Conducts his nutritional research at the Virginia Tech aquaculture center. Also with the Virginia Aquaculture Association, and the World Aquaculture Society, and a founding member of the Organic Aquaculture Institute.

Jonathan Shepherd is with the International Fish Meal and Fish Oil Organization. His topic is sustainable marine resources for organic aquafeeds. Qualified vet with doctorate in aquaculture economics, also with a number of
management posts in aquaculture with a variety of companies, and the managing director for Danish fish feed company, Biomar until he's with the Fish Oil Organization.

And last but not least is Dr. Torbjorn Asgard from Akvaforsk, Norway. Sorry for my pronunciations. Flexibility in the use of feed ingredients can turn the farm salmon industry sustainable. He is the research group manager with the fish feed nutrition in Akvaforsk, and fish nutrition at Norwegian University of Life Sciences, and has a field of fish nutrition research with emphasis on salmonids, a wide variety of nutrition and physiological related research.

So I think that covers it. And George, you're on, thank you.

MALE VOICE: Valerie? Where was Shepherd?

MS. FRANCES: Number five. Yes.

MALE VOICE: One question, Valerie. When the panelist are giving their discussion, will they be taking any questions in their 20 minutes or is that all at the panel discussion time?

MS. FRANCES: We discussed keeping that to the end, and now of 20 minutes, B. James is
going to have a little one minute sign for the
panelists to let them know they have one minute
left. We're going to try to stick to our time
clock as much as we can. We have a lot to cram
in. And I'll pronto be passing around index
cards.

MR. GEORGE LOCKWOOD: Madam Chair, I want
to thank you all very much for the effort you're
making to understand organic aquaculture, a
complex subject, and for being here today. You're
all very busy people and to come here a day early
is much appreciated by your aquaculture working
group. I'm George Lockwood, the chair of the
Aquaculture Working Group.

As Mrs. Caroe has said, we are a diverse
group of twelve that were officially appointed by
the secretary. Four of the aquaculture working
group are research scientists at various
universities across the land. Three are growers,
one is a former grower. One is a trade
association executive, another is a fish health
expert, another is a potential supplier of omega-3
fatty acids produced by algae, and we have a
member of the environmental community as one of
our members.

As we worked over the last several years,
and incidentally, this all began in 1999. We've come a long ways. Since 2005 we've been working intently on the regulations that we have proposed that you have before you.

During our work we've always had one member of the staff participating in our telephone conference calls and almost always at least one member of the NOSB. Mrs. Caroe, you were with us from the very beginning and we are very appreciative of all the time and effort you've put in towards what we are trying to accomplish here.

Let me point out that our interim final report, which is a document basically that the fish meal and oil section and the net pen sections was a consensus document. There is no minority report. The twelve of us reached a consensus on what the feed standard should look like and what the net pen standard should look like. It was not an easy task because we had a lot of diversity and a lot of diverse opinions, but nevertheless, while each one of us might think differently if we were to propose a standard we all speak with one voice. We were unanimously behind this consensus document. Every voice was heard.

Since then we have received numerous public comments having to do particularly with
feed issues and net pen issues, and those have been digested and reported. You'll recall that in February of 2007 we put together a commentary based upon all the public comments with a revised proposal. In that is a table that we have drawn up showing the requirements for fish meal in a wide range of either crops now grown in—fish now grown in aquaculture or our prospective candidates. It shows clearly the dependence for every specie, including tilapia, on fish meal. In tilapia's case, it's very low but the simple fact is if you don’t include fish meal or other sources of the critical amino acids in that diet, the animals do not grow well and they are not healthy.

In the proposal before you we have a number of features. One is we address the sustainability issue of marine ecosystems including but not limited to fishery resources. We address contamination from persistent organic contaminants. We have included a maximum for a seven year period of 12 percent for fish meal and 12 percent for oil. And we've also, in the case of reduction fisheries, namely Peruvian anchovies or American menhaden, require a maximum of one pound of wild fish to produce a pound of farm fish. You'll undoubtedly hear today and you've
seen in the literature, people are making claims that it takes a large quantity of fish from the ocean to produce a pound of aquaculture grown fish. We're saying that if any fish is coming from the ocean in a reduction fishery, that it's one pound maximum and our nutritionists believe that that is a practical rule.

Also we are favoring strongly the use of trimmings. In the case of Alaska, the Alaska pollack industry, it is a very, very large fishery. It is sustainably managed, it's recognized as being sustainably managed. When the pollack is harvested, the filet is cut off, which might account for maybe 30 percent of the total weight. The rest is wasted. If it is within Alaskan waters, state waters, the carcass is reduced to fish meal and oil. Because of the economics of the oil, it is burned as-mixed with diesel fuel and boiler fuel, and burned for its energy content, and that very valuable source of omega-3 fatty acids does not make it into the human chain. Our proposal would heavily weigh recovering the Alaska pollack by-products.

We also have a clause in here that the use of fish meal from wild resources will expire in seven years. Our nutritionists believe that is
a practical period of time and the questions you'll be answering today, hearing answers to, will go to that question. Is it reasonable to expect that in seven years aquaculture can no longer require fish products from the wild?

And finally I'd like to say that you've heard a great deal in the public comments and you probably will hear today about conventional aquaculture. We are not attempting to codify conventional aquaculture. We have something substantially different and we hope that you will recognize that as you go on.

So that's all I have to say. I guess you're the moderator, Valerie? Thank you very much.

MS. FRANCES: If we have any other comments for George right now or any questions for him real quickly? Anything anyone wants to say right now?

MS. CAROE: I just want to point out that the document that George has referred to is posted, so that is available to get a more detailed explanation of the response to the concerns with these issues. So that is available on the web site.

As we tee up for these presentations, I
will reiterate that public policy is important for this program. This is a marketing label and today we're going to be hearing a lot of the science but we will also be taking into account the public's concern on these two issues, as a marketing claim and protection of the organic label as Hue has indicated, is important to this board. This regulation is about protecting the consumers when they're purchasing these organic products, that they meet their needs for organic for that label. So this is kind of an interesting combination. We are entering into a symposium here which largely is based on science but the outcome of what this board does will also take into account those public policy issues.

I thank you George and with that, we're ready for the first speaker. Valerie?

MS. FRANCES: Our first speaker then is Md. Shah Alam, with the University of North Carolina, Wilmington. And amazingly, we're ten minutes ahead of schedule.

[pause]

MR. MD. SHAH ALAM: Good morning everybody. I'm Md. Shah Alam. Came from the University of North Carolina, Wilmington.

MS. FRANCES: Do you want to bring your
mike a little closer to yourself?

MR. MD. SHAH ALAM: Thank you.

MS. FRANCES: If you could give us your name and your association and then spell your name for the court recorder, we'd appreciate that.

MR. MD. SHAH ALAM: Okay, my name is Md. Shah Alam. M-D. S-H-A-H A-L-A-M. And I came from the University of North Carolina at Wilmington. I'm working as a research assistant professor with Professor Dr. Wade O. Watanabe, who is also present here. And one of our other quarters of this research is our graduate student, Katharine B. Sullivan.

Okay, before going to details I would like to a little bit brief introduction that organic aquaculture, what we are thinking now for organic fish feed and fish meal is one of the most important topics today. How can we get it sustainable and what level of fish meal we can use?

So before going into details, a little bit of background of this fish. My title was how we can replace the fish meal with soy bean meal, because soy bean meal is [unintelligible]. Now black sea bass are found in waters along the Atlantic coast from the Gulf of Maine to north
Florida, and of course this is an excellent food, and this is overharvesting. So the culture of black sea bass is increasing day by day, especially in the North Carolina region.

Now how are the resources on black sea bass culture? By the way, before going into details I'd like to say that today, this morning, I'm going to present this as original research. That is, that research will give some information for the fish oil, especially for the menhaden fish, the level of the organic feed.

Okay now, the research on black sea bass is for captive spawning larviculture grow out of [unintelligible] and economic evaluation is done. But unfortunately, nutritional requirements or feed development of this species not yet. We just did one study about protein requirement of hatch [unintelligible] fingerlings and at present we are doing several studies on this species for nutritional study.

Now, alternative protein sources in organic aquaculture diets. So this is very simple things that now today we know that primary protein sources is fish meal, which is limited and of course this is expensive. And of course, day by day, the use of fish meal is increasing.
The reason we chose the alternative protein sources is because it is less expensive, especially plant protein sources, and this is available, sustainable, and this is environmentally friendly. Phosphorus and nitrogen, two important things that is the problem in the water for fish meal. So in this case we can reduce this. And of course we have to think that these plant protein sources are deficient of some essential amino acids, which is really needed for fish to grow.

So the target of my research is to determine the maximum percentage of fish meal protein that can be successfully replaced by solvent extracted soy bean meal in black sea bass diets. So for that purpose, initially we did two experiments. One is partial replacement of fish meal protein by soy bean meal, which is from zero to sixty percent. Zero means no soy bean meal, all 100 percent fish meal based, and we replaced 10 percent protein, 20, 30, and 60. And we did another experiment is partial and full replacement of fish meal protein by soy bean meal protein from 60 to 100 percent. It was possible to do it in one experiment but unfortunately, due to limited space and time we did two experiments. And of
course we wanted to see initially how many percent
we can get.

So these are the basic formula for the
diet formulation. We used about 48 percent
protein and lipid 12 percent, vitamin, minerals we
used high quality starch, attractants, and others.
Now these are the formulation for these diets.
Here I want to mention that as we have no clear
organic feeds, what it must be, this is not yet
finalized, so this was initially our target was to
replace the fish meal by soy bean meal, not the
organic point of view, but we have planned now to
improve, to go to the organic diets. So that's
how we use attractants one percent, because to
make the palatability, which may be not allowed
for organic. And we used solvent extracted soy
bean meal, which may be not, but we can change
this one also. So we used menhaden fish meal, 50
percent, for the control diets, if you can see.
Unfortunately I don’t have any pointer. And then
we decreased the fish meal for each, you know can
see, and here is we increased the soy bean meal.

Here I have to mention that we used the
soy bean fish meal protein replacement, and then
others we used squid meal, krill meal, and fish
oil, soy bean lecithin. These all formulations
according to the recent nutrient requirements information for carnivorous fish, especially menhaden fish. And we used the protein. This is analyzed, lipid level 12 percent. And this soy bean meal, we know that it's deficient of two essential amino acids, methionine and lysine. So we just calculated what methionine and lysine is available here.

Now these are our feed preparation room. This is our University of North Carolina Center for Marine Aquaculture facility. Thank you very much. And then this is our feed room that we prepare feed and everything. Everything we purchased locally, either maybe United States or maybe some from Japan, especially like vitamins and minerals. And we prepared diets in our facility.

Now this is the rearing conditions. Here, one thing is that we used a recirculating aquaculture system. So we used for the first experiment we used 6.6 to 7 gram black sea bass, 75 liter tanks, and 15 fish per tank, and we used it in triplicate tanks. The other water quality parameters were according to the suitable conditions for black sea bass maintained. And we fed two times a day and 42 days we continued this
Now, by chemical analysis, some analysis we did in our facilities, our newly established aquaculture nutrition laboratory, and some of this equipment still we don’t have so we used the New Jersey feed laboratories. And all data we analyzed by [unintelligible].

Now this is the results from our experiment. What we found after the 42 days feeding trial. So you can see that we did sampling in each of two weeks, I mean, 14, 28, and 42 days. So you can see we did not find any statistical difference during 42 days, even from zero to 60 percent. It means even 60 percent replacement of fish meal by soy bean meal, we did not find any statistical differences. So on the basis of this we continued.

Then this is the weight gain. So you can see this is the effect on weight gain. There is no statistical differences. Now this is the other parameters, like SGR. As I said, this scientific research so we did specific growth rate, feed intake, FCR, feed conversion ratio, survival. No statistical differences. We did not find any differences for this species. And this is after feeding trial, we did body proximate composition,
like moisture, protein, lipid. We did not find any differences except some in ash content.

So what did we find from this experiment? One, we found that no significant differences on growth performance. And we found no significance on body growth, protein, and lipid, and moisture. And we found that replacement of fish meal protein by soy bean meal could be more than 60 percent. So on the basis of this experiment we continued another experiment.

This is the partial and full replacement of fish meal protein by soy bean meal protein. So you can see that from zero percent, this is the control one, and then 60, 70—we did again 60 even though we did before—until 100 percent replacement. So this is a guide formulation as we did before. Exactly same things we did, just only in this case we just increased soy bean meal and decreased the menhaden meal, and you can see the finally 100 percent replacement is zero percent. And the other [unintelligible] similar to experiment one.

So the whole thing is like a methodology for diet, rearing, and protocol. Everything is the same as experiment one, just different batch of fish. So in this case we used initial weight
of the fish was nine grams and then you can see that we did this experiment until 70 days. After 40, 50, 60, and 70 days, you can see the—significantly different, the growth is, we found. This is the body weight gain. If you can see that if we use more than 70 percent, the body weight gain was statistically decreasing. Whereas less than 70 percent there's no differences.

So what we found from this experiment?

Looks like that we cannot use more than—we can use if we want but in this case growth will be lower than the control diet. So these are the other parameters. As I said, specific growth rate, feed intake, feed conversion ratio, all were significantly decreasing if we use more than 70 percent.

Now could you please? Now these are the whole body proximate composition, I mean, body composition. We can see that if we use more than 70 percent then protein and lipid level is significantly decreasing.

So what we found from this experiment?

We found that if we use more than 70 percent replacement then growth is decreased, feed conversion and protein efficiency is decreasing. And more than 70 percent replacement decreased the
whole body protein and whole body lipid. Now we can recommend that replacement of fish meal protein for black sea bass diet, not more than 70 percent. Here I want to mention that I used with attractants like glycine, alanine, taurine, and [unintelligible] which may be not allowed for the organic aquaculture. But why I use here? As I said, this is the first study we did. We wanted to know how many percentage of fish meal could be replaced, then we can gradually improve. And these are for the palatability.

So on the basis of these two experiments, we designed another experiment. Let's see what happened without attractants if this is not allowed. So we did experiment, exactly like experiment one but in this case we did not use any attractants that makes the fish eat the soy bean meal. We used zero percent, 10 percent, to 60 percent. So in this case, I'll not say details as we did—everything is the same as experiment one but different batch of fish. So initial weight was one gram and after 42 days, you can see that after 14 and 28 days we did not find any statistical differences. But after 42 days we found that 50 percent and 60 percent replacement gave lower growth, without attractants. If you
can remember, the previous experiment was 70 percent with attractants.

So the next experiment we designed let's see [unintelligible] 50 to more than 50 percent, I mean, 100 percent, without attractants as we did experiment number two. So we did experiment number four to replace 50, 60, 70 to 100 percent, of course without attractants. Then what we found. I just showed only the result, body weight gain. You can see that if we use more than 60 percent then growth is significantly decreased. Just compare with the previous experiment we did, experiment with attractants, which was 70 percent. If no attractants then it's 60 percent replacement. So maximum replacement of fish meal protein is not more than 60 percent without supplementing attractants. That is—we are want to organic thinking.

So we tried to see another species like southern flounder, which is also a most important species in North Carolina region. So what we did in this case just change the species. So this will give us information that how species, water carnivorous species, how species to species difference the utilization of soy bean meal. So we did the experiment zero to 60 percent.
Now the results. We're just showing only the growth performance. We have a lot of data like proximate composition, fatty acids, amino acids, that we'll do later. So we can see that this result, just after 42 days, not more than 40 percent we can replace. Because if we use more than 40 percent then growth is significantly decreased. Water carnivorous species, one can use more than 60 percent, the other cannot use more than 40 percent. So my thinking is that before deciding that 12 percent fish meal or something, we have to think that species is of concern.

So final remarks from these, my five experiments. We can conclude that assuming no reduction in growth, if we think that there will be no reduction in growth, we don’t want it, then about 70 percent of menhaden fish meal protein could be replaced by soy bean meal protein, with attractants, that is alanine, taurine, vitane [phonetic], but I did not use any methionine and lysine. But if we add methionine and lysine, it could be more. This experiment is going on now.

In another sense if we [unintelligible] the calculation from the diet formulation, I found that 15 percent fish meal plus 47 percent soy bean meal, if we use 7.5 percent squid meal and krill
meal, and ten percent lipid for all, equal to the
40, 50 percent fish meal [unintelligible] no
reduction on growth. So we can use 15 percent
fish meal, but of course it depends on the
formulation. If we change something, vitamins or
minerals, it could be different. [Unintelligible]
no effect on growth. But if we think for organic
feed we want to compensate on growth then maybe
you can use 10 percent, 12 percent no problem.

So without attractants. That is the
organic point of view, that we need to use 20
percent fish meal to make the equal growth that is
100 percent fish meal based diets.

Okay, now in the case of flounder, we
cannot use more than 40 percent menhaden fish meal
replacement with soy bean meal protein. So on the
calculation of feed formulation we found that 30
percent fish meal we need. Of course, I said this
is on the basis of my formulation that I did, a
combination of squid meal and krill meal equal to
50 percent fish meal. This is for the case of
flounder.

So my consideration on the organic feed
aquaculture, that today we are going to debate for
that 12 percent fish meal and 12 percent fish oil,
my thinking is 12 percent fish oil is enough for
the fish growing, especially for black sea bass and southern flounder that we are doing an experiment. But 12 percent fish meal, if we want to use, we have to use something protein different like soy bean meal of other combination, animal protein sources. So diet containing 10 to 12, 15 percent fish meal, of course in combination of these protein sources like soy bean meal, squid meal, krill meal, produce slightly lower growth but in the case of flounder it produces 50 percent lower growth. So if we want to make an organic flounder—of course I said this is intensive recirculating aquaculture system. I'm not talking about pond or any other thinking. Okay, now we can get half growth but future, we'll do future studies with non-solvent extracted soy bean meal, which could be slightly different or—we don’t know. We'll do it. But most of the market we can find the solvent extracted soy bean meal.

Now we need to think about the culture system. My thinking is like extensive culture, same intensive, or intensive, or recirculating, because we know that intensive culture, we are not going to provide any other natural—it's not possible to produce. Is it possible to use this kind of system for organic, because if that is not
a level for pond or other system.

Now we all need to think feeding behavior [unintelligible] omnivorous, carnivorous, herbivorous, or [unintelligible] especially protein requirement. We know that for the menhaden fish, protein requirement is high. More than 50 percent. And especially they need higher animal protein sources to grow. If we can feed them lower protein based diet but in this case there is a possibility for disease outcrop or maybe some other negative effect.

So this is all about my research, what I did. As I said, this is all information about the original research which maybe gives some information, some data for you to decide organic feed, organic [unintelligible].

So I'd like to acknowledgment for the funding of these experiments is [unintelligible] Biotechnology in North Carolina, our ENCW [phonetic] program, and NOAA, also grants from the National Menhaden Aquaculture Initiative, and of course our staffs of ENCW, our aquaculture program, and finally thanks everybody for your attention. Thank you very much.

[applause]

MS. FRANCES: Thank you. I just want to
remind folks too that the presentation will be posted on our web site so you'll be able to go through them like a PowerPoint right on the web site.

Our next person is Dr. Craig Browdy from the Marine Resources Institute, South Carolina Department of Natural Resources.

DR. CRAIG BROWDY: Thank you Valerie. Before I get started can I ask, does anybody in the room have a laser pointer?

MS. FRANCES: Once again, if you can announce yourself, and then your affiliation, and the spelling of your name please for the court recorder.

DR. BROWDY: Yeah sure. My name is Craig Browdy. I work for the South Carolina Department of Natural Resources and my name is spelled, C-R-A-I-G, Browdy, B-R-O-W-D-Y.

As part of the South Carolina Department of Natural Resources, we have a marine resources research institute that has been around since the early 1970's and has engages in aquaculture research. In fact, our department has been doing aquaculture research since the 1950's. And in 1984 we built the Waddell Mariculture Center in Bluffton, South Carolina, where we've been doing a
lot of work on aquaculture, various aspects of aquaculture research.

This particular study builds on a lot of studies that we've done over a lot of years to try to make aquaculture a bit more sustainable and this is working on different things having to do with the feeds, the diets, building it towards organic certification, and it also builds on work we've been doing with systems, and with water quality, and with a lot of other aspects of sustainability in aquaculture.

The work that I'm going to present today is multi-disciplinary and has a bunch of people that helped me out with it. And if I can't answer any of the questions that might come up, I'm certainly not, number one, a nutritionist by any means, I'm more of a generalist, but my co-author, certainly Alan Davis and others, can find answers to questions that may come up that I may not be able to answer very quickly.

The two from DNR that worked on this was myself and Dr. John Lefler. The diet formulations were mostly done by Dr. Alan Davis from Auburn University. Some of the testing was done by Dr. Tsahi Samoha [phonetic] at the Texas Agriculture Experiment Station. And Bob Bullis has been
working with us on this. He was part of the 
aquaculture board and works for Advanced 
Bionutrition Corporation that makes these oils, 
which are alternative sources of DHA and ARA.
The diets were all manufactured by a 
company called Ziegler Brothers in Gardiners, 
Pennsylvania, for the large scale pond trials. 
The diets for the small scale trials were 
manufactured at Auburn. And then we did some work 
on post harvest flesh quality and that was done by 
Gloria Seaborn, who works at the NOAA Center for 
Coastal Environmental Health and Biomolecular 
Research in Charleston. She's the lipid lady. 
We have a couple of different sources of 
funding that went towards this research. We have 
some grants from the base funding for many years 
from the U.S. Marine Shrimp Farming Program, 
that's funded through the CSREES, USDA. We did 
get a small business innovation research grant 
through Advanced Bionutrition and subcontracted on 
that for some of the large scale studies. 
Recently we've gotten some funding from NOAA from 
a program called Oceans in Human Health and when 
we saw that program we felt like it was a good 
opportunity for us to get our feet a little bit 
wetter in the area of seafood and human health.
And it seems like a direct relationship between what's going on in the ocean and what happens to humans. And so we've been focusing on that. We've done a bunch of surveys. For example, we've done 70 different sources of shrimp and looked at contaminants and fatty acid profiles of those shrimp. And we've done the same with red drum from Asia and from farms in the United States and from wild, different estuaries around the United States, looking again at 79 different contaminants with NOAA partners and looking at fatty acid profiles in terms of human health benefits. So the benefits and risk and weighing the benefit and risk. So that paid for part of the forensic analyses that we did.

And then finally we just got a grant from the Integrated Organic Program last year. Unfortunately, the first studies that we've been doing on that program have only been over the last season so we don’t have a lot of that really digested yet and ready to present but I'll show you some of the directions that that research is going.

I guess we all know, I'm here to talk about shrimp. Shrimp is a really important seafood product, particularly for consumers when
we're talking about public policy and we're talking about what people want. I think in a lot of cases what people want is shrimp. It's the number one consumed seafood, and the quantities keep increasing, and people really enjoy it. This is just a little bit of data on fish meal use with shrimp culture. Today a lot, more, and more, and more of the shrimp that we're eating comes from aquaculture. Today globally I think it's almost, it's over 50 percent already. And it keeps increasing. This is the increase in global aquaculture production of shrimp. We've got a tiger by the tail here and trying to increase opportunities for sustainable production of shrimp and to deal with some of the problems that have come up with this kind of explosive growth. But I think that in general the world shrimp farming industry is doing a better job. There's opportunities for improvement in a lot of places but there's also standards now that are making it more environmentally sustainable. But one of the issues is certainly this fish meal and also, we haven't talked about it much, but fish oil use.

World feed production is about 630 million tons. Aquaculture does about four percent of that. Now that four percent from aquaculture
uses 57 percent of the world's fish meal and of that 57 percent used for aquaculture, some of it goes to shrimp culture. It's only four percent by volume of world aquaculture production. Most of aquaculture production is fresh water species like carp, but it's 20 percent of the value of world aquaculture production so it's very important. And importantly it uses 23 percent of the total fish meal used by aquaculture so if we can reduce fish meal use with shrimp then we can basically make a big dent in the amount of fish meal that's used by aquaculture.

A lot of this data comes from a paper by Albert Taycon [phonetic] that's cited in my testimony. What do you call it? White paper?

The simple fact is that fish meal supplies are limited, that use is increasing, price is going up, and toxin levels are a concern. So even the aquaculture industry has impetus to try and replace some or all of the fish meal, whether or not they're going to try to be organic. So we decided to go ahead and do some testing of the fish meal and fish oil free diets for shrimp. We're blessed to have a very interesting critter in Panaeus vannami, which is the shrimp of choice for shrimp culture in the world, in that it really
takes advantage of natural productivity. So we felt there were some real opportunities here and we decided to shake it out and test it.

We did test some, what we call organically certifiable diets, whatever that means without a certification protocol, but we tried to use some organic ingredients and we tried to move towards what we thought would be certifiable when we did this in 2004, 2005, some of it. One thing that we wanted to pay attention to was the PUFA levels in the animals at harvest, especially DHA and EPA. It's some of the most important components of seafood in terms of human health. The benefits continue to—new papers coming out all the time. Yesterday I just saw something come out on juvenile diabetes. There's a lot of work on brain development and health, and certainly heart disease is the big one. So it's very important for human health.

So where does this DHA and ARA, where does the DHA, which is critical for human health coming from. And this is a slide I borrowed from Bob Bullish showing the marine trophic pyramid that basically it's coming from phytoplankton. That's the original primary producers, and then it works its way up through the food chain into the
carnivorous fish such as tuna or salmon that have very high levels of lipids and very good for you in terms of DHA.

Other than fish, which when the bioaccumulation, algae is really the only source of DHA. Now this product that we were testing in this aqua grow is made from an algae called schizochytrium. It's fermented in a large factory in South Carolina in Kings Tree, and then algal meals are produced that are very high in DHA. So we did quite a few studies trying to look at the opportunities for replacement by using some of these products and we started out with small scale tank studies that were done at Texas Agricultural Experiment Station. These are tanks that are about 650 liters. It's in a shaded area with heavy aeration and we added SPF, Panaeus vannami, at about 30 shrimp per meter which is a relatively low or moderate stocking density. To give you an idea today, I'm growing shrimp in some of my super intensive systems as high as 550 animals per meter in large open ponds. Very low density shrimp are typically grown at 20 per meter or less.

We did a lot of water quality monitoring. Over the last 15 or 20 years we've developed techniques to grow shrimp without exchanging any
water in the system. So it's a very environmentally sustainable technology in that all the nutrients are cycled within the system and you get this sort of waste recycling within this closed system. And it's natural microbial processes within the system, not only maintain your water quality but also have a benefit in terms of the nutritional contribution to the animal that you're growing. And it's these nutritional contributions that we very much wanted to take advantage of. So all of the diet studies that we do are done in these brown water systems that allow us to determine what we can get from the environment, what we can get from the water itself. So water quality monitoring becomes very important when you're not exchanging any water and you're just running these, what we call, bioflock systems that we use.

The oil again was from these microbial fermentation—was supplemented with oil from these microbial fermentation products. And then we did two types of protein replacement or fish meal replacement. One uses Profound, which is a co-extruded poultry by-product meal with soy beans and it has an egg supplement. This was not for the organic diet, obviously, but more for just
producing a fish meal free diet that could be
commercially viable in terms of a replacement for
farmers in the world today. Can we go out and
sell them a diet that they can actually get
cheaper and better with less fish meal use?

The second is organic plant protein
sources. I know you can't see this. That's even
worse than I thought it would be but [laughter] it
is in the handout so if anybody has the thing
that's on the web and you can see it there.

Basically, the point I want to make is that there
were two experiments that were done. This shows
the two experiments. And this was done in two
separate years, and in both cases the diets were
compared to a commercial formulation. Basically,
we had—this was one of our first experiments. We
wanted to test the use of these algal meals so we
tested them at two different levels of inclusion
and then a third diet with no inclusion of those
oils, rather using the menhaden oil. So what
we're comparing is fish oil to a no fish oil diet
that just uses these algal meals. All of these
meals in the first year used Profound, the poultry
meal replacement and soy bean meal. No fish meal.

The second year, we chose one of the
levels of oil replacement and here we compared it
to a diet that had no dish oil and no replacement. So here there is actually no marine fish oils in the diet.

The last diet here that we tested in the second year in the small scale study was an organic diet, and if you look at the products that were used we got rid of the soy bean meal and used organic soy bean meal, organic [background noise] gluten. Again, these oils and different types of organic soy oil, organic flax oil, etc.

To give you an idea I'm going to put the two experiments on one slide just to go through it quickly so you can see what happened. There was no difference in survival. All survivals were well above 90 percent. No difference in feed conversion, feed conversions were reasonable. I'm showing you here the growth data and all of that data is in the paper in a table. But just to show you visually the growth data, you can see that we were able to— [sound cut]

DR. BROWDY: This is the control diet and it obviously did a little bit better although not statistically significant. Notice that this has
been truncated so that you can actually see the
differences but these differences are not
significant. Basically you could replace the
menhaden fish oil with the algal oils, even at the
lower inclusion rate with very good success in
terms of growth of this shrimp in the brown water
system.

In the second year where we actually
completely removed the oils we were surprised to
see how small the difference was but in fact it
was a statistically significant difference from
the control. At our first shot at the organic
diet it didn't do quite as well as we had hoped.
We were down significantly lower than any of the
other diets. But we learned from that and we came
back with some new formulations for our pond
trials. Again I think that the diet with the
algal oil replacements did almost as good as the
control diet.

So we decided to go prime time and to
take our studies out to the ponds, which is no
small matter because it's very expensive and very
difficult to run pond trials. One of the
disadvantages with pond trials is you don’t get
the replication that you can get with a tank
trial. So we used these tenth hectare ponds for
our trials and basically this is the Waddell
Mariculture Center in Bluffton, and we had three
ponds for each of our diets that we were testing,
so we had some replication. But probably not
enough.

Basically we did two series of studies
that I'm going to present. One using this plant
based organic diet. And again, here we used
almost all organic ingredients. I say it's
organically certifiable. We did have to include
some liquid fish solubles and squid liver oil at
about one percent for attractability, but by and
large it's what we call an organically certifiable
diet. And again we used these algal oils. So
it's no fish meal and significantly no fish oil as
well. So no marine products. And then again, the
second year we did a study with using the poultry
by-product meal and again, this is to provide a
more cost effective formulation that could go into
some replacement right away.

Six ponds, 89 day study. It's basically
a complete grow-out and we compared it to a
control 35 percent protein shrimp grow. Here you
can see the harvest size was not significantly
different. In fact it was even a little bit
higher with the plant based diet but not
statistically significant. These production levels are very reasonable. Five thousand kilograms per hectare per crop. And then a good growth rate and high survival. So this showed us that actually in the pond in this kind of a heterotrophic bioflock based system we could already use basically an organic diet with no fish meal and fish oil and get reasonable production results with this species of shrimp.

So then we ran a second study and this time—Significantly, that first study, I failed to mention was that 25 shrimp per meter squared. So again, that's at a relatively low stocking density. Shrimp are very different from terrestrial animals. They like being crowded. These guys live in schools in the wild, I mean, you put more in per unit area. I told you we're up to 550 per square meter. We never thought it was possible and the shrimp are perfectly happy. They love it in there. So the crowding in marine organisms, the schooling effect, is very different mindset than in land organisms. But we went ahead and increased the stocking density in the second study to 80 per meter so that we could get more production out of them and we used again, nursed animals. This is something that could go into
commercial use right away to replace fish meal in these kinds of diets. So we thought we'd try it out at high density. Limited water exchange here. We did do some water exchange in this study. Once we had a power outage, had to do 20 percent exchange, and then again we exchanged towards the end.

Here again, this time we got a significant increase in size with the poultry meal based diet. So we showed that it can work, we got production as high as ten or eleven thousand kilos per hectare, which is very reasonable commercially in the world today. And then a reasonable harvest size growth, good survival, and FCR with the poultry meal based diet with no fish meal and no fish oil.

So basically there wasn't any differences in harvest biomass and we concluded that these kinds of diets with these replacements can be comparable to conventional feeds even at high stocking densities. So I think Bob is out there now in the world kind of beating the bushes and showing the growers and the feed companies that, you know, hey, we can cut back on our fish meal use, we can cut back on our fish oil use, even if this never has significant implications for
organic, which I think it does, it also has significant implications in terms of sustainability of shrimp farming in the world. Now hopefully we'll make a step forward that we'll be able to start cutting back in a large scale in the amount of use of these meals and oils with these replacements.

So then we asked the question, do these diets produce an equivalent nutritional product from the human health perspective. Valerie, how many minutes do I have? Just one? Okay, I can't tell you about the human. Hopefully I can get an extra minute.

From a human health perspective we ran these fatty acid analyses. And we found that the differences in the lipid—there were differences in the lipid profiles between the diets. And to cut to the chase I'll show you the graph and explain it from there. Here you've got the plant based diet in blue and the fish meal based diet in red. The top is showing you what's in the diet, the bottom is showing you what's in the shrimp. And we're looking at four different fatty acids here, four very significant ones. We've got linoleic, linolanic, EPA, and DHA. Now the linoleic is very high in the plant based feeds, obviously. It
comes from the soy beans. This is not as good for
you in terms of heart health as the EPA and the
DHA, which we're looking for. The EPA and DHA are
much higher in the fish meal based diet with the
fish oil, the conventional diet, than they are in
our replacement diets. The replacement diets are
relatively low. And it's not surprisingly when
you come down to look at the shrimp you find that
in the plant based diet the linolic and linoleic
are higher and the EPA and the DHA are somewhat
lower.

What surprised us and what really kind of
made us take a double take was that it wasn't that
much lower. If you look at how low it was in the
diet the fact that the shrimp had such nice levels
of EPA and DHA, we found to be somewhat
surprising. So they either bio-accumulated it or
it came from the natural productivity.

So this takes us to where we are today
with the Integrated Organic Program. We're trying
to use a holistic approach to put all this
together—to increase the amount of fatty acids and
essential amino acids that's coming from the
bioflock, we're doing this through a number of
different types of studies that are focusing on
that in order to create a holistic approach to
formulating diets for organic standards and utilizing natural productivity within the system. Thanks.

MS. FRANCES: Thank you very much.

[applause] We're having some technical difficulties with some of the mikes. They have a life of their own up there and they keep popping on so that's what you're getting.

Our next speaker is Brad Hicks, who is chair of the Pacific Organic Seafood Association from British Columbia, Canada.

MR. BRAD HICKS: Good morning. For the record, my name is Brad Hicks, that's B-R-A-D, H-I-C-K-S. I am with the Pacific Organic Seafood Association from British Columbia. And I guess technically, Valerie, you're doing the advancing of the slides? Well this should be interesting.

First of all I'd very much like to thank the National Organic Standards Board for inviting me to come. I've been involved in fish farming, and fish health, and in fish nutrition for about 35 years. I've raised six different species. I've raised fish in Maine, Florida, Chile, Ontario, British Columbia, and I've raised oysters as well. In addition, about ten years ago I got involved in the organic movement in British
Columbia and a group of aquaculture people in British Columbia, some shellfish farmers, and some fin fish farmer got together and put together some standards for raising finned fish and for oysters. Those standards are currently before the, what's called the COABC, which is the local regulatory board in British Columbia, which has in terms of I guess political science has about the same position provincially as the NOSB has federally in the U.S. So it's about the same stage.

My topic is basically that I think feeding fish meal and fish oil does fulfill organic tenets and in addition I'm going to talk to you about the concentration of biological capital, which I will explain as we go forward here.

The other thing is I should mention is that although you've listened to a couple of technical talks, mine will not be technical. I'm going to perhaps more address the challenge from the chair this morning about protecting the USDA organic label, which is obviously part of your decision making process.

The goals for my talk are three. First of all I'm going to convince everybody in the room that fish are not [background noise] trophic level
carnivores, that they're actually the same trophic level in the system as our regular farmed animals are. Secondly, the main controversy over organic fish farming is political and not scientific. And third, that organic aquaculture standards should be encouraged [audio feedback] biological capital.

MS. FRANCES: I'm going to pause for a second. We're going to pause while we get this microphone so we can pay attention to your presentation.

MR. HICKS: I'd be delighted to pay attention. [laughter]

MS. FRANCES: Thank you. This is a phantom mike.

[off-mic comments]

MR. HICKS: So my goals for today are to get everybody to understand that fish are not top level carnivores, that in fact they operate at the same trophic level as the rest of our farm animals do. That the main controversy in organic fish farming is political and not scientific, and that organic aquaculture standards should encourage the preservation of biological capital. And during this talk you will get to understand what biological capital is.

Okay, this is Biology 100 here or Ecology
100, trophic levels. It will be on the exam so please pay attention. See I told you this would be tricky because I thought I'd have the button.

Basically in terrestrial systems, carbon is fixed by plants, and in farm animals that's primarily the grains, some fruits and vegetables end up in animals, but primarily it's the grains and grasses. They also feed, of course, terrestrial invertebrates. Terrestrial invertebrates, in turn, feed chickens and pigs. Chickens and pigs are both essentially omnivores. That's why they spend a lot of time digging around the earth looking for bugs to eat. Top carnivores, typically the bears and the eagles, and the tigers and the wolves, then eat the omnivores and the herbivores. That's kind of the way the system works, and to a large extent humans are top carnivores.

Major trophic levels in aquaculture systems—something happened in the translation here. Sorry about this. Essentially you have zooplankton at the bottom, they fix the carbon. That moves through a system of planktivorous fish, fish which each the plankton, and those include primarily the sardines and the herring group of fishes, menhaden you've heard of earlier, and
aquatic invertebrates including shrimp.

Piscivorous fishes, and I use the term piscivorous rather than carnivorous because in aquatic toxicology fish eating fish are called piscivorous fish. These are the tuna and the salmon. There are also omnivorous fishes, the tilapia and the carp for instance.

So you can see the plankton produces, goes to the next level. Some of the omnivorous fishes are direct consumers of plankton. But primarily they get their food from other sources that have already basically concentrated the plankton. And then you have the piscivorous fishes, the salmon and tuna, which primarily eat planktivorous fishes and invertebrates. And just like the other slide, the top carnivores in this system are the bears, the eagles, the toothed whales, not the baleen whales but the toothed whales, and predatory birds such as the osprey, and of course humans.

So if we put this all together you'll see that the fish that we farm are actually the same trophic level as other farm animals. So I'm just going to take all those lines out and I'm going to replace them with a whole bunch of new lines.

Okay, now in organic systems are essentially
prescriptive ways of rearing plants and animals. Organic systems have been set up to deal with grains and oil seeds. Organic systems are in place to deal with omnivores and herbivores, our usual farm animals. We have the rules that show how the food value moves from the grasses up to the farm animals. We also globally and the NOSB to a certain extent now has, I guess, preliminary rules for organic aquaculture. And globally, 14 standards are available globally that look after piscivorous fish and my sort of reading of the NOSB is they're already pretty well accepting of the omnivorous fishes.

In addition, it seems to me that the organic rules have accepted that we can take terrestrial plants and animals, or terrestrial plants and feed them to aquatic species. That's generally accepted is my understanding. It's also generally accepted in most organic systems that you can feed fish meal and fish oils to terrestrial organic animals. In addition, aquatic protein fish meal can be used as a fertilizer. So this is a bit of a circuitous route by which aquatic animal protein is moved into the organic food system. It goes down fertilizes a plant, that plant then is fed to an organic animal.
Humans, although there are some organic dog foods available, the primary top predator or the top trophic level individual that organic standards focus on is human. So currently we have a system that allows farm animals, through the organic system, to go to people. We have tentative rules in place to allow omnivores. The only place there's a question in this whole system seems to be with piscivorous fishes, okay? So that's what I want to focus on.

So why is that? Why is it we can accept all these other standards and yet we get hung up on piscivorous fishes? Well having been at this for many years my sense is that it's politics and not science. The science is actually quite simple once you understand it. The politics is extremely complex. Hence the protection of the label is as important as the science.

Organic aquaculture is a small sector of the aquaculture industry, just like organic agriculture is a small sector of the agricultural industry. They both rely on organic principles as the underpinning of the rule making. In addition, they are both open farming systems. All the farming systems we deal with, deal in the open. They are not closed systems. They deal with
diseases, parasites, waste, interaction with wildlife, and interaction with predators. That's primarily for this afternoon but I just caution the board to understand that there is a political overlay in most of what they’ll hear today.

One of the ways this has come to the attention of something I refer to as advocacy science, the development of science or the conducting of science to support a specific thesis. This is from the Moore Foundation. The Moore Foundation is one of the supporters of this group down here. Integration of Aquaculture Science Messages into the Anti-Farming Campaign. That refers to the anti-fish farming campaign. The pure salmon campaign is part of that. So essentially there has been an attempt to develop science that supports the anti-fish farm movement.

The board, of course, very familiar with this. You have received two letters that I know of and probably a whole lot more I don’t know of. The two letters I know of are from the Organic Consumer Association. I read the letter. Not a whole lot of science in the letter, but I did see that they represent 850,000 people. I feel the pressure on the NOSB already. In addition you've received another letter from what I refer to as
the 44 Organizations letter. Together we represent millions of voices. So the NOSB now has a lot of political pressure on it and a little bit of science to try and solve this.

Well, somebody else thought about this before I did. Science is a part of your input, but scientific debate is readily clouded by scientists who fail to recognize the boundaries between intrinsically scientific and intrinsically political questions and advocate their own ideological beliefs. So not all science is perhaps as we believe. Public acceptability of a given policy is a political not a scientific issue. For me, that is what the NOSB must deal with.

Okay, now back to a little more pragmatic issues. Preservation of biological capital. This has been a pet peeve of mine for a very long time. I think we should use our biological capital wisely. What do I mean by biological capital? Essentially all our food is generated by the sun, plus carbon, plus water, plus minor nutrients, to produce biological capital. I'm sorry how these slides turned out. They don't look like that on my presentation, but-- So this biological capital is essentially the plants and animals that are
derived and driven by essentially the sun. Fish meal and fish oil are unique forms of biological capital. Fish meal is very high in the limited sulfur containing amino acids. The very first speaker this morning, I'm sure you're not that technical, but at the bottom of one of his slides he showed in yellow, meaning it's not organic, the addition of lysine and methionine. The reason why most organic standards allow the use of fish meal in diets is to supply the lysine and methionine.

So it is unique. It is valuable. In addition, everybody knows about EPA and DHA, you've heard lots about that already.

So what so we do with our biological capital? Well old school, when there was no conservation, basically we used fish meal and fish oil to produce industrial chemicals, fertilizer, paint, fuel, and lubricants. So all of that EPA and DHA we just burned it folks, we didn't use it. Okay? New school, if you will, with conservation ethic, about 50 years ago we started to use these products in farm animals because we found them very useful and we found it a better use than using it as a fertilizer or industrial chemical. Then about 30 years ago we started using it in amounts in farmed fish primarily tuna, salmon, and
shrimp. Most recently, we've been using some in pharmaceuticals, fish capsules. In addition, I think it's important to understand that if we accept the use in farm animals, fish are about two to ten times more efficient at conserving this valuable biological capital than other farm animals. So if we're going to use it in farm animals we should use it in fish.

Next please? Okay, it didn't work.

Sorry about that, I emailed this in which probably didn't work. Essentially on this slide, these are actually movies and for me the choice is we can burn up this beautiful biological capital in a diesel engine pulling tractors around at a tractor pull or we can use it to produce a food that we can celebrate, i.e. fish. And for me, this is the actual decision that's trying to be made.

I've been at this for quite a while. I haven't been alone. And as a pioneer it's always a little bit difficult sometimes. You have to change some people's attitudes a little bit along the way. So I would like to acknowledge and thank the members of the Pacific Organic Seafood Association for their help and their perseverance in this process. And fish farmers, like all farmers, are proud of the things they produce and
I would like to thank you for your attention.

[applause]

MS. FRANCES: Our fourth speaker is Dr. Steven Craig with the Virginia / Maryland Regional College of Veterinary Medicine from Virginia Tech. And after talk we will have a break.

[off-mic comments]

DR. STEVEN CRAIG: Good morning. It's a pleasure to be here this morning. Last time I saw you guys it was about 9:30 at night, last March, after a long day of public comments. Hopefully we'll wrap it up a little quicker today.

I'd like to present some research we've been doing at Virginia Tech. Kind of on opposite ends of the spectrum, if you will, in terms of--

Again, we've been looking at alternate proteins from a little bit different perspective than most labs around the country and the world, in that we went straight to the organic alternate protein sources in terms of fish meal replacement. There's a need in conventional aquaculture to move away from fish meal inclusion. We took it a step further to go ahead and look at some organic source.
And so again, we've been looking at this since about 2003 in the laboratory, certainly with tilapia and kobia. Talk a little bit about kobia later. Tilapia is very well known in North America certainly. And then we've also done some commercial field trials with the marine shrimp that Craig Browdy talked about at the Organic Aquaculture Institute in Imperial, Texas. We have a poster in the back there that describes the three years of data we've collected there. Again, pulling all the fish meal out of aqua feeds for shrimp and having pretty good production under organically certified guidelines. And we're moving on, as we look at the alternate protein work, we're moving on to investigate the alternate lipid work using some of the ingredients Craig talked about in terms of the DHA algae and other sources.

So our problem is, as a nutritionist, the organic protein sources, the certified organic protein sources, there are very few of them, and those that are out there, there are even fewer that are suitable for aqua feeds. Fish tend to require higher levels of protein. They're more efficient converters of protein but they typically require higher levels of dietary protein for
optimal growth. These organic protein sources are very expensive and that compounds that problem certainly when you're looking at the economics of it. And so what we've looked at, at the Virginia Tech Aquaculture Center, soy bean meal, soy concentrate, soy isolate. These are pretty easily obtained. There's a relatively good market for them. We went and found some hemp meal out of Canada. It's a very interesting protein source. I'll talk about that a little bit later in terms of blending protein sources to achieve the amino acid requirements of some of these animals we're working with.

We've also done a considerable amount of work with a product called NuPro by All Tech out of Nicholasville, Kentucky. This is a certifiable protein source, if you will. It's the contents of the yeast cell and that's basically how we started our alternate protein work with kobia and we've advance from there just recently.

We've conducted over ten feeding trials to date. We have two in the water right now and all of these have been bouncing between 40 and 100 percent fish meal replacement. Now again, with the tilapia it's fairly easy to do. They don’t require that much fish meal. In fact they don’t
require any. We can do that very easily. With the kobia it's a high level carnivore, piscivore is probably a more appropriate term, and like the salmon, you can usually replace about 40 percent of the fish meal protein pretty easily across the board without any impacts on growth. Once you go higher than that you have some problem in terms of weight gain and performance.

So again, tilapia is a relatively easy fish to start with. As I mentioned last March, I think there's some animals that you can look at right now that are very conducive to organic aquaculture. Tilapia would be one of those. This was a ten week feeding trial. Again, zero to 100 percent fish meal replacement, or in this case we actually replaced the soy bean meal component of the tilapia diet. We kept four percent fish meal in most of the diets—all the diets except for one.

And then that final diet, we're always looking to replace 100 percent of the either fish meal, or in this case soy bran meal, with an organically certified protein source. And again, as with all our studies, we monitor weight gain, feed efficiency, biological indices. I'll just present the weight gain data today.

And so this is the growth, percent
increase from initial weight after ten weeks. You can see the zero represents a control diet and basically no differences in growth after the ten week study, especially that one bar on the far right. That's the 100 percent NuPro. That's no soy bean meal or no fish meal. That's 100 percent yeast based protein.

This is just a different way to present it as a percentage of the controls. Again, you can see all of the diets basically out-competed the control diet as we replaced the soy bean meal with the NuPro. Again, on the far end, that 100 percent diet again, a total yeast based protein, a totally certifiable organic diet had very good growth over the ten weeks.

So we kind of moved away from tilapia very quickly. In 2002 we looked at kobia as being really one of the exciting fishes for the future of aquaculture. It's a very rapidly growing fish, again, a marine carnivore or piscivore. Rapidly growing—we can grow this fish from a one millimeter egg to ten pounds in one year. So it's a very attractive fish for aquaculture.

We've conducted over 20 trials with this animal at the VTAC [phonetic] over the last five years, so we know the animal pretty well in terms
of nutritional requirements. And that's a key to, as we start replacing fish meal and pulling the fish meal out, you really need to know the quantitative nutritional requirements so that you can hit these fatty acid, amino acid levels, as you replace the fish meal.

And again, as I mentioned, we're a little bit unique in that all the alternate protein sources we use were certified organic. I'll talk about kind of a novel source we've just recently completed a follow up trial with. It's a Nereid worm diet that's very attractive for the future. And we've had success replacing 100 percent of the fish meal. Now we have some caveats. With some amino acid additions we found taurines very important and conditionally indispensable when you pull a lot of the fish meal out of diets for kobia. And again, those are things that are going to have to be discussed later in terms of national listing and such.

So again, zero to 100 percent. That 100 percent is always the holy grail. We want to pull all that fish meal out of this diet. We know we can do that now with and without amino acid supplementation. Again, as we move forward and move past this proof of principle if you will, I
think we can start blending some of these unique protein sources that are out there to achieve the amino acid requirements necessary so that we can move away from amino acid supplementation. In most of these trials we did utilize menhaden oil to supply the essential fatty acids that all marine fish require. Again, six to eight week studies and the same parameters—weight gain, feed efficiency, biological indices, to see the impact of these dietary manipulations on the animal's final product quality.

So this is the initial study again. This is with the NuPro, with the yeast protein if you will. And again, 25, 50, 75, and 100 percent replacement of fish meal. You see the decline in growth after we hit the 25 percent level. We analyzed these diets and saw some deficiencies in some specific amino acids so we re-ran it and just looked at the 50 and the 75 percent inclusion levels. In one set of diets we added methionine and tryptophan because they seemed to be a little deficient. Then we took that diet and added taurine to it, and you can see the dramatic impact that dietary taurine had when we're pulling out this fish meal. Taurine is relatively high in fish meal. So this got us really excited thinking
we had the silver bullet for alternate plant meal inclusion in diets for kobia.

So repeated the first trial. All these diets were supplemented with a half a percent taurine in the diet and once again, that 100 percent we're always trying to push that wall. You see the decreasing growth but it was a substantial improvement from the previous trial. So not quite there. Again, this is a yeast protein with taurine but it gave us some hope that kobia was be amenable to 100 percent fish meal replacement.

And then this one masters student did all this work. She did a wonderful job. She was interested in the organic aspect of it, so again, we came back, we looked at the NuPro at 25 and 40 again, just to repeat our trials to see if we could repeat those results, and we did. And then that soy bean meal, soy isolate, and then that hemp meal at the end.

Really good growth. We call this—this is our Katrina control. We got some menhaden meal out of New Orleans right after Katrina hit so something was wrong with that fish meal. But these growth rates represent pretty typical rates for our lab that we've seen over the years. So
again, at 40 percent inclusion or replacement of fish meal we can get adequate growth. Now this is important because these different protein sources we can utilize as a blend possibly to attack the problem about supplemental amino acids, specifically with kobia.

Something that we've just finished. I mentioned it in March. We still had the trial in the water. We've been working with a company out of the UK called Sea Bay. They grow these marine worms, these Nereid worms. They're certified organic by the British Soil Association and they're rag worms, they're fish bait, so marine fish typically love to eat these worms. They've got really nice protein content, 50 to 55 percent. About 18 percent lipid. Now that's very important because it's a marine lipid, so you're bringing in these N-3 [phonetic] fatty acids that are required by marine fish. Again, this is an organically certified protein source. Very expensive but very interesting in terms of what we're able to do with the kobia. We've run two separate trials to repeat these results to insure that what we saw the first time was indeed happening and thankfully it was.

So this was the first trial. The control
is a straight 100 percent fish meal diet, herring meal in this case. And then again, the 25, 50, 75, 100 percent replacement of that fish meal. That diet on the end is what we called our organic diet. It was a mixture of the worm meal, organically certified soy concentrate, and then the NuPro, which again is able to be certified as organic. You can see we got really good growth, particularly with the 75 percent replacement level. The organic diet represents the first time that we know of that a marine fish has been cultured on a fish meal and oil free diet. So you can do it. It can be done and we've done it. And we did it again. And we just finished this last spring. Step back—again the control is fish meal. We looked at 50 and 100 percent as well as we repeated our organic formulation, and again, we're seeing the same thing. So this makes us very excited in terms of the potential to culture at least a kobia, and we feel if you can do a kobia you can probably do any other marine fish.

So in conclusion, the work we've done at the Virginia Tech Aquaculture Center and in conjunction with the Organic Aquaculture Institute in Texas is we've produced shrimp, tilapia, and kobia on diets that could be certified as organic
and certainly have no fish meal or fish oil in them. You might need the supplemental amino acids at the start but again, I think by blending some of these sources, what we've seen, we can move away from the supplemental amino acids. Naturally, some fish are going to be easier to culture than others under organic certification and our mantra and our position is it should be difficult to do this. It's not for everybody to go out and produce an organic aquaculture animal. It should be hard, it should be expensive. But you've got to protect that label and that's our concern is that if the standards aren't high enough then the label loses its validity in the marketplace. And once you lose that you've kind of lost everything.

And so to tie this all back into the proposed rules in terms of the 12 / 12, as I mentioned in my paper, I kind of just rambled on for three pages. I didn't present a pure scientific paper for you, but I think it's a very good start. But what we could like to see is the phase out. We think it can be done. We feel like we've proven it can be done, and I think that we need to get something going now and the 12 / 12 rule is a great place to start. But we should set
our sights higher in terms of the phase out.

Thank you very much. [applause]

MS. FRANCES: We are scheduled for a break, about a 15 minute break. We definitely need one. We'll resolve the technical problems, we hope. It's now ten o'clock? Quarter of? So come back at ten o'clock. Good?

Anybody has index cards with questions, you want to leave them over here by my laptop, that would be helpful.

[sound cut]

MS. FRANCES: How are we doing on mikes? Not yet?

Our next speaker is Jonathan Shepherd. He is with the International Fish Meal and Fish Oil Organization.

DR. JONATHAN SHEPHERD: Good morning.

Thank you to the NOSB for inviting me. Ron Hardy and I presented a paper on sustainable marine resources for organic aqua feed to this conference. Ron sends his apologies. He's away in Asia right now and he's asked me to present it on our joint behalves. I'm originally veterinarian, turned fish farmer, with a career in the fish feed business, and for the last three years with the International Fish Meal and Fish
Firstly some background comments. With wild fish capture facing a number of severe constraints, global aquaculture production will have to double by 2030 to keep pace with the demand. According to FAO, the United Nations, that means in absolute terms an increase of almost 40 million tons.

Analysis of food conversion efficiency according to the International Council for the Exploration of the Seas, ICES, suggests a closely regulated combination on the one hand, of human consumption fisheries, and on the other hand, of industrial fisheries, by which we mean feed fisheries, by which we mean reduction fisheries, will provide the only solution to the long term demands for fish protein.

Then again, it's worth adding that in an ideal world, fish would be fed directly to humans, but where this is not currently feasible, farm fish are the best converters to high quality food for human consumption. Look, if you could get a higher price for selling a menhaden or for that matter selling processing offals into the human food market, then of course you could and you should do so.
Given that the organic rule book was not designed originally, as I understand it, with aquatic products in mind. I've tried to focus on the key points, which should influence our thinking during this debate. I'll seek to show firstly that as regards sustainability, feed fisheries will be a finite or a sustainable resource. I'll paint the picture of eco-efficiency, which is that of an improving wild to farmed fish ratio. Thirdly, human health. The massive positive impact on human health is totally disproportionate to the minor contaminants risk that we hear about a lot in the media. And finally, fish health and welfare. Fish, of course, have an essential fatty acid requirement. That not only means as a veterinarian I have an ethical obligation to promote fish welfare and take account of dietary requirements, but in my experience it's a sound economic driver for keeping fish healthy, otherwise they don't grow as they're expected to.

The view has got about that demand will outstrip supply within the next decade and this position was reinforced by a period of strong prices. As some of you know, the price has come down from over 1,300 to $1,400 a ton to about $800
a ton right now. On the other hand, the fish oil price has risen sharply to over a thousand tons [sic], influenced as it is by the whole bio diesel market, and rapeseed oil, and so on. The truth is that with the ongoing pattern of substitution with complementary ingredients, be they soy or whatever, reallocation from pig and poultry on the one hand to aquaculture on the other, and the more strategic use of fish meal and fish oil, there really is no current crisis. And I'll point out why we don’t have to fear of any crisis in the next ten years. So my conclusion is that increasing demand for fish meal and fish oil from aquaculture is not leading to an imminent supply crisis.

But let's look at the catch and production data. As you can see, from the last thirty years, these are FAO statistics, the global supply of feed fish, industrial fish, reduction fish if you like, has varied between 20 and 30 million tons per year and the variations reflect natural variation to a large extent and you can see the marked effect of El Niño, in this case in 1987, and minor ones along the way. El Niño being so important to the global catch because of course Peru and Chile together are approximately half of
the world's supply.

This overall picture of feed fish catch globally, of course, is mirrored by the fish meal and fish oil production statistics. This is from '86 to 2006 and you can see fish meal varying between five and six million tons per year with blips following the El Niño again and fish oil likewise at around one million tons per annum.

Let's look ahead for a moment and I believe there is no evidence of an out of the ordinary alteration to raw material supplies, but there are a lot of factors, of course, affecting this. On the one hand you've got—we've been talking about it—El Niño, which has a negative effect. You've got a more precautionary approach to fishing, which I think is a wise and responsible thing and it's very much in the minds, particularly of the Peruvian market, their government at the moment. Then there's more fish going to human consumption as for example in Chile with jack mackerel there are now processing innovations to try and utilize the bigger jack mackerel for human consumption. And these, if you like, negative in terms of feed fish and fish meal supply, negative factors of course offset by certain positive effects. La Niña, the opposite
of El Niño, krill coming on stream. I doubt if that will be used for commodity fish meal but it's becoming commercially available. And then more processing waste to the fish meal and fish oil industry.

So in summary our belief is that there will be certainly good years and bad years but the overall effect on fish meal and fish oil volumes will be neutral. In other words, it will stay a relatively flat curve over the period, certainly not getting higher.

So much for supply then. What about demand? I think the interesting message I want to put over, of the last two, three, four years really, has been the effect of increasing price leading to market reallocation based on value. In other words, that the pig and the poultry sectors are using less and less fish meal and that is therefore available for aquaculture or whoever indeed is prepared to pay a higher price. And if you look at the left hand column, 2002, I would say there was a high use of fish meal of course in aquaculture diets and in pig diets, including grower pigs, and moderate amounts, certainly in Europe, in poultry diets, and at that stage in the USA as well.
Also, I have not put on this slide, but here in the States I shouldn't pass up the importance of the pet food market in terms of usage of fish meal and fish oil. And then of course nutraceuticals is a growing but small-high value, small volume usage.

But then by 2007, by this year, of course the use in aquaculture has moderated quite considerably. We've heard already about the success in terms of substituting with complementary ingredients in a number of diets. In pigs I would say that worldwide it's more and more restricted at the moment to baby pig weener diets. It's gone out of pig grow-out diets almost completely and that's based on price. And certainly in the UK, where I live, we don’t see any fish meal in poultry at the moment except perhaps in small niches like turkey pouls and so on.

Looking ahead then, I think this trend will continue. I think in 2012 it will be start of finish of brood stock and recovery diets. In other words, fish oil for example, will only be as a washout in the last two, three months before slaughter to raise the long chain omega-3 levels. It won't be in the main grow-out diets. And I
think the same will pertain in terms of pigs and poultry where it will be in niches like breeder diets, and recovery diets, and so on.

So to summarize that picture I would say if you look at the foot of the table, the three green points, one has a picture of increasing animal production worldwide, a picture of decreasing fish meal inclusion rates, and a relatively constant availability of fish meal, a sort of plateau. Therefore, I mean, it's obvious that we've got a situation that's traditionally been a commodity and is becoming increasingly a strategic ingredient for use at critical stages in the life cycle. In other words, where people are prepared to pay the price to get the insurance and nutritional security that they need in the critical life stages, but not as a generality throughout the life cycle.

So if we stay with the picture of six million tons thereabouts, about a million tons of fish oil, we reach a point in 2012 where you'll see that approximately 60 percent of world fish meal production goes to aquaculture, compared with 52 percent in 2005. And 88 percent of fish oil will be used by aquaculture, compared to 84 percent in 2005. Now obviously, these are rather
difficult projections to make. They're published by Andrew Jackson based on Albert Tacon's [phonetic] data. But I think the point is that increasing demand for fish meal and fish oil from aquaculture is not leading to that imminent supply crisis. And it's worth just adding to that, that by 2012 fish oil will be getting tight if there's no production of industrially manufactured EPA and DHA by then, which I'm sure will come about. So that's the worry. It's the fish oil that's the worry in terms of longer term availability and fortunately there are substitutes in development.

Coming then to this vexed question of ratios of fish in / fish out, if you like. There's a popular misconception that, you know, there's eight to one, or four to one, or ten to one, or I've heard everything I think, and you've got to actually examine the data of course. And if you look up at the top left you see a little green spot. Belona [phonetic] the NGO, did a study in Norway in 2003 with Norwegian salmon and concluded that the figure there was 2.67 to one. And of course, since then it's been improving somewhat due to continually improving food conversion rate of feed to fish and increasing substitution particularly in Norway now as well of
fish oil by rapeseed oil. But I'll say more about salmon in a moment.

I want to concentrate on the other two, the red and the blue line, which is trying to take a global picture, input / output picture, and this by the way, is all fed compounded diets, right? Whether they're carnivorous fish, so-called, or all aquaculture. This is fin fish and crustacean aquaculture fed compounded diets. Again, Albert Tacon and the FAO have supplied the data and Andrew Jackson has looked at it. And you can see that, first of all, if you take the picture of all aquaculture, that's the blue line, by 2005 or 2007, it's already about 0.6 to one, below one to one. But of course, I think that's an unfair comparison. I think we should focus on fish which have a relatively exacting nutritional requirement, and so the red line is the carnivorous fish and today, in 2007, that's about 1-1/2 to one. But of course, the devil's in the detail, and if you feed back the offals from those farm fish to other species of fish, other species for preventative medicine reasons, then you'll get it at one to one or even less than one to one, even today. So it's a picture of continuing improvement due to the substitution [audio
Continuing improvement due to the strong substitution push.

Coming back then to salmon, I know this is of interest to a number of you, so I'm said that the Bolona figures, 2.7 in the early 90's and published in 2003 for Norway, this is now down to close to one to one on the protein side. But of course, it's the high fish oil which makes this something of a special case and now the growing use of rapeseed is the sort of secret factor which will help that. And logically, I believe that feed formulators can and should replace down to about 12 percent fish oil and make the rest up with vegetable oil in order, not for the benefits of the fish so much, they need less, they need probably only two percent, but in order to ensure there's enough long chain omega-3's in the filets for human consumption.

And it's worth reminding ourselves, I think Brad Hicks said that conversion efficiency is based on the edible protein and energy recovery basis and fish are about twice that of poultry and many more times efficient than in cattle. And why is that? Well of course that's due to biological fundamentals. The fact they're cold blooded, the fact of neutral buoyancy, and they don't have to
worry about gravity, don’t have heavy bones, and all the rest of it. So it's inherently more efficient. And going to your proposed 12 and 12 rule, those levels of inclusion as proposed in salmon would make the ratio around one to one, while with other carnivores with less oil it would be better than one to one. And especially of course if one then utilizes the salmon offals into non-salmonids for farming purposes.

But looking at sustainability then, what are the options here? Peruvian anchovy, as I said, is far and away the biggest fishery in the world. There is a highly precautionary approach by the government. There was a problem in the 90's with lack of compliance by the big fishing boats in Peru but the government has now imposed a whole system of satellite tracking, and seven day a week independent auditing by SGS, and it seems to have pretty well eliminated all that illegal fishing. And you've got to remember there, it's such an important part of the Peruvian economy, it's the second or third biggest export, fish meal, they can't afford to kill the goose that lays the golden egg. So it's a fundamentally strategic fishery for the Peruvians and fortunately for us too, who can take advantage of
it. But here in the USA, of course, you're exceptionally lucky—

[sound cut]

[END MZ005002]

[START MZ005003]

-in having access to trimmings from the Alaskan Pollock fishery. Also, that it’s MSE certified. And both of Pollock canvas [phonetic] salmon on managed targeted fisheries. So the segregation and traceability of fishmeal and fish are derived from. It was not a big deal.

As regards international organic standards, the Europeans, we Europeans, would regard fishmeal, fish offen [phonetic] certified sustainable fisheries as our gold standards. So we’re very envious of you guys with your Alaskan Pollock. But given our lack of current certified volume sources of supply in Europe, our default position is an acceptance of fishmeal and fish offen trimmings of fish processed for human consumption. Of course, with only natural antioxidants and so on.

Next slide. Human health. I’ll skip these two. I’m running out of time. But I just want to say the benefits to human and animal health from long-chain Omega-3s are overwhelming and eating
salmon reared on fish oil reduces atheromatous plaques. That doesn’t occur when you eat salmon reared on wholly fish vegetable oils. And that’s in the view of most commentators, is very important compared to the minor diminishing and manageable risks from persistent [phonetic] to organic Pollock pesticides.

Human health. Again, the only thing I would say here that’s relevant is it’s not really a deal here, because the levels found in pelagic fish from Alaska and the South Pacific are so very low. And less than 12%—going back to your 12 and 12 rule—less than 12% runs the risk there are not enough long-chain Omega 3s in the final product.

Next slide.

Fish Health and Welfare. What I want to say there is fish cannot convert the Omega-3s found in plant oils. So—and virtually all species are carnivorous during at least some parts of the life cycle even if it’s only as fry [phonetic]. And so the reality, ladies and gentlemen, is if fish were eliminated from all aquafeeds, production of nearly all fish species would be difficult, if not impossible on a general point. So my final slide, including points. Most international organic standards have recognized
the inherent differences between terrestrial and aquatic ecosystems and allow the use of meal and oil produced from fish processing byproducts in organic feeds. So the organic movement in the States is unhappy about using Peruvian anchovy meal or Manhattan [phonetic] meal, despite the sustainability record that I’ve talked, you have this waste stream of MSE certified Pollockical [phonetic] salmon processing on your doorstep in Alaska. And if the NOSB or any other organization rejects organic darts [phonetic] for aquaculture then I believe they remove the incentive for aquaculture to move further towards the responsible and eco-efficient approach to production which I’m sure you advocate. And if you don’t encourage its use, you know, the alternative could be to waste it. And surely, feeding it to fish and retaining the EPA and DHA has got to be better than using it for power up in Alaska. Thank you very much. [Applause].

MS. VALERIE FRANCES: Thank you very much.

FEMALE VOICE: Valerie, we have one more speaker? Can you hear me. Can you hear me now? Yeah. I’m not seeing any heads moving.

FEMALE VOICE: I can hear you.
FEMALE VOICE: Okay. All right. So we’re good. Thank you.

MS. FRANCES: Our last, but not least speaker is Torbjorn Asgard from Akvaforsk in Norway. I hope I got that right. And you’re [unintelligible]. Okay.

MR. TORBJORN ASGARD: Thank you, and thank you for the invitation—

MS. FRANCES: Hang on one second. I’d like to ask you to give your name and your affiliation, and spell your name.

DR. ASGARD: My name is Torbjorn Asgard and I’m affiliated to Akvaforsk, the Institute of Aquaculture Research in Norway, owned by the Ministry of Fisheries. It’s the main owner. My name is spelled T-O-R-B-J-O-R-N O-R-S-G-O-R-D. If it’s difficult you can change the ur or oe and the or to aa. [Laughter]. And my coworkers on this presentation are Dr. Gedmaled Barga [phonetic], Dr. Tuti Mofkara [phonetic] and Dr. Stolaresti [phonetic]. And we want to stress this point that flexibility in the use of feed ingredients—that’s very important for the sustainability and it’s very important, we think, for sustainability in any food production that there is flexibility. Next.
It has been said some words about the efficiency I heard in a unit in just draw the attention to different figures. This is a study from 1996 where they were studying what was actually the situation in the Bjorn [phonetic] Sea for the Northeast Atlantic cut [phonetic]. How much was it consuming? How big was the standing biomass [phonetic]? How was the annual harvest? Sustainable harvest. And how much was the fillet output from that.

And then this is compared to what would be the situation if Atlantic salmon got the same feed fish as their only feed. No vegetable ingredients in the feed. What would then be in the parallel output. And you see at the bottom line, the fillet output is considerable higher. And I think this is actually showing why we, as humans, switch to culture production in agriculture on land too. It is much more efficient when we can feed animals to situation and where they don’t have to go and starve for long periods. Next please.

And also this relation of efficiency between our most efficient meat producers are very important for where we should use the most valuable feed ingredients. And as long as we among
the aquaculture species find the most efficient
uses of these feed ingredients, I think that’s
where we should use this limited sources. Next
please.

And if we go 15 years back, of course,
the salmon diet, for example. It was very marine-
based. You could find diets consisting more or
less of fishmeal, fish oil and some wheat just to
get right the physical quality of the feed. This
is now showing more the feed composition today.
It’s a considerable content of fat protein
sources. This is then from Europe. Next.

And here is a feed composition based on
good plant protein sources and what that would
look like. And you can see also the relative
prices at the bottom line here, showing that there
is actually a very strong drive for going for the
plant protein sources because they are cheaper
than the fishmeal. But there are problems relating
to using this plant protein sources. As in salmon
there are several problems you have to deal with.
And that’s why we haven’t reached this level yet.

Next please.

In South America it’s a different
situation. We have—the industry have access to
more alternative protein sources, like animal
byproduct meals, blood meals, hydrolases [phonetic] of all different kinds. But in Europe that has been prohibited due to BSE from 2000. So it has not been legal to use these animal byproducts. Blood meal from non-ruminants were again, legal from 2003. In Norway it was again legal now from 2007. but hydrolases, they have to have a very small molecular size. All molecules smaller than 10,000 deladoltants [phonetic] and that means that most of the products available are not approved.

But we have several ingredients here where—excellent amino acid profile that would largely improve the possibility for using plant proteins sources without adding additional amino acids.

Then I would like to go a little bit more into this fish-in, fish-out [inaudible] we’ll say into [phonetic] and we have actually salmon producers today are using as low as 15% fishmeal in their feed. And what is the situation then? It means they are using then 150 grams of fishmeal per kilo feed. And if we say an average feed conversion ratio here is around 1.2, they are using 180 grams of fishmeal. And if that is on an average containing 67% protein, we see that the
fish protein spent for producing one kilo of salmon is actually 121 grams.
And in one kilo of salmon there is 180 grams of protein. Which means a net gain of 59 grams of protein. And if we then should pick a fish in, fish-out that balance around one, this means a fishmeal inclusion of around 20% when the feed conversion is 1.2 or 55%. Now, 25% of fishmeal, if the FCRA’s around 1.0. Next please.

Expressed in another way, how much marine protein did we spend at fishmeal inclusion levels. And how much fish protein do we produce? So here if we put the spending at one, how much do we then produce? And you see that it’s in the range between 20% and 30%. We balance on the protein side. On the fish-in, fish-out equal to what. Well, if we can go lower it’s considerably better. Next please

And then again, it’s important to think about what are we using of the fish if we make a fishmeal, and what are we using if we want to use it directly for human consumption. There is a considerable difference. In the—if we should use the, the fish just for filleting it’s a fairly small pollution [phonetic] that is recovered. But, of course, we can also use the rest for fishmeal
production. But here you see, if we look at fish
fillet spent and the fish fillet produced, we are
even on the—actually on the positive side, already
at 35% fishmeal inclusion level. Next.

And here you see just the possibility we
get if we can use the animal byproducts. The next
one in addition to please. Yeah.

And you see here the comparison then
between the plant protein based diet with a low
fraction of fishmeal and the animal byproducts
based diet and of course, it’s a growing concern,
at least in Europe, about these animal byproducts
that are actually very highly valuable protein.
Why are we not using this for food production in
feed? So I think that is an important ecological
concern. Why should we not use this extremely
valuable protein sources for feed and food. Next
please.

On the lipid side, the picture is a bit
more difficult. And of course, the lipid content
in fishmeal varies to some extent. But on an
average, the fish used for fishmeal production
contains 7% lipid. And some of this lipid roughly
2-1/2% of the 7% is actually in the fishmeal.
Meaning that the oil fraction will only be 4-1/2%
of the lightweight [phonetic]. So if we should
have a fish-in, fish-out ratio of one here there should not be more than 7% of fish oil in the, in the diet. But of course, more fish oil can be used if the fish contains more lipid. Next please.

So just to show you the calculations here too, if the industrial—if the fish contains 7% lipid, what is decide then if fish lipid level in the feed is 16%. You have discussion also about 12 or 14. well, fishmeal contains 10% lipid which means 100 gram of oil per kilo. And if it contains 25 fishmeal this gives 25 grams of fish oil. Next.

And the first kilo of fish we catch, of course, it contributes with all its lipid. The next kilo will only contribute with the lipid, we can separate out, which is 45 gram. And the next kilo, again, 45 gram, so then we are using actually three kilo of wild caught fish to reach the 160 gram or lipid in the diet. But of course, all the protein—that will be possible to convert to fishmeal and that will give us roughly half a kilo of fishmeal. Which can then be used to other animals.

So this means that the real fish-in, fish-out factor here is actually 1.09, but it’s at the same true that we need three kilo of one fish for this production. Next please.
But then again, to the—what is the demand from the consumer and what are the difference of course, between the fish species of the natural lipid content. And what is actually needed for the health of the fish. And what do we want for humans. But the fish itself requires somewhere between one-half and one percent.

Can we do something about the efficiency and retention of these essential fatty acids? Well, there are differences between species in their ability to elongate and desaturate their fatty acids. And carp and eel have quite some ability. It’s also some ability in rainbow trout and Atlantic salmon. Not very much. But maybe enough so that we can actually retain 100% of what we put in in feed in the product we get. While in the marine species there doesn’t seem to be ability for such elongation. Next.

And then I think it’s one aspect that is not raised here and that is the relation to the genetics. I think it’s very important that we work with domesticated animals. And they are much more efficient than the wild ones. And when we try to take care of resources I think it’s important that we utilize this possibility. And you see it’s in Atlantic salmon, the difference now between the
selected and the wild is really important. Next. And it’s also very important, actually the growth we achieve. If we look at the feed conversion ratio here in relation to the growth of the fish, you see that if you slow down the growth too much you will spend much more feed resources on producing a kilo of fish. Next.

So to conclude here, commercial feed production is gradually become more independent of fish meal and oil from the fisheries. And increased use of protein from vegetable and animal byproduct sources will make Atlantic salmon a net producer of marine protein. Vegetable oil sources can be used at high levels in salmon feed as long as the minimum needs for essential fatty acids are met. And the fatty acid profile of the fish will, of course, be reflected according to the feed we are using. Next.

So in the early 19s, roughly 2-1/2 to three kilo of wild fish was spent in the production of one kilo of farmed salmon. And this has now been reduced to approximately one to one on the protein side. And it is possible to improve this further. And the slaughter offal from the salmon industry are used for other species. And this is actually an important point because if we
say that the aquaculture industry has an offal production of roughly 40% of the lightweight, if that is converted to fishmeal it will be roughly 10% of the weight of the fish we produce, and that will mean that at 10% fishmeal inclusion level we are actually not using any protein, or we don’t have to use any protein from wild catch at all. So it’s not necessary to go to zero to be independent of fish protein from the wild. Thank you for your attention. [Applause].

MS. FRANCES: Thank you. And thank all the presenters. I will turn it over now to HUE, the livestock chair, to facilitate questions and answers from the board. Go right ahead. Do we have 80 more index card questions from the audience we want to get up like right this minute.

MALE VOICE: Let’s have them.

HUE: Please put who you want your questions addressed to when you send them up and don’t be afraid. Yeah, I know. Well, thank you to all our morning panelists. I really enjoy the fact that we’re hearing from people with different accents. I like that a lot. It means we have a real worldwide global input here, as the National Organic program is an actually globally based program so there’s a lot of interest, of course,
and where all the salmon and aquaculture and big
areas are in the world are not necessarily in the
U.S. so thanks to the panelists and of course, we
as the National Organic Standards Board have
questions for you and we also have cards from the
audience. And what we did at our last symposium
was basically our questions certainly have
priority in the question list so—and then we kind
of look into the cards and maybe entertain some of
them. But I should also say that, as at the last
symposium in State College, Pennsylvania, if I’m
not mistaken these cards will be scanned into the
public record so that they are officially put into
the symposium, okay?

MS. FRANCES: Posted on the Web site.

HUE: Yeah. In case we don’t get to them
all, which I’m we won’t. So I’ll just open it up,
I guess, to anybody on the board and just—Dan.

DAN: I’d just like to, first of all,
with a slight clarification on the recommendation
that was made from the aquaculture working group
was to have a limit of 12 and 12 from wild caught
sources. That was really only addressed with the
last speaker. But if we’re only looking at that
requirement being from wild caught resources, how
could any of the other speakers address how that
would change their view of the recommendation, if
they’re looking at essentially no limit on
fishmeal and fish oil coming from a natural
growing organic fishmeal and fish oil that
develops within the industry.

HUE: Any of the panelists? Brad Hicks
[phonetic].

MR. BRAD HICKS: I put up my hand ’cause
nobody else did. The reality is currently that
source is quite a ways off. It does not exist.
There are currently some small meal and oil
supplies perhaps out of organic poultry rearing,
but in its wisdom poultry has been excluded as an
ingredient for fish.

The other issue is it has been suggested
that people grow fish to produce the fish meal and
grow fish in our organic system to produce fish
meal and fish oil for rearing fish. If you
actually look at the ecological footprint of that,
as you look at the concept a little bit deeper
you’ll find it’s really quite extravagant. And I’m
not sure—certainly our group is not prepared to go
in that direction.

In the event that organic aquaculture
does grow significantly and is able to get to the
position where byproducts are available from
organic production they would certainly be used in
preference to other sources. Thank you.

HUE: Joe had a question. You’re up next.

JOE: Yeah, it’s been mentioned solvent
extracted soy meal in a couple of the
presentations and the industry—the organic
industry, as far as I know, is not able to provide
certified organic soy meal because allowable
extraction processes, which we do have, are too
expensive at this point in time for soy meal.
That’s my understanding, but I’d like to just get
a clarification on the availability of organically
certifiable, if not certified organic soy meal
that is—that only has allowable, you know,
solvents. Carbon dioxide, et cetera.

MALE VOICE: We—in our—we used a, a
certified soybean meal, but it wasn’t extracted so
I guess you would call that a full fat. But—and
then the soy concentrate is becoming more
available as the industry—as the fishmeal prices
increase more soy producers are going towards a
concentrate which give you a higher protein
content. It bumps it up to about 68% of 70%.

MALE VOICE: So it doesn’t necessarily—we
don’t need defatted soy meal meal. It’s not a
requirement for the aquaculture industry.
MR. STEPHEN CRAIG: No, the advantage of that in a traditional soybean meal is that it increases the protein content for you.

FEMALE VOICE: Please identify yourselves.

MR. CRAIG: Oh, I’m Stephen Craig [phonetic] from Virginia Tech.

MALE VOICE: Andrea, you had a question?

MS. CAROE: Well again, I just want to clarify what the AWG recommendation was. What we were looking at is a maximum of 12% from fishmeal, a maximum of 125 from fish oil. From wild caught sources; not organic sources. Not organic sources. This was a matter of—and I think George could speak on this, but it was a matter of without organic fish how do you have organic fish meal. It was—this provision was put in there with a sunset on it to develop other sources and to develop organic fish sources for feed. But we are not specifically looking at a diet for piscivorous—is that how you say it?

MALE VOICE: Piscivorous.

MS. CAROE: Piscivorous fish that includes organic fish or nothing. We’re looking at the possibility and the reality of allowing a wild caught alternative for a period of time for the
development of organic fish or the development of other protein and amino acid sources.

So again, that’s really not a question, but I just want to clarify with the researchers that are here and the board, just a reminder of what we’re looking at as far as this issue.

HUE: Questions? Tracy.

TRACY: This question is for any of the panelists who measured yields. I was wondering if there are any other metrics around say, the texture or the flavor of the fish that are also being measured as substitutions and the feed occurs?

MALE VOICE: Someone spoke to that, I know.

DR. BROWDY: I don’t know about the fish, but we tasted—Dr. Browdy from South Carolina. I don’t know about the fish, but we did some organelles uptil [phonetic] analysis of the shrimp that were fed the vegetable based protein diet. The “organic” quote/unquote diet that we fed the shrimp from the pond study. And what we found was that there was not a real significant difference. I can provide that data for you. For me personally, I can tell you that taste different. They’re not as—they don’t have that sort of fish,
you know, kind of flavor. That sort of iodine ocean kind of flavor. They’re much cleaner in terms of flavor. And when I took it to some restaurants locally and gave it to the chefs and said try this, try this, and then they handed it out to the people in the restaurant, it was really interesting to see in these blind tests that, you know, some people preferred one; some people preferred the other. But they definitely do taste different and they definitely have lower levels of some important fatty acids even with the algo-oils [phonetic] that we used. So, you know, we’re going to have to beef that up some if we want it to be as healthy. But there’s definitely a difference in flavor.

HUE: Jennifer.

JENNIFER: I just have a follow-up question to that. Your research compared your control which was also farmed to your organically fed. Did your taste test also just compared both farmed or also to wild?

DR. BROWDY: That’s a good question. It’s just both farmed.

HUE: Tina? Or who had the—was it—

TINA: This is also a follow-up to that question. The measurement most used was growth
rate. And I know that it’s always our instinct to want to just produce bigger, better, faster. But is there a linear relationship across the board between growth rate and health? And other, you know, other factors. Health, nutrition, susceptibility to disease, all those things. And that could be for anyone.

MR. HICKS: Having grown lots of fish I guess I’ll try. It’s Brad Hicks from British Columbia. I guess I’ve grown lots of fish under lots of conditions and there’s no question that you can overgrow them, for lack of a better term. You can push them too hard. It’s not unique to fish. We certainly that in other farm animals as well. The standards that we have proposed, to a certain extent, take into account, for instance, we limit that energy quantity that’s available in the feed, is one of the standards we used to manage that issue.

Health-wise, I guess my experience is that crowding is more of an issue than growth. It’s one of the issues, of course that will go along with animal husbandry of any kind. So we certainly limit crowding. I think for this issue about the use of fishmeal and fish oil there is—we have not got enough production under our feet to
look at the effect of this heavy substitution of vegetable proteins for fish proteins and vegetable oils for fish oils yet, to look at the health implications of doing so. We’re just too early on the system. We do not yet have enough experience. That may turn out to be a problem. I think from my talk I understand teacher 12 and 12, but I think even under that it is our responsibility, certainly our organization looked at it from an organic perspective that it is our responsibility to in fact use fishmeal and fish oil for the production of fish. That it’s a very good use of that material and our standards do require that half of that does come from fish processing processes. So it’s not virgin fishmeal and virgin fish oil per se. I don’t know whether that answers your question, but it’s an attempt.

MALE VOICE: I actually—Doc Asgard in a moment. Let me—I wanted to add on one thing on Tina’s question, if I may, which kind of related—I guess I’m a dairy veterinarian among the organic dairy farmers, and what I find is that—yeah, okay. Totally different terrestrial and their cattle, but I still work with conventional farms and what I find is that when conventional farming—I’m trying to phrase it in a more conventional and
organic—the animals are pushed a lot harder so you get more production, more efficiency, everything like that. But with cattle that are pushed hard, there are certain health problems that happen. I won’t go into them, but they do. Metabolically and everything like that.

And with the organic farms that are fed more—well, they’re not pushed as hard and other aspects about it, they don’t have those same kind of problems. I’m just wondering—I think it’s in the same line of what Tina’s asking, if you try to feed the animals to what the conventional paradigm all the time, you know, max efficiency, max everything to get max yield, are there some health problems that might come up with fish versus if you kind of back off a little. Does that make any sense? Anyway, it does to me.

MALE VOICE: I will try to answer this. And it’s actually two sides of that. One is that in general you will see that where they have health problems there is, in general, very poor growth. So remember this aquaculture activity is still very young. And the problem is actually to meet the requirement of the animals to the extent that they express their growth potential. Or close to that. Because I would say on an average, if we
see an Atlantic salmon, in an average the industry will express maybe 75% of the growth potential in the fish. And in some areas they are down to 50%. So and they far from growth rate being a stress.

On the other hand, when you reach very high growth rates then you are really challenging the diets. So if there are some deficiencies in the diets you will show it at the very high growth rates. Because then everything has to be precise. It has to be extremely well-balanced when you approach the maximum growth. And that is one of the things that appear here with the soya replacement. You will go into mineral deficiency as shown with reduced ash content. It’s very common to get a problem if you don’t care of the mineral balance in the diet.

So, and this complicates actually the balancing of the diet as you go for high growth. But actually it’s when the animal express its growth potential that it seems to be most in balance.

HUE: Okay. Thank you. Jeff, you’re—then you’re next.

JEFF: Thank you, HUE. My question is for Brad Hicks. Brad, in your presentation you showed an image that had a—indicated a traceable linkage
between grasses, herbivores on up into humans.

Then on the fish side of your presentation you started at the bottom of the slide with a zooplankton algae or plankton something like that, and then onto fish. But you specifically never highlighted the zooplankton, the plankton, or may any sort of linkage between that that was traceable on up through the food chain. You drew lines from grasses over to fish. And I’m just wondering why you specifically avoided that, or if there is a connection there that we could exploit.

MR. HICKS: Actually I’m not sure 'cause my original presentation, the lines weren’t quite the same as turned out with this projector. In the presentation there actually are linkages between the zooplankton and the phytoplankton up into the invertebrates. And there is a line up into the omnivorous fishes. Okay? Because yes, that does occur and that can—is exploitable.

JEFF: A follow-up question then. So are you inferring or on the terrestrial side we manage our soil organically, we produce organic grasses, grains or anything else that’s in the oil that moves up through the food chain. So are you explicitly saying then that you would work towards farming organic plankton, zooplankton that would
then be traceable up through the system, through our organic system plan?

MR. HICKS: At this stage I would say no. The reason why I would say no is because in the terrestrial system the management of the soil is quite easy. Quite frankly, the management water is much more difficult. Even in a soil system. Where does the water come from? It’s got the same issues for me as water, say, in the ocean. You know, when the rain comes down on your pasture do you know where your rain’s been? Okay? The rain is—contains all sorts of interesting things besides water.

So the idea that organically we somehow manage everything, to me is not quite there yet. Because we don’t manage the water system in terrestrial. The water portion of terrestrial agriculture we don’t particularly manage. When we draw water out of a well, for instance, you have no idea necessarily where that water’s coming from except upstream somewhere. And you don’t know the inputs necessarily into that water as a result.

So in a roundabout way to answer your question, I think that in the aquatic system the plant portion, because the system is based on single cell organisms that in fact don’t have a footing, if you will, don’t have a root system, it
is really much more difficult. And in the aquatic
system, or sorry, in the terrestrial system plants
bring billions of cells together already. So we’ve
got a unit we can manage.

In the aquatic system that doesn’t occur
until the planktivorous fish level or the
invertebrate level. Okay? We don’t have that
assimilation or that bringing together of a mess
of biology until that level. So it’s really quite—
from my perspective, that is impossible to fulfill
that desire.

But my other discussion point on that is
it is really not that unlike terrestrial
agriculture in the sense that the water portion
are both from open systems. Okay?

STEVE: I’d like to add something to
that. I work with the organic aquaculture
institute with the shrimp. What we’re proposing is
managing the microbial food Web within the pond.
Much like you—we call it treating the pond like a
ruminant. Where you’re actually feeding the bugs
and the bugs feed the organism. And we’ve had
tremendous success with organic compost additions
as feed supplements. And actually managing and
exploiting that microbial food Web. And in the
case of marine shrimp it’s very effective. So
there are certain applications where you can
exploit that aspect of the aquatic environment.

MR. BROWDY: This is Craig Browdy again.
I think that what Steve said is very true for
shrimp and it’s true also for certain species of
fish. But it doesn’t work for other species that
need clear water. So we need to make sure that we
keep in mind that aquaculture is a very diverse
industry. And one thing that works for one species
might not work for another and making one rule
that covers all species, you have to really keep
that in mind all the time.

The other thing I wanted to mention
specifically in answer to your question was that
these particular algomeals [phonetic] that are
produced by fermentative processes and similarly,
I guess they’re used to a certain degree, can
produce some—it would be like farming up the food
chain, I guess, except for that—I guess if you saw
the factory in King Street I’m not sure that you
wouldn’t shudder a little bit because it’s a big
fermenter, but on the other hand they assure me
that they’re working towards organic certification
of that part fermenter. So I guess that it is
possible that we’ll have organically certifiable
phytoplankton meals that are high in DHA and
possibly one day EI.

DR. ASGARD: This is Torbjorn Asgard again. It’s, I think it’s one thing you should think about in relation to this management of the whole food system. Not just organic; it’s any food production. I think one of our big challenges today is to manage to recycle nutrients back to the production systems. We are more or less stealing from the production areas and dumping in the cities. That is maybe the biggest challenge we actually have.

HUE: Andrea.

MS. CAROE: I’m going to circle us back around to the health issue a little bit. In my past careers I did a lot of work in water quality and bioassay work. And one of our prime indicators of water quality was looking at these indicator organisms for mortality first, of course, but also reproduction and fecundity. And I was wondering if any of the researchers have looked at these indicators for the overall sustainability of these, these aquaculture farms, and has there any research been done on egg production as it relates to a control, or the ratio of female to male population as fecundity and the selection, based on the environment or based on their health.
HUE: Before anyone answers, please, all panelists have to identify themselves every time that you’re going to speak. It’s for their reporter.

MR. HICKS: I guess I’ll go. It’s Brad Hicks. Our experience with fecundity specifically and in salmon is that the fecundity in farmed salmon is not as good as the fecundity in wild salmon. That was particularly true 20 years ago. In the last 20 years we have, for lack of a better term, I guess, and I don’t think it’s a discovery, I still think we’re pioneering and in the art form—we have learned that if we feed the fish better diets, and in fact, if we actually restrict their feeding which occurs naturally in that particular species, just post-ovulation, that we’ve actually been able to dramatically improve the fecundity in salmon.

So I like, I guess, all terrestrial species, as the better we get at understanding, the more we learn about them the better we are at trying to mimic nature for lack of a better term and we do improve those things. I don’t—is that the issue you’re looking at or are you looking at pollution?

MS. CAROE: No, I’m specifically trying
to find an indicator of, you know, these system were look—what I see in most of the research that was put there is production oriented, which certainly is important for the financial viability of these operations. But it doesn’t speak to us really about whether this is good for fish. So I was trying to get at indicators that would let us know if this is healthy for fish to be reared this way. And fecundity and reproduction definitely are indicators of whether, you know, that species of fish is thriving in this environment with this type of diet. So again, I’m just kind of trying to get some more, you know, sideways look at, you know, since the fish can’t tell us if they’re happy or not.

HUE: Okay. There’s no question that the diets that give us better fecundity, we have much higher levels of fishmeal and fish oil. At this point I don’t think we know the specific science behind it, but practically speaking, and we’ve got—our end [phonetic] here is very large. We have very large numbers to deal with. We’ve certainly discovered that much.

MR. SHAH-ALAM: Shah-Alam from the University of North Carolina, Wilmington. I just wanted to a little bit with this question—it’s
true that yes, if we had more fishmeal, fish oil, that’s good fecundity. Good eggs. We did some studies, I think Dr. Otranovy, he’s here [unintelligible] and some studies with the black sea bass and southern flounder. So when we fed the fish with some kind of, I mean, wild light fish, like not frozen fish, wildcat [phonetic] like I call a sardine, anchovy or something like this, then the highest fecundity definitely we found. And also we tried to develop some dyes [phonetic] with the different types of lipid. Because lipid plant could—important role for the, I mean, developing eggs. So we fed the lowly picked and highly picked one I think maybe 12 person and 18 person, lipid fish world [phonetic]. Let’s give the good excellent, I mean, fecundity sarbatar [phonetic] rate of this fertilization egg. So many parameters we look for this. So that’s true that for—if you think that for the high quality good stock we must add high quality diets. And again, same thing, that not only fishmeal and fish oil is the diet for molition [phonetic]. [Unintelligible] so many other parameter, well-balanced diets. So maybe due to nother small nutrients like [unintelligible] could be deference [phonetic]. So these things also we
need to consider. Thank you.

HUE: Dr. Asgard.

DR. ASGARD: Torbjorn Asgard again. I think again it’s a question of how we look upon it. If we look at the salmon industry there’s no doubt there has been an improvement in fecundity. The whole production is much more predictable. Getting average better and better result in, in the industry overall. Not just organic, but generally in the industries.

At the same time it has not been, as far as I can remember, any studies particularly on this replacement where you go very far down in fishmeal and checking then what is the quality. But in general, what I state as I had in my last slide, that it’s the nutrients that matters; not the ingredient.

So if we are able to understand what are the requirements of the animal and we can fulfill the requirements with the ingredients we are using, it will be working.

HUE: Bea.

BEA: First of all, I want to thank all of the panelists. Your information was very useful. A couple of questions that I have, there’re two separate question, but they
interrelate to each other. From a consumer perspective I think it’s going to be very important for consumers to understand the animal welfare conditions of the farms. And I’m curious what studies have been done or what considerations have been made as far as the health and the environment of the fish that are being raised on the farm.

I hear a lot about how important it is to make sure that their diets and their weight are maintained for their health through supplementation and the different types of feeds that you’re changing out of its diet. So making sure that you maintain a certain level of nutrients. But I haven’t heard much talk about the actual, you know, conditions of how these fish are being raised and how that compares to their natural habitat.

MR. JONATHAN SHEPHERD: Could I try and lay a little bit about that.

HUE: Please state your name for the—

MR. SHEPHERD: My name is Jonathan Shepherd. I don’t know if this answers your question, but maybe it’s worth—I’ve been fortunate in many ways to have grown up in the last 30 years of my career with—simultaneous with the growth of
the salmon farming industry in Scotland which I was very involved with. And we helped to pioneer the company I was with. Marine Harvest, Salmon Farming in the U.K. And then the Norwegians really sort of took over and Torbjorn can confirm or otherwise what I’m going to say, but I hope that—we helped each other really. Because in the very first years it was very much of an experimental thing and we didn’t know the—talking specifically about infectious diseases, the viruses and bacteria. Of course, we knew we had a problem in the wild furonculosis occasioned in wild salmon, and that worried us a little bit.

And the book said that this organism, aramon salmon asadra [phonetic] only survived in fresh water. So we were relatively relaxed because we wanted to farm in sea water. But then we discovered the book’s lying [phonetic]; we could take it to sea water and it caused a huge epizootic and we nearly gave up salmon farming in the early eighties in Scotland because of furonculosis.

And then fortunately, just in time we came up with an oil-adjuvanted vaccine because we were using a lot of antibiotics in those days and we knew it was an unsustainable setup. And we were
using, this was largely undomesticated salmon, I would say. Our improvement programs hadn’t really got off the ground then. So our feed, we were, you know, learning. The fish were undomesticated. They had these organisms that interestingly came from the wild environment around them. And presumably, in the wild the collision opportunities, the chance of cross-infection and so on were so long that they didn’t usually cause epizootics. But when you brought these fish together in pens in a, as you could say, a sort of unnatural environment, the cross-contamination risks and so on were much greater and you could get some quite nasty strains of this.

Fortunately, you could boost the immune response and, and I could tell you the same story again for a variety of viruses which again, came from the wild populations and didn’t cause a particular problem, occasionally up and down in the wild, but in the farmed environment caused big problems. So I think, I think the point I’m trying to make is that you’ve got to be careful to sort of compare the wild populations of salmon and their disease cycles with the sort of the epidemic situations you can get in a farm environment. If you don’t know about—if you don’t have a—if you
don’t, haven’t domesticated those fish to the extent that you’ve bred in disease resistance for the specific pathogen, and that you have a range of vaccines available as a routine so that these when they go to sea can happily live in this environment without it causing any problems. And of course, you’ve got to look after them very carefully. And then they’re that much more resistant.

DR. ASGARD: Torbjorn Asgard again. It’s, I think, the domestication is really important here. Because I think it’s wrong to produce meat in a zoo on wild animals. I think if we want to produce meat we should do it is on domesticated animals where we take full responsibility for the whole life cycle. I think that is the aim and that should be the aim for all the species.

And this requires actually that we develop very good breeding programs where we take care of genetic variation and avoid in-breeding. And that is no spreading in several species and in salmon it has become very far. It has been all the way very broad genetic program where you take care of the genetic variation, but I think that is very important for any cultured species. And I think that is even something you should think of in
traditional domestic animals. When you start with
small populations, again, in breeding is an
important issue.

MR. STEVE CRAIG: To add, in terms of
water quality—

HUE: State your name please.

MR. CRAIG: Steve Craig, Virginia Tech.

Thank you, sorry about that. We work almost
exclusively with recirculating aquaculture systems
so water quality is paramount. It’s got to be
maintained at very high levels. The implications
on growth are very apparent once your water
quality decreases so—and then growth is often the
first indication of a health issue. So it all kind
of feeds back. You’ve got to maintain excellent
water quality. You have to have very good diets to
optimize the growth and keep these animals
healthy.

HUE: Dan.

DAN: Thank you. As a trained ruminant
nutritionist I completely agree with Dr. Asgard’s
statement that we feed for nutrients and not
feedstuffs, and I think that’s true in all
species. But I also am very aware that—and I’ll
limit it to ruminant nutritionists without
questioning any of yourselves there, but I think we tend to be a lot—we think we’re a lot smarter than we really are. And sometimes we are far more effective with a shotgun than a rifle. And in light of that, I’d like to ask Dr. Alam, what were you trying to accomplish, or what was the reasoning for maintaining the squid meal in all of your diets?

DR. ALAM: This is Alam. An excellent question. Squid meal, I—

DR. SHAH-ALAM: --in Japan, I did my PhD and postdoctoral research on Menhaden fish and shrimp. Squidmeal is the excellent [unintelligible]. If you add just a small amount of squidmeal that gives good palatability and [unintelligible] that if we have any other [unintelligible]. So my thinking is here I used a higher level of soybean meal, so I used a small quantity of squidmeal, which gave them more palatability and that's helped the [unintelligible]. This is the one reason. The other reason is squidmeal is not used a lot of in the industry so it's just a small amount, so we can use this. So this is the reason I used
MR. HUBERT KARREMAN: Do you have a follow up, Dan?

MR. DANIEL GIACOMINI: It's not a follow up [inaudible]. Actually, it's not related, but it will be my last one for this group. A couple of you have mentioned domestic fish and your belief in the importance of it. At least two of the papers this afternoon, at least from the paper, they're recommending no more than, I believe, F2 generation and mainly in relation to getting away from the problem with escapes. Is there any other nutritional aspect or any other aspect that the nutrition panel would like to address on that point?

MR. CRAIG BROWDY: I just want to, I guess reiterate--this is Craig Browdy--reiterate the points that were made earlier about, from the standpoint of nutrition, with the shrimp, we've been almost completely closed reproductions since about 1990. And they go about a year a generation, so we're pretty far along on domesticated stocks and the differences that we see in terms of all the measures that we talked about, reproduction, growth, how happy they are, it's unbelievable the difference between now and
when we started. To think that we're going to go back to having to do no less than an F2 is just--
the animals wouldn't be as happy if you take them from the wild and put them in than an animal that's been domesticated for a number of generations. In terms of escapement, is the South Carolina Department of Natural Resources and growing an exotic species, the Pacific White Shrimp, we've had to deal with escapement for the last 20 years. And wearing both hats, it's a very significant issue, but I'm not sure that it's one that necessarily is for this particular panel. But there are probably technical solutions rather than necessarily trying to grow wild fish.

MR. KARREMAN: Rigo?

MR. RIGOBERTO DELGADO: I have three questions. The first one is for Dr. ALAM. You did your study with sea bass and I'm just wondering, did you carry out human nutrition analysis after your studies to see what the impact on those essential elements was?

DR. ALAM: Okay, thank you. I used, in this experiments, I used a small fish, so I did not use any [unintelligible] for this. But I did start using growth [phonic] fish. I fed three months with the two lipid levels. One is a small,
low level lipid, another one is a higher level lipid. So then after three or four months, I used this fish to test our [unintelligible] and some people who like fish, so we made some kind of test, that's how, like flesh quality, fatty fish. But we did not use any human nutritionist for this kind of thing that--how this quality test on--but definitely we found that the people like higher quality, if that fish contains higher level of lipid, then it is tasty. And then we did several sashimi sushi, different types of food we prepare and then we found that instead of 12%, the diets containing 18% lipid is the more tasty in general what I found for black sea bass. And black sea bass contain high level of lipid, definitely, compared to the other southern flounder. Is it make any...? Thank you.

MALE VOICE: Just a follow up: do you think your results would have been different if you had used the soy malt concentrate instead of what you used in your experiment?

DR. ALAM: Okay, here is the question is that protein percent is how many percent of soybean, how many percent is of fishmeal protein we're going to use, I mean replace? So if it's exactly the same, I think maybe not. But if we
change the formulation, it could be different, because soya protein content is completely different. This is only protein. It would be different. Here we are using soybean mill extrude and solvent extracted soybean meal which is contains fiber and so many other non proteinous substances. But soya protein concentrate I think is high level of protein, so it could be difference.

MALE VOICE: It seems to me that we're moving in the right track, that 12/12 and all the members of the panel more or less agree with that. There's going to be some trade-offs between the nutritional value for human consumption and how much we replace in terms of vegetable sources. I wonder, and this is a question for all the panel members--it points to the area of crowding--and I can picture our commercial farms trying to get the most out of their resources, so crowding would be an issue--I wonder if you consider that in your studies and to see if there's a confounding effect between the amount of vegetable sources that you can use and the actual number of fish per square meter of water or however you measure it. And if so, are there any other confounding effects that we should be considering, not only the
overcrowding and so forth?

DR. ALAM: For me I think density is a factor, definitely because if you use intensive [unintelligible] so many fish [unintelligible] so the feed area [unintelligible] so many things. Lower density could be difference and lower density of some spaces have some carnivorous [unintelligible] catabolism effect of something--cannibalism. So this kind of thing, also. This is my thinking.

MR. KARREMAN: Okay, we have ten more minutes left for questions. I have Dan, then Kevin, then Jeff, then Julie. Dan and Jeff, would you mind seating to Kevin and Julie, just [inaudible]? So, Kevin, you're up.

MR. KEVIN ENGELBERT: Brad has something to add.

MR. KARREMAN: Huh?

MR. ENGELBERT: Brad wanted--

MALE VOICE: [Inaudible].

MR. KARREMAN: You wanted to add on to that last question?

MR. BRAD HICKS: Yeah, I think the question was to all the panelists, so I thought I'd--and the question related primarily to crowding. It's Brad Hicks from British Columbia.
Crowding is a very species-dependent phenomena, much as it is with terrestrial species. The number of quail and the number of leghorns that you can raise in a certain space is different. And fish are no different.

And I'll just give you an example amongst the salmon group of fishes, never mind all the rest of them. Arctic char can be raised at approximately 12% density, that's 120 kilos per cubic meter, which is very dense. And if they are actually raised at lower densities, they do more poorly. Atlantic salmon's about the middle. Atlantic salmon's optimum density of rearing is around 25 kilos per cubic meter. That varies quite a bit depending on water quality, not unlike the number of cattle you can raise on an acre of land, which depends upon the ability of the land to produce nutrients for the cattle. So there's variation which are very, very similar. And Chinook, or Pacific salmon, the Pacific Salmon that's raised in British Columbia, it's at about 15 kilos a cubic meter.

If we "break those rules, if," I used to say, "listen to your fish, they have a lot to say." If you don't listen to them and understand them, what we find is if we raise at densities
greater than or less than, in the case of fish, and quite frankly the same in a lot of domestic species, we decrease their socialization, if you will.

Fish have a pecking order very similar to chickens, for instance. If you overcrowd them, you end up with both behavioral and health problems. Fish will begin to fight excessively, for lack of a better term, including salmon, if you get them too dense. Feed conversion goes to hell in a handcart. Feed conversion drops off dramatically once you get over density. So yes, fish, like terrestrial animals, are very sensitive to density.

MR. KARREMAN: Kevin, you're up.

MR. ENGELBERT: Thanks Hue, and thanks everybody. I think all your statements point to the complexity of this issue, but I'd like to bring it back to a basic question, yes or no, for each of you, back to what Andrea stated when we started this. The reason the 12% was on this proposed standard and the reason that I've heard is that we were told from the industry that you can't start an organic fish industry without fishmeal and fish oil being used as feed. We also heard from the organic community that they did not
want that allowed because if it's not organic feed
going into the product, it's not organic. So in a simple, yes or no from each of you, so that I can be sure I understand your papers and positions, if we did not allow wild-caught fish oil and fishmeal, could the organic aquaculture industry get started?

MR. KARREMAN: Go right down the line, I guess.

MR. HICKS: I'm at this end, It's Brad Hicks. No, we could not get started.

MR. JONATHAN SHEPHERD: Jonathan Shepherd. I totally agree.

DR. ALAM: No, I am not agree, because we need wild fish.

DR. STEVEN CRAIG: Steven Craig, Virginia Tech. No.

MR. BROWDY: This is Craig Browdy. For shrimp, yes. For fish, no.

MR. TORBJORN ASGARD: This depends on the alternatives you have and what is wise in the situation you are and not. Because it's not--don't think it's right to have a yes or no. It's depending on the situation. What is available where you are? What are the resources where you are producing? As now the huge difference between
the American continent and the European, between whether you can use animal byproducts or not. I think that is very important for the answer of yes or no.

MR. KARREMAN: Thank you. Jeff.

MR. JEFFREY MOYER: Thank you, Hue. Jeff Moyer. My question actually follows up very closely to Kevin's comments, which were the recommended document that we have has this 12% and 12% in for seven years. As we work towards eliminating that out of the recommendation, what's the true potential of reaching that goal, given your current statements that you just made in answer to Kevin's question? And so what would the diet look like in seven years from now as compared to where it is today? That question is for all of you or any of you.

MR. ASGARD: I can start. Torbjorn Asgard again. This also depends on the species you are producing because it's huge difference between the species in what they are actually requiring. And also just during the life span of let's say salmon, it's huge differences in what is the right dietary composition. And it's huge variation in what is the expected feed conversion ratio. So what I think is necessary is to accept
the complexity and actually make the rules according to what is right for this species, for this life situation. It makes it more complicated, but it is too tough a simplification to put up figures that is good for everything.

MALE VOICE: I think the Sunset Provision is important. I think we should eliminate fishmeal and fish oil in organic aquaculture. That being said, we need to get going. So in seven years, hopefully you'll have waste streams from organic aquaculture production that can be fed back in. I would strongly urge a consideration of at least organic poultry waste to be allowed to be incorporated into the fish-- organic fish formulation. It ties in with the organic mantra of recycling nutrients. It's ridiculous that the poultry byproduct meal from an organically produced chicken cannot be used in an aquafeed. So I'm a very strong proponent of eliminating fishmeal and fish oil with the Sunset Provision, but we have to have other sources of organically certified proteins to do that.

DR. CRAIG: Steven Craig, Virginia Tech.

MR. KARREMAN: Hold on, Andrea wants to put something in.

MS. ANDREA CAROE: I just want to remind
the panel that, like I said in the very beginning, we're balancing consumer perception and science. And although I completely agree, or your science very well may show the benefits of poultry byproducts, we have heard from the consumers on these issues, and the consumers don't necessarily want to see animal byproducts fed to fish. So again, I know it's frustrating for the scientists in the room to consider this, but we as a panel and as an--working through the Ag marketing service for a marketing label have to consider that consumer perception.

MR. KARREMAN: Also I wanted to add in one thing. There was a question here on a card. I think it's pertinent to this. Says for Dr. Browdy. Do you have any prediction as to when the worms would be commercially available and would combining them with algal meals help move this along?

DR. CRAIG: That would be Steven Craig, Virginia Tech. They're commercially available now. They're just very expensive, so with increased demand and increased production, hopefully that cost will come down, but it is commercially available right now. In terms of combining this worm, marine worm source, with
other protein sources, I think is really, could alleviate all these other concerns about protein sources and definitely would take poultry byproduct meal off the table because it does supply the N3 fatty acids that marine fish need. It can be produced under organic conditions. It already is. It's just a cost factor at this point.

MALE VOICE: As long as the consumers don't see it.

MR. KARREMAN: Hold on, Bea, because there's--Julie's been waiting very patiently.

MS. JULIE WEISMAN: I think a lot of my question was answered when Kevin asked his question, but I want to rephrase it from another point of view. I very much appreciate the complexity of the answers that have been given, but I want to go back to the really simple too. And so my question is, is the 12 and 12 enough? And this is more for Dr. Alam because you specifically noted 70% as the optimal level in your data, so really my question is for you. Is 12 and 12 enough?

DR. ALAM: I think for my study, what I did, I said that formulation is not only fishmeal 12 and 12, is contain other things like vitamin,
mineral, so many other things. But anyway, if everything is fine, everything is okay, we believe that vitamin, mineral, everything is fulfilled requirement, then 15% seems no differences with the fishmeal even 50%. So 12% maybe not big differences [unintelligible]. So my thinking in this case for this species, black sea bass, those like so many kind of food they can maybe--it's okay, we can use it. But what happen for the southern flounder? Those who [unintelligible] other fish--at this moment, I don't have this other information. But for this in general, for my thinking, 12% lipid seems okay, looks they are growing good because I did some [unintelligible] 12% lipid. For my personal opinion, seems low, not bad. But for the fishmeal, if the other sources, if squidmeal is allowed as organic certification, if krillmeal 5% is allowed, if [unintelligible] high quality vitamin and mineral [inaudible] okay, then 12%, I think, without reducing growth, may be possible. But if we want to, like reduce growth--like we don't want this maximum growth--then maybe we can wait for long time. But in this case there is a possibility due to lack of some nutrient, maybe disease or some other things may happen. Or how many long days
can we wait? So for my opinion, it's not bad at least for in general. Thank you.

MR. KARREMAN: I think Bea was looking at me first, Jennifer. You're next.

MS. BEA JAMES: This is actually a question that, George Lockwood, you might be able to answer also. In looking at the 12/12, and if we were to go more towards a plant-based diet using what I saw up there was soy, wheat gluten, wheat, that it seemed like supplementation of amino acids was an important component. So if all these species have different needs, are we going to end up with synthetic amino acids on the national list?

MR. GEORGE LOCKWOOD: We're not going to allow poultry byproducts. There has to be a source of certain amino acids.

DR. CRAIG: Steve Craig, Virginia Tech. I think the 12/12 is a good starting point and also not all fish are going to be able to be produced organically. So if you can't make it under those guidelines, you can't be produced organically. And I don't think it's very wise to think, with all the different species of fish cultured around the world, that every one of them is going to be able to be certified organic.
FEMALE VOICE: So are you suggesting that the aquaculture standards should be for specific species?

DR. CRAIG: No, I'm saying if you throw this 12/12 out there, certain fish species are going to be able to handle that. Others are going to take more research or maybe they can't make it at all. I think that's how you protect the organic--the notion of organic. If everybody can do it, then why is it special?

DR. ALAM: This is Alam. I'm just going to elaborate that methionine which is a really very important limiting amino acid for most of the plant protein sources. So if we use only 12% fishmeal, we must have something that gives methionine or good amino acid profile, otherwise due to only [unintelligible] or any kind of amino acid deficiency, there'll be something different--situation, like disease or so many thing. So if there is a possibility to add this methionine or lysine or some kind of organically certified or synthetic amino acids, could be fine, I think, for aquaculture industry. This is my opinion.

MR. HICKS: Can I say something?

MR. KARREMAN: Yeah, go ahead, Brad.

MR. HICKS: I'd like to actually be
extremely pragmatic for a minute on this issue of the 12 and 12. I've earned my living almost exclusively from growing fish or being very intimately involved with the growth of fish. If the 12 and 12 is fixed in stone and the Sunset clause is in place and it's only seven years away, and I say only because animal husbandry is a multi-thousand year process. We didn't get to the current organic chicken in seven years. I'm not sure how we're supposed to get to the organic fish in seven years.

So from a very strictly pragmatic producer's perspective, say we go this route. We begin to develop a market for organic fish with 12 and 12. And for whatever reason we're not able to get over the hurdle at seven years, we cannot produce the fish in seven years. What happens then? If you're the producer and you've invested a tremendous amount of time and effort, you've probably also behind you, dragged in a whole bunch of university research and tons of public money into this process and now you're over the cliff. From a strictly pragmatic perspective, I would guess it'll be pretty difficult, other than a very, very select few, to be able to go this route.
MR. KARREMAN: It's interesting you say that, Brad, because the issue of methionine in poultry is coming up again next year as its Sunset runs out for the second time. Joe, you have the last question. Then I'm going to read some cards and then it'll be lunch break.

MR. JOSEPH SMILLIE: Well, you took the wind out of my sails here 'cause that's exactly what I was going to say is that we did grant the poultry industry a Sunset synthetic amino acid. That was done, and we're coming to that sunset. So we will have an answer to your question. We'll see how we deal with the methionine issue with the poultry industry.

MR. KARREMAN: That will be interesting. Okay, let me read some cards here. As was mentioned, these will be scanned in and on the website just so the people that wrote them know also that you can speak with the presenters during our poster session this afternoon after the second panel. So here's--let me just go with this here then. Could we use organic poultry byproducts to grow nereid worms? Okay. Jonathan Shepherd, here's one for you. With regards to using [unintelligible] in fish feed, is there a difference in ash content when compared with meal
from Menhaden anchovies, et cetera? And if so, has that caused problems in terms of fish health or affluence or any difference? Any genetic variation for ability to elongate fatty acids? How big on input is fish processing waste to fishmeal, fish oil supply? Here's one for Jonathan Shepherd again. In fisheries, for fishmeal and fish oil, how do you ensure that the fisheries are sustainable for the long term and not just stable especially in the face of climate change and the poor track record of fisheries management? Here's one for Dr. Asgard. What are the waste pollution implications of increasing the vegetable content and decreasing the fishmeal oil content? And does increasing the vegetable component lead to increasing waste pollution, especially via open net cages? Here's one for Brad Hicks. Well, they're for everybody, but these have the names on them. Your presentation implied that science on environmental impacts of fish farming in British Columbia is fraudulent. This is a serious allegation. Please clarify. Either retract your statements or provide evidence of fraudulent science. Is squidmeal--this one's a tough one to read--I'm going to hold on to that one for a second. For Steven Craig, what is the
price differential between organic diets with nereids and conventional diets? What's the price differential? Okay. How will supplemental protein sources such as krillmeal and squidmeal be handled? It appears that some of the studies have listed krill and squidmeal separately in their ingredient lists. Fish oil issue comment: farms show good replacement of oils in salmon feeds. However, informally, nutritionists indicate that salmon fed with low fish oil diets show obesity, low blood oxygen, less immunological responses. Results are not only related to growth. Eight more, okay? What is the effect of fish meal replacement on the cost of production? That's for Steve Craig. Another one for you. Does total replacement of fish meal with yeast change the cost of production? Another one for Dr. Steven Craig. You suggest a phase-out of fish meal and oil diets in organic agriculture. Do you suggest the same for organic agriculture? What studies have been done with the in situ production of organic herbivores integrated with omnivorous and piscivorous fish? That's a holistic type question there. Question to Brad Hicks: Why is the choice between burning up fish products and feeding them to fish--wait--why is the choice between burning
up fish products or feeding them to fish?

Couldn't fish used to make fish meal and oil alternatively be fed directly to people as Peru is now doing with some of its very large anchovy fishery or left in the ocean as feed for marine predators as the Atlantic States Marine Fisheries Commission is now considering for some Menhaden?

For Steven Craig; you're popular. You specifically said in your presentation, protect the organic label at all costs. Where in your research did you consider the human factor and did you conduct any studies or testing on the taste, texture or flavor of the fish? I think we've--that's been answered a little bit. Two more, no, one more. Yeast and worms as fish fed replacer, are they really certifiable organic under NOSB, especially in light of unresolved issues? Yeast and worms, are they actually certifiable, is the question? Okay, I'll try to get through this one here.

MALE VOICE: This one is separate over there.

MR. KARREMAN: Oh it is? Okay. Is squidmeal different than fishmeal and cornfed--here, you want to try that Kevin? I'll get the last one. I've studied this one a little.
MR. ENGELBERT: Is squidmeal different from fishmeal? Are cornfed squidmeal allowed if fishmeal is not allowed? I think. What would be a source of lipids? How about the initial culture of algae, is it organic compliant? I can't get the bottom line there. Are there any data related to wild harvest versus conventional shrimp versus plant based diet? That's the best we can do with that one.

MR. KARREMAN: Okay, with that, we're going to wrap up the--what? No, no comments on these. Sorry, not right now. With that, Joe has one comment and then we're going to wrap it up.

MR. SMILLIE: I just wanted to point out one of the big issues that we didn't deal with this morning at all--we're talking about the 12 and 12. We still haven't really cracked the nut or even really discussed the sustainability issue. Again, we've had people talk about MSC certification of the Pollock Fisheries and we've talked about other sustainable markers for the Menhaden and the anchovy fishery, but that's going to be one of the issues this board has to deal with is what credentials for sustainability can we accept? And again, it's an open question to everyone. I just wanted to point that out.
MR. KARREMAN: Okay, I just want to thank the panelists and the audience, but especially the panelists for being here this morning. I think the livestock committee can congratulate itself. I think we've really put together a fine set of individuals and we certainly thank you for coming from everywhere where you did. And we look forward to after lunch hearing from the next set of panelists. So enjoy the rest of the day here and I'm sure you'll have questions coming to you later on.

MS. CAROE: Okay, so we will recess for lunch and reconvene at 12:40, not a minute later. We got a little bit shorter lunch than we expected.

MS. VALERIE FRANCES: So you don't want to do a full hour for lunch?

MS. CAROE: 12:40.

MS. FRANCES: 12:40.

MALE VOICE: 12:45. It'll be 12:45 when they get here.

MS. CAROE: Pithy issue for this symposium--

MS. FRANCES: Neil Sims is not in the room?

MS. CAROE: Neil Sims?
MALE VOICE: He's up number three, so we could start, but we'd like to have all six panelists here when we start.

MS. CAROE: Okay, well we'll give him a couple of moments. If anybody knows him or sees him could you--

FEMALE VOICE: [Inaudible]

MS. CAROE: He's in the restroom?

FEMALE VOICE: The restaurant.

MS. CAROE: Oh, restaurant. We're going to get started again with the net pen issue and as we started with the first part of the panel, we're going to have George Lockwood come up and tee up the issue, describing the rationale and thought process that the aquaculture working group went through when they came up with their recommendation. So, George.

MR. KARREMAN: One thing, George, before you start, extremely dumb question on my part, but I think there's some other people that have been confused at times, but if you could give us the definition of--it's really stupid--of net pen. There's open net pens, there's--are there closed net pens, or are there just net pens? Or could you just maybe also do that in your talk? Thanks.

MR. LOCKWOOD: I'm looking at our
proposed standard to see exactly--okay, we call
them open water net pens. Open water net pens are
a floating structure that have nets hanging from
the structure that are open to allow water to flow
back and forth. There are references to closed
net pens, or closed pens, and that basically is a
design that is being tested now that has a solid
plastic barrier, a flexible plastic barrier and
all the material that otherwise wouldn't move in
and out of the pen is collected at the bottom. So
those are--does that help?

MR. KARREMAN: That does, and also is
there any relation to the sea coast versus out in
the open water, way, way, way out? No? They're
all just net pens, then, generally? Okay. Thank
you.

MR. LOCKWOOD: They're also used in
freshwater in some places for growing tilapia in
lakes, it's just not salmon. I'm sure I want to
thank the board for what I think was a very good
session this morning, not only in the selection of
the speakers, but in all the questions that came
from you. And I hope you're getting a very good
education on aquaculture.

We're now dealing with open water net
pens and I want to again state that our standards
were a compromise consensus and that we worked hard on this one as we did with the fishmeal and oil for marine resources. Let me just briefly outline for you the considerations that we have proposed for the standard. The consideration must be given of surrounding ecosystems for each location, and as you can imagine, location is very substantial.

A predator deterrence plan must identify potential predators, appropriate deterrence methods, how predator behavior will be modified by application of deterrence methods, documentation of control methods and effects, contingencies for failure to achieve objectives and how plan implementation can serve biodiversity in the ecosystem adjacent to and including the aquaculture facility.

Another condition is natural [unintelligible] capacities of discharges must occur within 25 meters of the site boundary without degradation beyond. 25 meters. The site must have a containment management plan to prevent escapes. With the objective of minimizing environmental damages to the seafloor beneath net pens, our proposed standards would require consideration of water depths, current velocities
and directions, stocking densities and other factors, have a monitoring program, measures to prevent transmissions of diseases and parasites between cultured and wild animals. And the use of multiple species of plants and animals is necessary to recycle nutrients.

Now in two places in the proposed regulation, we mention, one, aquaculture facilities must be designed, operated and managed in a manner that seeks to prevent the spread of diseases within the facility and to all adjoining ecosystems and native fish species. We also state that facility managers shall take all practical measures to prevent transmission of disease and parasites between cultured and wild animals. So that's basically what our recommendation is and we look forward to this panel as well as we did the last one. Thank you.

MS. CAROE: Thank you George. Valerie, can you give us the line up of presenters for this issue?

MS. FRANCES: We have six open net pen panelists as we did have six fish feed this morning. We're going to start off--well--we have two substitutions today, so I'm going to read the bio as it was provided to us initially and then
refer to the person who is substituting and they're going to have to fill in a little more on their background when they get up to the podium. The first is Sandra Bravo with the Aquaculture Institute of the Universidad Austral de Chile on the use of antifouling in the Chilean salmon industry. She had a family emergency and could not attend. And we have Pir Gunnar Kvenseth in her stead and he works with Torbjorn who spoke on the earlier panel. He is also a producer as well [unintelligible] I think is farm? All right. Sandra Bravo is a fishery engineer and full time professor at the Aquaculture Institute and her data that she analyzed in her study actually was provided by Per? Am I correct? Mostly? Okay. All right.

Next is Kenneth Brooks, Aquatic Environmental Sciences of Washington. He's doing a comparison of environmental costs associated with open net pen culture of Atlantic salmon and production of some other human foods. He's been studying the environmental response to finfish and shellfish aquaculture for 20 years, has focused on effects of organic waste on marine environments and published extensively in peer-reviewed literature. His doctoral thesis looked at
epizootiology and genetics of hemic [phonetic],
neoplasia and various species of marine mussels
and the genus Mytelus. I hope I got all that
right. And next on our list is Andrea Kavanagh,
who's the director of the Pure Salmon Campaign.
Looking at a review of the research on the causes
and the quantities of farmed fish escaped from
open net cage systems and a literature review of
the impact of escapes on wild fish populations
using farmed salmon as a case study. In her
stead--she had a medical emergency today--is
Thomas Natan, who is the Research Director at the
National Environmental Trust of which the Pure
Salmon Campaign is a part. And he is their
scientist, staff scientist, so I think--and helped
prepare the presentation today and will address
her paper for us. Andrea has directed the Pure
Salmon campaign since April 2005. The Campaign is
a global project of National Environmental Trust,
includes close to 80 partners and allies in major
salmon producing regions aimed at raising the
standards for farmed fish. From 2001 to 2005 she
managed NET's Take a Pass on Chilean Sea Bass
Campaign and has been with the Trust since 1997 as
part of climate campaign activities. Follows
Martin--I should have gotten the pronunciation--
Krkosek, the Centre for Mathematical Biology, University of Alberta, Canada on the disease threats of salmon aquaculture to wild fish. Martin is a PhD candidate at the Centre for Mathematical Biology at the University of Alberta. He's trained as both a marine field ecologist and a mathematical biologist and has studied sea lice interactions in wild and farmed salmon in the Broughton Archipelago for five years. George Leonard, formerly with the Monterey Bay Aquarium, Center for Future of the Oceans and now currently with the Ocean Conservancy. He is looking at performance goals for net pen production of organic finfish and he was with the Seafood Watch Program at the Monterey Bay Aquarium, where he oversaw the development science based sustainability standards and recommendations of wild cot and farmed seafood for consumers and businesses and acted as science lead on those activities. He did his PhD at Brown and then more recently took a position with the Ocean Conservancy. Neil Sims, a producer with Kona Blue and he's the president and co-founder of the Kona Blue water farms. 25 years experience in fisheries, biology, fisheries management and sustainable aquaculture development throughout the
tropical waters of the world. His topic is
applicability of organic principles to marine
finfish aquaculture, comparing open ocean net pens
and closed containment systems for production of
Kona Kampachi. And the order is then been
selected today by pulling numbers out of a cup.
So our first up on deck then is actually Pir
Gunnar Kvenseth.

MR. PIR GUNNAR KVENSETH: Thank you. And
thank you very much for giving me this opportunity
to give the presentation of Sandra Bravo. My name
is Pir Gunnar Kvenseth and the spelling is P-I-R
G-U-N-N-A-R K-V-E-N-S-E-T-H. And I work in a
medium sized organic fish farming company called
Villa [phonetic], and Villa is the name of a place
and it's not a house. And my--usually that's a--
my background is I'm a trained fisheries biologist
from the University of Bergen and the Institute of
Marine Research in Bergen. And my experience is
mainly in the cold water marine species, as cod,
halibut, torbut [phonetic], cleaner fish, salmon
and trout. I've been involved in the development
of organic fish farming in Norway for 10 years and
now I'm also working as an expert in the E.U.
commission in developing organic aquaculture in
Europe. And through this work, I've been
challenging a lot of different problems according to develop environmental friendly organic solutions. For example, for sea lice, also for net fouling, and that's the topic I want to speak today, antifouling in the Chiles.

MS. CAROE: Sorry, my computer is taking a minute. My power turned off, apparently.

MR. KVENSETH: You had it there earlier, so it's there.

MS. CAROE: Sorry.

MR. KVENSETH: It's not working? Slowly?

MR. KARREMAN: Oh by the way, it's a good time just to remind all the panelists today, the twelve panelists, that I guess you are required to be around during the poster session to answer any questions people have, even if you have not made a poster. But since you're a panelist, if there's follow up questions, okay? So you're here 'till 5:30, just like us.

MR. KVENSETH: I don't have any fish jokes, but I can talk a few words about how potential the seawater is. So more or less, whatever you put into the seawater, the algae, the mussels and everything will start to colonize it and grow on it, so that's also this topic about this antifouling. So even if you put a glass
plate or whatever in the sea, it takes some longer time to colonize it, but—and one good thing from the sea is that a lot of animals have shells and mussels have solved these problems. So there are a lot of activities going on around the world trying to use enzymes or solutions from the animals themselves to stop antifouling, stop the fouling on the treads. Okay? Okay, here we go.

So the title is Antifouling on the Chilean Salmon Farming Industry. So just give me the next slide. [Unintelligible] made before I got—it's a combination of things I've got on the mail during the last night and that I made myself, so you can just continue.

Well, the Chilean salmon farming industry started back in the 80s and Chile had for some years been the second largest producer and 387,000 tons of salmon altogether in '96. And only one company had been involved in the organic salmon farming in Chile and I think they have stopped. And one of the main technical problems, as I already said, will be the fouling of the nets. And this will vary with season and temperature, salinity, tide. What's the will of organisms to grow? And one of the big problems is that the fouling will reduce the water flow through the net
and also increase the weight of the whole construction, so you have to take this into consideration when you make dimensions. And it will also have direct effect on the fish health, will reduce oxygen, can have jellyfish that will more easily stop in the nets or seaweed. And attached organisms may also act as [unintelligible]. Next one, please.

Copper: Chile is quite rich in copper, and copper is the only metal that's allowed in antifouling for fish farming in Chile. And as we note, copper is defined as an environmental toxin and it can accumulate in algae and a lot of different organisms in the sea. And the effect of the antifouling is that you make a paint with copper and the copper would leak out to the near environment and as long as there is copper, that will prevent the new organisms, at least reduce them, the possibility so they can [unintelligible]. And it's efficient with the quite low levels. So here's a diagram over--if you're used to different meshes and different seasons, we don't even know with antifouling how long a time it takes before you have to change your nets. And for the smelt production, when you have quite small measures, it takes down to 10 to
12 days in the summer without antifouling before you have to change your nets. And if you have antifouling, it takes several weeks, maybe 20 weeks if you are in a good position. So this just shows how important the antifouling today is for Chilean industry. This data collection is the project I've been going on for five years and they've been sent out [unintelligible] to the companies that sell the antifouling and also to the companies that giving the service, washing and painting the nets. So it should be quite consistent.

This shows the different products and I at least see several of the products that I know the products names from Norway that I established down there and we see one of the different things at least from Norway and I guess UK is that there are very few that are water based. If you can just show the next one.

This shows the specifications on the different antifouling. A lot of solvents are used with [unintelligible] and I think it's just 10% of the antifouling in Chile today that is based on water. And the copper content, well I guess it's quite cheap in Chile, so it's quite high compared to what we are used to having in Norway. So the
total sales were also quite high in 1999, 1 million 700 liter and with the 20% copper that accounts for 460 tons of copper. And I tried to compare this a little to Norway. The sales have increased quite rapidly in Chile, so it's 2003, 1200 tons of copper and compared with Norway, about the same amount of salmon production, Norway have about 200 tons, about 1/6 of that.

Well this shows a figure of the development of the aquaculture industry on salmon in Chile for the last five years and we see there's a more rapid increase in the use of antifouling based on copper than its increase of the salmon production.

And I think the next slide will give some explanations for that. One of the explanations is that the sizes of the cages have grown much, much bigger, so it's much more difficult to change the nets so often. So they need to have very good antifouling that will last for quite long. And they also moved out into more exposed areas so that gives more problems for changing the nets. And the claim that they have more quicker [unintelligible] by the [unintelligible] and that may be part of this--what shall I say?--more fertilizing in the sea and they have low
percentage of water based antifouling compared with what's usually in Europe.

Alternative solutions, that is to use different washers or brushers with high pressure operated by divers or operated from the surface. But they say it's not a good solution because it gives a lot of suspended materials out in the sea that gives problem for the gills of the salmon and also this organic load may accumulate at the bottom. And also it's difficult to operate this washer out on the more exposed sites.

So in [unintelligible], there are now several farms that try to operate without using antifouling, at least antifouling without copper. You have several possibilities to use net polish or other silicone-based that make a smooth surface and make the treads stay together without using any copper and makes it easier to clean. But also this frequent handling of the nets and changing nets may cause escape of fish and stress and [unintelligible]. And the copper based paint in Chile, at least [unintelligible], will be banned as soon as there are good possibilities available and they compare with the TBT that this 1000 time more better, and I think that's what's used on big boats traveling on the big seas. And in Chile,
they also have, at least have had a lot of net pens in the lakes for smelt production and they have not been permitted to use copper in those lakes. And when you wash these nets and you take care of the debris and the mussels and seaweeds that are--have a lot of copper, it's usually a problem to recycle it because it's quite expensive.

So this was the first part and the project was financed by the [unintelligible] Investigation Pescera so when I was asked to put down some slides about the situation and antifouling in Norway, so I think they will follow now.

Antifouling in Norwegian aquaculture industry has also been dominated by copper and its use is about 220 a year and the industry goal is to reduce this to 20 tons a year. There's an increased use of paint without toxin as I now test out in Chile and the purpose is to give a smooth surface that's easy to clean and also to pack the treads, giving it more difficult for the organisms to settle. And in Norway there's quite many cleaner equipment in use and we have had no problems with this suspended materials in the gills or gathering organic materials on the
bottom. We are operating quite deep areas, deep fjords and a lot of current. And there's also an increased use of so-called environmental nets where you have two nets that are put together that are not painted with copper and when the one is in use, the one is out in the air drying, so you just change them every second week or once a month.

And the next slide will show what I've been working with for the last 20 years, use of cleaner fish; that is fish [unintelligible] that will eat fouling organisms from the nets. So you can have the next one. Quite easily or rapidly during the summer, the net would look like this. So I have had several students working on finding out on what's growing on the net and what's eaten by the cleaner fish. [Inaudible] the next one. Well, giving you some organisms that grows quite rapidly; blue mussels will be quite easily and all the others will establish quite quickly. And for the cleaner fish that we mainly put in to have control of the sea life. This was with just like lunch table all the time. So we have looked into the stomachs of this cleaner fish, so I hope that's the next one, maybe. So here is a summer situation and the number of mussels that we found in each of these cleaner fish. So we see that
the--at the most, when the blue mussels settle, 180 blue mussels in the one cleaner fish. So that they really do a vacuum cleaning job.

MR. PER GUNNER KVENSETH: We see also this [Unintelligible] quiet manual then [phonetic]. And very nicely, we have had quite few sea lice [phonetic]. So when there are sea lice, they will raise them down if we operate this in the right way.

And to take, this is a quite abnormal environment for the cleaner [phonetic] fish, so to take care of them in the best possible way. We'll make a micro habitat for them with different arrangements.

I think this is my favorite picture, as you see, so if it's done the right way, they clean the net so you can just continue with the, like a new pressure [phonetic].

This is cleaner fish that's eating the sea lice and the good thing, continuously lower levels of sea lice, if do it in the right way.

So that's it.

[Applause]

MS. ANDREA CAROE: Thank you very much.
Valerie, our next speaker?

MS. VALERIE FRANCES: Our next person is Kenneth Brooks with the Aquatic Environmental Sciences in Washington.

MR. KENNETH BROOKS: Thank you, Valerie. I don't haven any jokes to tell either.

Okay. This is a typical salmon farm, this one is located at Fortune Channel that will [phonetic], in Clakawit [phonetic] Sound, British Columbia. Next.

At a meeting, oh, I'm going to guess it was 15 years ago, a young student in the audience said, "Well, there are no environmental effects associated with my diet, because I eat only bread."

In addition to being a scientist involved in examining the environmental effects associated with aquaculture, I've been actively involved in conservation since I retired from the Navy 30 years ago.

I've worked extensively with USDA soil conservation service, with our local conservation district as the chairman of that district for 12 years, and as chairman of Washington State's Conservation Commission. I'm fully aware as are those of you who are agronomists, of soil losses,
one effect of traditional terrestrial agriculture. The photo on the left is from the Pollus [phonetic] in Washington State. The photo on the right is from a talk given by General Herrel [phonetic] after the first draw downs on the Columbia River. And that's one of the impoundments behind a dam on the Columbia River.

All of the sediment that you see there has been deposited, primarily from agricultural lands into these impoundments. After his talk, I asked General Herrel, I said, "Well, there's a huge amount of sediment there." And his response was, "When we first built the dams, we thought they would have sufficient hydraulic capacity to produce power for 200 years. Because of the soil loss and sedimentation behind the dams, we now believe that's only 75 years."

Soil is lost from the wheat-growing areas where bread is produced in Washington State, at 4-11 tons per acre. Soil losses are over four tons, I think it's 4.2 tons average from airable [phonetic] land throughout the United States, and it's 16-300 times higher in other countries. Topsoil is being lost on average worldwide 17 times faster than it's being produced.

My point is that there are environmental
costs associated with a loaf of bread. Next slide.

Categories environmental cost. I'm a member of GSAMP 31, an FAO committee that has been working for several years to develop management recommendations for near-shore and offshore aquaculture for member countries. I've suggested that we can categorize environmental costs associated with aquaculture in these four categories.

Today I want to talk a little bit about category two, what I call inevitable costs, and a little bit about category four, possible effects. Next slide.

The benefits and economic costs. This is for one company, 2005 they produced 38 million kilograms of Atlantic salmon. That's a third of a billion meals for human beings. The production per site was 3,500-4,000 metric tons. They used 45,000 metric tons of feed, with a biological FCR of 1.16. And the water area covered by these 38 net pen complexes to produce a third of a billion meals was 15.2 hectares. Next.

Dissolve nutrients from salmon farms. I'm going to point this out because I notice in your recommendations, in some cases, not all, that
you look for broad-ranging prescriptive operating standards to apply to aquaculture. You hard earlier that it's inappropriate to apply feed standards across a broad range of species.

One of the things that we discuss frequently in FAO is that standards are at least regionally specific. The environmental problems that you encounter in the Northeast Pacific are very different from the environmental problems that you might encounter on the east coast of the United States, and they're further different from the problems that you would encounter in the southern hemisphere or in the Northeast Atlantic.

Environmental standards need to be at least regional, and if you try to apply blanket standards across all regions, you will either not be effective, or you will actually have unintended consequences that don't help us achieve sustainability.

As an example, on the West Coast, because of upwelling -- the bringing of nutrient-rich oxygen-poor waters from the deep Pacific to the surface -- we have a lot of nutrient, far more nutrient than the phytoplankton a macro algae can use. In fact, they're light-limited where we are. They are not nutrient-limited.
Back in the '90s, I monitored nearly all of the salmon farms in Washington State, and we were required to look at nutrient levels up current, down current at three meters and down current at 30 meters. And we were required to analyze those water samples within half an hour of slack tide when we anticipated that the concentrations of metabolic waste would be at their highest for ammonia, ammonium, phosphate and silicate.

What we found was, and it's really ammonium that we're most concerned about, that's what's directly evative [phonetic] for the phytoplankton, that's what's given off as a primary excrement from the fish. Nutrient-rich concentrations were infrequently elevated within three meters down current from net pens. We never saw a significant increase 30 meters downstream from the net pens in comparison with upstream values. And there's no evidence from dozens of studies in the Northeast Pacific that salmon farms have any effect on phytoplankton production.

In our region, nutrient additions, water column nutrification [phonetic] is simply not an issue except in a few isolated poorly-flushed embayment's [phonetic] where we don't site salmon
farms.

I was asked by NOAH about putting a 300-metric ton striped bass farm in Chesapeake Bay, at a meeting six, seven years ago. I kind of threw up my hands and I said, "you've got to be kidding me." Chesapeake Bay is nutrient-challenged in the extreme, and that's an example that's very different from the Northeast Pacific. Next slide.

Benthic [phonetic] effects. These are inevitable effects with open net pens, they are real effects. Some kind of an effect will occur and those effects can either be positive or they can be negative. In the worst cases, we see a significant reduction within 100-150 meters of the net pens in the macrofaunal [phonetic] production due to the enrichment of the sediments. In other cases, perhaps 10%, 15% of the forms in the Northeast Pacific, we actually see an enhancement, both in the abundance and in the diversity of critters living on and in the sediments under and in the vicinity of the farms. These are generally very well-flushed sites where the currents are in excess of a knot and a half, 75 centimeters per second. But we do see those enhancement effects.

Near-field effects are what we, the way I define near-field effects is that there can be
assessed at specific points in time. In other words, we can go out on Tuesday and monitor, and we can see where the physical, chemical, and biological changes have occurred. Far-field effects, which we're not going to discuss today, have not been well documented, in part because they're very difficult to document.

Effects are best managed by proper siting to avoid sensitive areas, we don't put salmon farms over shellfish beds, over eelgrass meadows, over rocky reef habitats, important to rockfish and a number of other species. We put them over the muddy plains or the sandy plains that are not so sensitive to nutrient additions. And macrobenthic [phonetic] environments have always been found to naturally remediate, and I've done numerous studies looking at the long-term response of these environments to fowl.

When you have a farm operating and then you stop operations, how long does it take for the sediments to chemically remediate, for the organic carbon to be catabolized [phonetic] and go back to normal sulfides decrease, redox [phonetic] increased, and for the macrobenthic community to recolonize that area? Next.

Because these effects have been very well
studied by many, many researchers over the last 20 years, and because this is essentially an inevitable effect of net pens, we've developed -- we haven't, Chrome E [phonetic] and Kenny Black and others have developed some models that predict the deposition of carbon on the bottom. And here you can see the net pen if you look carefully, and you can see the red area, which is where you get more than about 5 grams of carbon, which is the threshold above which they think they see significant effects. So we can predict what the extent of these effects is going to be. Next.

My own work has focused a great deal on determining the environmental response to what we call physical chemical surrogates, which are sulfides and redox potential and total volatile solvents in the sediment. And here you can see a very real response. The Y axis is the log of the number of taxa [phonetic] that we see; the kinds of animals we see in these sediments. And on the X axis, you see the log base 10 of the free sediment sulfides, and you can see there's a very nice, linear relationship with the reduction in the kinds of critters you find in these sediments as the sulfides increase. Next.

This is the number of taxa that we see
adjacent to a salmon farm, typical salmon farm in British Columbia, as a function of distance in meters on the X axis. And you can see, the control, which is about 500 meters away, it's plotted at 300 just for visual aide, you can see that from the control, the log and the taxa is about 1.6, and we're below that when we get inside about 65 or 70 meters from the farm. So near-field, close to the farm, we see a reduction.

I have never collected a sediment sample from a salmon farm or a shellfish farm, and we see similar effects under intensive mussel culture in the Pacific Northwest. I've never collected a sample that did not contain some animals. There is no desert there, but there is a significant reduction at some sites in the numbers of kinds of animals that we see. Next.

Same is not true for the abundance of critters, and very frequently at intermediate levels of sulfide, from about 200-300 micromoles up to around 4,500-5,000 micromoles, we see an absolute proliferation of animals, and there's a few kinds. I've identified eight, call them carbon opportunists, in the Pacific Northwest, and they proliferate and we get huge numbers of them. These are numbers per sample, and we get up to 18-
19,000 critters in a tenth-meter square sample. If this is all too detailed for you, imagine my poor techs who have to separate all those 19,000 critters from the residue in those sieved samples. Next.

Environmental costs, benthic costs have both spatial and temporal dimensions. In this direction, we have distance from the farm, and in this direction, we have ton. And these red areas here are areas where we have significantly elevated levels of sulfide. And you can see that at this farm, we got significantly elevated levels out to about 25 meters, and they extended through the production period, but then once the fish started to be harvested -- not when the farm went fallow, but as soon as the fish biomass started to be decreased during harvest -- those sediments started to chemically remediate. And within about six months, they went fallow in March of 2002, and sulfide remediation at this site was essentially complete at all stations by July of 2002.

It then takes some period of time when new critters can recruit into those sediments, most of them are planktonic and it can be up to a year. If the farm remediates in October or November, it's going to be the next spring, early-
summer before you have a cohort of new recruits to repopulate those sediments.

But in cases like this where we have chemical remediation in the summer, by the fall, those sediments will be well on their way to biological remediation. Not all farms respond this way. In the worst case that I'm aware of in the Northeast Pacific, it took eight years for the sediments to chemically remediate. But with better siting, in today's world, this is more characteristic of what we see. Next, please.

What are the environmental costs? Well, we lose species, biodiversity is decreased, and in some cases, in fact I would say in most cases, the abundance of benthic critters benthic critters is diminished. That results in a loss of wild fish production due to a loss of their prey.

The average footprint of a Northeast Pacific salmon farm is about 1.6 hectares. And the average temporal extent of the adverse effects during production and remediation, is about 44 months. Next.

What do these losses mean? Well, if you just assume one trophic [phonetic] level between the macrofauna in and on the sediments and in edible fish, then we lose about 307 kilos of wild
fish due to the lost prey base under the farm. In exchange, the average farm produced, during these year-2000 surveys, produced about a million kilos of salmon. That's 12,624 times more salmon produced than wild fish were lost. It's about 84 kilos of wild fish per year during that 44-month period. Next.

I was fortunate enough, when I was 23, to have bought 17 acres of old-growth forest on Horsefly Lake in the Canadian Rockies. This is some of the old growth timber near our cabin there. Next.

This is my farm where I raise cattle and trees. The wetlands that you see in the bottom there, that was all pasture. I moved 17,000 yards of semiaumal mud [phonetic] to create those wetlands which are now fantastic wildlife habitat. Next.

My cows and your cows can deplete the soils of nutrients. They destroy brush, trees and imperion [phonetic] habitats. They add to greenhouse gasses, they compact the soil, they add excess nutrients to surface waters, etc., etc., but they are a valuable source of meat that helps feed people. Next.

What are the spatial and temporal
footprints? And I'm just talking about the land consumed by these two ways of producing protein. For salmon, to produce 1,250 metric tons of edible salmon flesh, this assumes that 50% of the carcass ends up -- a salmon carcass -- ends up as edible flesh. It takes 1.6 hectares on average.

For beef, at 8 AMUs, which is typical of grass production in my part of the world, it takes 3,174 hectares. The temporal footprint for salmon is two to four years, for beef, for my farm to return back to that old-growth forest would take at least 200 years.

This is just one aspect of the environmental cost, but I think it clearly illustrates from an environmental-use point of view, the efficiency that can be achieved with aquaculture. Next, please.

Some of the costs of commercial fishing. In the Straits of Juan de Fuca, not myself, but a group of recreational fishermen got some side-scanning sonar and identified 2,000, I call them derelict pots and nets, other people call it ghost fishing gear. They were then able to retrieve, these pots and fishing gear are generally in deep water, they've been able to retrieve over 200 of the pots. I have dozens of pictures like the one
on the left which is of one of these pots. And all of those fish, prawns and crabs, and other critters in there, are just dying with no benefit to anybody.

The Department of Fish and Wildlife in Washington State has estimated that just in these three embayments, where these 2,000 pots were found, those pots are catching 10% of the allowable Dungeness crab fishery in Washington State. And you look worldwide at the lost fishing gear, at the lost pots, at the lost nets, and all the light areas you see in that pile of nets that these guys were able to get this commercial to haul up for them, that's all fish caught in those nets and dying.

Point being, there are costs associated with the wild harvests of fish. Next slide, please.

And in fact, there are environmental costs with every form of food production. Society needs to understand and accept that there are costs associated with a loaf of bread, a hamburger, or any other food, including the wonderful fried fish filet I saw someone consuming for lunch today. I wished I'd chosen that meal.

We need to prioritize environmental costs
and focus our energy on solving problems rather than using the environment as a battlefield upon which to debate social and economic issues. And I deal in a number of environmental areas and I see far too much of that.

At commission meetings when I was chairman of the commission, I used to constantly chide people that we're not going to make any progress towards sustainability until all you folks sitting around the table pointing your finger at the people across the table turn those fingers around and say, "What can I do to solve these problems?" not "What do I want you to do."

Next.

Ten years ago, these were some of the challenges put forth by the ENGOs opposed to salmon farming. Today, we're involved in sea lice extirpating pink salmon runs in the Broughton [phonetic], and escaped Atlantic salmon will out-compete displaced native Pacific salmon. Next.

MS. CAROE: Excuse me. Mr. Brooks:

MR. BROOKS: Yes?

MS. CAROE: You did run out of your time, but we want you to continue, briefly, please.

MR. BROOKS: I'll be quick.

MS. CAROE: Thank you.
MR. BROOKS: I'll try to be quick. I’m a retired professor and I tend to think in 50-minute increments. Anything less than that is tough.

This is even-year peak salmon returns to the Broughton, and salmon farming started where the purple line is and you can see that after the initiation of salmon farming in the Broughton, we've actually seen some of the highest sustained levels of pink salmon returns to the Broughton.

In 2000, there was an enormous return: 3.6 million fish, and the next year it crashed, and therein ensued the current debate over the effects of sea lice on those pink salmon returns.

Next slide.

I just returned from a meeting of the Pacific Salmon Forum, which is addressing this and Dick Baymish [phonetic], a revered DFO scientist presented some marine survival data for the years 2004 through 2007 for Glendale, the major spawning river in the Broughton. 2004 survival was 23%; 2005, 3.4%; 2006, 1%; and 2007, 2.6%.

Frazer [phonetic] river stock marine survival has historically averaged 1.2%, and coast wide, pink salmon survival averages 2-3%. The bottom line is that marine survival of pink salmon originated in the Broughton Archipelago watersheds
has been equal to or better than average. There is no crisis in those stocks. Next slide.

This is the number of escaped cultured salmon, and I noticed in the submission to you that it essentially ignored escapes in British Columbia, Maine, and in Washington. And as you can see, there were a lot of escapes, primarily Chinook in late-80s, early-90s, but today we have very few escapes.

Andy Thompson, with DFO has been running the Salmon Watch program for 15 years now and I talked to him just the other day and he said, "Ken, we're kind of discontinuing the program because we just don't find escaped Atlantic salmon in British Columbia streams, despite extensive looks." Next slide.

MS. CAROE: [Unintelligible].

MALE VOICE: How many more slides do you have, because--

MR. BROOKS: I think I'm done.

MS. CAROE: Yeah. I think.

MR. BROOKS: So organic standards, one, I would encourage you to look at efficiency in our food production. I would encourage you to use performance standards rather than operating standards. A lot of what I read is just fine. I
question why you have this passion for reducing or eliminating fish meal.

My recommendation is that you rely on regional laws, because regional governments do attempt to do a good job at managing the environmental costs associated with [Unintelligible – cough] and you should take advantage of all of their work. Next slide.

This is one of the ponds on my farm. There's four- to five-pound trout in there. That's my son trying to catch one. Last slide. And that's my bit of heaven on Horsefly Lake. I thank you for your indulgence of my exceeding your time.

MS. CAROE: Thank you.

[Applause]

MS. CAROE: Valerie, our next speaker?

MS. FRANCES: Number three is, Neil Sims, Kona Blue, Applicability of Organic Principles to Marine Fish Aquaculture.

MR. NEIL SIMS: Thank you. My name is Neil Anthony Sims, N-E-I-L, A-N-T-H-O-N-Y, S-I-M-S. I'm the President and co-founder of Kona Blue. And I want to speak to you this afternoon, a lot of people have put forward the idea of closed containment systems as an answer, and perhaps the
only answer for organic marine fin fish culture
and I want to just talk about my perspective on
this comparison of open-ocean net pens and closed
containment systems for Kona Kampachi.

I'm going to give a brief introduction to
some of the overarching questions that we're going
to address with it that we're addressing here, and
then run through some of the methods that we use
in this study, some of the results and then some
shameless podium thumping in the discussion.

In the introduction here, I do talk about
the McCarthyism of mariculture [phonetic] and I
realize that that's a fairly loaded term to use,
but I can't think of what else really describes
the morally questionable opposition to aquaculture
and where farm fish really has become a pejorative
in the common lexicon. That strikes me as
passingly strange.

We are scaring Americans fishless.
They're walking past the seafood counter and going
and buying something else. Yet, Moser, Ferry and
Rim [phonetic] the most recent meta study on the
benefits of seafood has shown that modest
consumption of oily fish, once or twice a week,
will result in a 30% reduction in coronary death
and a 17% overall reduction in mortality. This is
right up there with anti-smoking campaigns and seat belts in terms of the public policy issue, and we need to try and begin to turn this around.

Why do I call it McCarthyism? There is, as a good senator from Wisconsin liked to do, there's a lot of distortion of facts here. A lot of the past examples of salmon farms from 20 or 30 years ago are used to deride what organic aquaculture of marine fin fish might be now.

This constant reference to the plumes of sewage that's down current of fish farms, there's talk about net pens as being feed lots, when really what we're talking about here is putting fish in their natural environment and just fencing them so that we can come back and get them when we want to harvest them.

There's also a portrayal of organic principles as some idol or some ideal, where it really is an ideal that we ought to aspire towards for the benefit of the planet, the oceans, and the consumers.

Then I was very reticent to put this up there, but there's no other term to use for the outright lies that have been put forward to this orgast [phonetic] body at the last hearings here. My mother always said, "Don't use the term 'lie'
unless you absolutely have to." But when it is more than an order of magnitude, that's not a distortion. People have testified to you that there was a 50-to-1 food conversion ratio for Kona Kampachi, and the truth is, that it is less than 2-to-1 in our net pens, and in controlled feeding trials, we can get it down to under 1-to-1.

Enough of the emotion, let's, well, perhaps a little bit more of emotion, because the emotion stems a lot from the, what I would call the salmo-centricity [phonetic]. A lot of people are very emotionally attached to this beautiful fish, the iconic salmon. I come from Australia where this isn't such an icon, and I'm a marine fishery biologist. There are 20,000 species out there in the ocean and we've only just begun to scratch the surface. We've been doing terrestrial agriculture for 10,000 years, marine fin fish culture for 30 years. We need to get better, but let's develop, let's work towards solutions.

When we're talking about marine fish, we're talking about diversity, because we're not just talking about salmon in the Broughton, for crying out loud.

Right across the Mediterranean or Southeast Asia, or all across Eastern Asia, in
Norway and Scotland, all of these various species in all of these different areas, and yes, in Hawaii, we've grow Kona Kampachi as well as threadfin moy [phonetic]. So this is a much broader debate than just salmon.

Let's think again about the historical arc here. Yes, the earliest net pen systems, they were very primitive, and because of the engineering limitations, they put them in very protective bodies of water. They were feeding them wet fish or moist pellets. They had very little understanding of fish nutrition, they were using prophylactic antibiotics and there was almost no understanding about the ecosystem impacts or how to model that.

Yet now we have, in 30 years, we have vastly improved culture practices much better: net pen design which allows us to into more exposed sites, formulated feeds which are more digestible, reduce the effluent. We have prepared these strategies and vaccines for fish ill [phonetic] and we have very sophisticated ecosystem modeling as Dr. Brooks has shown.

With some shameless chest thumping here about Kona Kampachi, we have, I think we'd like to hold ourselves forward as one of the
representatives of how this has moved forward, where we're now using native species, actually reared wherein in exposed sites, sustainable feeds and healthful product.

Our Kona Kampachi, it's name, it's a deep-water fish, there's no commercial fishery there. We culture them there in the hatchery, we get excellent growth rates, very good feed conversion ratios, and it makes great sashimi and versatile cooked fish.

It's hatchery reared, that's important to us. Because we can control what goes into that fish all the way from hatch to harvest, from its very first feeding. But it's also important to us from a sustainability perspective, for our company, that we rear these fish all the way through, and we can scale our operation. We're not dependent on the wild stocks.

The siting is important to us, and constant monitoring, where, okay, we're only a half mile offshore, but it is open ocean agriculture. There's nothing between us and China to the west, and there's nothing between us and Antarctica to the south. We're in waters over 200 feet deep and the technical term for the currents through our farms like that is rip snorting.
Our feeding is always actively monitored, either by in-cage video or by divers. We also have extensive monitoring of water quality there. The basic parameter that we're always concerned with because we're in tropical waters is turbidity -- the scientific term for fish poop. And there's no measurable difference between what's up current and what's down current of the farm.

We are working towards more sustainable feed solutions. This is something that we're constantly discussing and striving towards both. With some of the NGOs that are actively involved in these issues, more so with our feed company. Everybody wants to move towards these sorts of solutions.

So our fish actually, the diet that we feed them is 50% vegetarian. The fish meal and fish oil that we use is from sustainable fisheries. We're currently using about 10% of byproduct from the British Columbian eight [phonetic]. We'd like to move towards zero fish meal and fish oil from reduction fisheries, but it becomes very expensive to do this if you're going to go and use byproduct. And the only other alternative, as you're keenly aware, is poultry meal or other terrestrial animal byproducts.
But we do grow, we're very proud of the fact that we grow a very healthful product. We are able to control the diet, we know there's no risk of internal parasites or ciguatera, which are banes of these fish in the wild. And there are undetectable levels of mercury.

There's fat levels of up over 30% in our fish, and these are all the heart-healthy Omega 3s. Well, they're not all the heart-healthy Omega 3s, but it's the fish oils that people really need to be eating more of.

We have higher Omega 3 fatty acid levels than almost anything else in the ocean. We're now harvesting about 18,000 pounds a week, and we're on track, we're hoping to do 30,000 pounds a week by the middle of next year.

We like to think of ourselves as all that ocean culture could be and should be. We would like to be organic, but we're not really sure we're going to be able to fit that model, because of these other various reasons about byproducts and how this all may play out in the end.

But just to come back now to the question of comparing land-based and open-ocean grown, I have done this. We have eight 50-ton tanks there at ESOP [phonetic] and we're going through the
pre-commercial stage here. We're growing our Kona Kampachi in these land-based tanks. And now we've reached the stage where we have eight of these
3,000-cubic meter cages offshore there in our farm site in Kona.

So let's first of all look at what this means in terms of the comparison of biological loading and stocking density here. This table is there in my written presentation. I'd like to highlight here the water exchange, this is, we're getting a turnover in the tanks every four hours of a full exchange of those tanks there, which we ran, actually, at 25 tons rather than the capacity of 50 tons. And this here was a very conservative estimate of the water exchange through those cages out offshore about a turnover a minute.

This is the relative flow right here and then what the actual fish feels is not the number of kilos, because these are, our fish are very happy to be schooling very close together. What they feel physiologically is the load in kilograms per liter per hour. And this is the production capacity from our land-based system of 10,000 tons out offshore. If we do it right, we should be doing 720 tons per year.

So in essence, a synopsis of this is
there is a 1,600 times greater load in terms of kilograms per liter per hour in the land-based tanks, and a 67% greater density of the fish. Out offshore will [phonetic] much lower density, much less exchange rate. And it's also a lot closer to the natural environment.

In our land-based tanks, we had heavy shading there, drew a juicy amount of algal growth in the tanks. Out offshore, we have natural lighting and there, the seasonal lighting there.

In the land-based tanks, there's constant centripetal motion, that's what you need to be able to move the particulates out of there. Yet out offshore, there's natural tides and currents.

In the land-based tanks, the fish are within a couple of feet of the tank bottom, which that's where the fish feces and the other fouling accumulates, yet out in the open ocean, we're over 100 feet away from the substrate where there is our rip-snorting current that pushes along through there.

And in land-based tanks, the fish will pretty much just hold in one position there, relative to their neighbors, oriented into the [Unintelligible]. Out offshore, the fish are able to swim freely throughout the cage there.
The effluent right and the nutrient recycling has always been spoken of very eloquently by Professor Brooks, but what I'd like to point out here is that in the work that we had done, there was no discernable difference, even over 1,600 times more concentrated in the land-based tanks, that was going into the groundwater at the natural energy lab, which is near shore and then goes eventually out to ocean. But there was no measurable impact on the groundwater or the near-shore waters, even at 1,600 times the concentration of what we see out in our offshore cages.

We have extensive water quality data available on our website, I'd like to refer you all to that if you're interested in numbers and graphs at length. But again, the take home message is there is no measurable impact on effluent water quality. And again, this is the measures of turbidity here.

Now what does this mean if we're going to scale, if we're going to build a larger operation? In the land-based tank, you're still going to be putting those into a single point source that goes into the groundwater, where out offshore, if you're going to scale your offshore operation, the
sensible farmer would go and put the cages across current and so there will not be any added [Unintelligible] effects on water quality out there.

From land-based tanks of particulates, there's often talk about recycling of the particulates from fish farms, but in a marine fish farm, these are salt laden. They do not make a usable fertilizer and I don't think that there is any use for the particulates from marine fish farming. Yet if you site your farm correctly in the open ocean, the particulates should stay up in the mixed layer of the water column, where they become bio-available.

So the land-based tank, there is some potential, eventually at some scale, for some detrimental impact on the coral reef there. Yet out offshore, the nutrients should become quickly assimilated, particularly in tropical waters where metabolic processes happen a lot faster, and they should become bio-available.

So the comparison between the two is that your nutrient enrichment in the land-based tank has the potential to become pollution, where if you site your farm properly out offshore, then it should just become a source of productivity.
I want to just quickly talk about energy usage and the carbon footprint. I know this is not germane to the criteria of organic standards, but I'm starting to lose the clicking here, Valerie, so I might ask you to occasionally step in.

But these were the, in the land-based tanks here, I used in the calculations, in the paper, I used a pump head of 5 meters, about 15 feet, which okay, in most closed containment systems that are going to be floating in the water, they're going to be the same head. However, you are going to have to be pushing water across a filtration system, and filters require a lot of pump heads. So I think that's a fair number to be using.

And without distracting you too much with all of these various numbers, what we end up with here out of this system, the production demand is about 1,700 kilograms of Kona Kampachi that we can produce per ton of CO2, just the electricity for driving the pumps. That's not counting the electricity for production of the oxygen or all of the other considerations.

Out in the open ocean, net pens, the main carbon demand there is the boats to go backwards
and forwards. We're eight kilometers away from the farm site. And again, these data and the notes, the explanatory notes are available in the full paper.

For our 720-ton operation, it's about 3,500 kilos per ton of CO2. So the take-home message here is [Unintelligible] in the carbon footprint, it's about twice as efficient in an open ocean net pen as opposed to a land-based system.

Let's look at some of the other considerations: animal welfare and ecosystem impacts, which are perhaps more germane to the organic discussion. We do undertake ongoing monitoring of wild con-specifics [phonetic], so it's still a very healthy population of Kona Kampachi, literally around the net pens there, and so we do catch these fish.

What we find in the wild fish is that they are somewhat late [phonetic] and fairly prevalent with a calogous-like [phonetic] parasite, but we don't find any of these copepod [phonetic] parasites on our fish in the net pens. What we do find in the net pens is that there is an ectoparasite, a skin fluke that does become prevalent there in the farm fish. Yet in
the wild, we only find about 0.2 of a skin fluke per fish there in the wild. So the wild fish are also very heavily laden with internal parasites, as a part of what renders them unsaleable, yet we have no internal parasites in our Kona Kampachi, again, because we have this level of control over their life, all the way through.

We find no evidence from our study of any negative interaction between pests and parasites, between the wild and the farmed fish.

Some of the other questions that are germane here, what we like to hold ourselves up to, as I said, we're not calling ourselves organic, but we do like to call ourselves what we're doing as environmentally sound as practicable. We're using a local species, there are healthy wild stocks, we're not engaging in any selective breeding, we don't go, we choose not to go past, if too we recognize that we don't have all these questions of cage, integrity nailed down with this new engineering out there. So we will not indulge in selective breeding until we actually have a big of control over that.

These cages are very resistant to predators. In the three years that we've been out in the water, we've only had one instance, and
that was really a management issue there where there had not been adequate management of the nets, where we'd had a predator problem there. But we think that this is something that the idea of a predator-management plan is very appropriate, because it's something that's progressive, that we will learn as we go along through this.

So what I'd like to do in this general discussion is just talk about some of the, to help you understand that some of the benefits of open-ocean fish farms. It's connected to the fact that these can become a productivity pump, particularly in oligotrophic [phonetic] waters such as in the tropics there. And whilst in other areas where your nutrient laden, in tropical waters, you're really nutrient poor. It's not measurable, but all of the modeling suggests that if you're putting these nutrients into the water, that you have the potential for further productivity down current.

And there really are no detrimental impacts if your farm is sited correctly. I want us all to just consider the hypothetical open-ocean fish farm that's stuck, for argument's sake, in the middle of the mid-Atlantic. And so you could presume there that there are negligible
impacts there. The only reason why you might claim that there are significant impacts is if it were farming salmon and that it was emotionally problematic.

But if this fish farm in the middle of the Atlantic has no significant detrimental impact, then why couldn't you consider it organic? At some stage you're going to want to move it closer to shore, and so it then becomes a question of what criteria do you apply to the siting there. And this, then comes back to these questions that you had posed. I want to run through all of these various questions that you had posed here that you wanted to have addressed here. And the first one is just what do you have to do to be ecologically responsible?

There are three critical factors: the species that you culture, the biomass at which you culture them at, and the site. The overarching aspiration, I think, is that you should always be operating within the ecosystem capacities. So we need to establish some standards there and then you need to monitor. And this is something that we, as a company, and I think we as an industry, would embrace.

The question of sea lice infestations or
other parasite infestations, perhaps, Aquaculture Working Group had said that you should take all practicable measures. I would actually suggest that there be something else be added in there. That there should be monitoring. That the onus be put upon the fish farm to monitor, to ensure that there is no proliferation there. Establish them some standards and then monitor.

Aquaculture Working Group's recommendation, again, suggested minimize the release of nutrients. I actually suggested it should be, in the case of open net pen culture, that you should optimize the assimilation of nutrients, and that, again, is a siting question. The assimilation of wastes, the Aquaculture Working Group talks about using a measure of waste assimilation from one species to another. Just purely from an extractive viewpoint, I think as a marine biologist, I would suggest let's look at this more in an ecosystem impact. But it doesn't necessarily, the additional productivity, the recycling doesn't necessarily have to be something that we take back. We don't always have to take. Some of this productivity we can let it go into the wider ecosystem.
Again, one thing I would like to endorse from the Aquaculture Working Group here with the assimilation of wastes is that they do emphasize that monitoring shall be employed. Establish some standards, and then let's monitor here.

They also talk about multiple species and polyculture as something that must be included. I think, again, siting is important here. It's inappropriate to have polyculture in offshore systems, but instead, you want to encourage fish farmers to move towards more exposed sites, and that's not where you want to go and have macro algae or mussels hanging off there, because that's additional loading on your mooring. Encourage them towards more exposed sites where there is better flow through, better flushing.

And the question about predators, I think the idea of a predator-management plan is something that we would endorse, because it allows for improvement and adaptation, and that really is the fundamental of organic principles.

The question of migratory instincts in cultured fish, perhaps for an adromous [phonetic] fish or for F1s, but certainly not for marine fish, and I would suggest certainly not for domesticated fish. This is like saying that there
are migratory instincts in domesticated ducks or
domesticated cattle. You do breed these instincts
out of the animals that you grow and that you come
to know and love.

I think in conclusion, closed containment
systems are actually further from the ideals of
organic aquaculture, because of the densities,
because of the nutrient recycling challenges,
because they're more removed from natural systems
and because of the additional energy loose there.

The question is not whether net pen
culture should be allowable as organic, but
rather, how: what the standards should be. We
need to establish siting guidelines and then you
need to put the onus on us, the farmers to monitor
and to validate that which you're charging us to
do.

Open-ocean net pen culture should be good
for the fish, it should be good for the oceans,
and it certainly should be good for the consumers
and good for broader humanity. Thank you very
much.

[Applause]

MS. CAROE: Thank you very much. It was
a good presentation. Now the next presenter,
Valerie?
MS. FRANCES: Our next presenter was to be Andrea Kavanagh, Director of Pure Salmon Campaign, and she had a medical emergency, so she is being replaced by another member of her staff who is their Research Director, Thomas Natan, and he can provide more information about himself.

MR. THOMAS NATAN: Thanks very much. My name is Tom Natan, I'm the Research Director at National Environmental Trust. I'm a chemical engineer by training and I have two broad areas of responsibility within National Environmental trust. One is one of my fields of expertise is on environmental inventory data of all kinds. That ranges from greenhouse gas emissions data to data provided on things like escapes which we're going to talk about today. And the other one is human health and environmental toxicology issues.

A little bit about the Pure Salmon Campaign. As you heard, we're a coalition of partners and allies from salmon-producing countries. The campaign rests on the simple premise that salmon can be farmed safely and with minimum ecological damage if there are standards that protect the environment, consumers, and local communities.

That leads to two questions applicable
here today. Can the farming of any fin fish in open-net cages achieve the goal of minimal ecological damage? And can the systems like that be labeled as organic?

We're going to be talking primarily about escapes as the indicator of environmental impact. Next slide, please.

These are the questions that you asked us to address and we're going to take them in reverse order. We're going to talk about escapes first. Next slide, please.

Over the past few years, the Pure Salmon Campaign has been collecting data on escapes in major producing regions via Freedom of Information Act requests in Scotland, Norway, Chile, Maine, and Australia. We've also obtained some data from British Columbia, so I think somebody said that we, one of the speakers said we didn't have those data; we do have data from British Columbia. We also have some data from Washington State as well, and we have some information that also come from conservation organizations.

We've been trying to form an inventory of the reported escapes of salmon and other marine fish from open-net cages, and this is the first agglomeration of these data in one place. And by
our calculations, it represents approximately 70% of salmon farming operations. So it's a robust compilation globally. Next slide, please.

Very likely that these data are only a conservative estimate of escapes, and they are reported in general by incident and then agglomerated over time. It does not include leakages and it only includes, basically, salmons for the most part, and we do not have 2007 data for all of the regions yet, so we're not presenting 2007 data.

There are lots of, in general, I think, most inventories of any kind, and that includes pollution emissions, are generally under reported. Next slide, please.

What do we know about escapes in general? These are the agglomerations of the data that we have for these various countries or provinces for the years that are indicated there. As you can see, if you total it up, there have been at least 10.2 million reported farm salmonid escapes and there were 262 reported escape incidents from the open-net cages between 2000 and 2006.

And even though regions or countries such as Norway and Scotland have regulations aimed at controlling those escapes, we're talking about
hundreds of thousands and millions of escapes from those countries.

The British Columbia data vary significantly from year to year, so when you take an average, it looks like it's lower. I'm not sure how, if we had more data over a longer time, if that wouldn't come closer to what we see from the other countries. On the other hand, if they're doing something right, we'd really love to hear them tell us what that might be. Next slide, please.

Norway has provided some data on escapes from other species and so we wanted to see if we could do a little comparison, and this is 2006. The escape ratio for cod was much higher than it was for farmed salmon, and if you look at the other marine species, such as Arctic char [phonetic], halibut, turbot, etc, it's three times greater than Atlantic salmon.

So if we can take these as representative, and of course, it's only one year, so it's difficult to say whether they are representative of or not, but if we assume they are, it does raise concern that escapes are going to significantly increase rather than decrease, if you see the expansion of aquaculture to other
species worldwide. And I think these are, this is relevant to your considerations, whether to include open net pens for other species as well.

Next slide, please.

We were asked to determine the rate of escapes from organic fish farms, and it's really actually impossible for us to do, because we don't know which farms are organic. Some certifying bodies, such as the Organic Food Federation, which certifies U.K. salmon as organic, they've refused to provide a list of organic salmon farms. So we don't have any way of comparing this to other escapes in Scotland on and off of organic farms.

We don't know the level of production for organic salmon farms, and company-specific information isn't actually shared with the Scottish executive, because it's considered to be commercially sensitive.

So we would need to get each of these farms to provide us data on escapes and then on production. This is what we do know, though, from the soil association of organic salmon farm sites to seek data in 2002 to 2006, there were 12 escape incidents, 132,000 reported escapes, only about 1% were recaptured. And as I said, we don't have production data so we can't calculate the escape
It's difficult to summarize globally what might cause escapes, because it does appear to have a high amount of regional factors. Failure of equipment was the number-one cause in Norway, Scotland, Chile, and Australia. In those regions, equipment failure was responsible for between 32 and 58% of the escapes in the reporting period.

In Scotland, Chile, and Australia, it was weather: storms, ice, etc., that was the number two cause of escapes during the reported period. Human error factored somewhat further down the list except for Norway, where it was the number-two cause of escapes.

In all regions though, human error played a significant role and predators -- sea lions and seals -- were reported as number three cause of escape in Norway, Chile, and Australia, and number four in Chile [sic?]. Next slide, please.

One of the concerning trends in escapes is that successful recapture is virtually impossible and as you can see here, this is Scottish data from 2001 to 2006. Out of 1.9 million escapes, about 1,900 were recovered. So we're talking about a very, very small percentage: one out of every thousand escaped fish was
recaptured.

Now this does not include some 130,000 escapes that were reported dead in 2006, and 125,000 escapes that were reported dead in 2006. So we didn't include dead fish within the calculations since they were likely still in the farm area, and they wouldn't accurately represent the ability to recover them once they've escaped into the wild. Next slide, please.

Some more Scottish data, and this is on escapes from IPN-infected sites. Sixty-percent of the Scottish escapees are from IPN, in fact, its sites between 2000 and 2005 we're talking about close to 1.2 million salmon escaping from IPN-infected sites. And in 2004, all of the reported farm salmon escapes in Scotland were from IPN-infected sites. Next slide, please.

Some more data on chemically-treated salmon escapes. These are also from the Scottish executive, and this is with, these are salmon sites treated with sea-lice chemical slice, access and oxytetracycline at the time of the reported escape.

So since 2002, over 115,000 escapes came from sites that were treated with slice. Next
Another consideration that we'd like to bring to your attention is escape of farm fish into special areas of conservation, protected areas, or areas deemed critical for wild salmon. So from this map, you can see that -- it's difficult to see, even for me standing here, sorry about that. But you can see that there are the special areas of con...

There were approximately 400,000 escapees in the Shatlands [phonetic], which is in the upper right of your map, and close to 800,000 in the western islands, and the paper provides a better breakdown for some of these so that you can take a look at that.

The reason these are concerns, wild salmon and other species are supposed to be, in theory, protected by international and national laws in those areas. Next slide, please.

So the observations that based on this inventory that the Pure Salmon Campaign created, that escapes continue to occur all over, and
despite having a zero-tolerance policy for escapes in Norway, they reported 1.2 million escapes of farmed fish in 2006.

Various causes for it, including failure of equipment and also weather. Less than 2% of escapes are recaptured on average, and certainly when you consider the total number over the years, it's much, much less than that. Escapes do occur from chemical-treated and diseased sites. New species, new to fish farming, anyway, are escaping at a higher rate than salmon are, at least according to the Norwegian data.

And we do know from the Scottish data, that there are escapes from organic sites as well. Next slide. I forgot we had the rolling pointer here. Thanks. Next one. There we go.

The paper does provide a literature review on over 30 scientific papers from authors across the globe. These start from the early 1990s, so they're not quite 30-years old, more like 20-years old. And two recent scientific reviews are a particular useful frame of reference. There's a 2005 review paper by Neeler [phonetic] et. al, and a 2007 review by Ferguson, and they're both attached to our submission. So I wanted to point those out to you.
These are the effects that are noted in these papers, significant and ecological genetic impacts on native wild fish populations, increased disease risk, sea-lice infestations, and then escapes from other species are an emerging international issue as well. Next slide, please.

The question that we have here is the only, is it true that the only solution to ensuring that escaped farm fish have little to no impact on wild fish and marine biodiversity is to prevent the escapes in the first place. That is what the Principle 15 of the Rio Declaration [phonetic] would support, and certainly it is the basis of the precautionary principle. Next slide, please.

You did ask us a bunch of other questions and we do not have the expertise to deal with those specifically. And so we, instead of trying to just end at that, it seemed appropriate to try and pose what sort of questions have to be answered in order to answer the questions that you had asked us.

So first, it's evident to us that the burden of proof that these systems do contain escapes and that they won't have the impacts that are described, really falls on the proponents of
the organic open-net cage aquaculture. And so
that's why we wanted to pose it in this way.
You asked how, the first question would
be how many escapes are too many? What number
would be too high? At what level are escapes a
threat to the wild fish populations? If one of
the solutions to this is farming native species
only, then this leads to the question of are the
potential increase in genetic disease risks
inherent with the culture of native species
preferable to the conventional genetic and
ecological impacts associated with the culture of
exotic species?

So we don't know if there's actually any
science to answer those questions, or if it's in
the pipeline. Next slide, please.

So the other, if it's impossible to
ensure that the open-net cage fish are not going
to contract disease, so what we would want to ask
in that case, is there certainty that diseases and
parasites will be effectively treated and fully
contained? Can we guarantee that these diseases,
including sea lice, are not going to spread? And
what kind of data are available showing that
organic pollution from the farms are not and will
not drive additional disease or parasite burdens
on wild fish?

That's all I have, so thank you very much. I appreciate the opportunity to come and present to you, and I apologize for not being Andrea. She sounded a little frantic when I talked to her this morning. But thanks again, and obviously if you have any questions--

MS. CAROE: Before you leave the podium, can you give your name and affiliation and spell it for the court recorder? I don't think you did that in the beginning.

MR. NATAN: Sure. My name is Tom Natan, N-A-T-A-N. I'm the Research Director with National Environmental Trust in Washington, DC.

MS. CAROE: Thank you.

[Applause]

MS. CAROE: We are now scheduled for a little break, and I guess we'll take 15 minutes. I have, that it is 25 after, so 20 of we'll come back, we'll reconvene. Thank you.

MS. CAROE: Valerie? Are we ready with the next presenter?

MS. FRANCES: Next on deck is Martin Krkosek, with the Centre for Mathematical Biology, Department of Biological Sciences, University of Alberta.
MR. MARTIN KRKOSEK: Hi. I'm Marty Krkosek, it's spelled K-R-K-O-S-E-K. I'm a Ph.D. candidate at the University of Alberta. I've been studying sea lice in salmon in the Broughton Archipelago for the last five years. That's mostly what I'm going to talk about today, but I'm also going to talk about some other observations we've made on disease interactions between wild and farmed salmon in the area over the years.

The term "emerging infectious disease" is probably something most people in this room have heard of. When we think about Avian Flu or West Nile Virus, those are examples of emerging infectious diseases. These diseases are emerging through interactions between humans and wildlife and domesticated animals.

When we're thinking about disease interactions between wild salmon and farmed salmon, we're dealing with this area here, which is an interaction between domesticated fish and wild fish.

Usually when we think about these kind of disease interactions, the conceptual framework is something like this: you start with a natural wildlife population, some domesticated animal is introduced, and it might have some novel pathogen,
and then that pathogen can spread between the wild population and the farmed population.

   And there's many examples of this, a lot of them from Africa. The most contemporary example is the critically endangered Ethiopian wolf, and its primary conservation threat is the spread of rabies from domestic dogs.

   When we're thinking about wild and farmed salmon interactions, this is the scenario that we're looking at. This is the migration routes, the migration pattern of wild pink salmon in the Pacific Ocean. They leave their rivers, go out to the open ocean and come back.

   Here's Vancouver Island, which is located right here, and each of those dots is a salmon farm -- an open-net salmon farm. They're situated on the migration routes of the wild fish, so there's an opportunity for pathogens and parasites to get transmitted between the wild and the farmed populations.

   The first example we have of pathogen interactions in the Broughton occurred in 1991, and it was repeated in 1993 where there were outbreaks of furonculosis [phonetic] on the Atlantic salmon farms in the Broughton, which subsequently spread to the wild salmon populations.
and into a hatchery located in Echo Bay.

This picture here is an escaped Atlantic Salmon caught in Scott Cove Creek amongst a school of wild Koho salmon and it is diseased with furonculosis.

The next example is IHN, this is a viral pathogen. It is highly transmissible in the water and it's highly pathogenic to Atlantic salmon and some Pacific salmon species.

In 2003, there was an outbreak that occurred on a salmon farm located right here, which is near Campbell River.

After that, a boat left Campbell River and traveled up the coast delivering smolts [phonetic] to salmon farms. And all those red dots are the subsequent locations of the salmon farms where the virus spread.

So it can spread rapidly, and that happened in one year. It can spread rapidly among the salmon farms, but one question from a conservation perspective is what was the impact on the wild fish stocks?

This is the Broughton Archipelago here, where we've been working. And that's the origin, the nadal [phonetic] river of all tagged wild salmon that have been recovered in the Broughton.
We're dealing with a highly-migratory wild fish species. The opportunity to spread these pathogens throughout the coast is vast.

I've been studying sea lice for the last five years. Sea lice are a crustacean, they're related to crabs and shrimp, and they're a natural parasite. They're native. They occur naturally on wild salmon. They're common also on farmed salmon, they're common in wild adult salmon, but they are rare on wild juvenile Pacific salmon.

Wherever you look in places where there are no salmon farms, the prevalence of sea lice on wild juvenile salmon is less than 5%.

Sea lice have a lifecycle that has two stages and it's important to understand this lifecycle. There's a definitive parasitic stage where the parasite makes its living on the host, feeding on surface tissues. It goes through a developmental progression from a baby copapoda louse [phonetic] freshly attached. They're only about a millimeter in size. They progress then through calamous [phonetic] stages, which are like middle-aged lice, and finally into motile lice, when they're sexually reproductive. They reproduce and they release their progeny into the water column where they can persist for up to a
week before infecting another fish. So you have
this dispersing planktonic stage that can move
through the environment, and a definitive stage
that it's attached to its host.

This picture here is a juvenile pink
salmon. It's about this big, it weighs about one
gram, it's about four centimeters in length.
These are female salmon lice infecting the
juvenile pink salmon. You can see the extensive
tissue damage to, you can see the extensive damage
to the surface tissues of the fish, puncture
wounds, scaring. The feeding of the lice on the
surface of the fish causes stress to the fish, it
makes it hard for the fish to maintain its osmotic
balance, and can ultimately kill the fish.

Wherever you look in British Columbia,
also in Norway, Scotland, and Ireland, there are
more sea lice on juvenile wild salmon in areas
where there are salmon farms.

What this means is when we're thinking
about, conceptually, about the interaction between
wild and farmed fish, we need to revise that a
little bit. Wild fish generally have the
structure where the adults occupy different
habitats than the juveniles. Juvenile fish are
small, they have different prey, they have
different predators and they have different
habitat requirements. What that means is if you
have a pathogen that's associated with the adult
fish, the juvenile fish do not encounter that
pathogen until they're recruited into the adult
population.

When you introduce domesticated fish into
the environment, you have the opportunity for new
transmission chains to open up and the juvenile
fish can become exposed to these parasites when
they are very small and not well equipped to
handle the parasite.

So we've been looking at three questions
when we're looking at sea-lice impacts on wild
fish, wild salmon in the Broughton. Do sea lice
spread from farmed to wild salmon? Do they kill
the juvenile salmon? And is that mortality
sufficient to threaten the wild salmon
populations?

This is how we do it. So to look at the
first question, we sample the juvenile salmon as
they're leaving the rivers and migrating out to
sea. Each one of these stars is a sample site.
We collect the fish by beach scene [phonetic] and
count the lice on them.

In 2003, there was one isolated salmon
farm located right there. So we were able to study the fish as they're approaching and passing that salmon farm. We can see where the infection begins, and how it progresses.

Here's a look at the data. Again, here's the migration route, there's the salmon farm. On this plot here, are the three developmental stages of lice on those fish. The copapodas, which are the baby lice, the calamous lice, which are the middle-aged lice, and the motiles, which are the adult lice.

The fish are traveling from left to right, which corresponds to their migration down this migration route. The farm is located at X equals zero.

Before they reach the salmon farm, there's few lice on those fish, but there are some lice there. As they pass the salmon farm, you see a rise in the baby lice, indicating transmission is happening and those fish are picking up lice as they're passing the salmon farm. As they continue to migrate out to see, you can see those lice maturing through the middle-age stage, the calamous lice. Finally, by the time the fish reach the end of the migration route, the lice have matured. They're sexually reproductive, and
we see a second generation of lice appearing down here.

When we analyze these data, we can reconstruct where all those lice are coming from, and that's what's shown in this plot here. Fish are migrating from left to right, and this is the spatial distribution of the infective larvae in the environment. This is like the cloud of parasites that the fish have to migrate through on their way to the ocean.

This thick curve here is the overall distribution. This first curve here are the lice coming from the salmon farm. The second curve here, is the second-generation of lice. Once these lice have matured and reproduced and re-infected the fish, and there's another line near zero here which is the natural abundance of lice in the environment.

These lice here correspond to the 2-3% of the lice that we see in areas where there aren't any salmon farms. Next slide.

These are the models that we use to analyze the data. I'm not going to explain it. Next slide.

This is how we fit the models to the data, and if anyone's interested, I'd be happy to
And this is how many times we've done it. We've looked at different species of salmon, migrating down different migration routes in different years. Every time we look, we get the same answers. Sometimes there's three salmon farms on the migration route, sometimes there's two, sometimes there's one. Every time, the answers are the same. There are natural sea lice in the environment, but there's also a lot of sea lice coming from the salmon farms and infecting those wild juvenile salmon. Next slide.

So to answer the first question, do sea lice spread from farm salmon to wild juvenile salmon, the answer is yes. And this occurs on the scale of about 30 to 80 kilometers. So you don't have to go right past the salmon farm, you can be 50 kilometers away and still feel that impact.

But so what? We really need to know what those lice are doing to those fish, and so that's what we looked at next.

We did some experiments where we collected these infected fish from the environment, sorted them by the number of lice they had, and held them in these ocean enclosures, protected them from predators, fed them salmon
feed, and monitored their survival over the course of a month.

Each one of these panels here corresponds to one of these enclosures, and this is the number of lice the fish had on them at the beginning of the experiment. The fish with no lice survived very well. There were two mortalities in this one and two mortalities in this one.

The black line here in each of these panels is the real number of fish surviving through time. As the number of lice increases, the survival of the fish declines. Next slide.

You can take that information and combine it with the information we have on sea lice infecting the juvenile salmon as they're migrating out to sea -- next slide -- and estimate the proportion of the wild salmon populations that are dying from the sea lice as they're passing the salmon farms. And that's what's shown here.

Along the migration route as the fish are traveling from their rivers out to sea, the grey area here is the proportion of the juvenile salmon population that is surviving the sea-lice infestations. Sometimes the mortality is not too bad, about 9%, and other times, the mortality is up to 95%. 
Ninety-five percent of the juvenile salmon leaving the Broughton are dying from the sea lice from the salmon farms. Next slide.

So clearly, if 95% of the juvenile salmon are dying every year from sea lice, we have a problem. We have a very serious problem. But the mortality of these juvenile fish, from when they enter the sea to when they return to spawn is very high anyways. About 85% of those juvenile salmon are going to die before they return to spawn, and so what if 50% of these fish are infected with lice?

This is a really challenging question to evaluate whether or not this is actually a threat to the wild salmon populations. Next slide.

Well, you can look at it mathematically. If we write down what we know about salmon population dynamics and how pathogenic the sea lice are to the juvenile salmon, you can estimate that an average abundance of about 2 to 3 motile-stage sea lice, the wild salmon populations are going to collapse.

We've seen sea-lice infestations in that range, and we've seen collapses of those populations. Now a few moments ago, Dr. Brooks presented some data from one population in the
Broughton suggesting that the wild pink salmon are doing just fine. That was from one population. There's at least 16 populations in the Broughton of pink salmon, there's also chum salmon and Coho salmon.

You can't conclude based on one population that everything is okay. No one's done that comprehensive analysis yet. Next slide.

Here's one example of a population from the Broughton that's doing really poorly. These are the Viner [phonetic] chum salmon. From 1953 to 2005, the number of chum salmon returning to Viner Creek. The first thing to take note is that it's incredibly variable. There's good years and there's bad years. Over this time period, there was a commercial fishery right in Viner Sound, fishing this population.

This is when the salmon farm came in about a kilometer and a half from the mouth of the river.

We used to have returns of 10,000-60,000 fish to this river. Over the last few years, the number of chum salmon returning to Viner Creek has been less than 100 individual fish. Next slide.

So do sea lice threaten wild salmon populations? You can be shown examples that say
yes, you can be shown examples that say no. The answer really is we don't know yet. I would say probably, but the comprehensive analysis hasn't been done. Next slide.

But I want to impress upon you that we are not dealing with just a few missing fish. This is one of the 89 chum salmon that returned to Viner Creek this year, 89 individuals. Next slide.

And humans come to British Columbia to fish the salmon for fun. Commercial fishermen depend on wild salmon and aboriginal cultures have evolved with the wild salmon for thousands of years. These are the linkages that are being threatened. Next slide.

But the story isn't limited to salmon. Over the last couple of years, we've been getting
reports of other fish species that are being
brought up in the shrimp dragger nets. These are
flat-head sole infected with some kind of bacteria
that we haven't identified yet. Near the salmon
farms, almost all of them have it, distant from
the salmon farms, it's almost absent. Next slide.
This is a rock sole infested with a
copepod, same story. Next slide. This is a
juvenile skate infested with parasitic worms.
Same story: near the salmon farms, they're
infested; distant from the salmon farms, they're
not. Next slide.
These are turbot infected with a copepod
that infects their eyeballs. Near the salmon
farms, almost 95% of the turbot have this
parasite; distant, they don't. These observations
so far are preliminary. We're only beginning to
analyze these kinds of questions. Next slide.
There are a myriad of ways that diseases
can interact between wild and farmed salmon. Not
just wild and farmed salmon, but also farmed
salmon and other wild fish species such as those
bottom-fish I just showed you.
These impacts are inherently
unpredictable and they are poorly understood.
Scientifically, we're just beginning to develop
the capacity to study sea lice, which you can go out and see and count, but there's all kinds of other viral and bacterial diseases that are much more difficult to study and we don't have any information on what's happening to those fish. Next slide.

The reason that disease interactions between wild and farmed salmon are so rich and so damaging is because the ocean is an open system. Pathogens can persist for long periods of time in the ocean. They are widely dispersed, there are abundant fish populations that are highly migratory, the system is well mixed. The salmon in the net pens are always going to be exposed to the pathogens that the wild fish carry, and then there's always the threat to the natural ecosystem of those pathogens being returned. Next slide.

I just put this slide together to address the points made earlier today, just to clarify where our funding comes from. Three-quarters of it comes from peer-reviewed scientific grants, the remaining funding comes as matching funds through a peer-reviewed system.

And that's all I have for you.

[Applause]

MS. CAROE: Thank you. Thank you very
much. Before we go to the last presenter, I would
like all attendees who have not signed in to
please do so. We really need a record of how many
people attended this symposium, so if you have not
signed in, I ask that you please go to the book.
And Valerie, the book is located?
MS. FRANCES: Right here.
MS. CAROE: Right there. So please go
and sign the book before we leave today. It's
very important that we have an accurate number.
MS. FRANCES: Behind the screen.
MS. CAROE: Behind the screen. The lady
with the red shirt. All right. Valerie, our last
presenter for today?
MS. FRANCES: George Leonard is formally
with the Monterey Bay Aquarium, Center for Future
of Oceans, and is now currently the Director of
Aquaculture program for the Ocean Conservancy.
DR. GEORGE LEONARD: Thank you, Valerie.
I want to thank all of you for toughing it out. I
picked number six out of the bag, out of the hat,
and it was totally unintentional, but I actually
think it's great because I get an opportunity to
do a little bit of cleanup here at the end of the
day. And I think I will touch, ever so briefly,
on all the issues brought up by the other
speakers.

My name is George Leonard, spelled G-E-O-R-G-E, L-E-O-N-A-R-D, and I am now currently with the Ocean Conservancy. Up until two weeks ago, I spent the last five years as the Science Manager at the Seafood Watch Program. And for those of you who don't know, the Seafood Watch Program at the Monterey Bay Aquarium, we have largely been the guys that have put out those seafood cards with the red, yellow, and green lists that you either love or hate, depending on where you fall on the rankings.

We are presenting, this is a joint presentation today with myself and Cory Pete [phonetic] who is in the back over here. This is work that we did at the Monterey Bay Aquarium. And what we want to do is talk a little bit about performance metrics as a potential solution to this quagmire about open net-pen systems and carnivorous or highly fish-meal- and fish-oil-dependent species as perhaps a third path, a way to think through some of these issues with respect to organics.

I'd like to thank the NOSB for all their hard work on this, the Aquaculture Working Group for the same, and in particular, George for his
leadership on this issue. We want to take where that work went and see if we can move it a little farther down the line.

I also want to admit that I think this stuff is really, really hard. Okay? I spent five years thinking about what is a sustainable fishery or a sustainable aquaculture operation. You now take that issue and you have to overlay it with the concept known as organic, and I think it's really hard.

So what we're trying to talk about here, I don't think is perfect, but I think it's an interesting concept. And for those of us like myself who sometimes has some difficulty with this concept, I think it's because we're trying to explicitly merge two concepts. Second slide.

So none of us need to be told this issue is controversial, there's a whole bunch of reasons for that. As I've mentioned, we think performance metrics may work as a potential solution instead of production or performance-based metrics. It is this intersection of sustainability and organic production. And this is really designed to be a thought experiment as a proposal for discussion rather than some certification regime that we should go off and start implementing tomorrow.
So first, starting with organic principles, I'm certainly no expert in organic principles, but my sense of this is that if you look back half a century into the 1940s and look at Sir Albert Howard's *Agricultural Testament*, it's a very nice sort of summary of this whole issue and where the concept started.

And what's really key about this is that the principles of ecology, the principles of recycling wastes, and in particular of natural defenses as part of an agricultural system is at the heart of what he's talking about 60 or so years ago.

Of course in 1990, the Organic Food Production Act kind of codified this whole issue, and really, in very much the same spirit as Howard was talking about. So we're talking about an ecological management system that looks toward the preservation of biodiversity, the maintenance of biological cycles within a farming system, and in the case of terrestrial where this all starts, really the maintenance of soil biological activity. Next slide.

Now the issue becomes difficult when we try to then think about the concept of organic as
it relates to aquaculture, and in particular, open
net-pen systems precisely because of some of the
sustainability issues that we've talked about this
afternoon.

And there really are five issues. I'm
really only going to talk about four of those
today, and none of this should be new to anybody,
right? But just for the sake of completeness, the
five issues are: the risk of escaped fish to wild
fish and natural ecosystems; the risk of pollution
or nutrient inputs and habitat impacts from
farming operations; the third issue is the impact
on predator populations; the fourth is the risk of
disease and parasite transfer, much like Marty
just talked about in advance of me; and the fifth
is the use of marine resources for feed. This is
the fish-in, fish-out kinds of discussions from
this morning.

We don't really think it's all that
useful to debate whether these are real issues or
not. I think much of the science -- it was
presented both in testimony and in writing --
suggests that many of these, if not all of these,
are very well documented in the scientific
literature. So the more important question is
what are we going to do about these potential
risks in the context of organic certification of fish grown in these types of systems? Next slide.

So our approach here was to have sort of two goals: one was to think about whether there are performance rather than production-based standards or metrics that could actually reduce these environmental risks to something that we think is tolerable, and at the same time the goal is that each of those metrics should be as consistent as possible with the existing organic principles, both as laid out by Howard in the 40s, as well as codified within U.S. regulation.

The goal here is to strive to achieve this balance, this overlay, without thinking about certain species or certain kinds of different methods of production. So much like Neil talked, this is much more than salmon, we would agree that this is not a discussion simply about salmon. Salmon can inform the debate, but this is much more about that broad sweep, I'm not sure it's 20,000 different fish, but certainly there's going to be a range of fish coming into production in the next 10-20 years, and the question is how do these principles apply to those as well as salmon?

Now the way we did this is we hosted a workshop last summer in July of 2007, and we
brought together a small group of constructive folks from both the aquaculture production community, from the organic certification community, from the scientific community, and from the conservation community. And we asked these folks, who have various opinions and perspectives, to come together and help us think through this explicitly with the idea of being constructive. Constructive engagement was the only criteria. And because this wasn't necessarily something that they were required to sign onto or some sort of consensus-based approach, the idea was what would come out of this, we will have to own this so nobody is responsible for what's on the paper other than ourselves. But we didn't create this in a black box. Next slide.

So what I want to do is I want to walk through each of the four issues, talk about what this performance metric might be, and then discuss how they either help or don't help solve some of the sustainability concerns in the context of organic.

So the first is the risk of escapes, and like the Aquaculture Working Group, we think that open net-pen systems must be designed and implemented to eliminate escapes. But we also
know from Andrea's work and the Pure Salmon Campaign, that in fact, even if you work to eliminate escapes, you still get escapes. So we have to go beyond that.

So our feeling is that as a consequence, if we're going to have escapes, we need to reduce those impacts in the wild, and that the only way to do that is really to farm native species of local genotype, which we've heard about today as well.

What that means is that non-native species, or native species with substantial genetic divergence from wild stocks, would simply not be able to be declared as organic farmed fish. And that also includes fish that would be heavily selected upon, even if they were natives. So we are suggesting here then that organic farm fish must essentially be the farming of wild fish. And that's a point that probably needs some discussion.

Our definitions are native is really endemic to the local area of culture, and that by local genotype, we do mean fish not beyond the, I think that actually should say F2, but the F2 or F1 generation. The idea being that you will bring in wild genotypes into the husbandry to
essentially maintain wild fish. And this is
something that Neil, I believe, is doing in Kona
right now. Next slide.

So what are the consequences of a native
fish kind of performance standard with respect to
organic? Well, the first is that I suggested, and
as we've heard today, escapes are inevitable. We
can make our nets stronger, we can do all the
right things with respect to our management plans,
but we will get escapes. And that a native
species requirement essentially reduces those
impacts as much as we possibly can, give it's an
open-net system.

Now to us, that strikes that that's
essentially on par with stock-enhancement programs
and procedures that are currently being used to
revive over-fished or threatened species. And so
we think that a native species husbandry-type
approach as identified here would at least be on
par with that approach, but it is important to
recognize that hatchery programs themselves are
not without their critics. And in fact, there was
just a paper published in Science a couple of
months ago, identifying some pretty big impacts of
hatchery programs.

However, it strikes us that the only next
step, if those risks are too large, the only next step is then to go to a fully-closed system to actually reduce those levels, in this case, essentially to zero. So again, this is probably a point that deserves some discussion about which way you would want to go on that.

Now there's also another big consequence of this kind of metric, of non-, of native species, and that is that that Atlantic salmon would essentially not be viable candidates for organic certification, because Atlantic salmon in the Atlantic, are essentially, have been heavily bred upon and selected from the wild fish. So there's genetic divergence there. And Atlantic salmon farmed in the Pacific are non-native.

So we recognize that such a metric would drastically impact the ability of Atlantic salmon to be declared certifiable under the NOSB standards. However, we would suggest that farming natives is likely better than the status-quo approach, in which you would allow the farming of non-natives to be considered organic. So that's issue number one.

Issue number two is the question of pollution or nutrient inputs, and I think for those of you who have not read Ken Brook's paper
in detail, it's a great summary of these issues. Thank you for putting that together.

Our approach, again, builds on the AWG work. We do believe that polyculture is a good solution to the issue of nutrient enrichment, and we suggest that you might use a performance metric or a performance goal of 50% of the dissolved nutrients in organic material be recycled through polyculture within the farm tenure.

We would also suggest, however, that the cumulative impacts of organic farms and non-organic farms within the surrounding ecosystem needs to be taken into consideration, and that those must not exceed the assimilative capacity of the surrounding ecosystem. I think this is also ultimately a point that's going to need some discussion, is the extent to which individual farms can be thought of as organic when they are embedded in the open system that Marty just touched on.

We would also suggest that benthic habitats should show no measurable impact on chemistry or biodiversity. And we heard from Ken with respect to salmon farms, that in fact, there is an inevitable consequence, at least a near-field effect, for salmon farming. But we also
know that with respect to a lot of the other species that are coming online, and Neil's Kona Kampachi is a good example, is that for many of these metrics, there are no measurable impacts. And perhaps having no measurable impacts is the acceptable metric for organic fish, not necessarily sustainable, but for organic fish.

We recognize that polyculture may be a difficult thing to do technologically and otherwise, and would suggest that a transition period of eight years be implemented. And we would suggest that that be incremental: building from an initial entry point of 10%, which is a pretty small number, up to 50% over an eight-year period, and we would like to see that incremental so that it's not a sunset clause where it goes to 50 on the end of year eight. Next slide.

So what are the consequences of this metric with respect to pollution? The first is that polyculture or integrated aquaculture, we do believe, meets the spirit of the definition of organic aquaculture. It's certainly been embraced by the Aquaculture Working Group.

We also think that a performance metric of 50% is actually a feasible number. This is based largely on Terry Chopin's [phonetic] work
with seaweeds and salmon farms on the East Coast. And we think that a transition period may actually provide some incentives to scale this thing up over time.

What are some of the other consequences? Well, one of the big consequences is if in fact we stick to a no-demonstrable impact within the farm tenure, that suggests that near-shore producers are likely not going to be able to be considered to be organic under this performance metric, and that would, obviously, include much of the near-shore farmed salmon.

So that likely, like the non-native metric, would perhaps include farmed salmon. We would suggest, however, that the offshore fish farms may in fact be able to meet this metric, but that at the same time, we should be cautious about that because there's at least one published paper in the peer-reviewed Science now that does show that at least at one farm, you can begin to show some nutrification problems even in offshore fish farms. So we don't believe that the nutrient issue can be dismissed entirely in open net-pen systems.

We certainly recognize that polyculture would be difficult in the offshore waters that
Neil Sims and Kona Kampachi is being farmed in, but at the same time, my sense is that 10 or 15 years ago, people didn't think we could farm fish out there at all. And so I suspect that incentives would result in some really new and creative ways of farming fish, even in those offshore waters.

Third issue is the impact on predators, which we think is the third important issue. And like the Aquaculture Working Group, we would suggest that an integrated predator management plan is critical. We must have one. But at the same time, much like the escape plan, we need some metrics around what's a tolerable impact.

We would suggest that non-lethal deterrents are always the first course of action. We would suggest that no underwater acoustic deterrent devices or similar methods can be used at all, ever. And we would also suggest that there is no intentional killing of predators, except for immediate human safety.

The key here is, the keyword is no "intentional" killing of predators, and the key is immediate human safety, which we would hope, obviously, is a rare occurrence.

And the final issue here is that what do
we mean by rare? We would also suggest that more than a rare mortality event would essentially result in loss of certification.

Now, what's the definition of rare? Obviously, this is sort of arbitrary, but we would suggest that one mortality event per certification period would perhaps be allowed under these circumstances, but certainly not more than rare.

The key here is this is a performance metric around predator mortalities because in open systems you can't necessarily guarantee you're not going to have a predator problem. Next slide.

So just to touch on that again, with respect to what are the consequences of this, it seems pretty clear that predator impacts must be addressed to meet the consumer expectations of the concept of organic. You just can't have mortality events in organic farms, and that site selection, low stocking densities within open systems and production management, some vigilance to that may -- and you'll notice that that's in italics -- may key predator impacts at bay.

But there are no guarantees on this and therefore we would suggest that three years of data that would support sort of a competitor, that would support no predator impacts should be part
of the system here. And we think that swift
revocation of organic certification would have to
go hand in hand with this kind of metric.

You'll notice that this is the third one
and it's starting to get squishy in terms of how
comfortable we are with these issues. And now
let's go to the difficult one, which is this issue
of the risk of disease transfer and parasite
transfer.

I think Marty's data speaks for itself.
It's strong, it's powerful, he's a very smart
mathematician and I can't follow the first one of
those equations. But it seems clear that there
are some major issues in terms of general issues
of disease transfer in open systems. Salmon is
one issue, my sense is that the general
mathematical dynamics that have been identified
probably apply to other systems. We just don't
know it yet.

So what do we do about that? Well, the
only think we could come up with, and this is
something we probably should talk about, but the
only thing we could come up with was a performance
metric that did two things: that said on an
organic farm, there simply can't be clinical signs
of disease or parasites; and at the same time,
there can't be any treatment with synthetic drugs except those that are permitted under the national list.

Now of course, we would allow treatment of sick fish for animal welfare issues, just as you would in terrestrial production. But those certainly couldn't be sold as organic. That seems relatively straightforward. But this metric then, is essentially a no-disease, no-treatment metric.

Next Slide.

The consequences is, this is clearly the most daunting issue for organic open net-pen systems, and it's the most daunting performance metric. We believe and I think the data suggests that disease transfer and the chemical treatments themselves negatively impact the environment. We're sort of caught in a Catch-22 here where you can't have either of those issues to be organic, but that there is a strong financial incentive to maintain low disease incidents on a farm, simply because of the positive financial reward of the organic label.

Consequences are salmon are likely going to be excluded because of the data we've heard today. It's not clear, it's likely maybe that other species are capable of meeting this metric,
particularly the new and upcoming species. How much of that is because it's at small scale? And at what scale disease issues become a major kind of ecosystem-wide issue is really, I think, where the rubber is going to meet the road on this. And that was actually a question I was going to ask you, Marty, is how we deal with the scale issue and the concept of organic.

Finally, I think we would say that although producers obviously have the right to petition the NOSB for things like parasiticides to be listed on the national list, we don't think that organic consumers would be tolerant of that proposal. Next slide. Next slide again.

The next two is this issue of feed. We did some work on feed, but that's obviously not part of this panel. Happy to talk about it or its in the paper we presented as well. So just go to the next one. Next one. See, I'm close. I've got one final slide in here.

Because these are performance metrics as opposed to production-based standards, it's really about sort of data of no impacts. So we would suggest that because of that, we really need three years of compliance data before certification would happen at all. That is, we'd need to, you
basically have to have a clean record before you could be certified, and that that should be obviously continual strong performance on each of those four or five metrics would be part of continuing certification. Final slide.

So the question then becomes, is this a way forward? Is this a way to get us out of this problem we're in? We have a yes camp and a no camp. We, as the Monterey Bay Aquarium have been on the record as closely aligned with the no camp. We think there are legitimate sustainability concerns. The no camp in general thinks that the concept of open net-pens and the fish-meal issue are sort of fundamentally inconsistent with the concept of organic, and are therefore, not certifiable, end of story.

The yes camp, of course, thinks that these issues are compatible and that these kinds of systems and fish should be certified as organic.

It may be that this kind of performance-based approach would help us to actually meld these two concepts in a way that makes people more comfortable, and builds on the very good work that's been done so far. The big implication for this though, as I've sort of hinted at, is that
only a very small part of the existing industry, if at all, would actually be certifiable today.

So the question is, does that create enough incentive to get this airplane off the ground? And I would suggest that if two things can't happen, the first being that if this is not deemed to allow enough of an incentive for organic aquaculture to really get a running start at this, or if there's a consensus or some growing understanding that these kinds of performance metrics don't reduce the environmental impacts to a level that people can live with, that the National Organic Standards Board should join the no camp, and should not certify open net-pen systems as organic under U.S. law. So thank you.

[Applause]

MS. CAROE: Thank you very much, and that is our final presentation for this portion of the symposium. And with that, I'm going to, we're about a half an hour behind, but that's pretty good. I'm going to turn it over to Hue Karreman, Chair of the Livestock Committee to facilitate the board's question and answer, and hopefully, we can get to questions from the audience as well. But again, the board questions will take priority. Go ahead, Hue.
MR. HUE KARREMAN: All right. Thank you, Andrea. I'll just open it up to questions from us. Steve?

MR. STEVEN CRAIG: I only heard one presenter talk about the fouling problem on net pens, and I was wondering, is that a common problem throughout the industry? And if so, is copper the common solution to that problem?

MR. KVENSETH: So far the copper has been a usual solution, but as I told you, there are new solutions coming up so you can treat the pens without copper. Just to get a smoother surface or to bind the treads closer to, you can use mechanical devices to clean them. So I would say that the copper is on its way out, and there is, you can at least operate the organic production without using copper.

MR. KARREMAN: Please, Andrea.

MS. CAROE: Just really quickly, is TBT tributyl tin [phonetic]? It is. Okay.

MR. KAREMAN: Wow. Big word there, Andrea. That's Ken, isn't it? Yeah.

MR. BROOKS: I'd like to just add to that, I left 10 CDs for the members of the Livestock Committee, and on that are several papers dealing with copper zinc, a computer model
for predicting water column concentrations of copper.

I'm going to agree that copper is identified by the U.S. EPA as a major marine pollutant in the United States. The Navy in San Diego is spending in excess of $10 million dollars per year looking for alternatives to copper for antifouling paints. And I think this is a technology that will proceed.

However, having said that, copper and zinc from feeds are two metals that are released from salmon farms and they're two metals that we have shown can be managed. But again, I do agree that I think five years from now, 10 years from now, you won't see copper used as an anti-foulant on any marine structures.

MR. KARREMAN: Jerry?

JERRY: Follow-up question to that on antifouling. Neil, didn't you mention something about the effects of the further offshore net pens in relation to antifouling?

MR. SIMS: Neil Sims. No, but just for the record, we have half of the net pens that we have are treated with copper, the other half are not. It's a huge burden to be keeping the non-treated nets clean because it requires divers in
the water because of the cage structure. We are working towards some other solutions there such as an invertible cage. We have half of our cages are invertible there where you can air dry the top half and then turn them over and air dry the bottom half there.

But the copper nets do reduce the amount of fouling there, which does increase the water flows through there, which presumably makes for happier fish. There's less restriction on the water movement through the net pens. So there are some benefits to having some sort of antifouling on the system.

JERRY: So the increased current out there further offshore doesn't have any impact on the type of species that want to foul that net? Does it cut down on some of them, or is it no different?

MR. SIMS: Because we are in open ocean and we are in, actually alogotrophic waters, they're very nutrient poor, we don't get the sort of fouling in our net-pen systems that they get, say, in the temperate waters closer to a coastal shelf.

JERRY: All right. Thank you.

MR. SIMS: So it is distinctly different
sorts of fouling.

MR. KAREMAN: Kevin?

KEVIN: I have a question for Mr. Sims very quickly, I thought it very interesting that your efforts to build up your net-pen system almost took an approach of telling us how poorly the land system was. But I was confused about the rip-roaring current and how the fish in that net pen are still able to swim about as their natural behavior, because of the centripetal forces in the closed system, they were not.

MR. SIMS: The currents offshore are highly variable. When there is a very strong current through there, it's periodic, it doesn't seem to be tidally driven, it's more the offshore gyres [phonetic]. When there is a strong current there, the fish will orient into the current.

Most of the time, however, they're able to just swim around inside the cage fairly freely.

In the centripetal current in the land-based tank, the fish can move from one side of the cage to the other, but that means going through the vortex close to the central stand pipe. And so they choose not to, and so you just tend to have the fish holding position in the tank.

KEVIN: So that centripetal force is
constant? There's never a break where there's no current in that water? That's a 24x7 situation?

MR. SIMS: Yes. You have to do that with the land-based tank systems so that you have the feces and other particulates move towards the central drain and then they move out of the tank. If you don't have that, you just have feces and particulates building up on the bottom.

MR. KARREMAN: Actually, I have a question. Let's see, one of you just mentioned, I think it was Dr. Leonard, about using only native species. And I just couldn't help but think about terrestrial agriculture and how we have a lot of Holstein cattle in the U.S. that are actually native to Northern Europe.

So just in case we were to adopt that, philosophically speaking, what would we do with the cattle that are in the U.S. that actually shouldn't be?

DR. LEONARD: I guess send them back is not a good answer? There are lots of non-native species now all over the world. I think the general principle here with respect to non-natives is to be concerned about it.

When I was doing my graduate work, I was impressed by the work being done by Jim Carlton in
marine systems in which he sort of became known for demonstrating that ballast water was responsible for moving a lot of non-native species around the world. And the story he told me once, was really eye opening, which was, there was a particular invertebrate that they'd watched for years and it had never come into the East Coast...

[END MZ005006]

[START MZ005007]

GEORGE LEONARD: Even though they knew it was in ballast water for ten or fifteen years. They figured there was something special about this thing. And just when they were getting ready to reach that conclusion it took hold in one of the bays and estuaries in Massachusetts and they have no idea why. And so you know his was to be worried about non-native species generally because they are very difficult to predict.

I don't know what you do about terrestrial systems other than to say that cows don't probably move as much as fish do and we can go find them. You know I think it's really interesting that something like less than one percent of the escaped Atlantic salmon can be recovered. I just - that's just not a viable you know strategy.
You know this issue of domestication I think is an important one because this is another one of these kind of catch 22 problems. We either need, in my opinion we either need to farm, basically farm native species of local genotype as we suggested wild fish, so when they get out they minimize the impact because we know they are going to get out.

The other alternative is to really domesticate them hard to the point where if they get out they are kind of like cows walking down the street, you know by the Safeway. They are not going to last very long. Okay. Some folks have said well what if you can put a suicide gene in a fish, right, and if it got out it couldn't - it literally had a survival rate of 0.0. So the difficulty is when we are in the middle, between either full domestication or wild fish where if they do get out there has been enough selection on them that those maladapted genes will persist in the population. And there is enough empirical and modeling data with salmon to suggest there's - there's some problems there. So you know it feels to me like you've got to go one way or the other but being in the middle is difficult.

HUE KARREMAN: Just a quick follow up on
that. At least in my little world I see that actually mixed breed cattle do a whole lot better than - than the pure breds. They are just genetically stronger, I guess the hybrid affect.

Can that happen with - in agriculture? You guys, you were just saying you've got to highly domesticate them or have the native stock. Why can't you have some kind of mix? Is that just not possible? Because in cattle they don't make as much milk, but they are really healthy.

GEORGE LEONARD: I am far from an expert on genetics, but there are a number of folks like Ian Fleming and Phil McGinnety who are and it would be really interesting to put that question to. You know I think you first have to recognize that wild fish are not, you know pure breds right? There's a whole diversity of genes in those populations that are breeding as a function of natural genomics. I think the real worry with - with genes from farmed fish is if they - you could make the argument if they get into the population they'll just, they'll have less fitness right, so they are going to be eliminated by natural selection. Which I think applies if escapes happen once. If it's a pulse experiment where you throw some genes into a wild population it will be
weeded out over - very quickly over a generation or two.

But the problem is as we now know; escapes are a pretty ongoing event. And in that case when you continually put maladapted genes into a population you can reduce the fitness of the wild population pretty dramatically because of that continual input. And I think that's where the worry comes from.

HUE KARREMAN: Actually what if you looked at it the other way around that you breed in native genetics into your farmed species? Or - is that possible?

MALE VOICE: Yes I think - and that solves it. But right--

GEORGE LEONARD: And maybe Ken or a producer can talk about this more specifically. My understanding is that there is often these like pleotropic [phonetic] effects where when you select for faster growth or larger fish or disease resistance, sometimes those run counter to the genes that would result in high fitness under the wild population. So you can't kind of have your cake and eat it too. But somebody else may be able to comment on that.

HUE KARREMAN: No I realize that but in -
I guess in organics I don't think of maximal production and maximal everything as part of the organic paradigm.

GEORGE LEONARD: Well I think that's exactly a really important point. And that came up this morning with respect to the much of the production data. Where the implication was if your growth rates were twenty percent or thirty percent reduced, that was a problem. But I think - I think it was Andrea over here - identified that perhaps maximum growth is not necessarily a metric on which you can measure successes of organic production.

HUE KARREMAN: Right.

GEORGE LEONARD: Right? I mean that's the whole point right? Is that it's organic but you don't get the fastest growth rates as you could at conventional. And maybe that's a consequence of trying to solve some of these issues, particularly on the feed side as well.

HUE KARREMAN: Julie.

JULIE WEISMAN: Yeah, I was also struggling myself with this issue of the arguments for native species only and things that I had heard from - in some of this morning's presentations, and I know that - that this is not
officially a time when any of those people are on
the panel, but I - I felt like there were some
interaction because I pretty distinctly remember
someone this morning talking about how F2 would
not be an acceptable parameter for - for farm
raised and fed fish. And there had already been
hard experience demonstrating how disastrous it
was when you tried to bring any - you know when -
until domestication had been achieved. And I was
wondering if it - if I'm allowed to ask anybody
from this morning's panel to address that piece of
it.

HUE KARREMAN: Do you know exactly who it
is?

ANDREA CAROE: -the post reception
[unintelligible].

JULIE WEISMAN: Okay.

HUE KARREMAN: Okay, Dr. Osgard
[phonetic]. Does any current panel member have an
answer for that? Okay Neal.

NEAL SIMMS: Neal Simms. I think this
morning's discussion was focusing on some of the
abilities of some species to metabolize some of
the anti nutritional factors or some of the other
factors that are included in soybean meal. And
that is, I think, very specific to that issue.
For all of the other species, of which I'm aware, people are using - starting obviously with wild stock and very few generations. There has not been a lot of work done with selective breeding of marine fish. The research shows that you can get some tremendous improvements in performance in growth particularly. But then when you take that selective pressure away it very quickly reverts back to - there is Charlie Darwin has his own barometer there. It very quickly reverts back to the wild type.

HUE KARREMAN: Okay. Andrea actually--

ANDREA CAROE: This may seem a little bit simplistic but bear with me. With all the discussion about the threat of the escaped domesticated or - or farmed fish in these - in these net pens, is there any consideration or any work being done on secondary containment systems or other mechanical methods in order to decrease the risk associated with - with escapes?

HUE KARREMAN: Ken. Please state your name also.

KENNETH BROOKS: Yeah Kenneth Brooks. I'd like to make a couple of points. One, this issue of escapes and their potential for genetic and - and ecological interaction with wild fish is
one of those issues I mentioned this morning which has to be addressed on a regional basis. If you read Ron Jeanette's 2002 report evaluating the potential for escaped Atlantic salmon to interbreed with and/or compete with Pacific salmon, or if you read Lee Alverson's [phonetic] discussion in the Pacific salmon forum, or the Salmon Aquaculture Review, you will find that both of these people concluded that there was very little or - I won’t say no - very little, minute potential for genetic interactions or for competition between escaped Atlantic salmon on the Pacific coast and Pacific salmon on the Pacific coast. And I think that's a perfect example of a situation in which farming an exotic species, if you will, significantly reduces the environmental risks associated with the production of that food.

Now if you are farming Atlantic salmon in an area where you have threatened or endangered wild Atlantic salmon, then other considerations need to be made. And so that is an example of these regional issues.

British Columbia, about three years ago I think it was, initiated a very strict net pen integrity program - escape prevention program I guess you would say. It has not reduced the
escapes to zero. But unlike the situation in
Norway and in Scotland, it has significantly
reduced those escapes to the point that in Ms.
Cavanaugh's paper she said British Columbia was an
outlier. And then went on to state that the
escapes from Scotland then and Norway represented
the lowest feasible and practicable levels of
escapes that could be anticipated from open net
pen systems.

My response in part is why didn't that
paper look at escapes from British Columbia salmon
farms and conclude that with that very aggressive
escape prevention program, that represented the
lowest level achievable and practicable? It's not
going to get to zero. Just like I try to keep my
cows in but unfortunately they do escape every
once in a while. And - but again that's got to be
one of those regional issues and the risks
associated with escapes are very much a regional
management problem.

HUE KARREMAN: Okay. Julie is up. Wait,
okay Jeff. And then Jennifer and then Dan and
then Katrina.

JEFFREY MOYER: Thank you Hue. In the
discussions that we heard about net pens, I
believe Ken brought it up; you were talking about
the fact that under - under the net pen scenario you often have reduced biodiversity right, in the region of the net pen. Yet in conventional organic systems we are encouraged to increase biodiversity wherever possible.

Then later George was talking about poly cultures. And I'm just wondering if we could get some kind of reaction from the panel on - on how we can farm with net pens but still maintain or improve the biodiversity of the waters surrounding the net pens and whether poly cultures would help do that.

MALE VOICE: Let me come back to the uh there are risks associated with everything. Now I don't raise chickens. But I've seen a number of chicken farms where the chickens are produced in houses. And the chickens may have access to a yard. What is the biodiversity underneath that house? In almost every form of agriculture there is some loss of biodiversity associated with the production. I like actually the provisions you have in the current recommendations before you, which are consistent with the BC recommendations, that you establish an allowable zone of impact, the site tenure, the site in your - in your example, and that you do not allow effects outside
that site. That's a very reasonable performance standard, and one that is probably achievable with the initiation of management practices. But guys you're not going to find zero risk. If you do we're all going to be eating soil and green.

MALE VOICE: So can I just follow on that real quick? I think the question that has to be asked in the context of - of the impacts around farms is are we talking about well managed conventional farming, or are we talking about organic and what make organic different? Because I would argue that having an allowable impact and minimizing that impact isn't organic, that's simply good management of whatever the traditional model is.

The question is how do you go beyond that in the spirit of organic? And I do think the concept of enhanced biodiversity and poly culture are the two key issues there. It strikes me that those are two separate but related issues. You can do poly culture but the issue of enhancing biodiversity or at least of reducing the negative impacts in the farm tenure, is simply a matter of stocking density. And you can get that by reducing stocking density, which you know
obviously there's a - there is an economic consequence of that. But you could perhaps have reduced stocking densities and maintain profitability because of the enhanced income from - from the organic label.

HUE KARREMAN: Neal go ahead.

NEAL SIMMS: If I may add to that as well. As you move into deeper water, into more exposed sites, then you do add to the biodiversity there. Our farm site for example, it was bare open ocean there before our farm site was there. And now we start with small bait fish and then larger decaptors [phonetic] and then larger tunas and Wahoo, there's an entire ecosystem in there that's built up around our cages. And that's even separate from the nutrient input which is model - you can model that and you can see yes there will be some increased productivity and therefore some increased biodiversity somewhere further downstream. We can't measure it but we know that that effluent is going to have an effect there. So there are two levels for that increase in biodiversity that we see in Kahona [phonetic].

HUE KARREMAN: Jennifer.

JENNIFER HALL: This is really for anyone. A couple of you touched on predator
defenses but nobody really talked about them
specifically, and I'm wondering what - what
practices are common and what the repercussions of
those are?

NEAL SIMMS: Neal Simms. In the open
ocean systems you have to use your cage as the
defense. You can't have any other deterrent
there. We are dealing primarily with sharks and
there are endangered Hawaiian Monk Seals in the
area as well. We very infrequently have them come
around the farm because there's nothing there for
them. And it's just the integrity of the net is
adequate there for us. We do have a seasonal
migration of Tiger Sharks that comes through the
farm site there. And we don't deter them anymore.
We have learned to live with them. This has been
part of - I said there's an evolving predator
management plan. We've gotten a lot smarter. And
something about having a fifteen foot Tiger Shark
around your cages makes you get pretty smart
pretty fast.

HUE KARREMAN: Dan.

DANIEL GIACOMINI: I'm not really sure
how to address this question but I’m - I have some
concern on the one hand in the process of - and I
think it was brought out in George's paper - in
the fact that most of this is in public waterways, working with states, foreign governments, all sorts of different agencies. In looking to move the possibility of - as Neal is suggesting - of deeper waters, in the salmon it sounded like - seems like most of them are in fairly somewhat inland. Is moving the salmon to deeper waters, is that feasible? Is it something that would have regulatory problems with - from the people you have worked with in dealing with getting approvals for that? And then specifically as that question develops, with Martin is the numbers that you used of thirty to eighty kilometers, I'm assuming that's in fairly confined environments. If you went to open, more open sea, deeper water type of environments, what kind of numbers do you think - where do you - it seems like that number would be reduced fairly tremendously. How - what kind of an impact do you think you would see there?

HUE KARREMAN: Please give your name first again.

MARTY KURKOWZIC: Marty Kurkowzic, University of Alberta. Certainly if you move offshore into more flushed environments you are going to reduce that risk. The dispersal of the parasites is going to increase so it will spread
much further. But the density is also going to go
down. So moving to the more flushed environments
would certainly help. And I can't - and in terms
of siting obviously it would be better for the
juvenile salmon if they moved the salmon farms off
the migration routes and offshore is a good place
for that, but I can't comment on the regulatory
aspects of how that would happen and those kinds
of complications.

HUE KARREMAN: Okay, Katrina?

KATRINA HEINZE: My question is for
George. And I can't remember what slide it was on
but you talked about the - your performance
metrics that it would be difficult for organic to
maybe meet this particular one - and again I can't
remember. But that perhaps a sustainable system
could. And I'm a little bit intrigued. What
would - maybe two questions. What's the
difference between sustainable and organic in your
mind? And how would the performance metrics be
different?

GEORGE: Yeah I'm not sure I have a great
- well this is a question that we have spent a lot
of time thinking about. From our perspective at
the aquarium, where I was for five years, in
talking to consumers I think many consumers think
of organic as kind of good for you, good for the
environment. And if you can say good for the
environment it's sustainable. Right? Then they
think of organic as sustainable.

But as I began to come up to speed with -
with the rules and regulations of how organic came
about and - and what it really means, there then
is this question. Is, you know, is organic equal
to sustainable? Right? And that becomes a much
bigger discussion, you know probably over beers
late at night and this kind of stuff. There's a
lot of philosophy involved in that right. But I
think in the - and the reason I'm really
interested in this with farmed fish is because if
the U.S. develops organic standards, that
basically by definition are sustainable, then
that's where we want to be. Because as a - as a
conservation person I am much more interested in
sustainability, broad kind of ecosystem
sustainability, than I am about a particular label
that plays out in the marketplace.

But if that label supports that concept
then that's great. But, and that's why I think
this so hard because there are the rules and
requirements of how organic works and how the AWG
did all it's work. But those aren't necessarily
the standards you might come up with in terms of sustainability. So you know the good example is the feed issue, right? Where we might say god, from a sustainability point it's really great to be able to recycle and use say poultry byproducts. But if that's not going to fly from the organic eater consumer or regulatory framework, then we're dead in the water on that issue. But that's not - sustainability would have taken you a different place with respect to feed. So that's kind of what we--

KATRINA HEINZE: So how would--

GEORGE: And I can't remember the specific example you were talking about to be honest with you. But I'll - if I go back and look at my slides maybe I can figure it out.

KATRINA HEINZE: So are there places where the performance metrics that you suggested would be different between a sustainable system and an organic system?

GEORGE: Uh--

KATRINA HEINZE: The ones he suggested.

FEMALE VOICE: I think it's relative to disease.

GEORGE: Relative to disease?

KATRINA HEINZE: I think so as well.
GEORGE: You know I'm sorry. Maybe it's because it's late in the afternoon. I was batting cleanup. I need some more coffee. Let me think about that a little bit and let me get back to you. I apologize for that.

KATRINA HEINZE: That's okay. Then I have a follow up question for you.

GEORGE: Okay.

KATRINA HEINZE: To give you a break on that one.

GEORGE: Maybe I could try on that one.

KATRINA HEINZE: You know I am an organic consumer. I have two young children. And frankly I like buying organic because it gives me confidence that my purchasing dollars are driving industry in a direction I want them to go. If we have an organic standard for aquaculture that is so stiff that few if any, I think are the words you used, fish meet that, that really denies me the opportunity to use my consumer dollars to drive industry behavior. Have you considered that? I mean what - how do we find that balance between providing an economic incentive?

GEORGE: Yeah. No you're exactly right. I mean and that's sort of what was at this - at the genesis of this concept, which was if we just
say no to organic under these conditions, then we have lost the power of the consumer dollar to actually achieve sustainability under the guise of this thing called organic.

But so how do you go there? How do you develop metrics that might support that? And what we came up with was what we came up with. I think the difficulty here is that - I think our philosophy is that we need - we need to follow the organic principles and the concept of sustainability to where it leads us with respect to standards. And then ask the industry to change to meet those standards if they want to be organic. Rather than trying to figure out a way to shoehorn existing processes into the concept of organic and/or sustainable.

And so you know I think that's the fundamental challenge to this is can we develop standards that aren't so unrealistic or somehow fundamentally flawed that nobody can ever meet it. But let's go through the thought process first and then say well, does this work for anybody? Yes or no. And then move from there.

KATRINA HEINZE: Thank you.

NEAL SIMMS: If I may just add to that?

HUE KARREMAN: Go ahead, yeah sure, go
NEAL SIMMS: The other area or the other side of fishery is biology so I can't help but throw into the discussion here the idea of the reuse of edible fishery byproducts. That's an example where clearly these sustainable solutions, something which we all should embrace, is the idea of these Pollock trimmings, which are getting dumped over the back of the boat in the Bering Sea. We should - that's a resource that we should be reusing. And whether you're going to call that sustainable or whether you're going to call that organic, it's a matter of semantics. But we need to encourage that reuse at every level.

I would like to see the opportunity for an industry to build up around that supply, that we create an incentive here in organic standards and with this window of opportunity that the aquaculture working group has provided, that we make it available for these byproducts for an industry to build up around there so that then it becomes more economically viable. At the moment for us to use the BC - British Columbian Hake byproducts, it's more expensive than for us to bring up Peruvian anchovies, and that's when our feed company is in British Columbia. This makes
no sense. But that's the way the economics work because it's a matter of scale, because they are working in tens of containers a week for British Columbian Hake it's a smaller fishery and it's more difficult for them to manage it.

HUE KARREMAN: Bea is up and then Rego [phonetic] after that.

BEA JAMES: First of all thank you again to all of the panelists. I enjoyed all of your presentations. My question is for Mr. Simms and anybody else who might be able to answer this. I am trying to understand the space in which you have an open net pen system. And I'm - I'm trying to imagine how you control that and how you determine to shrink and expand it as you grow your business. And you mentioned that - that at this point that you have a level of control and I'm curious to understand at what point would your net pen system be too big for you to have a level of control? And also, this is probably a very elementary question, but how - how do you keep your space protected? What if someone else wants to come into the area and also open up a net pen system?

NEAL SIMMS: Neal Simms. The primary determined over the area that we requested from
the state was the scope that we needed on the
anchors. We needed the holding power. And so
because we are in water 200 feet deep, we needed
to go almost 1,000 feet in each direction to get
the five to one scope to make sure that our cages
stayed where we - we put them. We would like to
move into deeper water but there's an interesting
trade off there. As we move into deeper water the
area that we need becomes greater because the
spread of the anchors becomes further.

And so we have been, for the last couple
of years we have been in discussions with our
community about where and how we might expand,
just because we have got overwhelming demand for
our fish. And so we want to look at this. And
there's still - I think because of, as I said, the
pejorative about farmed fish, there's still some
disquiet there in the community. People were
perfectly open to the idea of us putting larger
net pens in there and so what we - the proposal
that we have with the state at the moment is
instead of the 3,000 cubic meter net pens what we
have there, that we'll go and replace those 3,000
cubic meters with 6,000 cubic meter cages. So
that's what we have to the state.

I'm comfortable with that given the level
of water that we have - the amount of water we
have moving through our net pen and the fact that
we are not detecting any effluent - any impact on
the water quality and the effluent there.

Your second question about control of
other farms that may want to come into the area,
we would - the general rule of thumb that I think
it's the Mediterranean Industry - this is
something - it has become a conventional wisdom
that has been kicked around and I'm not sure of
it's origin, but the conventional wisdom is you
don't want to have your fish farms closer than
about five miles to each other. So at some point
this industry can be self regulating. Anybody
comes and requests another lease from the state
within five miles of ours then we will vigorously
oppose it just because peace of mind is a very
valuable thing.

We also - it is not an exclusive lease.
We do allow fishermen to come through - these tuna
and Wahoo and other fish that are attracted to our
fish farm, we allow fishermen to come through and
troll through our site. People can bottom fish in
the site. And people also catch some of the bait
fish that aggregate around our net pens there.
But we do restrict of course scuba diving and
spear fishing around the farm site for obvious reasons.

HUE KARREMEM: Rigo.

RIGOBERTO DELGADO: Yes, talking about risks, what would be the risk of using the byproducts from Alaska fro example in your farm, first of all. And second what are the risks of using copper antifouling materials for the fish inside of your nets?

NEAL SIMMS: Neal Simms. Copper is pretty toxic to most marine animals and so the idea of using copper as a feed additive is that perhaps your suggestion?

RIGOBERTO DELGADO: No you are using it as an antifouling. Is there any risk of using those products to the fish inside of your nets?

NEAL SIMMS: The level of ambient copper that the fish are exposed to or that the environment is exposed to is absolutely minimal given the amount of water that moves through there and the limited amount of copper that is on there. Remember eight kilometers away is a small boat harbor that has 200 boats in there who all have copper antifouling. There is no other antifouling that people use on their boats with any regularity and with any effectiveness. And so it's not like
we don't use copper in the marine system. It becomes a problem when you get it concentrated or when people are using other forms of antifouling, such as tributal tin is now I think universally prescribed. I don’t think anybody anywhere in the planet is still using TBT.

And I'm sorry your second - I answered your second question first. Your first question was?

RIGOBERTO DELGADO: The first one is risk related to the use of byproducts.

NEAL SIMMS: Right, the salmon byproducts. My understanding is that there is minimal risk of transfer of pathogens from between families. You wouldn't want to use salmon byproducts for salmon feed. And in fact that's actually one of the problems. We would love to be able to be using salmon byproducts in our Kahona Compache Feed. But our feed company will not allow salmon byproducts into their site because the risk of some potential down - down stream of some unknown prion [phonetic] or something to that effect. What - the reason why I would like to see us working towards some incentives is that we need to encourage the feed company to perhaps have different dedicated lines of extruders so that the
salmon meal and salmon oil can get fed - can - byproducts can become Kahona Compache feed. The Kahona Compache and the Cobia byproducts can become Barramundi feed. And then the Barramundi byproducts can become salmon feed. That's a beautiful reuse of resources and it's something that we should, I think, encourage and provide economic incentives for. I don’t think that that is diluting the value of the organic brand to start to lead on that rather than just letting consumers tell us what they think. I would say the same would hold true with the question of poultry byproducts.

HUE KARREMAN: All right, Joe and then I'm going to have one question at the end and read some cards yet.

JOSEPH SMILLIE: Well this is for Martin and Ken especially. What parts of the AWG recommendation do you think would move the salmon, the conventional salmon aquaculture industry to a better ecological perspective? And what additions do you think, sort of like George mentioned, performance metrics, should we look at in trying to create an organic and I'll, you know tackle the tough issue, the salmon - it's been - it has been pointed out that the salmon is a problem, it's
salmon-centric, and so I'd like to get some direct opinion from you two on exactly which - do you think the AWG standards will help the problems that we have noted with the conventional salmon aquaculture industry? And are there some things that we should go beyond the AWG recommendation to try and create an organic salmon industry? And again your perspective on whether that will help the problem rather than just saying no to organic salmon aquaculture.

MARTIN KURKOWZIC: Marty Kurkowzic. From the perspective of my background, sea lice and salmon, it's really clear that you need to separate the salmon that are inside the farm from the wild juvenile salmon that are migrating past it. And there are some options. One is to move the farms. Coastal waters - in British Columbia there are very few places on the coast where wild juvenile salmon don’t go. It would be really hard to find a site that would - that you could move an open net cage farm to - to eliminate that problem. So maybe moving offshore is an option. And the other obvious alternative is a closed containment system where the waste materials from the farm are treated before they are released into the environment.
KENNETH BROOKS: There are so many questions that can be answered in that one question that you asked. One - I deal internationally - U.S., Canada, FAO, on the development of environmental management standards - not standards for organic consumers. And so I have no expertise there. But I will tell you this, that the countries that I deal in and work with spend a huge amount of effort developing management programs to address environmental issues. And as I said earlier, those management programs differ by region, differ by the social and economic structure of the country, their priorities, their environmental characteristics, etcetera, etcetera.

From an environmental point of view I strongly recommend that you follow the trend that I see in - in numerous of your recommendations to rely on those local jurisdictions by requiring that organic consumers be in compliance with those governmental regulatory programs, which are regionally specific. The development of these programs takes tens of thousands of hours and years and years of study. And to think that the National Organic Standards Board, no matter how bright you guys are, are going to sit down and in
some reasonable period of time duplicate those
standards is I think unrealistic - or improve on
those standards is somewhat realistic. Because
you would have to look at a broad range of
jurisdictions and environmental conditions and it
would very quickly go beyond your - your time and
resources to do that.

I can't close without saying that I
strongly disagree with Marty's presentation - with
many elements in Marty's presentation. I just
came from a Pacific salmon forum meeting where
there are - were a dozen or more researchers who
have been doing specific research in this field.
And they would not reach the same consensus that
Marty has given to you. And I can only suggest
that I have included in the CD I sent to you, a
list of conclusions from that latest Pacific
salmon forum meeting that were reached by one
other academic and myself based on the
presentations. And I would suggest that you want
to read that to gain a different perspective of
the BC sea lice issue.

HUE KARREMAN: Okay, it's 4:15. We are
well beyond our cutoff. I mean we could keep
going but we do have a poster session and we can
keep talking about things and I will forgo
actually reading these cards at this time unless you all really want me to? No. Okay. They are going to be scanned in.

But I do want to say one thing about the regionality issue. You know that - that's a major deal in other aspects of organic agriculture. And you know, what can we say except this is a national program. And Andrea is going to touch on that more I know. But you know in another symposium we had, the same idea you know, there's regionality to that whole topic of pasture for cattle. So we understand that but this is a national program.

ANDREA CAROE: And just - I'm going to back you on this Hue. We agree that a regional - and even a species specific standards are really more appropriate. However we need to deliver a consistent platform for the organic label. That is our charge. If we are to recognize regional variance, we need to be able to codify that in our regulation with our recommendations stating what that - that level of authority is. Where - where that jurisdiction will go, which is not always easy because although this is a U.S. standard for U.S. products, these products are produced around the world. So we understand what you're saying
but the logistical challenges to that are - are pretty - pretty vast in themselves. So at this point we are looking at trying to create a standard that may be at the 30,000 foot view in some areas and not to the detail that we would hope. However that is the best way we can do our job to provide the consumers with - with an assurance to the - to the standard of that - that label on fish. So I think that again backs what - what Hugh said and you want Kevin - Kevin do you have something?

KEVIN ENGELBERT: Yeah I was going to speak about the same thing. But I also want to make a comment. I'm troubled by the implication that - that organic is going to lead down a different path than a sustainable approach. Because one of the tenets of organic agriculture has always been sustainability. And that is one of the things that those of us on the AWG, the NOSB members, have always considered when - in our debates, is this sustainable? We look at everything and every possible angle. We want a system in place that's going to be sustainable for the generations. So there may be Pollack being dumped out the back of fishing boats, but it's not organic Pollack. So if it was, then that would
come into play. But I really think that to say that organic and sustainable will diverge - I'm not, I'm not convinced of that yet. I just - I just wanted to make that point. I don't really need a response.

HUE KARREMAN: Okay. With that we're going to take a fifteen-minute break. And I want to thank all the panel members again this afternoon for coming in from all the different areas of the world and providing us with invaluable information as we go through our deliberations. Everyone please stick around and mill around by the posters and ask the panelists from today questions. That's what this next hour is for. We'll start up again in about 4:30 - 4:35. And it goes for one hour until 5:30.

ANDREA CAROE: I would like to call the November '07 NOSB Board Meeting to order. Thank you all for coming. Our first item on the agenda is to approve the agenda. So at this time I ask all board members for - entertain a motion to approve the agenda. Joe?

JOSEPH SMILLIE: I'd like to make a motion - Madam Chair I would like to make a motion to approve the agenda for November 7th - for November 27th NOSB Meeting. November 28th.

ANDREA CAROE: Is there a second?

MALE VOICE: Second.

ANDREA CAROE: Is there any discussion?

JULIE WEISMAN: Yes.

ANDREA CAROE: Julie?

JULIE WEISMAN: Yeah I would like the - the agenda currently - as it currently reads shows two items, one is a joint handling and materials committee item called the definition of materials and that is listed on the agenda as a recommendation. It probably is obvious from what has been posted on the website that that is going to be a discussion item at this meeting. We are not ready to make it be a recommendation. It's a
work in progress.

Also pet food is listed as an item for recommendation at this meeting and that is also going to go forward as a discussion item. There are two lingering details that have to be hammered out. Thanks.

ANDREA CAROE: Okay so those two items will be changed from recommendation items to discussion items. And the voting will be eliminated for Friday. Any other changes?

MALE VOICE: I would like to change the CACC item that is listed as a recommendation on multi site operation certification; the committee has decided that we will change that to a discussion.

ANDREA CAROE: Okay so that - that too will be removed from the voting items and changed as a discussion item. Any further changes to the agenda?

MALE VOICE: Madam Chair.

ANDREA CAROE: Dan.

DANIEL GIACOMINI: I believe we also have a speaker for the alternative perspective slot.

ANDREA CAROE: Yes. I think the published version that it was on the website reflects this, the Board - the Board - the version
that you have in your board books is - is just a
step behind and that's not reflected. And so - so
noted that that changed - that has changed
already.

       VOICES: We can't hear you.

       ANDREA CAROE: I can't get this any
closer. Okay so the - the issue is is that there
- the board books right now have an earlier
version that does not reflect a speaker today.
There is an empty slot. But that has been
resolved on the website and the version that was
posted there. So that is noted. I'm getting
feedback. Any other changes to the agenda?
Hearing none, all those in favor of the agenda as
changed by these - these two areas, say aye.

       VOICES: Aye.

       ANDREA CAROE: All those opposed same
sign? We have an agenda. Thank you. Okay the
next item of business is the wrap up from the
aquaculture symposium. Hue do you want to say a
couple of words on the aquaculture symposium
yesterday?

       HUE KARREMAN: Thanks Andrea. We had a -
wow that's really - pardon me. I'm back here and
you can hear that pretty well. Okay. We had a
very productive aquaculture symposium yesterday.
And we had - is that better? Okay. So yesterday we had our aquaculture symposium and we had two major topics that have been unresolved very - from a very in-depth perspective dealt with yesterday. Regarding the feeding of aquaculture fish, fish meal and fish oil, and also the net pen issue. I think the speakers we had were excellent. Certainly experts in their field. And I - I believe we will be able to move along now and come to a conclusion as a board regarding those two issues and hopefully we will have a - a recommendation to vote on at the spring meeting. All I can say is if you weren't here you really missed a - a wonderful and excellent USDA set up symposium. And I'm glad we were all here. So but thanks to all the panelists if you're here, and please I guess we'll be hearing public comment as well about the topic I hope. And I guess that's about it for now.

ANDREA CAROE: Thank you. As we have said before, the AWG as an appointed body for working in this project has done a stellar job in providing information. This was - the symposium was a great opportunity for the board to get further information on - on a couple of details that were - were of concern to the public. And of
course our - our first order of business is to maintain this label for public transparency for public confidence in the label, and so this was a good way of us to be able to do that. I thank the Livestock Committee for putting together a fabulous session.

And also for any of you that were not able to be here we do have the poster sessions still up and available for you to review some of the work that has been done in these areas and talks about the potential risks of these - these two particular issues. So feel free to look at those and learn more about the - the process.

Now the Livestock Committee will take the information that they have and they have until the spring meeting to develop a recommendation that will be voted on then. So we look forward to that and we'll move forward with this pretty big task of bringing aquaculture into the organic fold.

Okay at this point I'd like to talk about - a little bit more about what we are here to do, which seems like kind of remedial but in past experiences on boards that I have sat on we - we always started the meeting just kind of reiterating what our purpose is here. So I'd like to kind of bring us back, not only to focus the
board on what our work is, so that we can accomplish our task, but also to advise everybody that's making public testimony, what our authority is and - and in what way we can actually move things forward.

So with that I thought it was really appropriate to go back to the statute and actually look at what the statute says in regards to this board. So at this time I'm going to actually read the quotations from - from OFBA.

In OFBA, in regards to the National Organic Standards Board, it says in general the Secretary shall establish a National Organic Standards Board in accordance with the Federal Advisory Committee Act, thereafter referring to the - in this section as The Board, to assist in the development of standards for substances to be used in organic production and to advise the Secretary on any other aspects of the implementation of this title.

So the - specifically that is our task. It goes further to talk about the composition of The Board, the appointments, terms and meetings. The responsibilities of the board are - are listed. In general The Board shall provide recommendations to the Secretary regarding the
implementation of this title.

So once again that is our purpose. And if there is anything that we can do within this purpose to assist the organic industry; we really would like to hear testimony on that. As Board members we need to focus in on activities that move forward with this mission. And again it may feel a little bit remedial but I think it's just a good reminder. I like the idea of starting a meeting talking about what our purpose is.

So with that I will ask the Board if there is any announcements to make. Does - do we have any announcements? No announcements. Okay. Then we will move to introductions. And we'll start with Hue. If you can give your name, your affiliation, the seat that you hold, and any other information you want to give about your being here on this board.

HUE KARREMAN: Okay, my name is Hubert Karreman. I'm a dairy veterinarian from Pennsylvania. My background is in soil science, soil conservation, dairy husbandry and now veterinary medicine. I - my seat is the Environmental Resource Conservation Seat. And let's see I was appointed in 2005 so I have two more years on the board here. And I look forward
to moving forward with some very important issues coming up.

KEVIN ENGELBERT: Good morning. Kevin Engelbert, Nichols, New York. I'm a - I hold one of the Producer seats on the board. My family and I operate a 120 cow certified organic dairy farm in upstate New York. I want to go on record as usual thanking my sons for carrying the load for me and putting up with all the time that I spend working on NOSB business. And I'm just honored to be able to serve on this board.

JEFFREY MOYER: Good morning. Jeff Moyer. I'm - excuse me - I hold the farmer position on the board. I've been on the board since 2006. I'm the farm manager for the Rodale Institute. I live in Lenartsville, Pennsylvania where I have a small farm of my own. I'm on the Livestock Committee and the Crops Committee.

Good morning. I'm Jennifer Hall. I fill a Consumer Representative slot. I live in Spokane, Washington and work for an urban developer bringing a food cooperative to our great city. And I - I serve on both the Livestock and the Certification Committees and I have had past experience working with several NGO's that really commit to educating the public and consumers and
the culinary industry and restaurant industry
about foods and sustainability and organics and -
and where and how to do all of that.

RIGOBERTO DELGADO: Good morning. A producer from Texas. Chair of the Policy Development Committee. Member of the Crops Committee and also the Livestock Committee. I'm very pleased to be here. And for the benefit of my colleague, Bea, my name is Rigoberto Delgado. And it's - like Kevin said it's an honor to be serving on this board. I was appointed in 2005 so I have a couple of years left. Thanks.

DANIEL GIACOMINI: Dan Giacomini, I serve as a consumer position on the board. I'm from California. I am a consultant in the dairy industry for the most part. I am also an active consumer in dairy - in organic. I serve on the Chairman of the Live- of the Materials Committee and - that wasn't a Freudian slip Hue, don't worry about it - and also serve on the Livestock Committee.

JULIE WEISMAN: Julie Weisman, I am the - currently the Vice Chair of the NOSB and the Chairman of the Handling Committee. And I also serve on the CAC. I’m not sure if I'm forgetting something here. But I hold one of the two
handling positions on the board. This is the end
of my third year. I can't believe it. I live on
northern New Jersey, though I'm from Brooklyn.
And I have been - I have been a member of a
collectively owned vegetarian restaurant in a past
life, served breakfast to people sitting in this
room. I have been a psychiatric social worker in
the Bronx. And for the last 12 years I have been
running my family's business providing ingredients
to the flavoring industry and now proudly mostly
organic ingredients.

ANDREA CAROE: Hi I'm Andrea Caroe and
I'm Chair of this Board. In my paying job I am
Executive Director of Protected Harvest which is
an eco label certifier. I also serve on the
Handling Committee, the CAC, the Policy Committee
and the Aquaculture Working Group. This is the
end of my term. So this is my last meeting. And
that's it.

BEA JAMES: Bea James, I serve on NOSB
with the Retailer Position. I work for the
National Cooperative Grocer's Association which is
an organization representing 137 co ops across the
United States. I live in Minneapolis, Minnesota
but I'm a native Oregonian and that's really where
my roots are. I have two beautiful sons, Forest
and Harvest, who are anxiously waiting for me to come home and - and I look forward to that day.

JOSEPH SMILLIE: I'm Joe Smillie, I'm the Senior Vice President of Quality Assurance International and in that capacity I hold the seat of - Certifier Seat on the NOSB. I’m Chair of the Certification Accreditation and Compliance Committee and a member of the Handling Committee.

I was appointed in 2006 and I have been an organic farmer, a fertilizer dealer, a composter, and an inspector, and I am now a bureaucrat.

KATRINA HEINZE: Good morning. I'm Katrina Heinze. I sit in the scientist slot on the board. I am also on the Materials Committee and the Handling Committee. I work for a consumer products company in a regulatory affairs group. My experience is I have a background in chemistry. I have spent most of my time in manufacturing. And I'm a certified quality engineer. I was born and raised in Marin County, so long time organic consumer. I have two young children. And my interest on the board is making sure that we have strong national standards so that my children inherit a good planet.

TRACY MIEDEMA: Good morning. My name is Tracy Miedema. I'm from Philomath, Oregon. I am
also an organic consumer as are my three children and husband. And I sit in the Organic Consumer Representative Slot. My background is in organic education, marketing and consumer behavior. And I appreciate the opportunity to serve. Thank you.

STEVE DEMURI: Good morning. My name is Steve DeMuri. I live in Carmichael, California. And I hold one of the handler positions here on this board. I'm also on the Materials Committee and the Handling Committee. And I work for Campbell's Soup Company. I direct the company's organic production. I've been in the food business for 28 years and in organics for about 15 years. And I too am honored to serve on this board and very much appreciate all the fine work that's done here. And I was just appointed last year so I'm still a newbie. So be gentle.

GERALD DAVIS: Gerald Davis, I sit on the - a producer seat on the board. I'm the Crops Committee Chairman. I am from California and I have 25 years experience working with organic and conventional crops, about 40 different crops in those states. I got around a little bit. I work for Grimway Farms, a family owned very, very large vegetable farm that is the largest carrot producer in the world. But still owned by one family and
not a corporation. Thank you.

KRISTINE ELLOR: Hi I'm Tina Ellor. I sit in the environmental seat. I'm from Kennett Square, Pennsylvania. And as Steve said, this is my first meeting so I'm really, really nervous. But I see a lot of familiar, friendly faces in the audience that I'm looking forward to hearing from. So I think that's about it. Thank you.

ANDREA CAROE: Valerie do you want to introduce yourself?

VALERIE FRANCES: Valerie Frances, the Executive Director of the National Organic Standards Board. And this is a lively meeting as usual.

ANDREA CAROE: Bob?

BOB POOLER: Hi I'm Bob Pooler. I'm with the National Organic Program. I've been with the program since - well for many years. And was involved with the reg writing and getting this program implemented. And I deal with a national list of state organic programs and cost share amongst many other things.

VALERIE SMILLIE: Good morning. I'm Valerie Smillie. I'm the Quality Systems Manager for the National Organic Program and I just started with them in March and I'm very pleased to
be here. Thank you.

JONATHAN MELVIN: Good morning. My name is Jonathan Melvin. I'm the Accreditation Manager for the National Organic Program. Welcome everyone.

BARBARA ROBINSON: Barbara Robinson, I'm the Deputy Administrator for Transportation and Marketing Programs and the National Organic Program falls under my oversight. And I've been with this position now for I think this is my seventh year. And so I don't know how long I've been coming to these meetings. But — and I missed the last meeting for personal reasons. And thank you very much for your forbearance. It's nice to be back.

MARK BRADLEY: Hi, Mark Bradley. I'm the Associate Deputy Administrator of the National Organic Program. And I manage the NOP staff. I've been there for two years, something like that. Seems longer.

FEMALE VOICE: I just want to acknowledge Katherine Binham over here. She doesn't have a mic. There she is. She's trying to help us with our audio right now. We don't have our audio tech
with us. But she's our Advisory Board Specialist and is really responsible for logistics of making the meeting happen.

ANDREA CAROE: Thank you. She's been floating around. I haven't been able to-- all right well we're a little ahead of the time but we know we'll have a lot of public comment. So -- all right so moving on, our next item is the Secretary's Report so I'm going to turn it over to Bea.

BEA JAMES: I would like to move that we accept the March 2007 meeting transcripts into the official record. And I would also like to mention that the meeting transcripts do reflect a few errors that are not anything that changes the content of the meeting but there are some misspelled names and just misspelling in general. So Valerie and I plan on going through that and making those corrections. But I just wanted that to go on the record that it's a lot of paperwork and we haven't gotten around to it. So I need a second.

ANDREA CAROE: Is there a second?

MALE VOICE: Second.

ANDREA CAROE: Is there any discussion on the transcripts? Because I know everybody has
read every word of them. Every word. Okay.

Hearing none, all those in favor of accepting the
March 2007 Board Meeting transcripts say aye.

    VOICES: Aye.

    ANDREA CAROE: All those opposed same
sign. Okay we have transcripts.

    BEA JAMES: Okay. I would also like to
make a motion to accept the summarized minutes
from the March 2007 meeting, which also include
the summary of a lot of votes. And those are
posted on the website for anybody who is
interested in reviewing that. But I would like to
accept those into the NOSB official record.

    ANDREA CAROE: Is there a second?

    MALE VOICE: Second.

    ANDREA CAROE: Steve DeMuri second. Any
discussion on these - now I do hope the board
members did read the summary minutes.

    FEMALE VOICE: Can I make a point of
order here? I wasn't - didn't attend those
meetings so I would like to abstain from those
votes.

    ANDREA CAROE: You can at the time of
voting go ahead and abstain.

    FEMALE VOICE: Well there was no
opportunity to abstain from the last one so that's
just for the record.

ANDREA CAROE: Oh, very good. Thank you.

Any discussion on the transcripts - the summary minutes? Hearing none we'll go to vote. All those in favor of accepting the summary minutes from - summary votes?

BEA JAMES: Minutes and votes.

ANDREA CAROE: Minutes and votes from the March 2007 Board Meeting say aye.

VOICES: Aye.

ANDREA CAROE: All those opposed same sign. And abstentions?

FEMALE VOICE: Thank you.

ANDREA CAROE: One abstention.

MALE VOICE: Over here too, I wasn't there.

ANDREA CAROE: Two abstentions. Okay. The vote passes.

BEA JAMES: That concludes the Secretary's report.

ANDREA CAROE: Okay so this is the last time I'll say this this meeting, we're ahead of schedule by a half an hour. And the - it's the last time I'll say it probably ever. So with that we are prepared for the program report.

BARBARA ROBINSON: Are we doing what we
always do, I say my name first and - okay.

Barbara Robinson, Deputy Administrator, Transportation and Marketing Programs. Who did that?

Just a few things from the program for an update at this meeting. Again let me start off by thanking the board for its patience in my absence in the past year for personal reasons, and for your very nice sympathy for the loss of my husband. I do appreciate that.

Now there are just a few things that I would like to bring you up to speed on. The first one is that the program and the board received a - a letter alleging - well it was a complaint alleging violations - ethics violations about a member of the board. And asked that the board take action and that the program address this and so I will address this.

The letter was written by two private individuals who were former members of the board. And the letter alleged that a current member of the board had made ethics violations and had conflicts of interests and so we - we took a look at this. That the member of the board did not appropriately recuse himself from votes or declare his interest - a conflict of interest. And so we
took a look at this and - and furthermore the letter asked that the Secretary remove the board member.

Let me say this. First of all you are representatives of the Secretary. You are not employees of the Department. No FACA law - that's the Federal Advisory Committee Act - no OFPA law and no National Organic Program regulation has been violated here. None whatsoever. The references to the board policy and procedures manual, those are your rules of the road. Those are not anything that has to do with a law of the U.S. Government.

Furthermore your internal policy and procedures manual says - this is rules that you all have decided upon - say that you declare an interest in a vote before a vote takes place. Now let me say this first of all, each and every one of you is appointed to this board by the Secretary because you have a particular expertise. Therefore each of you comes to this board with a built in conflict of interest. We expect that. That's what we - that's the reason you were appointed. So that the Secretary would benefit from your particular interest that you bring from this industry. You are expected to participate in
every discussion that takes place on this board.
Not to participate in a discussion, to recuse
yourself from a discussion, is in effect to shirk
your duty and to deny this industry the benefit of
your expertise.

According to your policy and procedures
manual, as I recall, recusal is really up to the
board, not yourself. You may recuse yourself.
But as I recall, and maybe I'm wrong, when you
declare an interest, and you really don't have to
declare a conflict of interest, you can declare an
interest when a vote comes up.

Why would you do that? There are two
reasons that I can see that you would declare an
interest. One is you have an exclusive
relationship with the petitioner. Or you stand
somehow to materially gain from the vote that is
about to occur. Rarely have I seen that happen.
Now carried to the logical extreme, each and every
one of you stands to somehow gain from the vote
that is about to occur - either as a producer or a
consumer. You either stand to gain or stand to be
harmed, depending upon your views about the
material that is either going to be put on the
national list or put on for being prohibited. One
way or the other, depending on how you feel about
it, you either don't like it or you do.

Recusing yourself at some point can tip the quorum so that you will not have a full bodied vote. And that is not a good thing. So I caution you against this recusal that you have built in here. You know this is not necessarily - I know that the motive behind it appears to be - to appear politically correct and - and to refrain from doing something that would look inappropriate. But I caution you about that because you know once you get to a point where the quorum is very, very narrow, then - then again the industry is denied a full bodied vote of 15 members. And then we don't know how the vote might have turned out otherwise.

So as to the other issue in the letter about a member appearing in a private press release, affiliated with his or her firm, what you do on your own time and in your own businesses is your business as you have so often reminded the Department. You are private citizens. You volunteer your time to the Department. And there have been many occasions where you have reminded us that you are free to write to the Secretary as private citizens. And share with him your views. Well turn about is fair play. And in your private
business if you want to get your name in print,
the Department has nothing to say about it, and we
don't comment on your private press releases.

We have nothing further to say about this
except the following. The Secretary appointed
you. The Secretary supports all 15 of you. And
you are not getting off the board this easily.
And that is the end of the matter.

The second item that I would like to
bring up is - I'm not going to tell you about our
budget and you know our resources because you
never want to hear that stuff. However, in the
course of the last year and what I can safely
predict in 2008, the NOP workload will probably
turn into the following unless we do something.
Next year we will only work on what is known as a
FOIA, a Freedom of Information Act Request.
Unless we do something different. Because that's
pretty much what we are getting now, Freedom of
Information Act requests. And they go back to the
year 2002 when we opened the program.

So I have decided, and I have gone to the
Senior Policy Officials in the Agency and gotten
permission to do this, that we have to
dramatically change the way that we do business in
the NOP.
So we are going to do that. We ourselves are contributing to the FOIA's that we get. Does everybody know what a FOIA is - first of all? Anybody not know what a FOIA is? A FOIA is a - basically a request that the public is entitled to, for information that is records that are under our control and that are in our possession, but for which we do have to go back and redact, which is another word of saying black out any confidential business information. We contribute to this problem and we contribute to a growing climate of mistrust in my opinion by not publishing this information because as you know we - we have certifying agents, 94 or 95 of them. How many do we have? Ninety five. And we are continually, as time goes by, auditing them. And when we do we add to the pile of paper that is potentially releasable once we get it done. Then we get a FOIA request. So as you add to that pile, that is potentially releasable, and you don't publish it, and someone says I want it back since 2002, as the years go by, the stack gets higher.

There is nothing to hide. And there is no excuse for not having transparency. So as soon as we can, but hopefully by the beginning of 2008,
we are going to create for shorthand, ENOP, an electronic National Organic Program. A reading room, an electronic reading room if you will. Where everything that can be published about the National Organic Program will be published electronically. And the history of this program will be accessible through its certifying agents.

You will come in, you will click on a certifying agent's name and you will be able to start with the accreditation letter that they have received from the administrator that grants them the license to do business. And you will find a list of all the operations certified by the certifying agent. You will find the audits, the audit reports that have been completed by the audit review and compliance branch. You will find all of the appeals, that appealed decisions issued by the administrator that have been completed. Eventually we will get to all of the non-compliances that have been issued. Eventually we will get to all of the decisions issued by the National Organic Program.

Now my goal for this program is that when 100 people call in and ask the same question they get the same answer and we aren't there yet. We should be, but we're still a young program and we
do have terrible resource constraints. But this will help us get there. Because people will be watching and people will say well you answered this differently than you answered it over here. Because transparency will become a two way street. There will be accountability and it will be painful - painful for us. It will be a burden on us. But eventually there will be growth as a result.

But if we don't do this the program will simply be paralyzed very shortly by FOIA's and this all we will do. We won't do any rule making. You'll be having one meeting, not two. We won't work on anything but putting together FOIA requests.

Right now compliance and analysis, which does our investigations, which does all of the investigation work for the entire agency, and AMS, the Ag Marketing Service, has a staff that swells to over 4,000 people at various times during the year. Right now compliance and analysis tells me that they spend more time on FOIA's than they do on all investigations for the agency. And part of that FOIA burden is because of the National Organic Program.

So there's just, you know I don't say
this in any - I say this to you not in any, you know hostile sense at all. The public has every right to know what goes on in this program. And we have begun to do this almost a year ago but we delayed doing it because of something called web migration. The entire department was switching over to a - a single uniform type of home page. And then a problem occurred and so the contractor couldn't get it right. And so everybody decided well we'll just wait. Well this became ridiculous. I don't care if it takes twice as much IT resources, that's somebody else's problem to deal with, we're going to go ahead and do this anyway and we'll deal with those consequences later on. But I think we just need to go ahead and publish as much as we can electronically. So that's what we're going to do.

Third thing, we are moving ahead with equivalence discussions with Canada. We have gotten pretty far along. We are waiting for the Office of the Trade Representative, which is the White House Office, to give us a green light on whether we can take the next step and move ahead with discussions, formal discussions with Canada. As you may know their standards will come into effect in December of 2008. And so we want to go
ahead and actually sit down to the table with them and see if there is a possibility to actually engage in an equivalence discussion with them. Remember the last time that we tried to have an equivalence discussion was with the EU.

Equivalence is very, very difficult to achieve with the National Organic Program Regulations. Canada has problems with two of our materials, Chilean nitrate and Potassium Bicarbonate. And of course they have antibiotics. So we will have something to discuss. But they are eager to engage in this discussion and so we will proceed and see how that goes.

We have renewed some discussions with Japan. But of course we would like them to remove the restrictions on three materials that they have placed on us. So we will see how that goes.

And last but not least, dockets. I have signed off on Sunset '08, Sunset '11; we have no sunset for 2010 because you did not add any materials in 2005. So you will have to go through a sunset exercise in 2008 and 2011. Sucrose octenate ester is done. Dr. Karreman, your livestock meds, I signed off on the final rule just before I came down. All of these dockets will be published next week. So Merry Christmas.
ANDREA CAROE: Yes we certainly are ahead of schedule. Okay all right well perhaps we should take a little break right now. I know it's kind of early. But if we can take a ten minute break right now and then come back at nine o'clock. I know it's unscheduled but we are a little bit ahead of schedule and then we can just regroup a little bit. Okay? So we will recess for ten minutes.

[RECESS]

ANDREA CAROE: Okay, let's get back into session here. At this time I have the pleasure of introducing our Deputy Undersecretary of Marketing and Regulatory Programs, Dr. Eller, who would like to speak to this board. Dr. Eller?

DR. ELLER: Thank you Andrea. It is a pleasure to be here this morning and speak to you on behalf of Undersecretary Knight. He enjoyed his visit with you last March I believe it was. And he said this fall you need to go meet these folks. And I do because I need to catch up on your issues.

I've been involved with AMS pretty closely on the grass fed forage raised, whatever and now we're struggling with naturally raised. I'm not sure I can
define natural at this point. So we got off the hook with naturally raised. We're bringing that through. And I believe in those nomenclatures. I also believe in knowing what your nomenclature is. And I also believe that marketing is between the lines. And if you're going to sell something then it needs to be between the lines. So I do believe that perhaps we are at least starting on similar philosophy. But I've got a lot of catching up with the organics nomenclature, the organics lines so to speak, and the organic industry.

I grew up on organic agriculture but I didn't know any better. We milked our own milk. We had our own eggs. We had our own bacon. We couldn't afford a lot of the chemical fertilizers and we couldn't afford a lot of the pesticides so I grew up without knowing what I was growing up on - organically.

I'd like to congratulate your Chairman, Andrea I understand this is your last meeting. I understand you've been very busy in chairing the aquaculture symposium yesterday and that you have set a full agenda for these two days. And I understand you have been a very active board member and now a very active board chairman. So I think your shoes are going to be hard to fill and
I presume this board however has learned to be very active, fast paced and full agenda'd under your leadership. But congratulations and we appreciate your tenure.

I also want to thank the board on behalf of the Secretary and Undersecretary Knight. We really appreciate your experience, your expertise, your time, your efforts and your commitments on behalf of USDA and the Organics Industry. Without that we wouldn’t be where we are. Now I know from what I'm - when I talked to Barbara, some of you say well we're not very far down the road. But can you imagine how far we wouldn't be down the road if it wasn't for you folks stepping up to the plate.

You are an example of some of the best things in government, particularly USDA, and that is the public private partnership. We have made so many strides at USDA over recent years with a public private partnership, leadership philosophy. We really appreciate what you do and we thank the board members for your tenure and the industry here - I mean my goodness, I presume everyone in this room is interested in some phase of promoting and advancing organic agriculture and organic foods. So I - I think I see a lot of interest
around the room.

As you know USDA has been extremely involved in trying to change farm policy. This started to some extent with organic agriculture. We did listening sessions as you know. Secretary Johannes was very, very committed to listening sessions - just a year to 18 months ago around the country. As a result USDA proposed a number of new initiatives in the Farm Bill. And by golly most of those have been included in both the Senate and House versions of the new Farm Bill. It shows solid support for segments of agriculture that were never involved in farm policy debates beyond the subcommittee level.

Both bills include new funding for the organic data collection. And this will help provide better price and yield data at the production and distribution points for organically grown crops. Under both bills currently considered the AMS, your host agency here, could expand its coverage greatly. Fruit and vegetable marketing and distribution, volumes and prices - at production, at handler levels, at the import border crossing levels, and at the wholesale level markets. I presume that's some - if I were producing in your shoes that's something I would
go fight for. I believe that's something you can
hold in the Farm Bills.

In fact we have some indication, we were
meeting with the Senate staff, both sides of the
aisles, yesterday, there is some indication that
the Senate Ag Committee might try to go to the
leadership with a set number of amendments and try
to come back to the Farm Bill next week when they
get back in town. I hope they do because that's
about the only movement we'll get on the Farm Bill
by Christmas. And that means we can start writing
the real Farm Bill in the mid January timeframe
and maybe have a President's Day signing of the
Farm Bill that is late February traditionally.
Otherwise we'll have an Easter Farm Bill if the
Senate cannot get their Farm Bill off the floor in
the next three weeks we'll probably be signing
Farm Bills in Easter.

We'll be extending the MILC, M-I-L-C
program. We'll be extending the kumquat program,
the raisin - you know I mean - I'm being facetious
about kumquat program. But the Farm Bill is so
complicated that we'll have to cherry pick little
extensions and that's all they'll get done is play
little extensions until they can get the master
Farm Bill extended. So let's hope that the Senate
can come back and agree with the leadership next week and move a bill off that floor so that the real Farm Bill can be written in the Conference Committee, which is going to take a long, long, tough, tough time.

Both bills currently include expanded resources for organic research. This will focus on conservation and environmental outcomes and new and improved seed varieties which are well suited for organic agriculture. I think you've done your job.

The popular certification cost share program will be extended - I'm sorry - expanded significantly. Increase of funding and resources for reimbursement for both producers and handlers are included. We'll get more money for total reimbursement and the program can be expanded then to all states.

Of course USDA supports the increased funding for the National Organic Program. With a whopping 15 to 20 percent growth in the organic industry, it is hard for the USDA and the Congress to ignore the needs of the - for the additional resources in compliance and enforcement activities that AMS must carry out under that kind of a growth program.
I don't believe that we have any other one single program that is growing at that rate in the area that we are. We, Secretary Knight and I have the animal plant health inspection service, the packers and stockyards, the grain inspection and the agricultural marketing service, under our section of the sub cabinet. And this program, unless there is some new figures, it's the fastest growing program that we have.

We certainly hope Congress will demonstrate its continued support of organic farming, organic agriculture, organic food production and marketing, and we need a Farm Bill. We need a Farm Bill to recognize the true value of specialty crops. And we need a Farm Bill that serves both farmers and the American consumer as well.

We've come a long way in Farm Bills. I've been around town a long time but the first Farm Bill I was up to my ears in was 1985. I was the lead lobbyist for the Cattle Industry at that time in town. And I was told on many occasions by other lobbyists, by staff, and by members of Congress how dare you get involved in the Farm Bill? The Cattle Industry had no supports. The Cattle Industry wanted government out of our
business. We believed in the free market and all we needed was a chance to meet that market.

The bulk crops - so called program crops - had had a lock on the Farm Bill and to some extent still do, and I'm - I mean that's - that's our basis of world trade. I'm not saying we shouldn't do Farm Bill policy that keeps us active in farm production, keeps us producing a lot of product, and keeps us the world leader in trade and exporting our commodities.

But between dairy and the - the gross commodities, it was like how dare you get involved in the Farm Bill? The Farm Bill - this is - you can't be involved in the Farm Bill. We don't do those things in the Farm Bills. All we wanted was some level playing fields, etcetera, etcetera. So we have come a long way for the specialty crop interest to now be a - have its own section. I mean Title X of the Farm Bill didn't exist in 1985. We created Title X and now you guys are creating the - the fruit and vegetable title. Congratulations. Sometimes things just take longer in Washington right?

USDA and AMS, we also support a lot of other small farm programs. I'm sure many of you know of and probably even participate in the
Farmer's Market Promotion Program. Basically it is a grant program targeted to states, to tribes, to roadside stands, to community approved agricultural groups, economic development regional farmer authorities and other marketing authorities, that helps do a production to consumption direct link. And that is as good as it gets. I mean it's nice to have a choice and I've never seen such growth. One thing that's going to rival probably the - in my opinion, this is a personal opinion - one thing that’s going to rival the growth in the organic production acceptance and consumption, is going to be the local grown and consumed niche market growth.

Watch out! That is coming. That is here. That freight train is right behind us and I think it's wonderful.

You go up the street and buy your eggs. You buy your sweet corn. You buy your vegetables. I'm on the - I live on the edge of the Washington growth. I take a train in every morning. The way some farms around me are maintaining open space and their ability to farm is providing that locally supplied market. And you know what, right beside us there's three quarter to a million dollar houses going up and those households don't
care what the price is. I love it. They don't
care what the price is. And my neighbors are
going to provide it. So again those are exciting
things. These are exciting times in agriculture.
AMS recently held a very successful
National Farmers Market Summit in Baltimore. It's
part of our effort to look for new opportunities,
size up the niche marketing developments, and
other opportunities for medium and small size
farming operations.
Again I think the direct consumer,
producer to consumer production and marketing and
partnerships are the thing to watch in - in
agriculture as far as growth rates. Total volume
not necessarily but growth rates over the next few
years. And again that's personal.
Another way USDA might be able to help
and fit in with some of your organic and other
niche market plans in the future is by - and this
is switching over to the animal industry now, a
animal identification and premise registration
system. You know that we have been involved in
that. Secretary Knight and I were brought in
about 15 months ago. Our first job was to change
the animal identification - national animal
identification system from mandatory to voluntary.
And because that fits our philosophy exactly, that was a fun thing to do. And we've basically turned it around and we're very proud of that. The national identification system, or NAIS, as you've heard over the past, is now on board. It is operating. It is there. The conveyor belts are running. The screens are shining. The nomenclature is working. And the premises are being registered. RFID tags are going in the ears. And we have wands and ear tags and equipment that is technology neutral. So that 14 tags can be read by seven devices crossing at any place any time. The problem we're having is that the devices cannot read to the speed of commerce. And so we still have a lot to do. We knew that. And if we needed fifty million tags tomorrow, the industry could not provide it. We didn’t know that.

We thought industry - because a lot of you in this room probably have pet chips in. Some of you folks if you are a horseman, may have a horse chip in as a way to identify your animal should they wander off, be stolen, or whatever. It's a phenomenal thing for the food industry. The NAIS is voluntary. When we came in, Secretary Johan said okay, we've - we have learned a lot
about BSE now. I don’t believe in a – that this is the right time for a mandatory identification system. I want you to put the system together, make all three legs of the milk stool work, premise registration, animal identification, and animal tracing in case of a disaster, and have it ready so that when the producer wants it – if the producer wants it, and when a particular producer wants it--

[END MZ005008]

[START MZ005009]

MR. MARK BRADLEY: --it's ready, it's up and going, and it's operational. We're there, 15 months later. We're very proud of that. We're also very proud that it is a voluntary program. The reason I'm bringing it up here is that you're not obligated to register your premise; you're not obligated to put a RFID device in the ear; you're not-- or any other tag; you're not obligated to have you animal traced. But for some of you in the animal organic industry, it's probably one of the best management tools that you could ever imagine. From the start, we said, "If we're going to do this, it's going to be a management system that we can layer and tier." Yes, bottom line, we are going to have this program to hopefully
prevent animal disasters, from disease introduction. And once we get it, we can find people and animals, and not only find the diseased animals, but protect those around them. We'll--our job is to protect people and animals and lives and economies and businesses and farms. And so, if we can do that, we've accomplished our purpose. So, we're not just tracing diseases, we're trying to find people to protect. In other words, we want to put that border around that disease and notify everybody here, and know what animals are there, so we can protect these animals, while we're getting control of this disease outbreak over here. Now, layered on top of that, what happens when you have an export certification program? You got your NAIS program here, you had your export certification here. Grass fed, certified on top of here. One device, one program, one system. Organic, lay it here. It's there if you want it. How do you prove to me that you haven't brought in extra cows into your organic dairy and called non-organic milk organic milk? I can prove it to you with my management system. We don't tag those cows yesterday, we tagged those cows last year. We have a running record of those cows. We can show you where the
milk came from, calves, pigs, chickens, because we can-- Chickens you don't, their ear's not big enough. [laughter] We can lot identify a chicken house if you want. So, anyway, what I'm saying is, my message to you this morning, the main reason that the Undersecretary wanted me to come over was to say that we have something that we think is one more management step that, if you like, and if you're ready, Barbara's folks will recognize it, and they'll recognize it darn quick, because a RFID tag trail is a lot easier, faster and easier to prove than a paper trail. I see the certifiers over here. Hey, I'm looking for them to go out with a wand here one of these days. If you're, I mean, you know, maybe some day we'll figure out how to identify that lettuce and those tomatoes and everything else. Well, as you know, commercial industry already, the grocery industry already, many other industries already, are chipping the shipping containers. You know, it's hard to do an individual head of lettuce, but you can sure do the shipping container. I'm not suggesting that, I'm saying that boy, we're in a time where there's wonderful, wonderful opportunities, with technology, programs. The good thing about it is, it's not required, it's
voluntary, it fits into the free-market system.
2 And I love it. One thing I want to-- I'd like to
3 have as you, madam chairman, as you get finished
4 with your meeting, I see you have somewhere here
5 on my agenda, some reports for the Animal Health
6 and Welfare Research, then you've got a Global
7 Animal Welfare Initiative. I'd like to have those
8 reports, I'd love to, if you'd share those. I had
9 to chuckle, coming from a livestock basic
10 background, I always have to chuckle, animal
11 welfare this and animal welfare that -- we grew up
12 caring for animals on my farm, all animals were on
13 welfare [laughter] and I just have to throw this
14 out, I wonder why we don't call it animal care,
15 rather than welfare. Thank you for having me
16 here.
17
18 [applause]
19 MS. ANDREA CAROE: Well, thank you very
20 much for taking the time from your busy schedule
21 to address this group. We always appreciate
22 hearing from the USDA on the bigger picture as we
23 focus in on the details of our work. And this is
24 exciting and we look forward to seeing this
25 develop, it sounds like there's all kinds of
26 wonderful things on the horizon. At this point,
27 I'd like to recognize Barbara Robinson again,
there is a little bit more of the NOP report so,
Barbara, if you can come to the podium and give us
more information.

MS. BARBARA ROBINSON: Barbara Robinson,
Transportation and Marketing Programs. When I was
talking to you about the docket update, I forgot
to give you a progress report on pasture, and you
didn't ask me, I'm surprised.

[audience comments, laughter, inaudible]

MR. ROBINSON: I just am shocked, you let
me get away. Yeah. So, nothing to report. No,
just kidding. [laughter] Here's we are on
pasture: we have made significant progress on the
pasture rulemaking. As you know, in rulemaking,
there's two components to any rule. There is the
actual regulation, the regulatory language itself,
and then when we would publish a proposed
rulemaking, there's something called, what I call
the ancillary kind of documents, the regulatory
impact analysis, the reg flex analysis, the
paperwork reduction act, paperwork burden, and an
executive order, that we have to also address at
the end of the actual regulation. We have
clearance on the pasture rule, with our attorneys.
We have gotten them satisfied on the actual
language of the regulation. And what, all we're
working out now, is the-- those ancillary
documents. Kind of the impact on small producers,
sort of the cost benefit analysis of this, and the
paperwork burden, and I'm very optimistic that
we're going to get this done shortly. And once we
get that done, it will move out of the department,
and we'll have to get it over to OMB, Office of
Management and Budget. Now that'll be a tough
sell. But I think what I'm going to try to do is
actually make, rather than just, you know, the
normal course of events is you just, you send a
rule. And the-- and it goes over there. Every
rule that we do in this program, except for
materials, OMB has told me, "You might as well
consider it to be a significant rule." That adds
additional review time, that means OMB gets 60
days to review it. That actually means Congress
gets time at the end to review a rule. So I think
what I'm going to do, because this is so
significant, is I think I'm going to actually try
to make an appointment, and go over there and
brief them on it, sit down with 'em and talk to
'em about it, and see if that wouldn't help. I'm
not saying it'll help speed it up, but if I can
sit down and walk 'em through it, and explain to
'em what we're doing, then maybe that will help.
So that's-- all I'm trying to do is tell you where we are, but I am very hopeful about this. And we have made significant progress on it. So, that was all I wanted to tell you.

MS. CAROE: Is there any questions for Barbara on this?

MS. ROBINSON: You have questions?

AUDIENCE: How about the origin of livestock, Barbara, do you have anything to report on that?

MS. ROBINSON: That's being worked on, too, Kevin. It's just that I made pasture-- I have one person, and I've said, "Your only job is rulemaking. Materials dockets, pasture, and origin of livestock, and that is also being, it's drafted, but I keep manipulating this person around and saying, "Go back to pasture, go back to this, go back to that," so-- But it is being worked on, yes. It'll come right after pasture.

MS. CAROE: Any other questions for the program? Thank you, Barbara. Okay, so it is now 6:30, 9:30. So, we will start the public comment, and first up is Urvashi Rangen [phonetic].

Urvashi, are you here?

MS. URVASHI RANGEN: Yep.

MS. CAROE: Great. And on deck is Carrie
Brownstein. I'm going to go ahead while Urvashi is coming up. We're having still a little bit of technical difficulties with the microphone. But while Urvashi's coming up, I'm going to read from the board policy manual, the rules of engagement, as it is, for public comment. The manual reads, "NOSB policy for public comment at NOSB meetings. One, all persons wishing to comment at NOSB meetings during public comment period, must sign up in advance. Two, persons will be called upon to speak in the order in which they signed up. Now, there's a slight altercation here--alteration here, because we have tried to group the aquaculture comments in the first part of this meeting, to be consistent with the workflow, since we are just coming off our aquaculture symposium. Three, unless otherwise indicated by the chair, each person will be given five minutes to speak. The only change that we would have to this is we do have some presentations that are being made by public today, which were put on the agenda in advance, and also if we go into the wee early hours of the morning, we're going to cut back comment, not that the board will be hearing much at that hour, but we've done some pretty long ones in the past where we've had to cut back. I don't
expect that to happen. Four, persons must give
their name and affiliation for the record, and
again I just, will remind you periodically that
the court recorder needs to have the name and the
affiliation. Five, a person may submit a written
proxy to an NOS-- NOP or NOSB requesting that
another person speak on his or her behalf, and
that's just one proxy. Six, no person will be
allowed to speak during the public comment period
for more than ten minutes. And seven, individuals
providing public comment, will refrain from
personal attacks, and from remarks that otherwise
impugn the character of any individual. We will
gavel down any comments that are of this nature.
There's not need from it, this is not
constructive, and this board won't hear 'em. So,
with that, Urvashi.

MS. RANGEN: Hi.

MS. VALERIE FRANCES: One more logistical
thing. When you're on deck, when you're called up
on deck, and you have written comments, can you
come over and see me, or if you've already loaded
up PowerPoint, come and see me before you're up,
so we can gear things for that direction, and I
can help pass out the comments. Alright? Thanks.

MS. CAROE: One other thing, B. James
[phonetic] will hang up the one minute left sign. It's one minute left whether you saw it or not, so don't ignore her, 'cause we're going to, you know, one minute and then as your time comes up, you know, you can finish your sentence and quickly your thought, but it won't go very much further than that. Catherine?

CATHERINE: [inaudible]

MS. CAROE: Okay, so until lunchtime, we're going to have to grin and bear it with a little bit of squeak in the microphone system.

CATHERINE: Maybe you could use someone else's mic [inaudible]

MS. CAROE: Is it just mine? Is it just- - is it my squeaky voice? Okay, alright so, Urvashi.

MS. RANGEN: Good morning. Thank you. My name's Urvashi Rangen, I am a senior scientist and policy analyst and consumer's union. We're a non-profit publisher of Consumer Reports Magazine. I'm a toxicologist by training, I have a doctorate in toxicology. And thanks for holding the aquaculture symposium yesterday. I think many of us who were found it, on the most part, informative and helpful and I'd like to spend some time today talking a little bit about consumer
expectations of aquaculture and taking into account what we did hear yesterday, providing a little bit of guidance for the Board in terms of what we think needs to be done with the aquaculture standards. What's very clear is you're not dealing with one animal, you're dealing with multiple species, and so it's not just one type of chicken or a cow, it's actually multiple types. And so a one-size-fits-all standard is going to be very difficult. And while we certainly appreciate the fact that you need to come up with something that is a bar, that everything needs to meet, we think that bar needs to be very high, and it needs to be compatible with what's already organic. A lot of people who are here, talking about aquaculture, are somewhat new to the organic community, and I think for those of us who've been a part of this community for a long time, there needs to be a little bit of historical recollection and comparisons to what is compatible with organic? What have consumers come to expect and what are they willing to pay more for? Yesterday's aquaculture symposium really highlighted the fact that there are more questions than answers concerning the environmental impacts of fish farmed in open net systems, including how
to adequately monitor and control the detrimental effects of things like disease and contamination spread to the wild, from these open net systems. Most of the researchers we heard from also agree that lowering the amount of wild caught fishmeal is definitely a goal of all of their research, and frankly it should be a main goal, and so for now, we think that the coveted organic label should really be reserved for those species that can in fact meet the higher standard, where more research needs to be done, it needs to be done, whether it's on alternative protein sources, or on stemming the environmental pollution, but the National Organic Program is not an experiment, and it's not a charity effort for consumers to support different experimental procedures, it's actually a marketing program designed to label products that give consumers assurances that certain tenets have been met. When consumers vote with their dollars in the marketplace to buy these products, they're buying them because they're meaningful to them at the time that they're paying the premium for them. In this case, it means according to our survey from July 2007, that the organic fish that they buy is free or low in contaminants, and is also, does not cause environmental pollution problems --
[laughs] And this thing has bugged out on me.

Hold on just one second, please -- and is also free or low in contaminants. Where those tenets are met, that's where we think those products should be eligible for organic certification at this time. Where they can't be met, it's simply not appropriate for it to be eligible for organic certification. We think these high expectations need to be maintained. We didn't hear about contaminant problems yesterday, with wild fishmeal, but that happens to be a major concern for consumers. Having more choice on the market is one thing, and that came up yesterday, but as a mother and someone who has children, I'm looking for meaningful choices to make. 90 percent of consumers want to have clean fish, and that's really part of the equation when it comes to their willingness to buy organic fish. I also want to remind this board that a lot of the problems voiced by those who want to cash in on this industry yesterday, have to do with commercial availability, feed is too expensive, I've brought 17 news articles about a chicken producer in 2002 who wanted to gut the standard to lower the 100 percent organic feed requirement for livestock. There was huge public outcry and groups like us,
Organic Grade Association, even the Secretary of the USDA, had to come out and speak against it, that it did not meet the expectations, nor the high standard of the Organic Food Production Act. That 100 percent organic feed requirement is central and integral to what we all expect from organic, and we really urge you to maintain that standard. Allow the species that can be labeled as organic to meet that, like shrimp and tilapia, and continue the research for other species, and allow those to go as they can meet the high standard.

MS. CAROE: Thank you, Urvashi.

MS. RANGEN: Thanks.

MS. CAROE: Do we have any questions for- - ? Tina? I mean Tracy.

TRACY: Thank you, Urvashi. Yesterday, one of the speakers brought up a general aversion that the American public seems to have around farmed fish, in general. And I wondered if your group, or if you've heard of any research that has studied how organic farmed fish might be perceived, and whether the concept of organic and farmed fish are themselves compatible in the minds of organic consumers, at this point.

MS. RANGEN: Yeah, that did come up, and I
think that consumers do have, perhaps, a skewed notion that farm raised fish is less than wild caught. We're constantly trying to remind consumers that tuna, which is often wild caught, can contain very high levels of mercury, and so it isn't just a cut and dry situation. Farm raised organic fish, and I caution that, but where we feel it meets those high standards, let's say in the case of shrimp, certainly can offer consumers a much more valid choice in the marketplace. 70 percent of our shrimp is imported. We've had a number of problems this year with major contamination problems from China, including antibiotic drugs, banned fungicides. So having systems that do have a kind of oversight that we can provide, that do meet the high organic standard, can in fact provide consumers with meaningful farm raised choices in the marketplace, but I would caution again that if we start to slip those standards below what other organic livestock and other organic food have come to mean for consumers, that's a very dangerous marketing effort that could in fact backfire, and that's what we saw in 2002.

MS. CAROE: Joe?

MR. JOSEPH SMILLIE: Urvashi, your points
are well taken, and I agree yesterday that we
didn't get into the contaminant issue. But-- and
we will have to, and we'll have to look at that,
as we talk more and more about the alternate feeds
and all that. But my point is that once again,
organic is a process, and that we all live on a
polluted planet, and the people who made this
regulation and made the law were very cognizant of
that, and organic is not a contaminant free claim.
We all realize that organic is part of the
solution to this contamination, but we can't
promote organic as contaminant free.

MS. RANGEN: Joe, I would agree, and I
always cringe when I hear that organic is
pesticide free out in the media, so it's certainly
not my goal to convey that point; however,
fishmeal in particular has a problem with
contamination, and when you condense fishmeal,
those contaminants condense right along with it.
And if you look at the studies that are out there,
that concentrated contamination cascades down
through the chain, and you basically concentrate
that down through the chain. So contamination in
this case, with aquaculture, is particularly
egregious, and to not deal with that in any way
would really be problematic for the program.
MS. CAROE: Is there any other questions for Urvashi? Bea.

MS. BEA JAMES: You mentioned that you thought that the goal would be to get away from 100 percent fishmeal feed, so that leaves some of the alternatives, obviously, which would be soy, heard a lot about soy meal yesterday, possibly wheat gluten, corn. How do you think consumers would react to, you know, there's this pervasive amount of those particular ingredients out on the market, and you know, for those of us who have read "The Omnivore's Dilemma," there's concerns around just having too much of those ingredients, a lot of food allergies coming up. And I'm just curious if you have any information on how you think consumers would respond to taking away the natural diet and replacing it with that?

MS. RANGEN: Bea, that's a great question, and I think, you know, as we talk about farm raised fish, and protein from yeast being fed, or poultry byproducts, we do start to move away from what consumers think of as a natural productions system. That said, it is important to convey to consumers that organic is a production system, and controlling that production is very important, including the inputs and the outputs of
that system. Just to clarify, our issue is specifically with the wild fishmeal, and we think if you could produce certified, organic fishmeal, sure why not? And I think that they may be, while some species could be allowed at this point, you could start that chain in terms of creating that kind of commercial availability for organic feed, and certified organic fishmeal, that would be a very different scenario than allowing the wild fishmeal. It's that wild fishmeal that, at this point, ahs the contamination problems and issues.

MS. CAROE: Any other questions? Thank you, Urvashi.

MS. RANGEN: Thank you.

MS. CAROE: Okay, up now is Carrie Brownstein. Carrie? On deck, Corey Peet. Corey, are you here? We don't have Corey in the room. Okay, Jim Pearce, you're after Corey. Jim. Thank you.

MS. CARRIE BROWNSTEIN: Okay. Good morning, my name is Carrie Brownstein, and I work with Whole Foods Market. I'm the seafood standards coordinator. Okay, thank-- better? Okay. Did everybody hear me so far, though?
Okay. I'm going-- my written comments are being passed out, and I'm going to read them allowed so
that everybody can hear. Whole Foods Market appreciates the NOSB for creating a forum to carefully examine the issues of fishmeal and fish oil use in feed, and open net pen aquaculture production systems. Defining organic for feed in net pens is undoubtedly a major challenge, because there are no exact right answers. But at the same time, there's a lot at stake. Most importantly, we need to ensure that organic aquaculture does not become one additional contributor to the degradation of marine and coastal ecosystems. Instead, it should serve as a model for sustainable food production that fosters a sense of trust for organic consumers. While the aquaculture industry grows worldwide, many countries, including the U.S., are lacking basic rules and regulations to govern aquaculture production. Or in some cases, regulations are not enforced. Consequently, farm seafood sold in the marketplace can be associated with toxic chemical use, water pollution and other issues, such as poor animal welfare, that are of concern to organic consumers. In addition, there are already several organic labeling schemes under which species raised in net pens, and fed fishmeal and oil, are eligible. However, some of the European
organic aquaculture standards are not strong enough to meet the American idea of organic. For example, some of the European standards allow the use of antibiotics and parasiticides, or do not adequately limit the amount of fishmeal and oil that can be sourced from reduction fisheries. For this reason, and because we do not want to confuse our customers with multiple organic labels, to date Whole Foods Markets has refused to label any seafood as organic, until there are standards in place in the United States. To meet the expectations of seafood customers at Whole Foods Market, many of whom seek seafood that is raised according to organic principles, at least conceptually, Whole Foods Market fills this gap by developing our own set of internal buying guidelines, that not only prohibit the use of antibiotics and synthetic chemicals, such as pesticides and parasiticides, but also limit use of fishmeal and fish oil, and the impacts of net pen systems. In developing rigorous standards for feed, we aim to keep more small pelagic fish in the ocean, where they play a key role in marine food rubs [phonetic]. And with our standards for net pen systems, we're working to reduce the risk of escapes and disease transfer, as well as
minimize benthic impacts. Overall, we hope our standards will raise the bar among aquaculture producers. Yet, as the organic market continues to grow overall, and consumers become increasingly more informed about the issues associated with aquaculture production. The demand for organically raised seafood, including carnivorous species raised in net pens, will increase. Therefore, it behooves us to create strong standards here in the U.S., so that we do not run the risk of becoming inundated with seafood products labeled as organic under foreign standards that do not meet our expectations. We have an opportunity in the U.S. to set the bar where we want it. Whole Foods Market suggests that the NOSB develop rigorous standards for net pens and fish meal and fish oil use in feed, and not exclude their use from being eligible for organic seafood production. We believe that the organic label offers the greatest incentive for an improved industry. Whole Foods Market suggests that the NOSB establish specific performance metrics for feed and net pen production systems. At Whole Foods Market, our quality standards for farmed salmon, for example, set specific limits on use of fishmeal and fish oil, using a maximum fish
in/fish out ratio to reduce pressure on wild fish populations, and limit reliance on reduction fisheries. We encourage use of byproducts of fish processing, which do not need to be counted in this ratio. We also encourage producers and feed manufacturers to explore other innovative methods for lowering the amount of fishmeal and fish oil in feed ingredients, such as algae based products as a source of essential fatty acids, to reduce the amount of fish oil used. At this time, we do not allow byproducts of avian and mammalian species in feed. To address the impacts of net pens on marine ecosystems, our approach for farmed salmon has included, but is not limited to the following: prohibition on anti-fouling agents, such as copper based paints and copper treated nets; prohibition on parasiticides; required nutrient management plan; minimum redox potential levels for sediments in the benthos; required containment management system outlining protocols for preventing escapes; reporting requirements for escapes; requirement to develop a marking system to allow escaped fish to be traced back to producers; an accuracy level of 99 percent for counting fish stocked and harvested, to attain improved tracking of escapes; and a prohibition on
lethal methods of predator control. The proposal submitted to the NOSB by George Leonard and Corey Peet of the Monterey Bay Aquarium, presents a solid effort to establish specific performance metrics for organic net pen aquaculture. We would like to express our support for such an approach; however, there are a few areas in their proposal that we believe require further analysis. The risk of escaped fish to wild stocks: the current direction--

**MS. CAROE:** Okay, I'm sorry, Carrie, your time has expired.

**MS. BROWNSTEIN:** Okay, sure.

**MS. CAROE:** Is there any questions for Carrie? We do have your entire written comment--

**MS. BROWNSTEIN:** Yeah, you can read those last comments on the--

**MS. CAROE:** Thank you. Any further questions? Joe?

**MR. SMILLIE:** Are you internal guidelines published? Are they public?

**MS. BROWNSTEIN:** Not yet.

**MR. SMILLIE:** Not yet?

**MS. BROWNSTEIN:** Not yet.

**MR. SMILLIE:** Do you anticipate making those public, as a contribution to our work on
creating a standard?

MS. BROWNSTEIN: We haven't published them yet to the public, so I guess we would need to discuss what the options are.

MS. CAROE: Would it be possible that our livestock committee, as they're working on their recommendation, contact you as another source of information on these topics.

MS. BROWNSTEIN: Absolutely, mm-hm.

MS. CAROE: So, perhaps if you can make sure that Hugh Karreman has your contact information.

MS. BROWNSTEIN: Sure.

MS. CAROE: I think that might be a good resource for us to use.

MS. BROWNSTEIN: Sure.

MS. CAROE: If you're-- can oblige.

Okay, thank you so much.

MS. BROWNSTEIN: Sure.

MS. CAROE: One more call for Corey Peet, are you in the room? No? Okay, so Jim Pierce you're up, and then on deck is Joe Mendelson, Joe are you in the room? [unintelligible]

MR. JIM PIERCE: Corey was here yesterday, you might call his name again later, I don't know. I have submitted one set of comments
for the record, but I'm not going to pass out comments to you, so listen carefully. Hello, my name is Jim Pierce. The following comments are on behalf of the Wisconsin Aquaculture Association. In another life, a simpler, quieter, dreamier, Jeffersonian life, I raised rainbow trout in southwest Wisconsin. I also have the privilege as well of being a board director, figuratively and often literally on the Wisconsin Aquaculture association, a member organization of primarily trout, walleyed perch, and sunfish producers, piscivores as Brad Hicks referred to them yesterday. Last March I stood here on behalf of this organization and expressed concern that by delaying rules on fishmeal and net pens, you are effectively leaving us on the deck, as the SS Organic Aquaculture pulled out for federal register ports of call. Today, eight months later, my first comment to you is, "Good job, well done." You're not ignoring these black sheep issues but are facing them head on, calling on experts and authorities from around the globe for science, anecdote and opinion. It's truly encouraging to see you wrestle with these issues in order to establish organic aquaculture
standards that will benefit those of who raise piscivorous species. As the facts continue to accumulate, it's amusing and amazing to see how the possibility, the perspective, the reality of organic fish farming begins to align and resemble organic terrestrial farming. Sea lice, avian influenza, tide water, rainwater, net pens, feed lots -- in ever case there are levels of control, the best and worst practices, and in every case there are farmer who will eagerly push the envelope of better practices in order to capture a market niche and the corresponding reward. Not a square peg in a round hole, Urvashi, more like a lost sheep coming into the fold. To the meat, or filet of the matter now, as the case may be. Joel Solitan [phonetic], grass based, sustainable livestock guru, is well known for rejecting prescriptive rules in favor of goal performance based standards; "Show me the finish line" is his mantra. It is a mantra that I hope you respect and repeat ad nauseum as you move forward. As you digest all the information and transform it into organic aquaculture standards, please be aware that there can be a small step indeed between a high bar and an insurmountable barrier. The proposed performance metrics for net pen standards
look to me like standards on paper that are commercially unattainable in practice. Native fish-- Only native fish of local genotype, decertification of treated or clinically diseased animals, and the prohibition of fishmeal and terrestrial livestock byproducts, sounds like a poison pill that will effectively establish organic standards, but will also effectively prevent the development of organic aquaculture. Not a finished lane, so much as a high tensile razor wire. The upside to a high bar is obvious: environmentally sustainable practices that meet consumer expectations and bolster organic integrity. The downside is perhaps more opaque. If the finish line is at the end of such an overwhelming course as to deter participation, then the environment and the consumer are left without the choice, and therefore the chance to influence fish farmers into better practices. If net pen aquaculture is jettisoned from organic aquaculture, as many mari-culture McCarthyists would prefer, or if organic standards are set so high that Cona Blue Neil Sims [phonetic], the very poster child of sustainable net pen aquaculture can't clear it, then a serious disservice to both the organic producers and consumers has been
committed. Kudos again to the aquaculture working group on the development of bivalve mollusk supplement; not a directly critical document to the Wisconsin aquaculturists, but certainly important as precedent. These proposed standards strike a very good balance of subjective and prescription regulation. It's obvious that the authors have identified the shortcomings of existing organic livestock regulations, and are attempting to draw clear bright lines. When I read this document, I found myself smiling and noting in the margins that they have taken organic livestock standards writing from haiku to Tolstoy. In closing, let me reiterate our collective appreciation in your steadfast dedication, your impressive pragmatic approach in the development of organic aquaculture standards, including the cultured bivalves, prudent use of net pens -- and most importantly for the Wisconsin contingent, the use of fishmeal as feed. We encourage you to keep the finish line in sight, keep in mind that all farming, including organic farming, has inherent risks and economic impact, environmental impact, to exclude certain production models, especially models with the most potential for improvement, is counterproductive, and will, as Katrina Hyde so
eloquently stated yesterday, "preclude environmentally minded consumers from using their purchasing dollars to drive industry behavior."

Thank you.

MS. CAROE: Thank you, Jim. Is there questions for Jim? Hugh?

MR. HUBERT KARREMAN: Just one comment. Thank you, Jim, that was excellent.

MR. PIERCE: But you don't want to hear about the one point that I really wanted to put in but couldn't fit in five minutes? Alright. Thank you.

MS. CAROE: Thank you, Jim. Another question? Okay. So, next up, Joe Mendelson. Is Corey Peet-- last call for Corey Peet, are you here? Okay, on deck, Patty Lovera, I hope I pronounced that correctly. Are you here, Patty? You're on deck.

MR. JOE MENDELSON: Good morning, my name's Joe Mendelson, I'm the legal director of the Center for Food Safety, we're a non-profit consumer and environmental organization. I want to thank you all for your continued hard work, as always. It's very difficult to follow Jim's flair, but I'll give it a try. And also, I don't want to be too redundant, so I may be quick. But
I think anybody who was at the aquaculture symposium yesterday, which was excellent, and we thank you for, there was a certain tenor that suggested, and I think as Tracy brought up, that there is a negative stigma attached to fish farming. And that may or may not be true, but the role of the board and the program is not to solve the marketing issues for the aquaculture industry. And I think it's important to remember that within this debate, it's not a debate over whether fish farming is occurring, it's not a debate on whether someone like Mr. Sims is doing a better job than others, at doing that; he very well may be. He may in fact be able to market it in a different way, but the question remains is whether it is organic. And so, I just ask, and our organization asks, that the board keep that perspective in mind, and focus on the question of whether the standards that are being developed are consistent with the goals of organic. As I think you all know, through a number of letters and comments that we have submitted to the board, and more recently, comment that included 44 organizations that span the globe from environmental organizations, to producers, to consumer organizations, to animal welfare organizations, we
do not feel that the issues of open pen, net cage aquaculture, and fish, the use of fishmeal or fish oil, have been resolved, to be consistent with the environmental goals of organic. We-- you've heard the litany of issues around those escapes -- disease transmission, pollution from those systems -- I don't need to reiterate it, other than to say, we've submitted comments, you've received, I think, thousands of comments from consumers. Our expectation right now is that these two proposals, or the use of net pens and fishmeal or fish oil, do not meet consumer expectations, nor are they consistent with organic. There were a couple of issues that were not addressed yesterday, or got a full airing. One is, I think the very legality of the 12 percent/12 percent and a possible seven year phase out, as we know from the Harvey case, courts have looked, it's 100 percent organic feed is required for livestock -- fish are considered livestock under the act, they require 100 percent organic feed. Even if the board is supportive of the 12/12/7 year phase out, I'm not sure how you do it under the law. It's just inconsistent. I think you need to recognize that, and realize the limitations of how you dress it. You know, there may not be an easy issue there. And as far as the
phase out, I think organizations like ourselves are very concerned that a potential phase out doesn't become a phase out but becomes an entitlement. And we're on the, we're going to be on what, the second round or third round of methionine, 2008, it's a possible connection. So, like Urvashi's organization, we think you should go forward with what is possible now, and that is non-carnivorous, closed containment systems, and let's build it from there. Two other quick issues, on the grower group issue we certainly respect the board's efforts on that, we really think the recommendation or the discussion should be tabled and further, much more robust discussion. We think there are significant differences between growers and handlers and retailers dealing with staff and the amount of inputs and ingredients and things that go into different systems and I think it needs to be further discussed. On the commercial availability issue, I know you'll probably hear a lot from sea producers about some of the things. There's one thing in there, though, that we do support, and that is the guidance that recommends anybody who's taking advantage, or-- don't mean to use that with any connotation-- but using a commercial-- finding
something commercially unavailable, that they
should be proactive and come forward and say, you
know, this is what I am doing to support making
something available on organic form. I think
that's very important, that's consistent with the
spirit of the program. And lastly, I'd be remiss
if not saying that the program should get the
pasture rule out with due speed. Thanks very
much.

MS. CAROE: Alright, thank you, Joe. Any
questions for Joe? Comments? Alright, well I
have a couple, real quick. First, on the 12/12,
you're absolutely right, there will be some
challenges from the regulatory aspects of that,
that we would need to explore. We appreciate
that, there is a lot of logistical challenges with
many issues related to the agriculture organic.
Well, okay. My other option is feedback [laughs]
so-- So, I appreciate that, and this board will
have to work through those issues, and I'm glad
you understand that they're there, because you'll
understand and appreciate the work we're doing.
The second is regard to the phase out. Yes, we
have had the issue with methionine, and it'll be
very interesting to see what this board does as it
comes up again. However, I will point you to the
fact that we did use a phase out for 100 percent
Chilean nitrate allowance in spirulina, and this
board stood with that phase out and did not allow
its continuation. So we do have precedents for
holding our ground, as well. You know, input, we
expect input from the public, we appreciate your
input, but I did want to just kind of point out
that it wasn't a complete a rollover and that
entitlement would exist. We don't consider it so,
okay? Thank you so much, Joe.

MR. MENDELSON: Thank you.

MS. CAROE: Any other-- Dan?

DAN: Yeah, I have a question. Have you
ever looked, or you've gotten any input from the
consumer, on the carryover in their minds, for
instance, if methionine goes off the list, and
spirulina's the example we have, methionine goes
off the list and we lose a significant part of our
poultry, organic poultry market, what is the
carryover. I understand the implications to the
poultry producers. What's the carryover into the
fruit and vegetable shelf, as far as the
consumer's perception of organic and their
confidence in buying? Have you ever looked at any
of that?

MR. MENDELSON: Yeah, well, let me just
see if I have your question right. I mean, as far as if consumers, for instance, could not purchase organic chicken, will that affect their impact on other products?

DAN: Yeah, it's like, yeah, it's, you know, this is organic yesterday, it's not today. Well, what else is because of--

MR. MENDELSON: Yeah, you know, I don't think anybody's looked at that "taking away" a certain segment of product. I will say to the amount, with the pasture issue and the milk issue, we did do some research in surveying, and found that milk was essentially a gateway product. So, if there are controversies over the integrity of that product, you know, you could be affecting consumers first brush with organic. Oh, I'm sorry, do you want me to repeat that, or is it--Okay. The-- but I think with something like chicken, for example, it's not-- tends, the research I've seen tends that's not the first gateway product. But the short answer is I don't think we've, anybody, any survey that I've seen, suggest that, you know, if you, one product's here now and goes away, it's a problem. I will say on the fish issue, you know, we do have a complaint into the program about imported product, and I
think that's a concern for us, as far as what that means to consumers who are seeing an organic claim, but don't have a standard to back it up here in the United States. Now, I think that's also, frankly, discriminatory towards domestic producers, and their ability, too. So hopefully we can have that issue resolved. I would point out one thing, someone asked to Urvashi about the consumer surveys, I think Tracy may have on aquaculture. The ones that I've seen, the New Jersey Department of Agriculture survey, that I think there was a poster on yesterday, is the one that I've seen that's really investigates the issue, at length. I don't know of any others.

MS. CAROE: Thank you, Joe. Any other questions? Thank you, Joe.

MR. MENDELSON: Thanks.

MS. CAROE: Next up is Patty Lovera and I understand, Corey Peet, you're in the room?

MR. COREY PEET: Yes.

MS. CAROE: Corey, you'll be up next.

MR. PEET: Okay.

MR. PATTY LOVERA: Hi, my name's Patty Lovera, I'm the assistant director of Food and Water Watch, which is a non-profit consumer advocacy group based here in D.C. We're about two
years old, and many of us used to work together at Public Citizen, which is a larger consumer group that a lot of people know. We are here, and we're concerned, about the aquaculture issue, 'cause we have a long history of working on food issue and general food safety and labeling and quality, and that leads us very often to recommend that something consumers can do to deal with a lot of these concerns is to buy organic, so we're very, always very concerned about the integrity of the organic standard, and that what we're recommending to people because it is certified, and it is backed up by these standards that are enforced, that those mean what people think they mean, and the continue to have confidence in that, and we continue to have confidence in making that recommendation. Specifically on aquaculture, we have a lot of concerns about large scale aquaculture, especially open ocean aquaculture. And so therefore, any push to set up a standard to let some of those products be labeled organic is of concern to us, and very specifically the carnivorous fin fish in the open net pens. And so we heard a lot about it yesterday. We agree with Urvashi and Joe, we just heard a lot of their concerns, so I'll try to be really quick. But the
basic point that I have to make is that consumer
expectations of what organic is, and what the
organic seal offers them, is not compatible with
wild fish as feed and open net pens. And we think
that that, the board should readdress those issues
again before you come out with a standard. Really
quickly, consumers are starting, especially
organic consumers, are really starting to
understand that what you feed animals matters.
And for what we hear, from our members and people
that contact us, that's an issue that brings
people to organic livestock -- mad cow disease --
people started to understand that it matters what
you feed animals -- antibiotics, hormones, all of
those things are bringing people into organic, so
we think the wild fish feed and the inability to
guarantee that that fish in those systems under
this proposed rule might be fed 100 percent
organic feed, that's a deal breaker for us. We
think that you have maintain that standard that
it's all organic feed, and not allowing this 24
percent of the diet to possibly be wild feed. The
other issue that brings people to organic is
environmental impact, and we heard a lot
yesterday, I won't get into all of the issues of
disease and waste and escapes and biodiversity
impacts, but we think all of those concerns about open net pen aquaculture are another deal breaker for consumers when it comes to their expectation of what an organic seal means. So, and just to reiterate another point that other folks have brought up, kind of theme and the tone yesterday that there's some obligation for the standard to meet the current practice is really troubling to us as well, especially when you're talking about consumer confidence in all of organic. And you know, the organic seal is not an entitlement, and we're not grading on a curve. It needs to be set, a bar needs to be set that's going to meet the principles of organic and consumer expectations, and the industry has to come to meet them. We're sympathetic to the wish, you know, this aspirational goal that we can help drive industry practice by setting a good standard, but that's not what people are shopping for at the supermarket that day, they're buying food to put on the dinner that night, with a seal on it that says, "This food was raised in this way," not in seven years after a phase out it'll be raised in this way. So we think it's really important that the standard be set firmly now, and that the industry come to meet it, not the other way
around. We support what Joe was saying about imports, we think that's a really important issue that the agency has to deal with now, which are organic products coming in from countries that don't have a standard, we think that's a huge issue for consumer confidence. And so just to wrap up, I think the integrity of organic standards really depend on really solid standards being written, and when it comes to aquaculture, that means no wild fishmeal and no open net pens, and we'll just reiterate what other folks have said about pasture, when it comes to consumer confidence and their feelings about the integrity of the rule, we have to deal with the pasture issue yesterday. Thanks.

MS. CAROE: Thank you, Patty. Are there questions for Patty. Hugh and then Rigo.

MR. KARREMAN: I'm just wondering, I don't think you can answer this, just kind of rhetorical maybe, but as far as having a 100 percent feed for organic livestock, I always wonder how that's reconciled with the other products that are on the shelves that's, to get the certified label, since you're a consumer group. That can be down to 95 percent organic ingredients. I'm just wondering how that's
reconciled, that livestock has to be 100 percent, but products on the shelf can be 95, and carry the seal.

MS. LOVERA: I think that's one of the issues when people start to do more investigating, when consumers start to really look into what they're doing, that's one of the questions we get asked, is what about these percentages. I mean, they want it to go as far as it can go, and so that's an ongoing [unintelligible] issue I think for consumers.

MR. KARREMAN: And I realize the Harvey case has really hammered that home, but maybe that 12/12, you know, and seven years type phase in or phase out or whatever, or maybe as George Leonard put yesterday, you know, kind of proscribed step down, year per year, not just at the end of seven years, maybe somehow, I don't know, regulatory wise, that can be worked in with the other parts of the certified shelf products that are out there, that are 95 percent. Maybe some board can remember when we deliberate on that.

MS. CAROE: Rigo, did-- Rigo?

MR. RIGOBERTO I. DELGADO: Thank you. I have a question about open its pens. If we were to minimize the risks of pollution, escapes, or
whatever, and established standards, metrics, performance metrics, as was suggested yesterday, do you think that would be something that the public will accept? Or where is the cut off point, if you will?

MS. LOVERA: Where's the line? I mean, I think we don't yet.

MR. DELGADO: Bear in mind, a lot of the commentators yesterday pointed out that we'll have to deal with species specific standards, perhaps. So, I wonder what the public will think of it.

MS. LOVERA: I think the public is very confused about aquaculture. I mean, we have opinions on it, other groups yesterday had different opinions on it, but the consensus was that we don't know that much yet, so I don't know if we're able to come up with those performance standards, yet, without a lot more research. So, you know, I think consumers will be very confused if it's a performance based standard, when we don't know enough to know what the best performance can be, if we're still figuring out, this industry is trying to figure out how to minimize those impacts.

MS. CAROE: Is there any other questions for Patty? Thank you.
MS. LOVERA: Thanks.

MS. CAROE: Oh, wait, hold, Kevin?

MR. KEVIN ENGELBERT: I'd also like your opinion on the point that Dan made to Joe, about the methionine issue, not to beat a dead chicken, but it's relevant to what--

MS. LOVERA: About the impact on other foods? Or--

MR. ENGELBERT: Yes, because it was sunsetted twice now, it's coming up again, and this issue with the fishmeal and fish oil, it plays into that, and what's your thoughts on the methionine issue, and what happens with that, and consumers' perception and trust of the organic label, if that sun sets.

MS. LOVERA: I mean, I have kind of the same response as Joe, which is we don't know, but I also worry about the risk of continuing to allow something that people might not be comfortable with, and as more and more people hear about that, does that undermine their integrity and everything because it's allowed to stay on the shelf as organic. There's a flipside to that.

MR. ENGELBERT: I have a question right now: do the organic consumers, sorry to bring up the methionine again, but do the organic consumers
have an issue with the organic eggs and poultry right now?

MS. LOVERA: Based on people buying it, probably not. [laughs] I think there's an awareness issue that's growing. I mean, I don't think it's a secret that there's a lot of people gunning for organic, and saying it's a rip-off, saying you know, you're not getting what you're paying for, and that's not going away. So I think, you know, allowing things like that, that are questionable when people come to know about them, sets you up to be attached in that way, and really undermine people's confidence in organic as a whole.

MS. CAROE: Any other questions? Thank you, Patty.

MS. LOVERA: Thanks.

MS. CAROE: Next up is Corey Peet, and after Corey I have Felipe Caballo, I believe. Felipe are you here? Okay, Becky Goldberg, Becky are you in the room? Becky's here.

FEMALE VOICE: There is a proxy for Felipe Caballo.

MS. CAROE: I don't have --

FEMALE VOICE: Alex Buschmann, should've been on there.
MS. CAROE: Oh, Alejandro Buschmann.

FEMALE VOICE: Ale-- yeah.

MS. CAROE: Alejandro, are you here?

Yes, you're up on deck.

MR. COREY PEET: Okay, good morning committee members, thank you for the opportunity to comment. I just wanted to start by pointing out that I spend five years studying the interactions between sea life salmon farms and juvenile salmon in British Columbia for my graduate research. And I'm currently the aquaculture research manager for the Sustainable Seafood Initiative at the Monterey Bay Aquarium. For the last six years, the Sustainable Seafood Initiative has been working to foster consumer and business awareness and action for sustainable seafood. We have previously submitted comments to this process, and I was a coauthor on the paper by George Leonard, presented yesterday at the symposium. I'd like to thank you for your careful attention to the development of organic aquaculture standards, and the lack of credible aquaculture certification option for producers in this situation, adds to the appeal of the organic label and the importance of this process. We are in support of organic aquaculture in systems where
inputs and outputs can be carefully controlled, and where ecological sustainability can be maintained. Today I'd like to comment on the use of fishmeal and fish oil, the difficult of a disease metric, and address the issue of scientific integrity. With regards to fishmeal and fish oil, we are in support of feed ingredients being 100 percent organic in aquaculture production, and for the elimination of fishmeal and fish oil from wild fisheries after a transition period. During the transition period, fishmeal and fish oil must come from sustainably managed fisheries byproducts and foraged fisheries; however, we believe that the entry point for organic certification must be a wild fish into farm fish out ratio of one to one. This is the starting point. We would also encourage the use of organic poultry byproducts, as an organic feed ingredient, to help producers comply with this ratio. On the disease metric we proposed yesterday, of no clinical signs of disease, no treatment other than approved treatment methods, and animal welfare maintained, I want to emphasize the difficulty of compliance with this metric, as it is only a theoretical possibility at this point, that will depend highly
on site selection. The nature of open net systems and disease interaction suggests that the only real way to stop disease amplification and transfer in open systems is basically separation of wild and farmed hosts. And I think the work by Neil Fraser on those posters over there is a testament to the difficulty that you will have in setting this metric. The transition period, therefore, that we propose in our paper of three years, is imperative to ensure the compliance and the process must be governed by data, if the integrity of the USDA organic label is to be maintained. Finally, I'd like to comment on the scientifically documented impacts of open net pen aquaculture, particularly salmon farms, by sharing a personal experience. During my experience as a graduate student in science in British Columbia, I was exposed to a significant amount of political interference affecting both my work and the work of my colleagues, one of which was Marty Krkosek, that you saw yesterday. And I would suggest that actions such as countering peer reviewed science in the public forum, with non-peer reviewed counter-hypotheses, threatens to erode the credibility of the scientific process in the public eye. And that the quality of the science
being conducted on these issues is solid. It's, you know, and this is-- the peer-review publication record can attest to this fact. It really is the qua--

MR. PEET: -lity of the interpretation of this research by some that must be questioned here. So, in closing, I would like to emphasize the importance of insuring that the aquaculture industry adapts its production practices to meet the principles of organic production, and not vice versa. It cannot be forgotten here that you may be trying to put a square peg into a round hole, and that while it's worth trying to see if you can find a way to make it fit, if it ultimately does not, that is an acceptable outcome, as integrity is more important than inclusiveness. I thank you for your work and diligence on this issue, and urge continued caution as you move forward.

Thanks.

MS. CAROE: Thank you, Corey. Do we have any questions for Corey? Hugh? It's you. Hugh.

MR. KARREMAN: Just wondering, I guess I'm a little confused by what was said yesterday, and you kind of reiterated it today, regarding, I
think a performance metric of no disease in the
net pens.

MR. PEET: Mm-hm.

MR. KARREMAN: You mean no disease.

MR. PEET: Well--

FEMALE VOICE: Can you speak into the
mic?

MR. KARREMAN: Are you-- you're being
very firm that there shall be no disease in net
pens if they're going to be organic. I think that
was a performance metric?

MR. PEET: Yeah, I mean basically if you
want to ensure that wild fish aren't going to be
impacted, that's what you have to get to. And if
you look at the work by Neil Fraser, it shows you
basically that in order to ensure that, you need
disease levels on farm fish that are orders of
magnitude smaller than those on wild fish, which
are already really small to begin with.

MR. KARREMAN: But in land-based
agriculture right now, with livestock, there's--
there can be disease in herds. Sometimes that can
be transmitted, I guess, to wild animals, but
actually the reverse is usually more the case,
like wild deer with tuberculosis transmitting it
to actually farmed animals in Michigan and certain
parts. So, I just, I have a problem with a kind
of blanket statement that disease, you know, shall
not be tolerated on farms, it's just, it happens.

MR. PEET: Right.

MR. KARREMAN: And I think it's
unrealistic to make that as a, you know, it's a
good goal, of course you want as little as
possible, you want the animals as healthy as
possible, but to just say, you know, to be organic
there cannot be disease on the farm, which was
said yesterday, and you did reiterate it in your
public comment, it's a little bit idealistic.

MR. PEET: It is, but you have to
consider what's at risk. In land based farms,
what are you impacting? I think Marty Krkosek
showed some examples yesterday of how terrestrial
farms can impact wild animals as well. So, you
know, there's a risk, and the risk has to be
addressed. And I think what it means to be
organic is that you are being harmonious with the
environment, and if you're spreading disease to
wild fish, especially if those fish have lots of
value both economic and social and otherwise,
that's a problem.

MR. KARREMAN: But you're also kind of
precluding, it seems, any possibility that there
are treatments that would be available or come available to the fish farming community, under organic management. I give you personal testimony because a lot of the regulation on medicines right now, you know, that does stimulate research and clinical trial of natural treatments. So--

MR. PEET: Yep, well and in our proposed metric, we said if those treatments are approved under your system, then that's appropriate.

MS. CAROE: Any further questions? Thank you.

MR. PEET: Thanks.

MS. CAROE: Oh, Barbara.

MS. BARBARA ROBINSON: You know, that, I would say one thing that's sort of analogous, you don't have a zero tolerance program in the NOP, anywhere. You don't have zero tolerance in crops; as Hugh pointed out, you don't have zero tolerance in livestock. We don't have that kind of a regulation.

MR. PEET: Right, but it's also a different environment. You're dealing with the marine environment, which has different dynamics in terms of transmission vectors for disease, and the potential impact. Oops. Sorry, I was just saying that you're also dealing with a different
environment. The aquatic environment has different, you know, transmission vectors and potential for those, for disease to be transmitted and have an effect on its host is much different. There's also, you know, in the case of salmon, wild salmon are really important to people. So, there's a bigger risk than maybe there is in terrestrial systems.

MS. ROBINSON: I guess what I'm asking, you said-- are you implying that there's no disease in the natural environment, in the wild.

MR. PEET: No, absolutely not, there's lots of disease in the natural environment.

MS. ROBINSON: Right. It's naturally, it gets selected out.

MR. PEET: Well, it gets put into a balance, into a dynamic equilibrium, to which domestication of animals and culture can change that dynamic that threatens wild hosts. That's exactly what you have with sea lice and salmon farms. It's not a-- it's a two way street, right? It starts with the wild fish infecting the farm fish, and then coming back. It's not a one-way street at all, which is where the separation needs to happen.

FEMALE VOICE: Hugh's got something.
MS. CAROE: Hugh had a question, hold on.

MR. KARREMAN: Just curious, are there diseases that wild fish, like wild animals in the terrestrial land, are there diseases that wild fish can pass to farmed fish, instead of always focusing on what the farmed fish can do to the wild fish. And I'm not just talking salmon, but since you're a salmon guy, I guess, are there things in wild salmon that they can transmit as they go by to the farms?

MR. PEET: That's how it starts, for everything. I've-- of the top of my head, although maybe furunculosis might be an example of that, but you know, sea lice, IHN, pretty much all of them start with the wild fish infecting the farm fish, the farm fish then amplifying the ambient levels, and then transferring it back to the wild fish. But the wild fish as juveniles, not as adults, which is where the problem is. The smaller you are, the more susceptible you are to impact by these diseases, so it-- that's how it works.

MS. CAROE: Any other questions? Thank you.

MR. PEET: Thanks.

MS. CAROE: Okay, Alejandro, you're up.
And Becky Goldberg, are you in the room, Becky?

FEMALE VOICE: [unintelligible]

MS. CAROE: Okay, Becky, you're on deck.

MR. ALEJANDRO BUSCHMANN: Thank you. I'm trying to bring up some very specific comments on open up the culture--

MS. CAROE: Excuse me, just, I just--

MR. BUSCHMANN: Oh, my name and--

MS. CAROE: I just want to point out that, one, tell us your name and you affiliation, and also that's a-- that mic is particularly quiet, so if you can get very close to it, when you speak, it would be best.

MR. BUSCHMANN: Okay, I will.

MS. CAROE: Thank you.

MR. BUSCHMANN: Thank you. So, my name is Alejandro Buschmann, I'm from the University of Los Largos in Chile. I've doing research about environmental affects and bioremediation, actions that can be take around open aquaculture, during the last 20 years. My perspective is I think that from hearing yesterday the discussion, there a few issues that need to be, to me, point out. First, siting is an important point for, have a open aquaculture, but it's not only siting, because depends also about the intensity of aquaculture.
You can have good siting, and you have a high, intense use of the environment, so you will start to get interactions between cultures, open a culture activities in the site. So, it's not only a site decision, siting decision. Also, when you start to increase intensity, like what is happening in Chile today, you start have these interactions, and diseases will start to move, not only interact to between the farms and the wild, but also in between farms and transmission of diseases will be an important issue in those scenarios. So, my point is that in this first, do not only take in account in about a siting, but it's a much more complex when you have intensive aquaculture. Second point is that we are willing to have, or when you have open aquaculture, we are hoping that the sea maintains the capacity for assimilating all the discharges. There is some, in some cases, when you have low intensity of aquaculture, and you have a low farming sites, that is possible. But that is not possible in, again, in a high density of farm situation. In that cases, you need to understand how waste can be bring out of the system. And that is another, quite different type of a scenario, and there is some actions that are in the literature that can
be take in account. But, like integrated aquaculture was, which was brought out yesterday, but again, that is not the whole solution. There are many other aspects that remain, or will be used in aquaculture generally, chemicals and terra-pollutants [phonetic] and so on, that will be not be taking out by integrated aquaculture. One example, was taking, was mentioned yesterday: anti-foulings. Anti-foulings with copper, perhaps in the future will be gone, but today, they, if you go beneath the sediments you find high copper concentrations. And we just published a paper in Chile, it's in Spanish, but I can tell you, that you have a good correlation about biodiversity lasses and copper concentration. Okay. So, the last point is about terra-pollutants. Terra-pollutants are also be used, and in many areas, in the northern hemisphere, there are alternative ways how you make and handle the-- these, and lower the use of these products. But, when you go into a high density farming intensity, and you have a almost, all the coastal areas, cover it, like the situation in China, that is almost impossible now. You not depend from your own activities, but you are depending also from your neighbors. So, that makes the systems quite more
complex, and that needs to be taking account, in open aquaculture. You're not isolated from the rest of the other actions that are taking place. Thank you.

MS. CAROE: Thank you, Alejandro. Are there questions? Jeff, and then Rigo.

MR. JEFFREY MOYER: Yeah, Dr. Buschmann, Jeff Moyer. We're going to be charged with writing a universal standard.

MR. BUSCHMANN: Yeah.

MR. MOYER: In doing so, I think the discussion, or the points came up yesterday that clearly, what we have currently, is lacking in some aspects in terms of siting. You bring up those issues right now. We're aware that there's a problem there, but do you have any solutions that you can point out. I mean, what sort of standards should we be looking at regarding siting and density levels?

MR. BUSCHMANN: Well, siting and density, you must, I think, we must, we cannot apply rules for growing and activity and developing activity, without taking up account the assimilation capacity of the environment. That is the first thing. And that has been going on in several areas, in several regions in the world. So, that
is a main issue. So, we must maintain a relation about the capacity of the systems to assimilate a sort. For example, for salmon, for salmon farm, there is literature that we can move a little bit from the numbers, the more accurate numbers, but the literature says that we need an assimilation, or we need an environment that is 10,000 times greater than the farming area, to maintain that sustainable -- 10,000 times. My calculation is that, for example, to maintaining the salmon farm from 1000 hectares, from perhaps that will produce 1000 tons, you will need, for example, at least 150 hectares of seaweeds to take out the nitrogen that is going out. So that is makes the point that you need, it's not very simple to maintain the systems, so you must things that heavy producing in a small area, which has a big volume because salmon farms are using the water [unintelligible], it's not like a farm in agriculture that is flat, no, only depending from the surface. For assimilating all those nutrients, you need the huge area. So that is an important area. And things like that are in the literature, you can do-- you can make some calculations and you can come up with some figure for how intense aquaculture should be. And if
that is the ma-- if that happens, perhaps you can
go and have a-- and have some standards
integrating size, integrating siting, integrating
density of farms, for a region and for an area, to
become possible, the clear organic concern. But
if you go beyond that, it's almost impossible.

MS. CAROE: Rigo.

MR. RIGOBERTO I. DELGADO: Well, exactly
the same question that Jeff had, and I thank you
for being here, doctor. So, it seems to me that
you can literally pinpoint sections of the ocean
where you can support certain size farms, if you
will, certain numbers, and also the density per
farm. Is that correct? Am I understanding this
correctly? Are we [unintelligible]

MR. BUSCHMANN: Well, you can-- you can
do it and you can cal-- make some calculations,
and you can enhance recycling of nutrients by
using some technology available, and you can
enhance all that. And you can come out with some
figures that will be, in some extent, lower some
risk. But you will not come to zero point levels,
that is for sure. You know, you are an open
system.

MS. CAROE: Is there any further
questions? Hugh, and then Jeff. No. Hugh and
then Jerry.

MR. KARREMAN: I guess I always, because my life revolves in Lancaster County with all those dairy farms there, we have 1900 dairy farms in one county, which is like an astronomical amount of farms. And they're mainly small family farms that everyone just loves. And it's a main source of pollution to the Chesapeake Bay. And you know, wherever agriculture is, the environment is not pristine, even organic agriculture has its impacts, and we of course want to make sure that we reduce the impacts and we have good biodiversity and everything. I'm just-- you know, there's a 100 organic dairy farms in my county, and they create manure pollution, I guess some people would call it, I would call it nutrient management, or whatever the other politically correct term is. I'm just wondering, you know, the agriculture industry is relatively new, 30 years old, and you know, we saw some maps yesterday of a lot of density of farms, fish farms along the coastal areas of various islands and continents or whatever. And all the impacts with that, but it is also, isn't it reasonable to expect, with agriculture, or aquaculture, that you're going to have some impacts that, that's
producing food. I mean, and yeah, we need to site these appropriately, of course, and but I think some people think it's supposed to be just pristine, and the environments going to be the exact same as before the farm gets there, and I don't think that's the case. So anyway, I just want to agree with you that siting is very critical, but even when the farms go in, hopefully we will have some performance standards to look at, as far as environmental type effects.

MR. BUSCHMANN: Oh, for sure, every human activity will have an impact. But still, if you want to make sure, in open waters, the diffusion coefficient of particles, nutrients, is much higher. You cannot contain it so easily. And normally, also places that have good, are good for aquaculture, they have strong water movement, so dispersal should be enhanced also. So, there's several issues to must be taking account, that this, I'm not taking about zero impact, but we--but we cannot go to extremes. That can be very dangerous. And we must couple things, balance things, no?

MS. CAROE: Gerald.

MR. GERALD A. DAVIS: In relation to Mr. Buschmann's comments, I have a question for the
livestock committee. Has your discussion on aquaculture issues so far delved into the issue of runoff, the analogous terms in terrestrial of runoff and pesticide drift from conventional farms and what kind of boundary zones we would have for aquaculture?

MS. CAROE: Hugh?

MR. KARREMAN: I can't say in regards to aquaculture, per se. I mean, I'm sure the AWG has been working on that, but in terrestrial agriculture, you know, there's buffer zones, that the certifiers, yeah--

MR. DAVIS: Has that entered into your discussions yet in this process?

MR. KARREMAN: Yes, it has.

MALE VOICE: And it will. [laughs]

MR. KARREMAN: Yeah, absolutely, without a doubt, without a doubt, yeah.

MR. DAVIS: I was just wondering if you'd got to that point yet, 'cause it-- this discussion here just brought that to mind and went, "Wow, talk about a giant different between terrestrial."

MS. CAROE: Thank you, Gerald, and I think that'll be part of the work that the livestock committee does between now and spring, is to consider that as well as all these other
aspects. Any further questions for Alejandro?

Thank you very much.

MR. BUSCHMANN: Thank you very much.

MS. CAROE: Becky Goldberg, you're up.

And on deck, we have whoever is the representative from Pure Salmon League, Pure Salmon Campaign. Is there somebody here from Pure Salmon Campaign?

Okay, so you're on deck. Before you start, Becky, these are good questions, I'm glad we're asking them, I just want to remind the board members that we have 24 people speaking before you can go to lunch. [laughter] So keep your questions on point and I ask the commenters to also keep their responses on point. I don't want to stop anybody from asking these questions, I just want to remind you of the implications of your actions.

[laughter] Becky.

MS. BECKY GOLDBURG: Okay, I guess I won't get any questions now. So, I'm Becky Goldburg, I'm a biologist, a senior scientist with Environmental Defense, which is a national non-profit organization. I'm also a former member of the NOSB and the environmental representative on the aquaculture working group. And I wanted to offer today some, just reactions, observations, and following yesterday's excellent aquaculture
symposium, which, you know, I'm really grateful that the board convened. And then also talk briefly about an issue that didn't get brought up yesterday, which is the use of compost in organic aquaculture ponds and tell you the results of a little bit of work that I'd done and ask that you consider a way forward on the issue, how we proceed. Well, I'd first like to offer some observations from yesterday on the feed issue, that we had some excellent presentations yesterday. They were largely about, you know, how to use alternative ingredients and what some of the options are in farm fish production. Perhaps what was lost yesterday, or at least didn't get brought up is an issue I think that's really important, is that there are some really real ecological motivations for moving away from heavy use of fisheries ingredients in feed for farm fish, at least fisheries ingredients from wild fisheries. And these issues stem from the fact that the small fish that are caught to make fishmeal and oil are of course the underpinnings of marine ecosystems. And while not all the science is in place, there's substantial concern that at some of these fisheries, while they may be harvested at a rate where the fishery itself...
replaces itself, there may be too many fish being
taken to support the sorts of populations of
marine predators, be they sport fish or marine
mammals or whatever, that people care about. And
this is an issue now that's being tackled for the
U.S. Menhaden Fishery in the Atlantic, regulators
are beginning to take it seriously. But it's yet
another reason why I think the NOSB is, and
aquaculture working group, is on the right track
in moving away from fishmeal and fish oil use.
Also, with respect to feed, I think one thing
that's critical is that if the board does
ultimately recommend a sunset provision for use of
fishmeal and fish oil, as the aquaculture working
group has suggested, that that be made a real
sunset. I was on the board when we recommended
the methionine sunset, so I'm familiar with how
challenging these sorts of things can be, and I
would urge that if you do put in a sunset that it
be part of whatever rule comes out, whatever
standards come out, for aquaculture, rather than
built into the national list, where sunsets are a
little harder to effect. I also think the
Monterey Bay Aquarium made an excellent suggestion
yesterday, in that sunsets could be set up with
transition periods, or ratcheting down, for
example, of fishmeal and oil use, so that you
don't just go from 12 percent fishmeal and oil one
day to zero the next, which makes sunsets also
harder to effect. Moving onto net pens, you know,
continue to be really challenging issues around
net pens. Part of this is because there's, of
course, no long history of organic production in
aquaculture. European certifiers, a few of them
have had standards for a few years now, but there
isn't a lot of agreement about what organic
aquaculture should be, especially with respect to
net pen systems. And there are some really, you
know, serious issues with some of the conventional
systems, especially for salmon farming. That
said, you know, I think about my experience
working in terrestrial agriculture, and you know,
I could step into now, the debate about dairy
farming or hog production or whatnot, and on the
basis of my concerns about kafo [phonetic], say,
we shouldn't have organic, you know, agriculture.
In reality, what we need really are organic
systems that are different, that are more than
just, you know, no use of drugs and synthetic
chemicals, but that have some real ecological
underpinnings that people are comfortable with.
So, I urge the board to think hard about setting
some tough goals for organic net pen systems that are consistent with that logic. Finally, on compost I had, at the behest of the aquaculture working group, a graduate student look at the literature on the use of compost in fish ponds, which is recommended by the aquaculture working group. There isn't much of a literature there. There is, however, a World Health Organization report last year, to do with the use actually of human waste water and excreta in aquaculture ponds, which is a practice in Asia, actually. And the WHO report offers some insights, one of them being that at relatively low levels, things like coliforms in ponds don't turn up in fish flesh. Another is that, you know, WHO does set some levels for, safety levels for coliforms and other bacteria in ponds, so there is some science to build on. And while it's not directly applicable to organic compost use in ponds, it's actually for, you know, practices we don't advocate, I think there ought to be a way forward to allow compost use in pond. Pond fertilization is really important, it's consistent with organic principles that you grow a flora in a pond that fish and shrimp can feed on, and I ask the board that we have a way forward to think through these issues
in a way that works for the organic community and for growers. Thanks a lot.

MS. CAROE: Any questions from the board for Becky? Okay, I actually have a--

MALE VOICE: I actually-- oh.

MS. CAROE: Go ahead, Gerald.

MR. DAVIS: Becky, can you provide a way that I can get that WHO report on the composting in ponds?

MS. GOLDBURG: Well, it's not on composting in ponds, it's actually on use of human sewage, essentially, in ponds.

MR. DAVIS: Right, but that princi--

MS. GOLDBURG: Absolutely, it's on the web, I'd be happy to email-- well, I'll give you the URL, the report is actually about 23 megabytes, I don't want to email it to people.

MR. DAVIS: Okay.

MS. GOLDBURG: I can share that URL perhaps with Valerie.

MR. DAVIS: Thank you.

MS. CAROE: Joe.

MR. SMILLIE: Just like to thank you, Becky, for working on the AWG, it was really great. I know you are sort of alone there [laughter] but you guys did great work and I
anticipate the AWG continuing and working with us to create a final recommendation.

MS. GOLDBURG: That's great to hear, thank you.

MS. CAROE: Okay, well the comments that I had for you, Becky, two of 'em, one I just want to clarify that the sunset, the seven year allowance that we're looking for is not an allowance for fishmeal and fish oil, it's an allowance for a non-certified fish oil and fishmeal.

MS. GOLDBURG: Mm-hm, right.

MS. CAROE: After that date, if there's certified available, and which we hope will be, I mean, that's part of the premise of, you know, creating fish so that we could have organic fishmeal, but just an allowance, we're not talking about eliminating the use of fishmeal and fish oil. So that's one point that I just wanted to clarify. And secondly, the concept of using compost was actually abandoned by the AWG. It became an issue, and it was brought up as one of three issues, and the AWG said there wasn't enough interest to pursue it, so it was actually pulled out. So we're not looking at compost.

MS. GOLDBURG: Hm, that-- I've discussed-
- Well, let me respond first to your comments on fishmeal and oil, and I absolutely agree to you, and my terminology was sloppy in my comments, and you know, I was speaking from fishmeal and fish oil, non-certifiable because it's from wild fisheries. On compost, perhaps we at the AWG should reconvene, but you know, I talked about the issue before the meeting with George Lockwood who specifically suggested it was still on the table. So, I don't, I'm not sure it's wholly abandoned, but maybe the whole matter needs a little bit more consideration.

  MS. CAROE: Dan.

  MR. GIACOMINI: It was one of the three big issues, and in planning the aquaculture symposium, there was the plan to have three panels. It was the request of the AWG for time constraints and other issues to drop that as a discussion item; it may still be on the table, but it was at their re-- it was the AWG request to not have it as a panel for the symposium.

  MS. GOLDBURG: Okay, yes, that's correct, and that's different. I think it's a lower priority issue, than the feed issue and the net pen issues. I think if there is a constructive way forward, though, on the compost issue, we'd
still like to pursue it, 'cause again, pond fertilization is an important consideration for any production system for filter feeding or scavenging fish, and shrimp. And you know, use of compost is a very good way to fertilize agricultural systems.

       MS. CAROE: Thank you very much, and Hugh, just make sure that's on the livestock committee's work plan. Of course, prioritize below these two items that we looked at yesterday, but-- Thank you, Becky.

       MS. GOLDBURG: Okay, thanks a lot.
       MS. CAROE: Any other question. Thank you. Next up is, and I don't-- Is this, are you Rachel Hopkins?

       MS. RHONDA BELLUSO: I'm not.
       MS. CAROE: You're not, but you're from Pure Salmon Campaign.

       MS. BELLUSO: That's correct.
       MS. CAROE: Okay, on deck, Sebastian Belle, are you in the room?

       MR. SEBASTIAN BELLE: Yep.
       MS. CAROE: Sebastian, I'm going to ask that, I've gotten board requests for a little break, so after--

       MS. BELLUSO: Rhonda Belluso.
MS. CAROE: --Rhonda.

MS. BELLUSO: Yes, R-H-O-N-D-A.

MS. BELLUSO: After Rhonda-- thank you.

After Rhonda speaks, we're going to take a little break and then we'll reconvene with you, Sebastian.

MS. BELLUSO: Thank you. As you said, I am with the Pure Salmon Campaign, it's a global project under the National Environmental Trust. In the past meetings that the NOSB has held on this issue, the Pure Salmon Campaign under our director Andrew Cavanaugh submitted full comments, and those comments still hold true. I'm actually here today to relay the message of many U.S. consumers. Over the past few months, consumers have been sending the Pure Salmon Campaign thoughtful letters with the purpose of having me deliver them here to you today, because it was important for them to have their message heard. The letters range. Initially there are 37 substantive comments that range from restaurant owners, organic farmers, representative from the New Hampshire House of Representatives, natural food store owners, fly fishermen, and regional organic farming associations. All have the same message, they unanimously agree that open net
cages, along with wild fish for feed, do not lend itself to an organic label when considering aquaculture production. Each may have their own reasons for writing the letters and for having those thoughts, but again the message is consistent. Additionally, 14,547 consumers signed a letter, again with the same message, asking you the NOSB to exclude open net cages and wild fish from feed, when considering aquaculture for an organic standard. The letter that they agreed to, more or less, reads this, that: "We the undersigned United States consumers, urge the NOSB to prohibit the use of wild fish for feed source, and open net pen farming systems, in an organic farm raised fish production. The feeding of wild fish to organic farmed raised fish concerns us for three critical reasons: the first, organic feed should be 100 percent organic; the second, organic farming practices should not damage the environment; and third, organic food should be free, or lower in contaminants. We also do not support open net pens, mesh cages anchored in the ocean's environment for two key reasons: organic farming systems should at least collect, if not recycle waste; and organic farming systems should not endanger wild fish or marine mammals." They
support organic standards for farm fish that are in accord with the organic principles; specifically, vegetarian fish species farmed in fully closed systems. However, if the NOSB decides to include non-organic feed, and open net pens in organic farmed fish standards, their confidence in the USDA organic label will be greatly diminished. Thank you.

MS. CAROE: Thank you, Rhonda, just really quickly, could you give us the spelling of your last name again?

MS. BELLUSO: Sure, it's B-E-L-L-U-S-O.

MS. CAROE: Thank you. Any questions for Rhonda? Thank you, Rhonda.

MS. BELLUSO: Thanks.

MS. CAROE: And again, we're going to take a short break right now. It is five of, let's convene at 11:05, give everybody a ten minute break. Promptly back at [break in audio] We're going to start folks. Sebastian Belle. Can I ask the audience to be-- to keep down the chatter, we're going to go with public comment now. Excuse me, those of you in the back of the room, that are having discussion, can you take it outside the room? Sebastian Belle, you're up. On deck we have Jonathan Shepherd, Jonathan are you

MR. SEBASTIAN BELLE: Thank you madam chair, my name is Sebastian Belle, I run the Maine Aquaculture Association. We are the oldest state aquaculture association in the country. We've been in discussion for over 30 years, and we represent aquatic growers. Our members, we've got anywhere between 130 and 150 farms on any given year, depending on what their membership status is. Our growers grow freshwater fin fish, saltwater fin fish, and saltwater shellfish, as well. I am also a member of the aquaculture working group and was involved with the group, NOAG, which was in existence before the aquaculture working group was created. Thank you very much for the opportunity to speak to you today. I want to start by going on the record, and I think the madam chair will particularly appreciate this, with an acknowledgement that I was wrong. I came for- to the idea of this aquaculture very skeptically and was convinced that it was going to do nothing but establish a bully pulpit for the people who have been beating me and my members up for the last ten years or so. And I was wrong. I think the committee deserves a
great deal of credit for the boards that they assembled, and there was some bully pulpit phenomenon there, but I think -- I sat in the audience and added up the number of years that nine of the members of that committee had in terms of experience in aquaculture research, it was over 200 years. I think that's quite astounding, to be able to put that kind of group together. I'm going to make my comments this morning on two pieces, one first on the fishmeal and fish oil, and then on the net pens. I'm going to focus more on the net pens than the fishmeal and fish oil because I think yesterday's board was very good and gave a very comprehensive treatment of the issue. The one point I want to make is from the producers' point of view. I heard a lot of questions from the committee yesterday about growth rates and focusing on increasing growth and why were people talking about that so much with respect to fishmeal and fish oil? I think it's important to understand that the reason that most of us as producers use fishmeal and fish oil is that we are still early on in understanding what the nutritional requirements are for our animals. And so, we're using it, essentially, as a safety factor in our diets. And particularly in marine
fin fish, where we have very little understanding in many cases of what the nutritional requirements are of those species, fishmeal and fish oil is being used as a way of kind of couching our risk from a nutritional pathology point of view. So, just to start with that point. Second thing I want to really support is Brad Hicks' points he made yesterday on the committee about trophic levels. I think it's the first time I've seen anybody clearly articulate what is so different about marine ecosystems and terrestrial ecosystems, and I think it was a very important point and actually this board deserves a great deal of credit for giving somebody the forum to make that point. I think it was-- it's not been made, honestly, in many other arenas. And finally, on fishmeal and fish oil, as producers we are concerned about the sunset provision, and principally we're concerned about the length of the sunset provision. And the reason we're concerned is if you look at the generation time of the animals that we're growing, particularly on the fin fish end of things, but also on the shellfish end of things, depending on which animal you're talking about, a generation of production for us is anywhere from 18 months to 42 months,
and in some cases, in the case of for example, halibut, it may actually be longer than that. So when you're doing nutritional studies, and developing diets for fin fish, and the generation time of your animals is relatively long, my worry is that we'll get to the end of that sunset period and we won't have been able to develop those alternative protein and lipid sources. I recognize that having that sunset period is very important to provide incentives for people to develop those diets, and I don't want to mislead you, we support the sunset provision, we're just concerned about its length. Finally, I have fair disclosure, one of my members is a company called Sea Bait and they grow worms, and they grow worms that were alluded to yesterday as some diet ingredients. And I just say that it's a very novel application of their product, and it's very early days yet to see how it's going to work out. It is very exciting and promising and we hope that it does work out. But it's going to take a lot of years to really understand whether or not that's a realistic source for some of those compounds. Net pens and their implications -- I want to just say that, and if I leave you with one thing, this is what I want to leave you with: if the standards
go forward and they preclude the use of net pens, it will be a great irony, because of all productions methods in aquaculture, net pens are the method which are most transparent to the environment, have the most interaction with the environment. And that means that they have the greatest risk of impact, but it also means we have the greatest possibility of changing those risks and reducing them over time. If you go forward without net pens, you will essentially—if you put it in terrestrial terms, ponds, raceways and tanks are methods of containing water on land. In terrestrial terms we would be going forward with a set of standards that were precluding, or that were requiring people to use barns underwater in which air was injected into, to raise organic animals. Okay? So think of it in those terms. And I'll leave it at that.

MS. CAROE: Thank you, Sebastian, and it is on the transcripts, that mea culpa, and I'll print it up later for the board. I knew for, I knew with great confidence that our livestock committee would not let you down with that aquaculture symposium. And they did a fine job. Is there are questions for Sebastian? Steve.

MR. STEVE DE MURI: Just a quick
question. What length of the sunset provision
would you propose?

MR. BELLE: I honestly would want the
feed formulation folks to make that proposal. I
don't feel that I'm qualified. I think that
Jonathan Shepherd, and I don't know if he's still
here or not, but Jonathan would be very qualified
to do that because he's been working on feed
issues for many, many years. But I think that the
proposed period, if you look at it, and you look
at the generation time, and then you look at the
time it takes to do the nutritional studies-- And
an interesting note, I think, yesterday you heard
a bunch of nutritional studies. The longest of
those nutritional studies was 72 days. None of
those studies tell you anything about nutritional
pathologies that occur over a longer time. And I
think that's something to be quite concerned about
as you're beginning to formulate feed. And that's
really why we want to be able to use fishmeal and
fish oil at some level.

MS. CAROE: Any other questions for
Sebastian? Bea.

MS. BEA JAMES: So, yesterday we heard a
lot about the feed recommendations for fish and
net pens versus farm raised ponds, and in
livestock we have taken a lot of time and care to
try to create an environment that's conducive to
the natural behavior of the animals, so that they
can roam freely, so that they can have pasture.
And I'm trying to understand, or maybe you can
help me understand, what would be the ideal
situation for raising fish so that they have the
same consideration?

MR. BELLE: Well, it's, I think Neil put
his figure on it yesterday in his presentation.
It's not a simple answer. It is, to some extent,
species specific, it's also site characteristic.
In other words, in the case of pens, site
characteristics really change the way fish behave
in a pen. But if you-- let me put it to you this
way: if you as a person put on a scuba suit, and
sit in a tank, a raceway, a pond or a net, it any
one of those production methods is done correctly,
and understands how animals behave in that method,
you will find natural behaviors. There will be
behaviors in those systems which are perfectly
natural, and which you would see even in the wild.
So it's not, I don't believe it's so much the
specific production system as it is how it is
managed. And how you provide opportunity for
those animals to do what they would do naturally
from a behavioral point of view.

MS. JAMES: So, does domestication of fish mean that we train them to live in a condition for our consumption? Is that--?

MR. BELLE: No, I think domestication of fish means the same thing as it does for terrestrial animals, which is over time we select for strains of animals that tolerate domesticated conditions.

MS. CAROE: Any further questions for Sebastian. Thank you--

MR. BELLE: Thank you.

MS. CAROE: --Sebastian for your participation in AWG. It was always fun to banter with you. [laughter] I'll miss that. Okay, next up, we have Barton Seaver, and second call for Jonathan Shepherd, are you here Jonathan? Okay, next up Rob Mayo. Are you here? Rob? You're on deck.

MR. BARTON SEAVER: Hi, good morning to the board and everyone here. I'd just like to say [unintelligible]. My name is Barton Seaver, I'm the executive chef and partner of a restaurant here in Washington D.C. called Hook Restaurant. We feature 100 percent exclusively sustainable seafood and I'm here to ask the board to listen to
a chef's perspective on this. So often in conservation and in critical matters of environmental issues, the chef's perspective is left out. Chefs represent the keepers of the food culture in America. Sixty percent of seafood is eaten in restaurants in this country. Up to two meals per day in the average family are eaten outside of the house. That means it's really up to me, it is up to my colleagues to really push forward these ideologies, push forward the ethos of sustainability, that we really seek to do. I really appreciate you allowing me to participate in this today. The consumers in my restaurant really want answers, and it's my opportunity, it's my burden, to sell solutions. I think that with the environment and with our impacts that we have made on fisheries in the wild, it is-- we're in very dire straits. And I come to you really talking about the word "sustainability." When people come into my restaurant, the word "organic" is a very valuable tool. It suggests and promotes an ideology and ethos that this food, not just this system, but the food on the plate, is-- has a positive value for us corporally. It has a positive value for us socially. It has a positive value for us ecologically. Not just in the fact
that the way that it was farmed or raised, does not have a negative impact, but that it creates a system that can be replicated and sustained throughout our future. We are not only seeking to sustain today's demand, but also to ensure adequate supply for all future generations. When it comes to fish, this is even more important. I believe that farmed carnivorous fish are simply—should be set aside for now. It is a hard thing to, for us to, for me personally, to invest in or to recommend to my customers, that when we're dealing with a global fishery crisis, using a method of aquaculture that is a negative sum equation, simply doesn't work for me. I applaud aquaculture methods, I applaud herbivore fish aquaculture. I applaud the efforts that people are making towards sustainable aquaculture of carnivorous fin fish. I really do. And I support you. I think that it is very important that we move very quickly in that direction. Those who are argue that we have a right to eat carnivorous fish, maybe our time is done with that. We have been given an opportunity by our environment, by our ecology, to do so, and we have screwed it up. I think that we-- until we are at a point where we can do, we can provide a sustainably raised
aquaculture carnivorous product, it should not be
rewarded with an organic label. The organic label
to me suggests, as I said earlier, that it is a
positive value for many of the systems in our
society, not just the agricultural or aquacultural
one. I think it's very important that we
understand that it's valuable to have a standard
that really sticks up for-- has a rigid set of
values behind it, that it-- forgive me, I'm a
little nervous, I'm a cook, not an orator--
[laughter] I think that it's very important to
have a standard with solid meaning behind it, that
really sticks up for an ideology, not just to have
a standard to begin with. As I said, it is my
unique opportunity to sell solutions, to diversify
the demand that we place upon our environment, in
our fisheries, and by removing, as we already
have, the top tiers of the trophic level, to then
begin targeting the bottom levels of the trophic
scale, in order to recreate the top, I think is
only going to create an implosion. So, that is
it, I will actually finish a little bit early. I
am sorry for being a little passionate, but this
is what I do. And this is what I believe in, and
I know a lot of chefs stand behind me in this.
And I, as I said again, am honored to have the
opportunity to speak for them, so I appreciate it.

MS. CAROE: Well, thank you very much for your comments and don't apologize for your passion. Is there any questions for Barton? Katrina.

MS. KATRINA HEINZE: Thank you for coming this morning. If we passed a performance standard, some of the metrics that we heard yesterday, that precluded farmed salmon from being labeled organic, would you serve a substitute in your restaurant? And what would that be?

MR. SEAVER: Serve a substitute in terms of--?

MS. HEINZE: Salmon. Or would you replace it with a different fish?

MR. SEAVER: I, in my restaurant, we'll-- I refuse to serve anything that isn't sustainable. I think even if salmon-- I mean, in this case we have wild salmon fisheries. You know, as I said, it's important to diversify the demand that we place upon our oceans, that if it's my-- Wal-Mart simply cannot sell Trivali [phonetic] or Corvali [phonetic] or some of the weird things that appear on my menu that people come to me looking for a unique experience. And that's what top tier chefs can do. And I understand the plight of Wal-Mart,
and I applaud their efforts, and groups like Wal-Mart.

MS. HEINZE: Would you—so you would serve wild salmon?

MR. SEAVER: Yes, wild salmon regularly makes an appearance on our menu.

MS. HEINZE: How do you reconcile that with what we heard earlier from the consumer's union, that consumers are interested in products with low contaminant levels? 'Cause they, I don't know if you were here yesterday, I'm still wrestling with this idea of organic, sustainable, where do they overlap? Where don't they overlap? So, I'm wondering if you have any thoughts on that subject.

MR. SEAVER: On our menu we do have a—a number of different species, and there are contaminant levels that vary, up and down. You know, we do serve Atlantic bluefish. Some of the species that we serve, it is important just to support the fisherman, just to enable the fishery to continue to exist. One of the great issues with wild fish is that fish don't vote, but fishermen do, so it's important to employ, keep those fishermen employed. The contaminant levels in salmon are an issue, it is a personal choice
that we allow our customers to make, and we are very open and honest about the contaminant levels that there are. You know, and in this case, I think that's the best that I can do on that level. Is to be open and honest and to open the dialogue about the state of our fisheries.

MS. CAROE: Bea had a question.

MS. JAMES: Well, I was going to ask you how to grill sea bass, but I'll save that for later out in the hall. I'm curious what your criteria is for what you do serve in your restaurant, and do you communicate that to your consumers?

MR. SEAVER: Yes, absolutely, we work very closely in cooperation with Blue Ocean Institute, especially, Seafood Choices Alliance, as well as Monterey Bay Aquarium, Shedd Aquarium, Charleston Aquarium, and really cross-reference a lot of these various, you know, and sometimes widely varying information systems, that-- And I do a lot of onsite research. We do a lot of fishing, we buy a lot of fish out of Tobago. My partner Joshua went down there and fished with them. Just-- we're starting to do a lot of work with an African fishery. I'm going to go over there in a month to check all this stuff out; went
up to Maine to actually investigate a lot of this stuff. And you know, I think that is part of my duty, is to very much understand not only the science behind it, the numbers behind how many fish there are in the ocean, but also the sociological impacts of the fish.

MS. JAMES: Just specifically, like your top three things that you look for when you're doing your research.

MR. SEAVER: There's five questions. I think a lot of people stop at three, they ask what, where, and how. I think, you know, what is caught, where it is caught, and how it caught are all very, very important. I think beyond that, though, I ask two additional questions, which is who and why. I think who is catching this and why they're catching this is even more important. Anybody that's going out there with a boat the size of the Empire State Building, is not going to make a profit until it's 95 percent filled up. And so it's inherently unsustainable to the state of the fishery that they're after. If we're talking about artisanal fisheries where people are going out the same way that their great-grandparents did, fishing with hand lines, you know, on a day boat catch, that's very important.
And this is also part of the story that we can sell to our customers, and this is part of why they engage. And so all of our wait staff is very much engaged in this process of the story of sustainability and the story of our future.

MS. CAROE: Kevin, and again, board members, keep it on track for what we're trying to accomplish as much as possible, please.

MR. KEVIN ENGELBERT: Bea asked the questions I wanted to know. I wanted to know who they turn to, to determine the sustainability of the fish they use, that's what I was--

MS. CAROE: Thank you. Any other questions? Thank you very much.

MR. SEAVER: Thank you.

MS. CAROE: Okay, we have Rob Mayo next. Third called for Jonathan Shepherd, are you here Jonathan? Okay, then I'm going to try this next name. Earnest Papadioanos [phonetic]. Did I get close? No. [laughter] I apologize, to you and all of your ancestors. [laughter] Go out and--

MR. ROB MAYO: Okay. My name is Rob Mayo, I'm a member of the AWG, I operate Carolina Classics Catfish in North Carolina, so I'm a catfish farmer, made the decision to get into the business 22 years ago. And I did this in large
part because of my experience growing up around
the commercial fishing industry, near the mouth of
the Chesapeake Bay. I watched that fishery and
that industry in decline as a young teenager. And
it was a large part of why I got into the
business, because I believed that catfish farming
represented a healthy, environmentally friendly
alternative way to provide a great seafood product
to U.S. consumers. Catfish farming, which
especially employs a soy corn diet, to grow a
mild, delicious white-meated fish, is pond based.
More catfish are produced in the U.S. than any
other aquaculture species. But, all of U.S.
aquaculture is relatively small. Only a very
small percentage of farmed seafood that is
consumed in the U.S. is produced in the U.S.
We're talking about less than ten percent. U.S.
aquaculture industry's small, and the average
producer in the U.S. is small, compared to a lot
of the overseas suppliers selling their products
into the U.S. market. U.S. farmers need an
organic standard as soon as possible. The longer
the U.S. continues not to have a standard, the
more disadvantaged the U.S. aquaculturists are
relative to their international counterparts, many
of whom are producing organic to other non-U.S.
standards. As a producer, I want to point out that even for species that would appear to be best suited for organic production under the standards that we proposed, it's not going to be easy to adapt to those standards. Let me give you a for instance, the feed will require some major changes, even for warm water species that are basically vegetarian, because for instance, soybean meal, moving from a solvent extracted soybean meal to a full fat bean meal may not be possible because the fat levels are too high. So we're going to have to rewrite our books and research and reformulate what we can do. I do believe that the proposed fishmeal and fish oil sunset is a good idea, gets the ball rolling. I believe that if the current standards, proposed standards are approved, that you're going to see a number of U.S. aquaculturists adapt their production, change their production meaningfully, in order to produce organic. The industry, consumers in the U.S., and the environment, will be the beneficiaries if we are able to go forward. Thank you.

MS. CAROE: Thank you, Rob, and again thank you as one of the members of the AWG and all of the work that you've done on that committee.
We really appreciate that. Is there questions for Rob? Dan.

MR. GIACOMINI: As a livestock nutritionist working with a number of organic dairies, it's my goal and preference to try and get them to switch from organic, mechanically extracted soybean meal to the high fat. Are you saying that you have a, that what you've looked into so far, you would have a hard time procuring mechanically extracted?

MR. MAYO: The whole subject is more complicated than I thought it would be, and based on geographically where we are, formulating a feed and procuring the ingredients, and you know, at the volumes we need, it's going to be more of a challenge than I thought it would be, for, you know, from the early on front end, I think it's going to be a challenge.

MS. CAROE: Any other questions for Rob?

Thank you, Rob.

MR. MAYO: Thank you.

MS. CAROE: Ernest. You're up, and I'm not going to say your last name again. I'll hurt somebody.

FEMALE VOICE: Spell it though, please.

MS. CAROE: And then-- then the next one
on deck is Brad Hicks. Are you here? Brad? You are. And Ernest, when you come up, if you could spell your name. [laughs]

MALE VOICE: And pronounce it.

[END MZ005010]

[START MZ005011]

FEMALE VOICE: ...and pronounce it for me.

MR. PAPADOYIANIS: I’m going to stand over here because I have a couple slides that I’d like to show you on some products that we have. My name is Ernie [phonetic] Papadoyianis, president of Neptune Industries public aquaculture and aquaculture technology company in Boca Raton, Florida.

FEMALE VOICE: [unintelligible].

[laughter]

FEMALE VOICE: [unintelligible].

MR. PAPADOYIANIS: No, the [unintelligible]. We have been working on two technologies that address some of the concerns that were brought up yesterday and have been reiterated throughout the National Organic
Standards Board’s discussions. The first technology that we’re working on is a sustainable fishmeal replacement. It’s called Ento-Protein. And I have to go through these rather quickly because it’s—I’m only going to harp on a couple of different slides.

Ento-Protein, as I said, is an insect-based protein. We’re working in cooperation with Mississippi State University to develop this product. This is a product that we’ve known intuitively that freshwater fish consume insects; many species consume them almost entirely in their diet. It’s a very sustainable product in the wild, and we’re looking at doing it on a commercial scale, very large commercial scale, with these select insects—produced under controlled conditions, harvested, dried, ground and produced a very high-protein meal. And very quickly, I’d just like to go over where we are in that research ‘cause I think it’s valuable in terms of a sustainable replacement. This is our—our first tier of research that we did on this was—with Mississippi State is selecting from literally hundreds of species of insects, based on
a litany of parameters not only for commercial
production but also for nutritional profiles, and
we selected four species of insects out of that
search, based on those parameters. And these are—
again, very briefly ‘cause I know we’re pressed
for time, the profiles—that’s why there’s a range
in these compared to fishmeal, soybean meal and
poultry meal. And what we found was very, very
promising, as you can see by the crude protein as
well as omega fatty acids and limiting amino
acids, that it’s very, very close to fishmeal and
often exceeds it in certain circumstances, as well
as exceeding soybean meal and protein meal. Now,
there are some concerns that we have with regard
to the omega3 fatty acids, and certain insects
with the methionine levels, but as you can see,
for the most part they’re very, very strong. And
then we took this research to the next level.
Basically, what we’ve done is we’re working on our
phase two production right now, which we did—we
finished off, actually, in October. Someone asked
the question yesterday about fishmeal replacements
and the actual taste of the product. We kind of
took the cart before the horse. Instead of doing
the growth trials first, we did the taste trials
to see if it was worthy to do the growth trials.
First of all, what we found was, in three-week trials with hybrid striped bass at Mississippi State University, there was no significant difference in diet acceptability with 100 percent fishmeal replacement in the diet with insect protein. In terms of the taste quality, the fish were harvested after three weeks and brought to the Food Science and Technology Department at Mississippi State, where they were reviewed by a blind, independent taste panel which actually found no significant difference in the taste. However, in the survey, they actually preferred the taste of the insect-based protein-fed fish over the fishmeal, which we thought was very, very encouraging. Our third phase, which we’re about to—or, actually, our phase two-B, which we’re about to enter in January, will be 90-day growth trials on this product. Again, with 100 percent fishmeal replacement, we’ll be testing two insect species with 100 percent replacement and a fourth treatment that will do a blend of two—a 50-50 blend of the two insect species. And we hope, by second quarter of 2008, we will be in pilot production, producing approximately 500,000 to 1 million insects a week; and by the end of 2008, a full-scale facility producing 200 to 220 tons of
product—dried product—per week.
[unrelated conversation]
What I wanted to show you, very quickly, is...
[pause]
[unrelated conversation]
I wanted to show you an integrated model that we’ve created with regard to this product very quickly. We have two models with two different groups of insects. What we’re looking to do, on one basis, is utilize waste, not only from our fish production but also from agriculture and livestock production, as a source—a feed source—for select insects. And the insects would actually consume the waste and we’d produce—be producing—a high-quality protein from this that could then be ground, dried and turned into fish and livestock diets. In the second model, the insect species that are basically feeding on grains, vegetable sources and so forth, we’re working with several companies right now to utilize the byproducts of other industries, biodiesel, ethanol production, fruit and vegetable processing waste that can be consumed by the insects and converted into this protein source, which then goes back into fish production. So
we’re looking at establishing a very sustainable product here.

FEMALE VOICE:  You’re going to have to wrap it up.

MR. PAPADOYIANIS:  That’s it.

FEMALE VOICE:  Okay.  Does the board have questions?  Joe [phonetic] Smillie?

MR. SMILLIE:  I saw your last slide.  Do you think this is certifiable to organic standards?

MR. PAPADOYIANIS:  Yes, [unintelligible].

MR. SMILLIE:  Great.

FEMALE VOICE:  Jeff [phonetic] Moyer?

MR. MOYER:  Yeah.  What are the byproducts and the environmental impact of actually producing those insects?  And what’s the risk of escapes and the effect that that would have in the environment?

MR. PAPADOYIANIS:  Good question.  With regard to escapes, this procedure is very much synonymous with a marine fish-related hatchery in terms of the actual quality control and protocol on this.  First of all, we’d certainly be doing indigenous species to wherever we did this.  We’d be doing non-invasive species, in terms of their impact on human health and the environment.  For
instance, the facility I showed you in the picture is a picture of a screwworm facility in Mexico. Now, these insects are produced by the government to eradicate a pest insect. They’re basically produced; they’re sterilized with UV light; they’re released in the wild so the males breed with the females and populations drop. Now, as a noxious predator, that insect—the quality control on that facility is tremendous. The insects that we’re using, that’s not the case. So [unintelligible] the quality control in there in terms of keeping the bacteria and other contaminants in the food courses low and disease is critical to maintaining those populations.

FEMALE VOICE: Bea James?

MS. JAMES: What diseases do you encounter, and how do you deal with prevention and remedy?

MR. PAPADOYIANIS: I wish I had an answer for you at this time. We don’t. We’re too early in the research to do that because we haven’t reached the full-scale production basis yet. But from what I know what [phonetic] our research team, Mississippi State, that’s worked in producing these large-scale facilities, most of the contaminations affect, as they do with fish
populations as well and [phonetic] [unintelligible] livestock, actually affect the populations of the insects. In other words, you’re getting contaminants from things like mites and other pests that will actually influence the reproduction and productivity of the facility. So that’s why quality control will be extremely important.

FEMALE VOICE: Dan, and then Gerald.

MR. GIACOMINI: Just wanted to let Barbara [phonetic] and Mark [phonetic] know we’ll start working on the insect regulations. We’ll try not to make ‘em species-specific, and we made need a working group for that, though, so...

[laughter]

FEMALE VOICE: Gerald?

MR. DAVIS: What family of insects are you focusing on that work the best for your production?

MR. PAPADOYIANIS: The species are confidential. We’re working on—basically, the orders [phonetic] we’re working on are dipterans and lepidopterans. That’s as specific as I can get.

FEMALE VOICE: Any other questions from the board? [Unintelligible], Rigo?
MR. DELGADO: Thank you. Ten years down the road, what do you think will be your capacity and will you be able to meet the demand for your product in the marketplace, first question? And second, in terms of pricing, how do you expect that to be compared to the commercial fishmeal.

MR. PAPADOYIANIS: Good questions. One of our goals in being able to do this is to—you know, with fishmeal, the facts are, basically, that every metric ton of fishmeal has to travel approximately 5,000 kilometers to get to the end user from where it’s produced, so there’s a real economic liability there. What we’d like to do in our facilities is be able to base these facilities strategically, in strategic locations, to be able to combat a lot of the freight costs in doing that and be able to supply to the largest markets, you know, on a cost-effective basis.

FEMALE VOICE: Hue?

MR. KARREMAN: Just wondering—maybe I missed it in the slide—but what protein level does the insect meal give, because actually, Dr. Alam, during the poster session yesterday, wanted to kind of point out that, you know, even if there’s a 12 percent fishmeal, you know, inclusion for now, you know, the protein of that
fishmeal varies from batch to batch and all that. So just wondering what kind of variation of protein is in that meal that you’re making.

MR. PAPADOYIANIS: Yeah, I went through that pretty quickly, but in the slide we had four species and it ranged from a low of 42 percent with one species up to the one that we’re moving forward with [unintelligible] commercial production, which is up to 60—between 62 and 63 percent, versus fishmeal, which is usually 67 up to 70 percent, typical menhaden meal.

FEMALE VOICE: Any other questions from the board—from the [unintelligible]—Barbara, [unintelligible] program?

BARBARA: Is—are you—does this only have application as a substitute for fishmeal or are you going to be considering its use in any other— as a supplement, or does it—is it only in fishmeal?

MR. PAPADOYIANIS: No, absolutely not. We’re looking at it as a very high-quality, sustainable protein meal that could be used for fish and livestock diets, and eventually, we hope for human diets.

[laughter]

BARBARA: So—oh, really?
MR. PAPADOYIANIS: Well, people laugh, but you consume insects every day in your corn flakes and your bread. And everyone knows...

[laughter]

There’s an allowable percentage of insect parts in any grain-based diet, so you’re consuming ‘em.

BARBARA: So this could be a possible substitute for methionine?

MR. PAPADOYIANIS: For what?

BARBARA: This could be a possible substitute for methionine?

MR. PAPADOYIANIS: Uh huh.

[Unrelated Conversation]

FEMALE VOICE: We’ll give you five more minutes.

[pause]

MR. PAPADOYIANIS: Okay. The other technology that we’re working on addresses closed containment system. We have a product that we’ve trademarked as the Aqua-Sphere. It’s a closed containment—floating closed containment system. It’s constructed of flexible, high-impact polypropylene, and the tank system has actually
incorporated flexible neoprene joints in it to actually combat wind and wave stress factors. Some of the other benefits of the system are that it actually concentrates solid waste in the bottom of tank and shunts it, periodically throughout the day, to a waste-concentrated trap, which [unintelligible] the waste can then be shunted to the land-based production system or a barge for disposal. The other benefit that we’ve targeted—I’ve heard a lot of critiques on closed containment in terms of operating expense. What we use is—instead of using high energy consuming pumps to pump the water from the outside environment to the inside, we use a very old but very efficient system of an airlift, and those—organ pipe design on the side of the tank actually is a very low-high-volume, low-pressure air injection system that moves water very efficiently into the system. And to give you just an idea, we have a land-based hybrid striped bass farm in South Florida, adjacent to the Everglades, and it takes us approximately 300 horsepower in pumps moving water throughout the farm to produce 1 million pounds of product a year. In this system, from our six-month operating history, we’ll be down to less than 60 horsepower to produce the
same amount of product. And what that’s done is
it’s allowed us to begin work with several
companies now for integration of alternative
ergy to be able to run the system, and we’re
looking at wind, wave, solar and also methane or
[phonetic] biogas as a full operating energy
component and as an augmentation to the grid.

[pause]

Just wanted to go over some of the
benefits of using closed containment over net
pens. We—as I said, we’ve had a system operating
for six months with the production of hybrid
striped bass, albeit on a pilot scale in a quarry
[phonetic] lake system in South Florida. And
we’ve been able to achieve some pretty tremendous
results in terms of the reproduction, and also,
the cohabitation with some pretty good predators
in the system. We’ve had—we’ve lived
cooperatively with the alligators, soft-shell
turtles, anhingas and cormorants, and a bunch of
other predators. So closed containment really
allows that—the containment of the crop
and also the protein of that crop from outside
predation, and that’s a very important component
of the system as well. The other thing that we’ve
done is we’ve fully—our business mantra is really
to fully integrate our systems so that there’s no waste and we’re actually producing secondary and tertiary products. All of the waste that’s being produced in that system is being pumped to shore. It’s being digested, anaerobically, with a methane digester. We’ll be using that methane to actually power the air blowers to pump the system, and then the digested sludge is used as a fertilizer for herbs and vegetables in our greenhouses. And we’ve, again, successfully closed that loop over the last six months in doing that. And again, we feel that integrated aquaculture is a very sustainable model. We heard yesterday that all sustainable products are not necessarily organic, but certainly, organic products should be sustainable. And we also believe that producing secondary and tertiary crops, at no cost, from those byproducts, helps supplement, and oftentimes eclipse the cost of energy to pump that water in that system. Thank you.

FEMALE VOICE: Thank you. Any questions?

Steve?

MR. DEMURI: How do you address the fallowing [phonetic] issue with your systems?

MR. PAPADOYIANIS: We’re doing testing right now on the polypropylene. We’ve had
extremely low following on the outside. Now, we haven't tested it in the marine-based systems yet. We’re looking—in mid 2008, we have—our second-generation system is going in the water in January, and we’re looking about mid 2008 to have the system in pilot operation elsewhere, with other species in the marine environment. And part of the reason I wanted to address the board today is wanted to have an impact that private enterprise is moving forward on these items very rapidly. We’re looking to have both these products to [unintelligible]—to market and commercial development by the end of 2008, beginning of 2009.

FEMALE VOICE: Any other questions from the board? Thank you.

MR. PAPADOYIANIS: Thank you.

MR. HICKS: Good morning again. My name is Brad Hicks. I’m with the Pacific Organic Seafood Association from British Columbia, and today I’d just like to address some issues on fish welfare. I noticed, when I was preparing to come
here, that there was a paper on fish welfare so I just thought I would let the NOSB know what the Pacific Organic Seafood Association did to address that issue. I guess first, having raised several species besides fish, and my understanding of the organic aquaculture—or organic agriculture system—Freudian slip—was that the systems that would be adapted in organic agriculture would have gone through a process where people accepted them. So for fish, what we did was we looked at organic standards, both terrestrial and aquatic, and we chose the Five Freedoms as the underscore for our section in our standards on welfare. The Five Freedoms are freedom from nutrition—we heard yesterday, that as we try and move away from fishmeal and fish oil, currently we have to substitute with some synthetic amino acids. At least, certainly, for a transition period, we can use fishmeal for that process. So we have to be able to husband fish that are well-nourished and not malnourished. The next freedom is freedom from thermal and physical discomfort. For those who are not familiar with fish, we know an awful lot about the thermal comfort zones for fish because their behavior and their survival outside their thermal comfort zone is very, very poor.
That’s well known. So in our standards, we have our standards set up so that we can adjust them for species, based on their temperature requirements, as one of the metrics. Hot on the heels of George’s [phonetic] presentation yesterday. The next freedom is freedom from injury and disease. We actually—fish diseases have been studied for a long time. The first fish disease was diagnosed with something called furunculous, and that was over 100 years ago. So we do have some experience in fish diseases, much more than in nutrition, as it turns out. So like organic terrestrial systems, we have in place a system whereby if the animals do get sick and we cannot solve the problem with conventional organic methods, then the fish do need to be treated from a health and welfare perspective. And once they are treated, they have to be removed from the system. Pretty standard practice. Freedom from fear and distress—for those of you who are unfamiliar with fish, perhaps fish behavior doesn’t seem so transparent, but for those who work with them—those of us that work with them every day, we can tell when a fish is upset, for lack of a better term, ’cause we—so we set up systems—I think there was question earlier about
how do you know when the fish is happy, sort of—and so we set up systems, and the fish is pretty transparent [unintelligible] telling when he’s unhappy. So we assume when he’s not telling you he’s unhappy, he’s probably happy. Okay. It’s a bit of a negative, but—and, you know, fish—you can watch a pecking order in fish just the same as you can in a field of chickens, once you get to figure out how to do it and what a pecking is in fish. So we set up systems where the stress is as low as we can get it. Freedom from unnecessary restrictions of behavior—one of the issues that has come up in fish farming is the migratory issue. I guess my issue is good fences make good neighbors. All the animals I ever raised wanted to get out of the barnyard at one time or another. Migratory behavior is real. One of the reasons why husbandry of all animals work, including fish, is that we [unintelligible]—migration is for food and reproduction, primarily, and we supply the food and we look after the reproduction, so the migratory requirements are removed in a farming system. And that, for me, is the same for virtually all species. Thank you very much.

FEMALE VOICE: Thank you, Brad. Any questions for Brad? Kevin?
MR. ENGELBERT: Do you have any parameters for density?

MR. HICKS: Yes, we have specific parameters for density, for both the—just so—our standards are for salmon, primarily, because that’s what we do. We have standards for the net pen systems, and we have standards for the land-based system. In salmon rearing, when they’re juveniles they’re raised on land. So we have densities in place for both.

FEMALE VOICE: Joe?

MR. SMILLIE: You have an organic association composed of organic aquaculturalists?

MR. HICKS: That’s correct?

MR. SMILLIE: How—are you self-certified or have you employed an independent to agency to verify compliance to your standards?

MR. HICKS: We are currently self-certified, and the reason is, in British Columbia, where we live, there’s provincial legislation, which would be equivalent to state legislation, and we currently working to become certified under the provincial legislation. Now, in all honesty, just like you people have, and the people in this room have issues to deal with, the current discussion in British Columbia is whether or not
the legislation applies to aquatic species as well
as terrestrial species. [Unintelligible] pretty
common question. So at this point, we’re self-
certified, but we’re—certainly have standards that
have been—the stage they’re at with the COABC is
that they’ve been passed by the Standards Review
Committee is the stage they’re at, so we’d be
comfortable [phonetic] to take them elsewhere.

MALE VOICE: Brad, could you forward that
to the Livestock Committee, your standards and any
verification procedures that you guys have
investigated?

MR. HICKS: I can. I have the standards,
but we have the ISO 9005 booklets, et cetera. We
have all that done. You’d like all of that
material?

MALE VOICE: Not the ISO, but—

MR. HICKS: [interposing] The standards?

MALE VOICE: Hue?

MR. HICKS: We have the standards, yeah.
I will certainly give you the standards.

FEMALE VOICE: All right. Any further
questions for Brad?

MR. HICKS: Thank you very much.

FEMALE VOICE: Thank you, Brad. Next up
is Spencer Evans, and on deck, George Lockwood.
And just a status to the board, we have eight more
speakers before lunch and 44 this afternoon for
the four hours of comment period. Don’t want to
stop you from asking your questions, just want you
to know what you’re up against. Go ahead.

MR. EVANS: I understand you’re hungry so
I’ll go quickly here. My name is Spencer Evans.
I’m a farmer. I’ve been farming fish for about 20
years, and I’m currently the general manager of
Creative Salmon. It’s a small farming company
operated on the west coast of Vancouver Island in
British Columbia, Canada. Before—I’m going to
just touch briefly on the sea lice issue, and then
I’d like to tell you, briefly, a little bit about
what Creative Salmon does. But before I get
going, I just wanted to thank the NOSB and the
Aquaculture Working Group for taking on this
challenge. I know it’s been difficult. Like Brad
said, we’ve gone through a similar process—we’re
going through a similar process in B.C., and it
is—it’s very difficult. And you’ve been given a
lot of information, some of it conflicting, and
it’s difficult. You’ve got some very difficult
decisions to make. Just on the sea lice issue, I
want you to understand that not all farms have
problems with sea lice, and I think that’s kind of
the message that’s been conveyed up to this point.
We as a company, Creative Salmon, have been
growing Pacific Salmon for 17 years in the
traditional territory of the Colloquia [phonetic]
First Nations on the west coast of Vancouver
Island. We’ve never had a problem with sea lice.
We have never had sea lice mortality on the farms
or mortality related to sea lice, and we have
never treated for sea lice. For us, sea lice is a
non-issue. Having said that, it has become a
public issue in British Columbia, and when it did,
our First Nations neighbors came to us and said,
“What’s going on here”? So we took the initiative
to embark on a sea lice monitoring program, and
for the last four years, we’ve been looking at
lice levels on our fish on the farms, and on wild
fish in the river systems near the farms and away
from the farms. And in all cases in our area, the
sea lice levels are very, very low, so for us sea
lice is not a problem. We—Creative Salmon is a
very small company, very small producer. We are
one of the founding members of the Pacific Organic
Seafood Association, and the standards that Brad
Hicks referred to, we have been growing our fish
according to those standards for the last four
years. So that means things like we grow
indigenous species only; very, very few fish per cage; very, very few fish per farm; every farm sight is routinely fallowed; no chemical treatments of any sort for the nets; a whole bunch of standards that ultimately result in a high-quality product, a high-quality salmon with the least environmental footprint possible. When you grow a high-quality salmon, it means you grow a healthy salmon. And on our farms, we have survival rates anywhere between 90 to 95 percent survival from smolt introduction to harvest. And that’s without antibiotics. We haven’t had to treat our production fish since October 2001, and those are the fish that we sell into the marketplace. Farming salmon, if it’s done right, can have a very small environmental footprint, and that’s exactly what we’re striving to do. And at some point, we’re hoping that we’ll be recognized for our efforts and be able to have some sort of organic certification. Thank you.

FEMALE VOICE: Thank you, Spencer.

Questions for Spencer? Joe?

MR. SMILLIE: How are you sited [phonetic]? Like you’ve obviously achieved a lot of what we’re talking about. Is the [phonetic] sitting [unintelligible]...
MR. EVANS: In British Columbia siting—
the regulations in British Columbia are extremely
stringent, probably the most stringent in the
world when it comes to aquaculture, and siting is
just one of those issues that are highly
regulated. Our sights are in protected waters.
They’re in fjord-like [phonetic] inlets on
Vancouver Island. Some of them are excellent
sites; some of them are less than excellent. But
that’s why we fallow sites. We know, from our own
experience monitoring program, that indeed we do
have impacts on the sediment under the farms, but
we also know from our environmental monitoring
that fallowing the farms reduces those imprints.

MR. SMILLIE: What would be your
rotational cycle on the fallowing?

MR. EVANS: We do two types of fallowing
programs, one we call the short-term program and
the other one’s a longer-term program. One of the
things we do with organics, or organic operations,
is we do single-year class [phonetic] stocking, so
we put a group of fish on one farm; we never move
those fish; in fact, we don’t even touch them
until they’re harvested out of that farm; and
after that process, the farm will sit [phonetic]
fallow for a minimum of two to four months before
we restock. That’s the short-term fallowing program that every single farm goes through. The long-term program can be anywhere from two, to four, to six years. We have six farming locations in this body of water that we operate in, but we only operate a maximum of four farms at any one time. A maximum of four at any one time, so we actually rotate, physically rotate, the cages from farm site to farm site, and we do get fallow periods for two, to four, six years, so forth.

FEMALE VOICE: Hue?

MR. KARREMAN: Just want to thank you for coming here for—it’s great to hear from a real farmer, like yourself, at this meeting.

MR. EVANS: Thank goodness I got a good staff back at the farm that’s looking after those fish for me.

FEMALE VOICE: Any other questions for Spencer? Steve?

MR. DEMURI: Can you give me some idea just how big this sea lice issue is? You don’t have it, but we heard some pretty compelling evidence that it is [phonetic] out there. Can you give us some kind of idea of how bad it really is?

MR. EVANS: Personally, I think it’s blown way out of proportion. Salmon have sea
lice, absolutely. When you grow Pacific Salmon, it’s a non issue; when you grow exotic species, like—well [unintelligible]—when you grow Atlantic Salmon in the Pacific, it is more problematic, however, there are government regulations that require farms to monitor lice levels on their fish, and at certain thresholds, they are forced to treat. And the lice levels are very, very well-contained on the farms. The idea that somehow farms are causing the collapse of Pink Salmon around the province is not true, in my opinion. Some pink runs are definitely in decline, but there’s a whole bunch of reasons for that. And sea lice, if it is one of the reasons, is very, very low down on the list of reasons. Having said that, we need more research on sea lice, absolutely, and that’s why we participate, and the whole industry participates in sea lice research. But from a public perception standpoint, I think it’s far—it’s blown way out of proportion, in my opinion.

FEMALE VOICE: Gerald?

MR. DAVIS: In your opinion, what—do you give up anything in using indigenous Pacific Salmon versus what the other Atlantic Salmon producers get by farming Atlantic Salmon in your
MR. EVANS: Yes, and that’s actually a really good question. When the industry first started in British Columbia, everybody grew Pacific Salmon. That’s what the industry did, and I’m talking 25-odd years ago. And we were basically putting wild fish in cages and growing them, and we soon ran into problems because we didn’t know—we didn’t have very much information about the nutritional requirements of the fish, the fish health aspects of the fish. And we had a lot of early problems in the industry and there was—to address those problems, there was a dramatic shift from Pacific Salmon to Atlantic Salmon, and now the entire industry, except for a small handful of farmers, are growing Atlantic Salmon. The disadvantage to growing Chinooks, or Pacific Salmon in our case, is they take longer to grow; they convert feed at a higher rate; and when you do have mortality with Pacific Salmon, it typically happens later in life, where with Atlantic Salmon, mortality more often occurs at the smolt size. So it’s a much more challenging animal to grow, and that’s one of the disadvantages of doing it. However, one of the advantages of doing it is we can distinguish, or
find niche markets for it in the marketplace.

FEMALE VOICE: Thank you. Any further questions? All right. Thank you very much.

George Lockwood, you’re up next, with David Guggenheim—you’re next. Again, board members, I really don’t want to take people to three-minute comments, which is what we’re going to have to do if we can’t kick through some of these, but, you know, keep your pertinent questions coming.

MR. LOCKWOOD: I’ll be very brief. First of all, the aquaculture worker wants to thank the board again for yesterday’s superb day. I think we are all very satisfied that the selection of the 12 experts and leading advocates was outstanding, and I would hope that you have a real good idea now of what these issues are and what the science behind them is. It’s also, I think, important that these—to know these people volunteered their time, and at their own expense, came to be with you. On the matter of the issues that are remaining from our proposal of February 1, there are five. Yesterday, we dealt with the fishmeal and fish oil issue and net pen issues. But we still have working, as Becky [phonetic] indicated, a revised proposal concerning compost, and we need to pick up on aquatic edible plants,
and we, of course, have submitted a second report having to do with the biovalve mollusk [phonetic]. The reason why we focused—or urged you to focus on fishmeal and oil and net pens yesterday was that without fishmeal and oil, virtually, there is no aquaculture. I think the message yesterday was very clear from all the feed nutrition people that the amino acids that come out of fishmeal, or the alternatives, poultry byproduct or free amino acids, are indeed necessary. As for net pens, if we don’t deal with net pens, there are—will be no salmon grown. One hundred percent of the salmon and about a third of the world’s tilapia is grown in net pens. So the three remaining, we’re still working on, and we hope that the biovalve mollusk report that we submitted will be accepted and we can go to work on it. One thing I would like to comment on, we’re eagerly looking forward to the program to move ahead with rule making on what was passed last March, and we’re prepared—the Aquaculture Working Group is prepared to assist in any way we can, in any of the writing or any of the research that’s necessary. And lastly, we look forward to continuing to work with the Livestock Committee as we move forward on fishmeal and net pens issue that are most pressing right
now. Thank you very much.

FEMALE VOICE: Thank you, George.

Questions for George? Thank you very much. David Guggenheim, you’re up. On deck is Mike Picchietti. Mike, are you here? You’re on deck.

MR. GUGGENHEIM: Good afternoon. My name’s David Guggenheim. I’m a marine biologist and president of the non-profit, One Planet, One Ocean, formerly vice president of the Ocean Conservancy. But I’m here today representing an aquaculture company called Aquaculture Developments, based in Pittsburgh, and I serve as a consultant to them.

[unrelated conversation]

In my years in conservation, I grew to view these as my clients.

[unrelated conversation]

And as you know, my clients dealt with—have continued to deal with some very serious situations. This headline appeared in the New York Times about a year ago, “Wild Fish Stocks are in Great Decline.”

[unrelated conversation]

At the Ocean Conservancy, I worked with a number of commercial fishermen, including one in St. Croix, and these are his kids. And
every time I’d show up at their house, they would
dive into the cooler that their dad had brought
back and show me the biggest fish that he caught
that day, and those are the biggest fish. And the
other ones in that cooler, you would see more
likely in your aquarium. So, you know, obviously,
a lot of problems. And I had a bit of an epiphany
about three years ago, when I left the Ocean
Conservancy, and since it’s the holiday season,
I’ll put it this way: I have seen aquaculture
future, and it looks like this, and it looks like
this, and it looks like this. These are all
examples of next-generation, recirculating, land-
based aquaculture technology. This one’s based in
Malaysia, growing barramundi, and that also has a
[unintelligible] hatchery associated with it.
This is—on top, you see an eel facility in
Northern Denmark which supplies 1,000 tons per
year of eel. That’s 20 percent the European
demand. Below it is a halibut facility in Norway.
And we’ve talked about recirculating systems, and
this is, very simply, what one looks like. And
the most important thing to see in a recirculating
system is that there are no connections to the
outside world; 99 percent of the water is
recycled; and basically, if you’re familiar with
water treatment facilities, this is a water
treatment facility that just happens to have a
fish tank in it. I became enamored with closed
systems because they addressed virtually all of
the environmental impacts we see associated with
open systems, escapement, water pollution, habitat
destruction, and use of antibiotics and chemicals.
None of these are issues at all. The only issue
that remains, like all other forms, is feed.
Well, invoking one of my favorite shows,“MythBusters,” I wanted to dispel a couple of
myths about closed-system aquaculture. First
myth: Land-based recirculating systems can’t
compete with other forms of aquaculture. That
myth is busted. These are proven commercial
success since the early 1990s, gross margins as
high as 30, even as high as 40 percent in
Australia, and strong consumer demand. In fact,
they’ve succeeded in establishing a consumer
preference for farmed fish in Asia, because of the
safety issues. So very different from the
discussion we were having earlier. Myth number
two: Land-based recirculation systems use too
much energy. In fact, one of the best-kept
secrets are great efficiencies—there are great
efficiencies in recirculating systems, and in
fact, they use, in [phonetic] order of magnitude, less feed to produce the same amount of fish. So here we see 1 kilogram of wet fish to produce a kilogram of barramundi, versus 15 kilograms. Fish grow much faster, 10 times faster. This is halibut grown in a recirculating system, compared to a flow-through. No heat is used to heat the water in this facility in Northern Denmark. The metabolism of the eels is sufficient to keep the water warm. And you have to consider food miles. Closed systems offer the possibility of locally grown fish, fresh to market and close. So in conclusion, set the bar high. The technology already exists for the standards that you’ve posed to be met. And setting that bar high will continue to encourage further innovation to make this happen. We still have the problem of feed. We support the sunset provision that you’ve outlined; we feel we can make it, and well beyond. Thank you very much.

FEMALE VOICE: Thank you, David. Any questions for David? Kevin?

MR. ENGELBERT: One quick one. How would you address the animal welfare issue of the fish being in a closed building, obviously not their natural environment whatsoever?
MR. GUGGENHEIM: I think it comes down to a very species-specific question. I think there’s some fish where the jury is still out on whether or not they adapt themselves well to a closed environment. I think one of the best measures of whether these animals are doing well or not, just as on land, is to observe their behaviors and to observe the measurable health parameters of the animals. And from everything that I’ve observed in these systems in Malaysia, in Denmark, these animals seem very healthy and they seem to be exhibiting normal behaviors, at a variety of stocking densities. The eels you saw were packed like sardines, if I can use that pun, very high stocking densities. And I don’t know exactly what a happy eel looks like, but I was impressed at the health of these animals and their ability to still exhibit as normal behaviors as you might expect. Welfare goes beyond some of the science, and welfare issues do bring up subjective issues as well. The consumer tolerance of seeing animals raised in captivity, that’s a different issue, and not one that I’m prepared to respond to.

FEMALE VOICE: Thank you. That is something we’ll delve into in the future. Any further questions for David? Thank you, David.
MR. GUGGENHEIM: Thank you.

FEMALE VOICE: Up next, Michael [phonetic] Picchietti; on deck, Alice Chiu. Alice are you here?

MS. CHIU: Yes.

FEMALE VOICE: Thank you. You’re on deck.

MR. PICCHIETTI: Hello. Mike Picchietti, P-I-C-C-H-I-E-T-T-I. I’m a-made my living in tilapia for the last 27 years, and I’m currently president of Regal Springs Trading Company. I started farming in Africa, and then went to India, and then Brazil. I lose track sometimes. And then to California, Florida, and now we’re in Indonesia and Honduras. Regal Springs is a vertically integrated producer of tilapia with operations in Indonesia and Honduras, active in the business, Regal Springs, that is, since 1998. [Unintelligible] of Germany and Bioswiss [phonetic] of Switzerland have certified some of our farms organic in 2006, which comprise land-based hatcheries and cage installations in artificial dams and natural lakes. So far, only about 2 percent of our production is organic, most going to the market in E.U. and Canada. Today’s focus is, basically, can net pens be considered
organic? Regal Springs is one of the founding members of the Steering Committee of the World Wildlife Fund’s tilapia aquaculture dialogue. Our effort with WWF is to reinforce the image that tilapia is a green, sustainable species. We are creating a certification for the sustainable production of tilapia producers worldwide, with the WWF and other producers. I mention this participation to share with you how our early experience with the various stakeholders, mostly environmental NGOs, brought up similar objections to cage farming and the issues being discussed here. From the WWF dialogue, the purpose is to discuss the facts. We realize most of the objections were grounded in a lack of knowledge about how tilapia’s farmed, how tilapia in cages is farmed, and how our company operates. Specifically, some stakeholders were imposing their knowledge and experience with marine shrimp and ocean net pen of salmon onto cage farming of tilapia in particular. After the first meeting discussing the main issues and objections with stakeholders, testimony provided by experts, the WWF adopted a single guiding principle to oversee the direction. That principle is tilapia production facilities will be evaluated based on
performance standards and will not be prejudged as environmental or socially acceptable. In reading over the objections today of the marine net pen culture [phonetic] of carnivorous species—allow me to briefly go over some of the issues that we have. As far as fishmeal, we have constructed a fishmeal and fish oil extraction facility next to our processing plant. We process whole tilapia into fillets. Before we had the fishmeal facility, our fish heads, blood, guts and frames had to be trucked and buried into landfills. Now all these wastes from the filleting operations are converted into fishmeal and fish oil. Our fishmeal is sold into the feed mills for shrimp and poultry industry, so not to backcross into the tilapia feeds, while our tilapia diets trade [phonetic] the fishmeal purchase from the poultry and shrimp feeds yielding Regal Springs as a net zero user of fishmeal-fish oil. This has significant impact on our conventional fresh tilapia fillet market because our company supplies about 25 percent of the entire U.S. market. Fish oil—from the same facility, the fish wastes we produce produce high volumes of fish oil, approximately 3,000 gallons a day. We sell about 40 percent of this into animal feeds, and the rest
we convert into biodiesel so that our entire operations in Honduras are using tilapia fish oil biodiesel to fuel all the farm vehicles, motors, pumps, rather than consuming fossil fuels. This effort awarded Regal Springs the highest environmental award in Central America. OceanChill carbon footprint—Regal Springs has developed the techniques to ship fresh fillets to the U.S. from Honduras via ocean ship rather than airfreight. To compare this to the industry standard method of air shipping, the difference in fuel kilocalories per pound of fillet produced is what 2 percent of what airfreight uses. Regal has trademarked this process OceanChill. There is much discussion in organic circles about fossil fuel use in the production of these products. Escapees—again, a regional issue, like Mr. Brooks [phonetic] said yesterday. We have kind of a polyculture. Our escape tilapia are caught and consumed by humans and all the native animals in the surrounding environment. Thirty years before we arrived in Honduras, the government stocked the same species of the tilapia in the same waters we’re using. Since then, the government regularly stocks the same species in the lakes for human communities living near the lake. They also
channel catfish, largemouth bass, which are all exotics. There are thousands of fishermen organized into cooperatives that provide a balance in the productivity of the lake, a way to remove nutrients and escapees together. Effluence—the most open water bodies suitable for net cage culture have wild fish population. In ours, we have natural, exotic and indigenous fish, stocks which congregate around the cage and feed off the extra feed and fecal material. Proof of this is found in the stomach contents of the fish. A well-designed net cage system allows for surrounding bodies of water to recycle fecal material without accumulation in the water body bottom without increasing end [phonetic] values of water quality parameters. We have the data to support this observation, for many years. We are in a more closed system than the ocean by a scale of about 2 million to 1. We do, and can, measure our impacts, and we have data going back years so we can measure the increase in any phosphorus, nitrogen and other important levels. The fact is there’s actually been a decrease in phosphorus level since we’ve been the lake, which we don’t quite understand. The key is the balance to assimilate the waste within the lake as a whole
organism. We are constantly monitoring. Being in a public body of water intensifies the governance and monitoring, as we are working, literally, in a fishbowl, not behind barbed-wire fences, like private farms.

FEMALE VOICE: Excuse me. Your time has expired.

MR. PICCHIETTI: Okay.

FEMALE VOICE: Is there any questions from the board? Joe?

MR. SMILLIE: Yeah, I encourage you to get certified, your organic operations, once we have the standard ready, ‘cause I’m hoping that the tilapia, catfish and other industries can start the fishmeal. Even though the biodiesel use may be attractive from an environmental point of view, we’d like to see it all go to be certified fishmeal. In your certified organic operations, could you mention the biggest obstacles? One of ‘em is the lack of production because you actually have to select for sex rather than using hormone treatments, but if you could just elucidate on the challenges for your—what are the barriers that you face in going organic with all of your production.

MR. PICCHIETTI: Well, the—In cages, there—tilapia need a substrate to spawn, and in
cages there is no substrate, so the need for the
sex reversal is not as apparent as in ponds, where
it’s certainly needed. So we got a big break
there. Then biggest problem for us to expand our
organic is the USDA has not provided it, so we
don’t want to expand it because we don’t know
which way it’s going to fall, with regard to net
cages specifically. The other problem with
production is the feed ingredients cost quite a
bit, ridiculous, actually. [Unintelligible] has
to certify, you know, the grains and the farms and
so that takes quite a bit and it takes ‘em a lot
of time. So the feed cost is prohibitive, and it
makes the product expensive where it doesn’t
really have to be.

FEMALE VOICE: Any further questions?
Thank you so much. Up next is Alice, and on deck,
Dick Martin—are you here? You’re on deck.

MS. CHIU: Hi. My name is Alice Chiu.
I’m a researcher at Stanford University, working
with Dr. Rosamond Naylor on analyzing the
environmental impacts of aquaculture. I wanted to
thank you for this opportunity to provide public
comment, and for taking the time to consider the
trickier points of organic aquaculture through
yesterday’s excellent symposium. Dr. Naylor and I
recently convened a meeting of several scientists, industry and NGO collaborators to discuss sustainable alternatives for aquaculture feed inputs, a summary of which I thought would be beneficial as you consider developing organic aquaculture standards. In the coming months, this group will be producing a rigorous evaluation of the alternative sources of aquaculture feeds and their tradeoffs, which I would be pleased to share with you when it’s complete. But today, I’d like to discuss the strategic use of fishmeal and fish oil and provide a more general overview of the alternative sources of nutrition, particularly for carnivorous or pestiferous species that have more demanding nutrient requirements. So from an ecological standpoint, the use of fishmeal and fish oil from reduction [phonetic] fisheries should be minimized, and eliminated where possible, in order to protect the status of wild forage fish. An important step in minimizing the use of fishmeal and oil in aquaculture feeds is to use these fish-based feeds only during the life stages where it is nutritionally necessary for the fish, for example, in the juvenile stages. Alternative sources of nutrition should be substituted at all other times. This already
occurring, to some degree, due to the high price of fishmeal and fish oil, but an organic standard including this would further encourage the substitution. The discussion of alternative feed inputs raises the question of whether a fish raised on alternative proteins can be comparable, from a human consumption standpoint, to a fish fed fishmeal and oil. This concern can be addressed, to a large degree, through the use of a finishing diet that includes fishmeal and fish oil. Fish derive their characteristic taste through the oil that they are fed, and studies have shown that feeding a fish-based diet for a period of time immediately before harvest restores omega3 levels, and also the customary taste to a fish otherwise fed a vegetarian diet. Some scientists say as little as three weeks on a finishing diet is adequate, while others suggest two to three months to ensure that high levels of omega3 fatty acids are present. Even so, limiting fish oil to the final three months would still reduce the total amount of fish oil consumed over the fishes’ lifetime by 85 percent. Because of this, I strongly encourage the strategic use of fishmeal and oil only in life stages where they’re considered necessary, and using alternative forms
of nutrition at all other times. As far as an assessment of some of the alternative sources of proteins and oils, I have submitted comments so I don’t have time to go into, you know, all the details, so I refer you to those. But terrestrial—meals from terrestrial plants such as soy and wheat are what are most commonly available, and because they’re available at fairly commercial quantities, plant-based feeds may provide the most practical avenue for meeting organic principles. However, the use of plants in aquaculture feeds have other biological and environmental impacts that must be considered. Vegetable proteins lack certain essential amino acids, such as lysine, along with [unintelligible] omega3 fatty acids that consumers desire for their health benefits. And on the ecosystem side, plant-based feeds have a higher fiber content, which results in increased fecal output which exacerbates the problem of pollution. One alternative which I think should definitely be encouraged, and which people have spoken a lot about today and yesterday is the use of seafood processing byproducts in—if it’s from a farm origin, this would be a traceable and controllable input that fits well with organic principles. And
in either case, it’s an efficient use of material that would otherwise go to waste. Fish trimmings often have a high lipid content, making them a good source of fish oil, which is often considered a limiting factor in the fish oil-fishmeal debate. One potential issue is that corresponding high levels of contaminants can be—is a problem in some cases. However, purification processes do exist that remove contaminants of concern and add only $3 to $5 per ton to the price of feed. As Mike mentioned previously, the cost of these seafood byproducts appears to be a problem. Currently, the majority of farmers are not asking for alternative feed [unintelligible]—

MS. CHIU: ...and lacking that demand, feed companies have no desire to complicate their manufacturing processes with numerous specialty mixes and separate bins for each species of byproduct. Organic certification could be extremely useful in driving the demand that will speed this change. Increased production of these byproduct feeds would bring the price down, and the price premium that comes with organic certification would simultaneously allow the
producer to afford the more expensive feed. Another producing alternative is that of the use of animal byproducts. I realize there’s a consumer reluctance for this, but scientifically, animal protein contains high levels of lysine and is a much more complete source of nutrition than vegetable protein. And the potential for this industry is quite large, as it’s available in enormous quantities. Again, further research is needed, and in order for fish raised on animal byproducts to be organic, only organically raised animals could be used in feed. Since it is important to avoid fueling further, industrialized [unintelligible] operations by creating [phonetic] an additional demand for them.

FEMALE VOICE: Thank you, Alice. Your time has expired. Is there further—is there questions from the board for Alice? Thank you so much. We have Dick Martin up, and on deck, Will Fantle. Will, are you in the room? Very good.

MR. MARTIN: Good afternoon. I’m Dick Martin. I have been in the industry for 28 years. I own Martin International Corporation, which is a seafood import-export company in Boston, which I’ve owned for 22 years. I’m going to try and skip over things that have been said already
today. We’ve had great public comment, so I’ll try and get to the key points, and so bear with me as a skip around. I’m not going to read off my text. Madam Chair, you stole some of my thunder right at the very start. I think, at this phase of all the work you’ve done, it’s key to back to the basic premise of what you’re trying to accomplish here, which is that the NOSB is charged not with creating the perfect world in a vacuum model, but you are required to uphold organic principles, comply [unintelligible] the final rule on a practical and viable basis. Most of the testimony and literature brought forward by the opposition is based on worst-case practice and taken out of context in historical observation of poorly run and poorly managed systems. We shouldn’t waste our time thinking about poorly run conventional systems. We should think about, now, setting metrics for what your goals are, and they’re attainable. Common sense should prevail in considering [phonetic] those arguments, and the existing working models provide excellent examples of what is possible and what is plausible. I want to kind of key on net pen culture a little bit. That seems to be hot topic. My opinion, and it’s been for some time, the worst thing about open net
pen culture is the exaggerated use of the term open. Ocean fences are no more open or closed than the terrestrial variety. A net pen has no inherent property that makes it any more or less damaging than the environmental—to the environment than a fence in a pasture. When one considers the hypothetical proposition, the sea pen is more likely to pose a threat in the [phonetic] potential transfer of diseases than a terrestrial fence, once you consider the openness of terrestrial systems in recent historic epidemics of Hoof and Mouth Disease and avian flu. I would argue that sea pens are far less likely to propagate disease, as a human vector is generally eliminated in the aquatic system, and that is a serious contributor in disease transfer in the terrestrial models. A lot of the organic farms that are in existence today have very little disease. Part of that is the advent of better improvements in vaccines. Disease now is related more to high-intensity—high intensive farming than it is just to the practice of farming fish altogether. In terms of talking about pests, the favorite topic here is sea lice. It is a valid consideration that a captive population of hosts can [unintelligible] potential problems, yet
proper management of the sites [phonetic], low-density, low-intensity, location, location, location has more to do with pest management than random chance. In the U.K., the organic salmon sites are located in areas mostly in the Shetlands, Hebrides and Orkney Islands. There are no rivers on those islands. That’s a significant reason why they’re there. They aren’t there because people like to live there. It’s a good place to farm the fish. Without rivers, there’s no breeding [unintelligible] population. Through sensitive site selection, which reduce or eliminate the wild [phonetic] population vector, there has been minimal sea lice infestations in those locations. Observation of what is possible and that which has been practiced, such as siting [phonetic] requirements, are key issues in developing organic standards for real world applications, not hypothetical, worst-case scenarios. Siting should be a key consideration in the establishment of a U.S. standard. In terms of escapes, that hasn’t really been talked about today very much but I want to harp on that a little bit. In considering the threat of escapes in aquatic systems, you’ve been pounded by statistics that quantify worldwide escapes, and
you’ve been led to believe that the genetic code
[unintelligible] the ancestral species is somehow
endangered. The fact of that matter is that
restocking programs for various strains of
Atlantic Salmon have been reared in hatcheries and
have been in place for more than a century.
Similarly, in British Columbia, identical strains
of Chinook have been used to restock ocean
ranching programs and commercial net pen culture
alike. Up to 38 percent of wild Pacific Salmon
species actually begin their life reared in
hatcheries, using the same chemical assistance,
identical feeding regimes as their farmed brothers
and sisters. One man’s escapee is another man’s
stocking program. In terms of effluence, when
discussion turns to effluences [phonetic] from an—
of aquatic sites, it’s hard to believe that some
people actually are astounded to feel or hear that
fish poop in the sea.

[laughter]

For those who are incredulous to consider
this—and I’ve been waiting all year to do this—I
suggest reading a book authored by Taro Gomi,
“Everyone Poops.” It’s what you do with it and
how you manage it that’s important. We shouldn’t
be gaga over the fact that these critters actually
live a life. The natural excrement—

FEMALE VOICE: [interposing] All right.

MR. MARTIN: --of fish populations—am I

FEMALE VOICE: Your time has expired.

Your time has expired, and lunch is way past due,

so I’m [unintelligible]—

MR. MARTIN: [interposing] It’s better
for toddlers [phonetic] [unintelligible], but...

FEMALE VOICE: Is there questions? There
questions? Hearing none, thank you for your

comments.

MR. MARTIN: You’re welcome.

FEMALE VOICE: Will Fantle, you’re up,

and Harriet Behar, you’re on deck.

MR. KASTEL: Okay. Thank you. Good

morning. My name is not Will Fantel. My name is

Mark Kastel, and I’m speaking on behalf of the

Cornucopia Institute. I’m its co director and

senior farm policy analyst. This is a little

segue into the afternoon sessions, folks,

Cornucopia—we are organic watchdogs; we are

industry watchdogs. But I want to really

emphasize we are all watchdogs. I also want to

say I have a—in addition to my comments, I have a

proxy from one of our policy advisors, Merrill
Clark, a former member of the National Organic Standards Board. We know why people first come to organic food, why consumers first come to organic food, and it’s selfish, and there’s nothing wrong with that. It’s folks who are concerned with the health and wellbeing of their families and want to provide the very best food, and I’m sure we all share that motivation. But research clearly shows why there’s such little price resistance in the organic marketplace, and that’s because consumers don’t just feel that they are doing something selfishly, they feel they’re doing something positive for society. They think they’re supporting a different kind of environmental ethic; a different, more humane form of animal husbandry; and they think they’re supporting economic justice for family farmers. It’s not surprising that consumers feel betrayed by the lack of enforcement on scofflaws operating factory farms producing organic milk, the largest product segment in the organic industry and a gateway product. The NOP might be satisfied with the [unintelligible] new rulemaking, but many in the organic community are not. The National Organic Standards Board has passed five guidance and rule proposals since the year 2000. None of
them have been put into effect by the USDA. Progress. In the meantime, the people are taking the law into their own hands. Many in this room know that Cornucopia has filed three legal complaints since—starting in 2005, regarding dairies operated by Case Vander Eyk, Aurora Organic Dairy and Dean Foods-Horizon. Here’s a status report, which you might have not read in the trade media: Ten-thousand-cow dairy operation by Case Vander Eyk Jr. in Pixley, California, had its certification yanked [phonetic] this year; Issues: origin of cattle—could not prove they were organic—record keeping is the backbone of organics; pasture—what’s an organic farm? Well, we know what it’s not; it’s not a feedlot. In 2005, we delivered a survey report of all the organic farmers polled in this country, and we delivered to this body a report that the average was one cow per acre. There’s quite a range, but that was the average. In the E.U. it’s three-quarters of a cow per acre. On the Vander Eyk spread, it was 44 cows per acre, and part of the documented complaints that we received in our freedom information request was the fact that they weren’t even using the 120 acres available to over 5,000 cows. Hard to believe that, post-2002, QAI,
the certifier, allowed this operation to continue to ship milk to Strummex [phonetic], Heritage and Horizon. Aurora—based on Cornucopia complaints, AMS compliance entered into an investigation. The results of that investigation was the issuance of a letter of proposed revocation by the National Organic Program. This letter cited 14 willful violations—willful—of the organic law, including inadequate pasturing of animals; origin of livestock—cows were on these farms—thousands of cows that did not qualify for organic certification. And most importantly, again, they repeat it in the document, “Willfully selling milk labeled as organic that did not qualify under the law.” Well, was this firm indeed decertified? No. Were they fined? Not a penny. Well, they did enter into a consent decree and there was some publicity that you might have seen on that, and it said that they would reduce their herd and remove certain animals from the herd. Well, here’s the fine print, and this is what we feel is the most egregious and illegal aspect of this document and agreement between the USDA and Aurora Dairy, it cited that they would remove the cow—the 80-20 cows transitioned to organics from their herd, those would be removed from their operation. The
funny thing is those were the only legal cows on
the two dairies in question that they operated.
Those were the legal cows that they transitioned,
using the 80-20 rule ending in December in 2003.
The thousands of illegal cows that they brought on
their farm subsequently, this agreement between
the USDA and Aurora would allow them to keep.
Now, this room is not filled with dairy farmers,
so I ask the question, rhetorically, why would
they do that? Why would they—this is an ass-
backwards agreement. Why would they allow them to
keep these illegal cows? Well, how many of those
original cows are still in that herd? And by
measuring the call [phonetic] rates that they’ve
disclosed publicly for those facilities, they
answer is virtually none. So instead of enforcing
the law and removing maybe 98 percent of the
cattle, the thousands of illegal cows from these
farms, they were allowed to keep them and maybe
remove 2 percent of the legal cows from those
farms. That’s what we call a sweetheart deal;
that’s what we call an illegal deal. So, folks,
this is wrong. We need the National Organic
Standards Board to stand with the rest of the
organic community. This is quite an irony because
in the year 2000—one other ironic part of this
consent agreement is, in the year 2000, the National Organic Standards Board passed a resolution that stated—and passed it onto the NOP, that lactation was not a stage of production, which would exempt farmers from managing their cattle according to the access to pasture rule. It took them from the year 2000 to 2007 to put that into effect, but it’s only in effect for one dairy operator in the entire United States, and that’s Aurora, because it’s in the consent agreement. The other 1,599 or so farms don’t have to abide by that. Your rulings are being disrespected, but there is a higher authority in this country than the USDA in these matters, and that’s the organic consumers. And it’s been reported widely in the media that there are now a total eight class-action consumer fraud lawsuits, representing plaintiffs in 30 states, that have been filed against Aurora Dairy, because if our federal regulators aren’t willing to take action—and by the way, we think the NOP did the job on this. The decision not to come down on Aurora happened at the political appointee [phonetic] level at the USDA. But if they’re not willing to do the job, the civil courts are still there. So this is a warning, and I don’t care what commodity
you are, if you’re an investor, if you’re a
private operator, if you’re engaged in organic
commerce, don’t think that if you have lobbyists
in Washington and you’ve got payroll in the
Legislative Branch due to campaign finance
contributions—don’t think that that’s going to buy
you immunity, because we have the civil courts.
So this could cost you millions of dollars, and it
could cost you your brand value. And so the cost
to Aurora is going to be high. There are already
customers looking for options. We understand some
have already switched, private label customers.
We need this board to send a strong statement to
the secretary of agriculture that this enforcement
history is totally unacceptable. Folks, you have
the voice of authority. You represent us in the
organic community. We need you to speak. And
I’ll close by just touching briefly on the
conflict of interest charges which were brought up
by Barbara Robinson [phonetic] this morning. We
do not think—and I’ll quote Merrill Clark here,
“The National Organic Standards Board must be made
up of people who have the best interest of organic
agriculture at heart, and I think you folks do.
We must enforce a high code of ethical standards
for this board and for this community. The fact
that—and this supersedes the board and talks about
our certifying community—“The fact that QAI and
the state of Colorado both collaborated with
Aurora Dairy, in issuing their damage control
press releases, quoted—

[background noise]

I’m sorry, ma’am. Did I say something?

FEMALE VOICE: I do not—the rules of
public comment were clearly stated, that

[unintelligible]—

MR. KASTEL: [interposing] Maybe you’ll
have to repeat them.

FEMALE VOICE: I will repeat them.

MR. KASTEL: Thank you.

FEMALE VOICE: And you are not to impugn
the character of any board member or company that
they represent, and I will not have that here, so—

MR. KASTEL: [interposing] Wait a second—

FEMALE VOICE: --wrap your comments—

MR. KASTEL: [interposing] Let me back
up.

FEMALE VOICE: Wrap your comments—

MR. KASTEL: [interposing] I made a
factual statement that represents from Quality
Assurance International and the state of Colorado
were quoted in press released issued by Aurora
Dairy, Incorporated.

FEMALE VOICE: I’m sorry. I’m sorry. You indicated that there—you stated there was a collaboration that is not a fact. It is not a fact, it’s your—

MR. KASTEL: [interposing] These were press releases that were issued by the company.

FEMALE VOICE: This—

MR. KASTEL: [interposing] These representatives of the certifiers had to speak directly and in a—

FEMALE VOICE: [interposing] Please wrap your comments.

MR. KASTEL: —collaboratively manner.

FEMALE VOICE: Please wrap your comments.

MR. KASTEL: I’m sorry?

FEMALE VOICE: Wrap your—

MR. KASTEL: [interposing] Thank you.

Okay. We think that type of behavior on the part of the certifier community is inappropriate, and we hope this board will make a statement along those lines. Thank you very much.

FEMALE VOICE: Since this board has no authority in compliance and enforcement, I see that we’ll make no comments or have no questions for you. We will not—we have no authority, and we
have to actions to take in regards to you comments.

MR. KASTEL: I think you have the moral authority, and I thank you for the opportunity to speak.

FEMALE VOICE: Harriet Behar [phonetic]?

MS. BEHAR: I believe I’m the last.

FEMALE VOICE: Just for this morning.

[Unintelligible] mornings [unintelligible].

MS. BEHAR: Okay. My name is Harriet Behar, and I am an organic educator, inspector, farmer and consumer. Thank you for the opportunity to give input into the process of protecting and enhancing the U.S. organic standards. Thanks also to Andrea, for her many years of dedication and hard work to this process.

I will repeat again my disappointment that the NOP has not implemented the OFPA mandate of a peer review panel to oversee the NOP accreditation program. In addition, there is no written protocol available detailing how the NOP and the NOSB interface. Both you, the board, as well as the public, put countless hours into the development of recommendations. There is no transparent protocol without an NOP quality manual in place, detailing how the NOP may or may not use
or incorporate these recommendations, which, if
the proposal—the protocols were known, would
clearly affect how the NOSB and the public
interact with the NOP. The need for clarification
of the apiculture standards and the ever-popular
pasture for ruminance [phonetic] requirement are
two of the many examples which illustrate how
frustrating and damaging it is to the organic
community to let these languish in regulatory
limbo. Consumers are aware that consistent
standards do not exist, and that this confusion
and mistrust is damaging to all involved in the
organic marketplace. Aquaculture—I believe in
consistent standards. If non-organic feed is
allowed for organic fish, then why not for
chickens or dairy cows? Consumers will be
confused, and rightfully so, when some foods have
different standards in their production. There
are fish species now that meet current organic
standards, such as tilapia. Let’s start with
these and work into the development of fish raised
in a truly organic system. While organics are not
based in purity testing, the wild stocks used in
fishmeal or oil could be contaminated, and this is
not what organic consumers would expect in their
expensive organic fish. We have all worked very
hard to obtain and maintain a significant organic premium in the marketplace for organic products that meet strict standards. When aquaculture has matured sufficiently to meet the spirit and current standards, then we can eat organic fish. Other eco labels can be applied now to these sustainable raised fish, and a trade organization could educate consumers on the value of these specific production practices. Let’s not water down the organic standards that we have in an effort to award the organic label to this food category. As fish farmers develop sustainable methods, they can work towards building an organic system. This is the same way that organic land-based systems developed. Commercial availability—the guidance for reviewing commercial availability for processing ingredients and seeds should be separated, especially the section suggesting producers work to encourage the development of an organic equivalent. It is unrealistic to assume this of farmers. I believe the recommendation should include the use of catalogs and Web sites as proof of search [phonetic] for organic, and [unintelligible] that a letter be obtained for each variety of non-organic seed used that organic was not commercially available. The documentation
requirement places a huge paperwork burden on vegetable producers who purchase hundreds to types of seeds, and I am one of these. The mandate that certifiers collect and report all the non-organic seed used by their producers is also a paperwork nightmare and serves no useful purpose. Organic certificates—the current NOSB recommendation does not include a date by which buyers, sellers, inspectors and certifying agents can verify the current status of a certificate. This renders the document almost useless, since I have inspected numerous operations where a certificate was presented to me and I personally knew that the client had switched certification more than six months previously. The next annual monitoring date, or current certification inspection date, or dated signature of the annual certificate could be examples of a date scenario which is truthful and would not oppose the no-expiration mandate in the current rule. Multi-site certification—I agree with the National Organic Coalition comments submitted. Retail stores or processors are a different animal from farms. Farm management does not change regularly, whereas I know—well, we know there is significant personnel turnover at the retail level. The group certification of handlers
is a completely different type of certification and should be discussed as a separate topic from the farmer-based grower groups.

FEMALE VOICE: [inaudible] minute left.
FEMALE VOICE: Less than five minutes.
Wow.
FEMALE VOICE: Thank you, Harriet.

Questions for Harriet? Joe?

MR. SMILLIE: We did pass a recommendation—gosh, last October, wasn’t it?
Yeah. On the expiration of certificates. I would direct you to that. This current recommendation is on the standardization of the certificate.
There’s a previous recommendation on expiration.
It hasn’t been accepted nor rejected by the NOP, as yet, but—

MS. BEHAR: [interposing] Well, that goes to my first point.

FEMALE VOICE: Hue?
MR. KARREMAN: Just a question. I fully realize the Harvey Rule nullified the 80-20, but the 80-20 was put into place to help organic dairy get going, so wouldn’t the 12-12, or whatever, be, you know, somewhat mirroring of that, if it’s allowed by regulation?

MS. BEHAR: Well, we did find that it was
not allowed by regulation.

MR. KARREMAN: True, but the intent of the board and the NOP at that point was to create an industry, so that’s a possibility of what we’re trying to do, of course.

MS. BEHAR: I’m concerned about consumer confusion in the marketplace, and just wondering why—how can organic fish not eat organic food and that sort of thing.

FEMALE VOICE: Jennifer?

MS. HALL: On that first point, I would like to come back to your desire for an understanding of your relationship between the NOSB and the NOP. And I am an equal advocate and proponent of transparency, but I also think that there is equal value to the freedom of the landscape within which we work, and that sometimes when you have too much regiment to follow, it can limit the quality and the creativity of what we’re able to put forward, and that there is some inherent risk, then, that the recommendations that we might make would be to fit the bill that we think might be accepted versus what’s the best thing. So it’s a balancing act.

FEMALE VOICE: Any other comments for Harriet, questions? Thank you, Harriet, for
keeping it brief. And this—we are done with our
morning session, at 1:00. The board members are
going to break for lunch, but they have generously
offered to truncate our lunch period to 30
minutes, so we will reconvene at 1:30, with the
presentations on animal health and welfare, and
then global animal welfare initiatives.

[break in audio]

...that we’re running late, we’re going
to continue with the agenda, and I ask our
speakers to just bear with us. Some of our
members are still finishing, but they promise that
they’re all good multitaskers and well capable of
listening to your presentation while eating their
lunches. So, Kathleen, if you would come and give
us your presentation, we’d appreciate that.

MS. MERRIGAN: Thank you. I’m here with
Dr. William [phonetic] Lockeretz, my collaborator
on this project. We come here from Tufts
University, the home of the Red Sox, the Patriots,
the Celtics. You may know a little bit about
where I live.

MALE VOICE: [unintelligible] Bruins.

MS. MERRIGAN: Well, yeah, the Bruins,
the Revolution. We’ve got a good year going up
there. I just want to say thank you for the
opportunity to testify here today, and I know how hard you all have worked as board members. I survived just shy of five years as an NOSB board member. I was an environmental representative to the board. Willie Lockeretz was also an environmental representative of the board for a couple years, so we’ve been in your shoes and we know how complicated your tasks are. I was also asked, by Hue, to give a little background on myself, because I don’t know a lot of you, so you understand my connection with the organic standards. I worked for the Senate Agriculture Committee in the late eighties, early nineties, working for Chairman Patrick Leahy, and drafted the Organic Foods Production Act of 1990, the Senate committee report that is, in large measures, still the major text of congressional intent that helps in the administration of the law; and then, later on in my journey, took over the job of administrator of the Agricultural Marketing Service, toward the tail end of the Clinton administration, and was primarily tasked with getting out the final organic rule that we have that was put into place in 2002, I guess, when it finally was implemented, though we finished a couple years prior to that. So I have
a lot of historical knowledge, and I say that at the start because one of the things that I want to say to you is I think that animal health and welfare issues have always been a part of the NOP agenda, maybe not always explicitly written out; maybe not always detailed in the way that we’d like, but when we were framing the legislation in 1989 and 1990, I can assure you that animal health and welfare issues, as nascent as the livestock sector was in the organic then, were on peoples’ minds. And we saw that when we developed the livestock sector and more expertise in organic livestock management, that animal health and welfare issues would be part and parcel to all the standards elaboration that would be necessary to have a fully operational NOP. And when you look at the Senate committee report, and I’ve passed out some testimony—I’m just going to read you a couple of passages from it. The first says, “More detailed standards are enumerated for crop production than for livestock production. This reflects the extent of knowledge and consensus on appropriate organic crop production methods and materials. With additional research, and as more producers enter into organic livestock production, the committee expects that the USDA, with the
assistance of the NOSB, will elaborate on livestock criteria,” and there are passages that I cite from that committee report of the same nature, so it’s on the agenda. It was on the agenda in 1990; it’s still on the agenda today. When we look at the final rule that was put out by USDA and the National Organic Program, again, a whole lot of anticipation of health and welfare standards for livestock. Some passages from the final rule: “An organic livestock producer must—a whole dropdown list that I’ve provided you, to do things like provide shelter designed for the natural maintenance, comfort level and opportunity to exercise appropriate to the species. One of many, many dropdowns on livestock criteria, and then a whole lot of place markers for the NOSB in the final rule, things like we’re looking for—species-specific guidelines will be developed in conjunction with future NOSB recommendations and public comment; we will seek additional input from the NOSB and public comment before developing such standards on a specific length of time that cattle or other species may be confined prior to slaughter. We anticipate that additional NOSB recommendations and public comment will be necessary for the development of space
requirements. The NOP will work with the NOSB to
develop additional guidance for managing ruminant
production operations. We will continue to
explore with the NOSB specific conditions under
which certain species could be temporarily
confined to enhance their wellbeing. You see a
lot of these things woven into the final rule,
clear indication, again, that animal health and
welfare standards are expected to be a part of a
fully developed, robust National Organic Program.
That brings you to our testimony today. We feel
that the time is right to really engage. The NOSB
has been involved. Clearly, the pasture thing has
taken a big chunk out of your life, among other
issues. You’ve been engaged in some of these
issues, but we’re at a critical juncture where the
industry is about to grow, and grow in a big way.
We’re still at a point, particularly with swine
and poultry, where there’re not that many
producers, things are not in a situation where
you’ve had huge investments in infrastructure,
things are in a lockdown situation. Now is the
time where you really could move forward with
standards and not be overly concerned about dire
economic consequences that you’re placing on the
industry, which then becomes a problem when you’re
tying to get a rule through the Office of Management and Budget with your cost benefit analysis, and all of a sudden you realize all these industry folk are going to have economic hard. Makes your jobs a lot harder. So there’s a real opportunity now, the timing is right, and we really want to implore you—that’s one of our main objectives today, is to implore you to really place time in your agenda to dive into some of these issues. We brought five particular potential standard recommendations to the board today, based on a project that we’ve been funded through CSREES to do in looking at potential elaboration of organic health—and animal health and welfare standards. The paper that was put up on your Web site that we submitted prior to our testimony today was something that we’ve done a year ago that gives you some sense of where different standard programs are in this arena. What we’re providing today are some scientific literature citations to back up what we would consider the low-hanging fruit standards here. We tried to pick one per species to just give you a sense of some of the opportunities where you could go forward, where there’s scientific consensus, where there’s, largely, industry consensus on some
thing that could be done right now, if you wanted. And so the—first, I looked in the poultry field, and one of the things that came out of a stakeholder meeting that we had in April of this year at Tufts University, following our scientific and standards analysis, was the issue of perches for layers. And people felt, and we feel very strongly that perches are very important for poultry wellbeing and health, and so we put that out there as something—I don’t think we’re ready to say, “The perch has to be this long, and it has to be this many and [unintelligible],” all those little details. But the actual idea that you must have perches for layer hens seems to be a very commonsense, important standard to have in the NOP. The second standards we through out there, also for layers—I should’ve had one for broilers, but I didn’t—that is induced molting by feed and water withdrawal that—you know, sometimes we see birds going as much as two weeks without food to induce molting, and we don’t see any reason that that’s necessary. There’s also some economic consequences for the industry because the molting increases the breaker eggs, and there’s not a big market for breaker eggs in the organic industry right now. So it seems like there’s an
opportunity there to carve out a position in the NOP and set up a standard. The third issue is beef [unintelligible]—in the beef cattle domain. There’re a lot of standards that are coming out with specific space requirements for cattle in feedlots. We don’t have a huge number of cattle in feedlots right now in the organic industry, but we don’t know where this industry is going. And a basic principle that we feel would fit well into the NOP is that cattle in a feedlot situation should have [unintelligible] minimum amount of space to lie down, and that’s not always the case in conventional systems. The E.U. has very specific space requirement based on how much an animal weighs that’s also consistent with Whole Foods Tier 4-5 [phonetic] standard. I know Margaret Wittenberg is about to testify. You know, I don’t even know if you have to get to that level of the actual space, you know, numbers, but the concept that animals should have at least enough space to lie down seems to be a very important concept to have as a part of our program. Dairy cattle—tail docking. AVMA, the American Veterinary Medical Association, would say that the scientific literature shows that there’s no real value to tail docking. And at this point,
the science and the industry should come together here and say, “This is just not necessary in organic production and let’s just prohibit it outright.” Swine—gestation crates. Farrowing crates are going to be a big controversy for the board in the future, and the standards are all over the place when you look across the different programs on farrowing crates, and that’s a big discussion. But gestation crates seem to be something that we could prohibit right now, outright, just say no to, not necessary in organic production, not consistent with organic production. So we provide you some scientific references, some thoughts on those five issues. And in moving forward, I was trying to think of what I would do in your situation. There is something that’s appealing about the idea of putting together all the standards for a species, because if—perches—well, how do perches relate to the roost area, you know, to the—how many doors, and the placement of the doors, and then you start getting in, everything is interwoven in a certain sense. And there’s certainly an appeal to want to put together a species standard in a holistic way, but I would argue, if you try to proceed that way you’ll get bogged down because some issues are
more complicated and controversial than others. And just as a strategic process suggestion, Willie and I would argue that you try to move forward, once you start to get agreement on discreet pieces and put those into place, and make those recommendations to the secretary, and for the secretary to get those proposed rules out and public comment on them. Again, the industry is on the verge of growing. You know, we didn’t have organic livestock until 1999, so it’s behind the other aspects of organic production and it’s just exceedingly [phonetic] timely to invest the time and energy, and to pin down these desirable standards when we can. So that’s it. I thank you for your attention to my testimony. I will provide an electronic copy to the staff so it can go out on the Web site. I’m sorry I didn’t bring enough copies for everybody in the room. And I’m happy to accept questions if you have any.

FEMALE VOICE: Does the board have questions for Kathleen? Hue?

MR. KARREMAN: Just—I want to thank you, Kathleen, for bringing this to the board’s attention, and also your perspective from your experience in how to get things through the system in a good, clean, quick way, if that’s possible.
MS. MERRIGAN: I stand ready to help.

FEMALE VOICE: Do you have that magic one? All right. Good. Does anybody else have any questions or comments? Barbara Robinson?

MS. ROBINSON: Kathleen, are you suggesting to the board to do this in a species-specific way, or just—if they had consensus, if they agreed, say, with your five—suppose the—we were in the spring meeting, and they agreed with all five of your...

MS. MERRIGAN: Low-hanging fruit options.

MS. ROBINSON: And they were to just simply pass a recommendation on animal welfare—these animal welfare—are you suggesting that they not do it as just—but they do it as species-specific?

MS. MERRIGAN: [unintelligible]. Thanks for that question, Barb [phonetic], because I guess, in my ramble, I wasn’t as clear as I could be. I’m suggesting that when you have movement on any particular standard in this arena—

MS. ROBINSON: [interposing] Get it done.

MS. MERRIGAN: --move forward, get it done. Don’t try—and we all want to do things holistically, but that’s going to be the death nail of it. It just—it will not happen in the
time that you need. I mean, if it’s 10 years from
now, just think of—in the pasture debate, you had
certain operations, and they had this
infrastructure and investment, and it becomes a
very tough, tough thing. And if you’re talking
about a small number of organic swine producers, a
small, infant industry, now’s the time to put down
the standards, and also anticipate that not
everyone—gestation crates may not be a factor in
organic production right now. I don’t know. I
haven’t been to every swine producer, but I don’t
think it’s a major practice in organic production,
but it could be if it’s not prohibited. So now is
a great opportunity to move forward on these
things and build consensus before it’s too late.

MS. ROBINSON: So this could just—we
could amend the 205.239 section, you know, and
just amend it in piecemeal, adding various little
subparagraphs?

MS. MERRIGAN: Yeah.

FEMALE VOICE: Hue?

MR. KARREMAN: Just one extra thing, we
can also—for the more entrenched industries, like
dairy and perhaps layers, certainly we can canvass
individual certifiers and see what they do to come
up with something that is palatable and has
already kind of been in force at the certifier level, so we might be able to go in even though the industry is more entrenched.

MS. MERRIGAN: Absolutely. And of course, that’s the whole role of public comment, is to put out a proposal and get that public comment in. And USDA, in its history of organic, has done a really great job of responding. I think my colleague wants a word.

DR. LOCKERETZ: One of the questions that’ll come up in this sort of thing is how far do we go? Do we push the standards to the point of that things are the way we would really like them to be, or do we start out by presenting things that we really don’t want to see? [Unintelligible]—so there’s a minimal standard that will come into play, just to get the bad guys, the few people who are really below what’s acceptable these days; and then there are—the standards are dynamic. They can be developed to build onto that and go further to what we would like to see in the future. But you don’t necessarily have to propose standards that go all the way. Some people will not be happy with your standards because they don’t go all the way, but a practical strategy is to put a floor under
the practices now, and then in the future come back to it again and again and push it further and further, but at least start with things that are—by prohibiting things that simply should not be allowed in organic, period, and so there is no real argument about it, and then the arguments can come a little bit later.

FEMALE VOICE: Bea?

MS. JAMES: Thank you so much for your presentation, and I also want to thank Hue for actually spearheading this whole initiative to get this discussion going. But—and I apologize, I haven’t really had time to thoroughly go through your presentation here, but it seems to me that wouldn’t it be worthwhile to maybe look at the idea of an animal health and welfare task force? Because even thought it is a large issue, and yes, it could be something so monumental that we may not be able to accomplish it right away, but it seems like there’s more things that are immediate that should be addressed besides what you have here. And you know, I’m just trying to figure out the best way to try to come up with a first draft of a recommendation on health and welfare where we can have, maybe not the whole enchilada, but a little bit more than what you have here. And
would you agree with that?

MS. MERRIGAN: I would agree to that.

And you’re very kind to say you haven’t had a chance to read through all the testimony, since I just passed it out. I apologize to the board for not sending it sooner. We chose these five issues as illustrative of the opportunities that the board has before them in terms of this arena. A task force might be a very appropriate way to move forward. You also have your subcommittee. I don’t know how the board wants to proceed, but I do want to say that Willie and I stand ready to assist the board in preparing the background documentation, and to the NOP, because I have a little inkling of what it takes to get a rule out. You know, we’ve spent a lot of time this last couple years looking at various standards, looking at the scientific research, and we want to help bring this to public debate.

FEMALE VOICE: Hue?

MR. KARREMAN: One last thing. I guess I would be—I’d like to just possibly start with this within the Livestock Committee. I think task forces can have extremely long lives and, you know, the AEWG’s been around nine years and they’ve done a great job and—nine years, isn’t it?
Eight, whatever. They’ve been around a long time.
And I think if we just start with some of the low-
handing fruit, as they mentioned, I think
Livestock Committee, as a committee, can start
with that at least, and if there’s bigger issues—
even the pasture issue, we worked on within the
board and not a task force. [Unintelligible].
Thanks.

FEMALE VOICE: Any other questions?

DR. LOCKERETZ: I’d like to just add one
point to that as far as how much work is involved.
You’re not—you don’t start from the beginning.
There is a tremendous amount of work that has
already been done in other countries, which we
drew on. [Unintelligible] in Sweden has very
highly evolved livestock standards; Soil
Association in Britain has a very evolved
livestock standards; and any number of others, so
a lot of the work—the groundwork—has been laid
already by very responsible and effective
certifying programs and standards writers in many
different countries. And so the task is not as
enormous as you may think, because people have
been working on this for so many years already.

FEMALE VOICE: Bea?

MS. JAMES: I know we have a lot to do
today, but I just really want it to go on record that I think that this is an extremely important issue; and that I believe, from my experience in retail, that consumers have an assumption that a lot of this is already in place, even though it’s not in place; and that I really feel that it is the duty of the NOSB to try to bring to the forefront these—the health and welfare standards, because the—it encompasses the environmental issue that so many consumers want to believe that they’re eating things that are coming from the natural state of their natural environment. And I mean, when we’re talking about fish, and the living conditions and the welfare conditions there, that it seems like our focus oftentimes is on getting to production, and that we also really need to keep in mind that the environmental impact that we will create with a standard that we develop really needs to be taken into consideration, too.

FEMALE VOICE: Hue?

MR. KARREMAN: One last note. I mean, there are already good regulations in the book which the industry has started from, and that’s due to your work and your work over there. And there’s some areas where it’s silent, and I think
that’s where we need to fill in. But there are
certainly good regulations already that consumers
can rest assured with, we just need to fill in
some of the silent areas. Barbara has something.

FEMALE VOICE: Barbara?

MS. ROBINSON: Let me just reinforce

something Kathleen made—a point Kathleen at the
beginning, and then again at the end of her
testimony, and this is really important here. I
think the critical point here is that this is an,
as yet, less-developed industry. Economic rents
have not been really built up. I mean, meat is 2
percent of this industry in terms of retail sales.
So I think the point Kathleen is making to you is,
if you do want to do something, first of all, keep
it simple. I mean, I can’t stress that to you
enough. You start creating task force, you start
creating your own infrastructure and then we’re
another two years down the road before we get a
recommendation from you. By then, the industry is
that much further along. And I think what
Kathleen is saying is now it has an
infrastructure, that means it has economic rents,
it has something to lose when you go to make
changes. And when it has something to lose, then
the consequence of us disturbing that with rule
making makes it that much more complicated and stretches out the time that it will take to effect those changes. Whereas the sooner you do it, with an underdeveloped industry where people haven’t put in place a lot of these things, it’s pretty simple to come out and say, “Birds should have perches.” That’s the whole statement, that’s it, birds should have perches, and then we let—we kind of let the industry morph around that. And what Willie is saying is, you know, we don’t try and address the whole thing, just get your toe in the water, do something. Animals should be able to lay down without touching, simple statement. I could work with this; I could do something with this; and, you know, you go from there and you don’t get a lot of—you haven’t done something drastic to an industry yet because the industry itself hasn’t—help me out here, Kathleen. It’s—it has not—

MALE VOICE: [interposing] Matured.

MS. ROBINSON: Yeah, it hasn’t matured and it hasn’t put all these systems in place that you then disturb.

DR. LOCKERETZ: But we have to also recognize that standards for livestock are much more difficult, much more complicated than plants.
There’s more of a history in plant production, organic plant production. So it’s not a trivial job, but it’s quite appropriate to do it in steps and do some basic things first. But it’s a subject that seems to be much more difficult for people to wrap themselves around than plant production, maybe because it’s newer. Organic plant production goes back 60 years, and livestock is much more recent than that, so it will not be a trivial job to complete the task. But you don’t have to worry about that, as far as getting started.

FEMALE VOICE: Okay. I have Dan. Is there anybody else besides Dan? Dan?

MR. GIACOMINI: I’ll certainly respect the experience the two of you have, but in the brief observation I have, it seems like the only one that’s easy is the first step, and every time after that there’s already the first step to deal with and everything that comes up—that comes with it. And I agree with what you’re saying—there’s a tremendous amount of history already; not having to get into the length of time of a life of a task force; but I’m hoping that when we do look at this, for a spring meeting or something, we have more than, you know, four to six things that we’ve
looked at because it seems like the second step is
going to be much harder than the first step, even
if the industry hasn’t developed, because you have
all the other parts that go along with it of, you
know, “Well, what’s the status of the previous
recommendation we made”? and, you know, “Is it
going forward? Was it accepted? Was it
implemented”? you know. It’s—I’ll trust your
[inaudible]—

[break in audio]

MS. MERRIGAN: Well, I know how
frustrating it can be, being on the NOSB, having,
again, sat in your chair, when you make
recommendations and then there’s only so much
control you can have about how they’re taken up
and the process by which USDA vets the
recommendation to the federal register. But you
can only do what you can do, and come up with the
good recommendations, and be a focal point for
this very important topic that people want to talk
about and want to come to consensus on. And then,
you know, hopefully, Mark [phonetic] and his team,
Barbara, will put the wheels in motion. There’s
only so much you can control, and again, I think,
if you at least get out a first series of
recommendations, the easy ones—they’re going to
get harder. But if you get some of those out, then people are going to say, “Hey, that NOSB, they’re about animal health and welfare standards, and that’s the forum to go to, and that’s where it’s going to be happening,” and USDA’s going to be looking to you for help in this area because this area’s hot, and it’s going to get hotter. And as Bea said, consumers have certain assumptions about what organic foods are, and we need to understand that and respond to that. So we thank you for your attention today. I know Margaret’s [phonetic] behind me, waiting to get the podium. And again, we just want to, in any way we can, support you in your very good works. Thanks so much.

FEMALE VOICE: Wait one second, Kathleen.

[Unintelligible]-

MS. MERRIGAN: [interposing] Oh, sorry.

FEMALE VOICE: Mine’s very quick. I did not get a copy of your paper, so if you get a chance, if you could get me one, I’d appreciate it.

MS. MERRIGAN: Certainly.

FEMALE VOICE: Thanks.

MS. MERRIGAN: Thank you.

FEMALE VOICE: Thank you very much for
your presentation. Next up we have Margaret Wittenberg, with Whole Foods, to give us her presentation on global animal welfare initiatives [phonetic].

MS. WITTENBERG: Okay. Thank you very much.

[unrelated conversation]

Okay. While Valerie’s [phonetic] putting the presentation up on PowerPoint, I wanted just to thank the board for this opportunity. It’s really great being here, and wonderful being able to follow, you know, the previous comments. I think they’re just right on the beam here. And what I’m going to be [phonetic] talking about is really enchaining the animal welfare—health and welfare within the organic livestock standards. I think it’s been teed up for us on how important this is and I want to show you a new approach that I think you might find quite interesting and quite helpful. It’s a tiered, five-step animal welfare ratings system approach. Oh, and for the record, my name is Margaret Wittenberg. I am the global vice president at Whole Foods Market for quality standards and public affairs, and I’m also proud to be a prior National Organic Standards Board member from 1995 to 2000, and a livestock member
for that five-time-five years as well. And I
think that’s been interesting—we’ve learned quite
a lot from that time. I remember when we were
wrestling with all these issues, just even the
basic issues, from when I was on the board, and
now a lot has really changed. A lot has really
changed in the livestock field and the consumers
are really interested in more. You know
[phonetic], as this has already been kind of
reiterated, that there is a consumer demand for
this now. I know, even with Whole Foods Market in
the early days, you know, people were interested
in it, but now the demand is there, they’re really
looking for something. But they’re already
expecting that organic is a gold standard; they’re
already expecting that all of these standards have
already been figured out, and I think we’ve seen
that with the organic—the pastures and the dairy
situation. Very, very strong consumer outcry on
that one, and that’s just pasture. There’s so
many more opportunity with that. We’ve already
heard about the livestock standards being very
different throughout—not only in this country, but
also throughout the world. I know that the E.U.’s
been working on different issues on this as well,
and the consumer publications are really getting
into this and showing that there is a lot of confusion on meat labeling and in poultry and in diary labeling. And then, certainly, there’s also—livestock producers are now seeing [phonetic] that they have uncertainly about creating systems, “How do you do this”? They’re interested in it, but how do you do this? So the—I’m going to show you just the—one of the more recent things I’ve seen in the consumer publications. Many of you are probably familiar with the UC Berkeley wellness newsletter. It’s a great publication. I’ve been a, you know, fan of that for many, many years, and this one just came out in November of this year, and the title of it is “Got a Beef With Your Butcher”? And within this they’re talking about beef labels, and I’m going to read it because I know there’s some people behind that can’t see the screen very well. But it says, “Beef labels, even those that are independently or government certified are confusing. Don’t assume, for example, that organic beef comes from animals never confined to feedlots or treated and slaughtered more humanely, or that natural grass-fed beef is raised without antibiotics or hormones. Natural is not interchangeable with organic, nor grass-fed with pasture-fed. If you
care about these issues and don’t mind paying extra for your meat, you may want to do a little background research.” And then within the article, they list some of the different labels, and this is what they have for USDA certified organic: “To meet USDA organic standards, cattle are raised on 100 organic feed, whether grass or grain, that does not contain animal byproducts, manure, poultry litter or plastic pellets, and without antibiotics or growth hormones. They must have access to pasture and opportunity to exercise, though what this means is still not specified.” So that’s all they could say about the organic label, and consumers are expecting a lot more. And then for producers, too, many of you’ve probably already seen the Organic Farm and Research Foundation’s—their 2007 National Organic Research Agenda Report. In chapter three, they get into the organic livestock and poultry management systems and they have a summary of the research goals that they are really hoping are [phonetic] happening, focusing on animal welfare and health. Says, “Production challenges persist due to lack of well-funded research efforts targeted [phonetic] at specific animal healthcare, pasture management and nutrition issues.
Producers rank animal healthcare as their highest priority for organic livestock research. Effective disease controls will require systems-based research on intensive [phonetic] grazing management, good nutrition and strategic use of supplements and preventative treatment. Standard, economically viable rations [phonetic] to complement pasture and provide complete nutrition for all species of livestock and poultry within the constraints of the national organic standards also need to be developed. And then finally, breeding programs that emphasize adaptability to organic management systems are needed to enhance animal health and productivity.” Well, I’m here today to give you some—you know, just share some insights that Whole Foods Market has had with our experience working on animal welfare standards within our own meat and poultry quality standards program. We’ve had meat since, well, about April of—let’s see. April 1981, a few months after we opened our stores, when we first starting selling meat. And then at that point, we just focused on, like—

[END MZ005012]

[START MZ005013]

MS. WITTENBERG: —the no antibiotics. In
fact, it was no subtherapeutic antibiotics at that time. This was very early in the game and producers really didn't know and we were just trying to find small producers. Well, as we—as the years went by, we found people were interested and some of the pioneers in the field.

But in 2000, we decided, you know, we needed to do more. We needed to go beyond just the added—no added growth hormones. And at that point, it was [inaudible] had said no antibiotics, not just subtherapeutic, but no antibiotics. And we wanted to put more emphasis on the humane treatment of animals.

So we started working on that. And then in 2003, we went another leap. We decided that we were going to initiate in addition to our just basic standards or benchmark standards a whole another label called the Animal Compassionate Standards.

And how we developed that is saying that we had two—we understood there were two goals, primary goals within livestock production. Goal A is to maximize the welfare of the animal. Goal B is to maximize the cost and maximize efficiencies. And so with the Animal Compassionate Standards, we wanted to have goal A—oh, wait a
minute. I had this—the wrong [inaudible] my
goodness. We want to have goal A supersede goal
B. There we hare. So I will change that before
it goes on the public record—well, actually on the
web site. But we wanted to have the—we wanted to
maximize the welfare of the animal over the issue
of minimizing costs and maximizing efficiencies
while at the same time knowing that we needed to
have producers that could make a living. I mean,
my goodness. That's certainly an issue.

So as we were doing this process, we
realized the complexity. We'd heard about that
before here with the complexity of the influences
that affect animal welfare. You have genetics.
You have indoor and outdoor environment, health,
group size, stock and density, feed, all of that
type of thing. And even on the other side of the
coin, just plain old management, husbandry and
being a good stocks person. All of these are many
components of it.

So we are finding that there's there
complexity. This was even more than we had
imagined. So then what we did is that thought
okay, we need to get feedback. And we're very big
on multi-stakeholder group processes. There's no
way a grocery store that's committed to any amount
can do it on its own. You have to get input from a lot of people. So from winter 2003 to spring 2007, we have a series of Animal Compassionate Standards developmental meetings.

And we included animal advocate groups including like Humane Society of the US, PETA, Animal Welfare Institute, Animal Rights International, Animal Place. The producers, we went—like first we started with ducks and then beef cattle and so on. And those producers, the [inaudible] market producers at—of those species we invited to this meeting.

We also had a third party auditor representative so that when we were working on standards, they were saying you know, you can't audit that or that's something you an audit or look at it this way kind of thing.

We also went the world over to find animal welfare scientists that could really give us the detail work on who were experts in these issues—Dr. Jim Webster [phonetic] from New Zealand, Dr. Ian Duncan from Canada, Dr. Mike Appleby [phonetic] now from the U.K., Dr. Temple Grandon [phonetic], people know her from United States, Dr. Renee Bourgerone [phonetic], who is in Canada, and Dr. Joe Stuckey's [phonetic] also from
Canada. And then we also had a lot of committed Whole Foods Market executive leadership there; our quality standards team and our national meat coordinator, regional meat coordinators.

Okay, so the insights of all of this, what we found on that is that the producers really wanted and needed support. They are interested in it. They wanted to do it. They thought, you know, this is a big field, don't really know how and what.

And when we have these multi-stakeholder meetings, we're going through like detailed detail. It's kind of reminiscent of going on—being on the National Organic Standards Board. If you like detail, you're in heaven. And this is how these meetings were, too, and sometimes a little heated. And, you know, that's fine because I think that's where you get the real nub of it on what is really important.

We also understood that more research was needed on alternative livestock. You know, the OFRF has always been very good on showing how organic research in general needs more work. Well, we talk about animal welfare, whether it's conventional or organic, there's a—certainly a need for that.
So what then we did is that we also realized that we needed to see if we could help fill in those education research gaps. So we actually created a private foundation called the Animal Compassion Foundation in January of 2005 to do that. And we hired a wonderful woman, Anne Malleau, who is actually—had done all of her research in Canada with Dr. Ian Duncan, who is a well known—worldwide known poultry—animal welfare poultry expert. And she's been in charge of our program here. And these are sample research fundings that we have done so far and still working on. One is alternative to castration in pigs. You know, one of the issues on—with male pigs is boar taint. You know, how do you get—you know, if you don't castrate, then you have that issue, especially in the United States , as we grow—the pigs grow larger here as opposed to Europe when they are slaughtered younger and you have that issue of boar taint to deal with. So there's a certain feed additive that—an herb that is being looked at to see if that could really work on that.

Breeding short-tailed sheep to eliminate tail docking, pastured poultry, how do you maintain pond quality, how do you maintain pasture
for ducks and geese and turkeys and then how do you deal with making sure that you don't just really denude the land in the process.

And then another one is like looking at transport and the welfare of pigs. And then we also did a lot of workshops to any producer. It didn't have to be Whole Food producers. We just put that out in the network and people would come and we really focused on grazing workshops this past year to really get people back into pasture and really knowing how to maintain it and what to do and what integrated livestock systems are like.

So then as kept going through this and then Animal Compassion meetings, we realized that, you know, you just really can't do an all-or-nothing thing. and—because there are different gradations there. There are some producers were at a certain level and others were at a wide level. But if you just had, you know, two different types of labels, you could have people who were doing minimal effort being lumped in with people who were just doing incredible and—efforts. And we thought, you know, that really isn't fair. And they also should, you know, get economic value for all of the work they put into too.

And we also saw that a lot of producers
were really kind of reticent. They—you know, if I have to go like to the nth degree, I just don't know if I can do that right now. So maybe I won't do it at all.

So we thought about that. And then we thought, you know, what we need to do is look at a five-tiered system. And not only would it be helpful for producers, but also for the consumers. So next slide.

So what we did is we worked on this internally. We took all of the information from the Animal Compassion Foundations. We worked it into a five-tier program. And I'll get into that a little bit of that in just a second here. And we actually initiated it in our Kensington—New London/Kensington store in June of 2007, this year. And very successful. Consumers loved it. We had a lot of producers over in the UK that we were all ready to put in the program there.

And what—the three things that we think that are best about this, it supports continuous improvement on farm animal welfare. It's a framework. It's a framework for producers knowing how they can continue to improve as they move along and get recognition all the way.

Increases opportunities for farm animals
to be treated with dignity and respect in conditions that let them express their natural behaviors. And it's a fabulous transparency tool for consumers and we also found very educational. People really have no idea how meat is produced. They don't want to hear it. A lot of times you say well, do you know how? They say I don't want to know, you know? And have you ever been? You know, no. They haven't been in slaughter plants. They don't want to know about that either.

But it is important for them to know because if they're really concerned about the meat that they eat and how it's really impacting the animal and the Earth and everything else, it's very important to know that.

So you see on the bottom of the screen, there are five different labels that we used. And I'm going to get into those in just a second in just a little bit more detail on that.

But—next slide.

But I do want to tell you that it is very, very focused on independent verification and auditing. In fact, we spent a lot of time working on this because being connected to the organic program and just knowing how important that it is for third party audits and to be—and anything that
you put out there as a standard has to be verified. We thought this was a—we put a lot of effort into this program. In fact, even [inaudible] of this year, the USDA Food Safety Inspection Service approved a label recognizing our five-step animal welfare rating system. And it, you know, a process label that authorized producers that can meet the requirements to actually use that label. So we're very, very proud of that and that work.

But the verification bodies, we had long decided that we wanted to like organic have the ISO-accredited verification bodies. We felt that it was very important for credibility.

And the auditors have to also go through very, very specific training on how to audit to the five-step animal welfare rating program because this is not a normal thing. This is—we looked the world over and there's not many systems where on a standard that they have these five tiers that people are looking at.

And there's also when they're doing the audits, they're looking at recordkeeping, condition and practices on the farm and ranch, and then the slaughter plant.

We're also developing producer guidance
materials and also auditor guidance materials so that they know what to look for. And we also tested this in the summer. This summer, we invited many auditors who had livestock training. In fact, many of them were organic auditors already and verification bodies to come and do a training with us on this program. It was a three-day training on farm. And we also used it as a trial of the standards and also wanted to have feedback. And it was just an extraordinary event, very extraordinary. We learned a lot and got a lot of insights and that type of thing. So it really made us examine more and see what we could do with this.

So next slide real soon and we'll get more into the details. [Inaudible] just one more slide. Okay. Okay, thanks.

So anyway, just wanted to get into this a little bit. So the five steps, steps one to three are varying degrees of welfare practices. The first one is a benchmark, which is the minimum welfare standards.

This is not, you know, you sell meat, you get a level. You have to have a certain minimum level of showing that you have animal welfare or you are concerned about your farm, you know what's
going on. So just a, you know, a couple of these things, you know, this is just a very, very, very small list, but no animal byproducts in feed, no gestation or farrowing crates, third party audits on slaughter to make sure that humane slaughter is being done throughout the process, just a few. There's just a score of many more that really indicate that. In fact, even for the FSIS on these labels, and you can't see the detail, but we had to put a good summary of what each step meant. You know, if you have just a one label, you just say well, here is the label and you can look at the information on a web site or a brochure. But this, we had to summarize what each of these levels meant on the label so people could see.

Step two, outdoor access is required. So that brings it another level up. And we also, just a couple more things on that. You know, shade was required for any outdoor area for the livestock. Extended weaning requirements, you know, we wanted to-the-there was a minimum weaning for bench one, for step two had that extended. And everything is incremental. You, you know, it kind of adds on to each other with each of the steps.
Step three is pasture-based, continuous access to pasture. Pasture is just, you know, is where the animals live. It's really important. [Inaudible] access to shelter. That's definitely an aspect of this as well.

Next one.

Animal-centered and animal-centered gold, four and five. This one, who's—it really ratchets it up. And in—this is where we have the all integrated—integrated all farm approach with proactive measures that demonstrate, you know, agricultural animal production systems have a primary emphasis on animal welfare. This is really where the rubber hits the road when you're really looking at the [inaudible] animal welfare.

And so this gets into, you know, even more stringent on even higher standards than step two and three and so forth on transport and weaning and everything you can imagine. And then even on step five, there's no transport off the farm because transport is one of the hardest issues or—on an animal, one of the most traumatic parts of their lives. So anyway, they found that transport was something that we really wanted to have on step five is as one of the big highlights on that.
Okay, just what do these standards cover? We'll, they're outcome-based standards on how does it affect the animal's wellbeing. And you can see that the—on the on the list on the left, beef, cattle, sheep, or other, chickens, turkeys, ducks, laying hens, pigs, dairy, veal, these—we're really trying to get in all the detail on it. And these are detailed standards. They get into farm plan and documentation, pest and predator control, breeding and source of livestock, animal health, animal handling, animal management, feed and water, outdoor conditions and land management, housing, loading and unloading and transport. And, you know, that's for pigs. And then on the next slide, we get into the poultry and, you know, just a few little nuances. You have hatchery in there and so forth. And then the beef/sheep, you get into other details that even go right in with the—with beef/sheep and so forth.

But the other—when we were developing these standards, the standards, some were for all steps, that they were just so basic to the program, they have to be. And then you have others that are different steps within one standard that kind of differing [phonetic], like transportation, now long we will allow for
transportation along the different steps from
going from the farm to the slaughterhouse and so
forth.

Okay, and so then we decided to take this step. We found that, you know, private standards are real great and we—very proud of them at Whole Foods Market and so forth. But we felt, you know, we really want—if we are really interested in animal welfare, we're going to make them available to any retailer, any producer in the world.

And so we decided to move this from a private standards program to an independent global verified labeling program with a new not-for-profit that is outside of Whole Foods Market, completely independent foundation called the Global Animal Partnership. This will be a successor to the Animal Compassion Foundation. It will include the animal welfare education, the research, but also include the—this verified labeling program so that you have the five-step program within it.

And so right now what we're doing, and as this global animal partnership is being finalized, it'll be launched in early spring 2008, we're completing a—an intensive re-review of all of the five-step standards that Whole Foods Market has
already done with a—this—an independent task
force, again with animal welfare group
representatives, farmer representatives and
producer representatives, animal welfare
scientists and retailer. You know, quite frankly,
we're a retailer in there, but we have all of the
others. This is not our—we don't consider these
our standards anymore. These are out there.

And so what we're doing is working on
those right now. And as soon as they are all
completed—and we're getting quite close to that
and also the verification program and the
training, we're getting close on that too, but
once this foundation is launched in the early
spring of 2008, all of this will be on the web
site, all of the details on the standards will be
there. They will be by species. We think that's
very important because an animal isn't an animal
is an animal. Each one of them has their own
needs and it was extremely apparent as we've gone
through since 2003 on extremely detailed meetings
on these issues that you really have to go for it.

And quite frankly, both—these meetings
were open to both the conventional and organic
producers that Whole Foods Market has been dealing
with. And we see that animal welfare is important
for all. But we think, you know, here today just saying, you know, there are some things that you can explore and look at. You don't have to start from scratch. There are some things that have been third party reviewed globally throughout the world. And we're really anxious to have you look at the details as soon as we're ready to have them launched, which like I said, the new foundation will have them, you know, hopefully in early spring.

Then on my last slide here, just again, why the consideration on this. You know, we do think it's consistent with core organic principles. It emphasizes continual improvement by rewarding a higher rating to producers who improve their practices.

It's really important that, you know, we don't know the whole story all of the time. And a producer, you know, the incentive, then give them the opportunity to get credit for that. I think it's really important. And that also goes along with the organic as we're continuing learning. That's how the whole organic process is.

Greater transparency regarding the treatment of farm animals, so consumers will know how to really evaluate the meat that they eat, and
multi-stakeholder process, this has definitely been a multi-stakeholder group process open for any of the slings and arrows and suggestions and everything. It's important and we went through all of that.

Scale neutral, the—definitely scale neutral, but there's certainly a good support for small, local producers, especially when we get in the higher tiers. Levels four and five are probably easier for a smaller producer than for a large.

It's a good extension of what's already in the national organic standards. And it's also consumer tested. When we've done that in UK and we started with the lamb, chicken, beef, and pork, that was already at step four. You know, it was pretty amazing being able to do that. And they're very stringent standards to boot, and then ducks and veal even at step three.

So anyway, I again am very happy to be able to be here today and to share and I look forward to and we can give you even more detail on it so that you can look at it and we'd be happy to continue to work with you. And I know the new foundation will be very thrilled for the opportunity too because animal welfare's important
for all of us.

So thank you.

FEMALE VOICE: Thank you, Margaret. Dan [phonetic]?

MR. GIACOMINI: Margaret, do you think these kind of labeling programs are at risk at all if there's any continued swell of—and carryover from the recent milk labeling court decision?

MS. WITTENBERG: You know, these—when you have very detailed regulations on a label where people know exactly what they're getting and you've got a really—a real high quality verification and auditing program, I think this is—just enhances opportunities for people to know what they're getting and for producers to know what they should be doing. And if you have the verification program right, it can be verified and, you know, done well.

So I think this is going to be a real boon for organic to have people really understand. What really frustrates consumers is not knowing. They are forgiving if you say you know, here is what we're doing. We're not where we want to be, but, you know, this is where we are now. Much better than if they find out the other way. It's like, you know, we really thought you've been
doing something else and we're feeling like we've been had. So I think what is great about these standards is that they're very detailed. Here is exactly what you're getting. And you know when you're buying that meat. And you have a conscious choice, whether it's organic or conventional meat, you can say, you know, in our case, and we will be having this in our retail stores, these five-step standards, both organic and conventional meat will have it labeled at a certain step so that our consumers really know.

MR. GIACOMINI: But do you think that—do you think there's going to be—the question, though, is do you think there's going to be any fallout and attack on these questions from the more conventional feedlot part of the beef industry, for instance, in light of the new—the recent court decision on the milk labels where they can't use no BST [phonetic]. They can't have any of those kind of—there are certain areas of the country where they can't use any of those kind of statements anymore.

MS. WITTENBERG: Yeah. Well, we're—we do see in—I think what you're getting at especially is we're looking really at the production methods. And, you know, rbST, it won't be allowed in these
standards. But what we're going to be doing is really, you know, really focusing on, you know, if you're talking about feedlots, exactly what does that feedlot have to—the conditions for that animal.

It's pretty much—it's pretty objective information on this, things that you can actually audit and look for. And I think that's the real key here. If you've got a really good auditing program, you need to have something you can really audit to.

And the rbST, you know, that's a hard one for—to really test for. And you have to really, you know, kind of look at records, know what the producer is doing and that type of thing. But with the way that we have this program set up, it's very specific on things that can be audited.

FEMALE VOICE: Hue first, and then Bea [phonetic].

MR. KARREMAN: No, that's okay.

FEMALE VOICE: You going to pass? Bea?

MS. JAMES: I just want to thank you and congratulate Whole Foods for taking on such an initiative. I know it was probably a monumental amount of work to try to come where you are today and that if it is successful, it is really going
to benefit consumers and retailers. So thank you.

MS. WITTENBERG: Thanks Bea.

FEMALE VOICE: Board comments? Any more board comments?

Thank you, Margaret.

MS. WITTENBERG: Okay. Thank you very much.

FEMALE VOICE: Just a status for the board, if we work really hard and we get through these as -

[Crosstalk]

MALE VOICE: - dinner?

FEMALE VOICE: - as quickly as possible, we'll be done around 8 o'clock. We are that far behind already. So again, you know, I'm not—I don't want to stop anybody from having any questions, but just know that we're right now very much behind.

MALE VOICE: [Inaudible].

FEMALE VOICE: Our first commenter is Jim Pierce [phonetic]. Are you here, Jim? On deck, Tom Hutchison. Tom? There he is.

MR. JIM PIERCE: Eight o'clock, huh?

Are we ready? Okay. Excuse me. Okay, for the record, again, I am Jim Pierce, self-appointed certification czar at CROPP Cooperative
representing over 1200 member farmers in 28 states
who market under the Organic Valley and Organic
Prairie brands.

This year, we accomplished two things
noteworthy to the NOSB. In the six weeks leading
up to June 9th, 2007, what we like to refer to as
H-day, we brought in just over 2500 dairy farms
into the co-op as we wistfully watched the sunset
on 8020 [phonetic].

Second, maybe more noteworthy, we
conducted an internal audit on every one of our
nearly 900 dairy farms to assess compliance to the
NOSB 120-day, 30% pasture recommendation, which
has been adopted as co-op policy.

In a nutshell, it can be done and it is
being done and it can be measured.

With the logjam of 606 get-'er-done lists
barely behind you, it's exciting to see this
diverse agenda, so many things to comment on and
yet so many good people here to tell you what they
think and tell you what you should think.

My comments will be limited primarily to
materials. These comments have, by the way, been
carefully vetted, scrutinized, and censored by and
so are indeed the position of CROPP Cooperative.

I begin with a cooperative confession.
We have use issues. Of the seven processing materials being reviewed for re-inclusion, we used three. We use animal enzymes to make award winning cheddar cheeses and Italian cheese. We use carrageenan as a stabilizer in chocolate milk. And since we're bearing our souls here, let it be known that in 2000, we actually petitioned [phonetic] cellulose for use as hot dog casings as and as a flow agent for shredded cheese.

Since its addition to the national list, we have tried, really tried to kick the cellulose habit. And, in fact, to a large degree we have. Since cellulose is synthetic and since it has to be labeled and since we strive for clean formulation in labeling, it's clearly in our best interests to do without. In fact, many of our shredded cheeses are dry enough that they don't need or contain cellulose. And the mantra for the rest of the shreds is as-needed.

Please forgive us along with so many others for missing the opportunity to endorse these seven materials early on. We encourage you to approve all seven processing materials, as well as the five crop materials for reinstatement to the national list.

Of equal or greater importance is the
pending approval or rejections of three crop
materials. Time for another confession—I read all
of the petitions, TAPs, and recommendations. And
I enjoy it. I know it's serious geekisms, but I
can't help myself. I'm hooked.

The crops committee is recommending the
rejection of all three of the materials being
reviewed at this meeting. But I don't see it
quite as—quite that cut and dry. I see all three
of these materials as having uses that are
compatible with a system of organic farming.

Potassium silicate in particular I see as
a material that was endorsed by a previous NOSB
board and one which could be used instead of
copper and sulfur products.

As a standards conservative and a
materials liberal, I would remind you that the
toolbox for organic farmers is severely limited,
as it should be. I would also remind you,
however, that when it comes to adding materials to
the national list, this committee has a persistent
history of making decisions not always based on
reason, let alone science.

Your clear mandate as NOSB members is to
review materials. My request is that you read the
petition and TAP carefully, challenge the
committee recommendations, and then make your own decision.

If the committee convinces you of their position, by all means, vote to prohibit. But if not, please have the courage to overturn that decision.

In the minute I have left, I would like to deliver a message from our farmers to the NOP [phonetic]. Keep in mind, this was written last night.

Please, please publish the 12 livestock materials that were included, including the troubled six, and please, please publish the pasture rule.

The timely publication of the pasture rule have parried a tremendous amount of largely unnecessary damage to the organic—to the integrity of the organic label, saving everyone, including yourselves, unnecessary pain and stress and it's clearly prohibited in 205.238(a)(5) [phonetic].

With the delay of the livestock materials, it is important that you realize that you are unfortunately responsible for unnecessary pain and suffering of organic livestock. Even the best, most humane organic animal husbands are not doing the best they can because they can not reach
for butorphanol, xylazine, or flunixin, materials that were determined five years ago to be compatible with a system of organic farming.

Good and hardworking NOSB board members, please make it your issue, your passion, dare I say, even your addiction to keep pressure on our fine appointed public servants to move your work through to our farms.

Thank you.

FEMALE VOICE: Thank you, Jim.

MR. PIERCE: Okay, questions?

FEMALE VOICE: Questions for Jim? Julie [phonetic]?

MS. WEISMAN: Could you specify what—you mentioned seven materials. Three of them you use, but you were endorsing the approval of seven handling materials. And six of them I can figure out, but I'm not—could you specify what all seven are?

MR. PIERCE: They're all listed in the agenda, so I'm not sure if I-

MS. WEISMAN: [Interposing] Mm-hm, okay.

MR. PIERCE: - can recite them the same.

MS. WEISMAN: Were you including petitioned material?

MR. PIERCE: I was including the—
referring simply to the sunset materials.

MS. WEISMAN: Only to sunset.

MR. PIERCE: Because that was an issue -

MS. WEISMAN: [Interposing] Right.

MR. PIECE: - with the processing committee that they simply had not had any -

MS. WEISMAN: [Interposing] Yes.

MR. PIERCE: - any feedback, so there's ours.

MS. WEISMAN: [Inaudible].

FEMALE VOICE: Thank you, Jim.

MR. PIERCE: All right, thank you.

FEMALE VOICE: Any others? Thank you very much. Tom Hutchison? And then on deck I have DeEtta Bileck. Are you here? Okay. How about Alex Moreno [phonetic]?

MR. TOM HUTCHISON: Good afternoon, everyone. My name's Tom Hutchison. And I am the regulatory and policy manager of the Organic Trade Association.

First, I'd like to thank the board for its extremely hard work in generating and covering all of these agenda items and extend congratulations for a successful and informative aquaculture symposium yesterday. We look forward to continued progress on a broader aquaculture
standard and we support the recommendation on bivalve mollusks.

Hope you've all had a chance to look at OTA's comment on the recommendation on multi-operation certification, which we submitted through regulations.gov and which I'll review in a moment.

We also have a detailed comment on the definition of materials, plus shorter comments on a number of other agenda items. Please refer to the handout for the specific comments.

Regarding the recommendation on multi-operation certification, we believe that our comment addresses the root problem that gave rise to this agenda item, which is the logistical problem of how grower groups meet the inspection requirements of the rule.

We provide a framework that addresses the agricultural segment and emphasizes a single organic system plan with a single internal quality system, a definition of production unit that defines the focus of the annual inspection, and we call for the development of detailed inspection protocols.

The following are specific recommendations. One, the agricultural group must
be organized as a single legal business entity, such as an association or a cooperative, and our use of the terms does not mean that they are legally defined as under US law.

Each agricultural production unit must be inspected as part of the required annual onsite inspection under the NOP. Plots or subunits within an agricultural production unit must be within geographic proximity, but need not be contiguous.

Individual members may be split or parallel operations, including plots intended for self-provisioning. However, if prohibited substances are used on any portion of that operation that adjoins an organically managed plot, that portion should be considered a higher risk for loss of organic integrity and factored into the choice of subunits to be included in the organic inspection.

And lastly, only products marketed through the certified group operation may be represented as organically produced.

For more detail, please look at the full document provided in the handout.

Again, OTA has chosen to address only the original segment of concern to the NOP and NOSB
and we hope our comment set a template for consideration by the board.

Regarding the definition of materials, we appreciate the thoughtful consideration given by the joint materials and handling committee to these complex issues.

We disagree that an agricultural substance can be processed to a point at which its agricultural nature ceases to exist. We support a broad definition of consumption as used in OFPA's definition of agricultural products, to include personal care products, fiber, etc.

Regarding the definition of non-agricultural substance in the final rule, we support either ending the definition after the word mineral or perhaps substituting the phrase mineral derived substance for bacterial cultures and ending the definition there.

We agree that the concept of unrecognizable substances is not useful. And we appreciate the effort to develop a different model for classifying substances, but believe that the new paradigm does not go far enough. And we disagree that some life may not be agricultural, especially if it is ecologically managed.

On other matters, OTA supports the
research recommendations, believes that any
substances being considered for sunset review be
approved to remain on the list absent any new
evidence for removing it, supports standard
certification information as recommended, urges
the handling committee to move the Pet Food Task
Force report forward for recommendation by the
full board, and supports the proposed guidance on
commercial availability, noting that recommending
approval of a substance should not require
documentation of its current commercial
availability.

          Thank you very much for your
consideration.
          FEMALE VOICE: Thank you, Tom. Is there
questions for Tom? Tracy?
          MS. MIEDEMA: Just one quick comment.
          I'd like to publicly thank you, Tom, and the OTA
for convening the task force that produced this
excellent body of work and also publicly thank Kim
Dietz [phonetic] and Grace Gershuni [phonetic] for
their leadership of this group. It was quite a
large task force. It was one of many groups
weighing in on this issue under quite a bit of
time sensitivity. And I know many of you came to
this meeting expecting a vote on a recommendation.
And as we have found, we're much more at the beginning of this question that at the end. And I just wanted to thank you.

FEMALE VOICE: Any further comments or questions for Tom? All right. Thank you, Tom.

Next up is Alex Moreno. Are you...

MS. DEETTA BILEK: No, I'm not Alex. But DeEtta Bilek. I'm the president -

FEMALE VOICE: [Interposing] Oh, you did.

MS. BILEK: - of OCA International. And Alex has folders to pass out to the board.

FEMALE VOICE: Okay. Now are you—I just need to make it clear because I've got both of you listed. Are you both giving five-minute comment?

MS. BILEK: If we can and if we can do it together, that -

FEMALE VOICE: [Interposing] Do you want ten minutes for the two of you?

MS. BILEK: Total, right.

FEMALE VOICE: Thank you.

MS. BILEK: And I'm thinking I'll take less than five.

MS. BILEK: Okay. I've been on the international board for this is my second year. It's my first year as the president. I'm from Minnesota. In your packet that Alex has just passed out, I'd kind of like to run through the material that's in there.

FEMALE VOICE: [Inaudible].

MS. BILEK: Spell my first name?

FEMALE VOICE: Yes, your full name for the court reporter.

MS. BILEK: Okay, spell it?

FEMALE VOICE: Yes.

MS. BILEK: My first name is D-e and a capital E-t-t-a, Bilek, B as in boy, i-l-e-k. Okay?

FEMALE VOICE: Thank you.

MS. BILEK: Thank you. The first item is a letter, which I will read at the end. And in the folder, we have our membership brochure and two sheets of information about OCIA. We're one of the world's first, largest, and most trusted leaders in organic certification. And we are talking about the community grower group topic today. We're-community grower groups in our organization consisting of approximately 30,000 farmers, so it is an important topic for us.
In the opposite side toward the back is our most recent newsletter, the Communicator and then some of the points on community grower groups and how they can operate from our perspective. Those two pieces Alex will speak to. The photo is an example of a community grower group that's becoming very successful. It's actually a group of women in Mexico.

And if I may read the letter, I'll start at—by thanking the board for giving us this opportunity to be in front of you on the NOSB recommendation for certification for multi-site operations on the—under the National Organic Program.

OCIA and group certification, small holder farmers are important as it has been estimated that they contribute up to 70% of organic products imported to countries in the Northern Hemisphere. As an example, most products containing organic sugar would not be available without small farmers who produce sugarcane. The same could be said about coffee, bananas, chocolate, pineapple, etc.

For decades, based on IFOAM's criteria and its own experience, OCIA has successfully certified grower groups in developing countries
under social and cultural conditions very
different from conditions in the USA.

These organized groups of growers comply
with NOP certification standards and from the
compliance perspective have earned their
eligibility for certification.

However, cultural barriers, language,
 geography, sorry, reduced production volumes, and
their very scarce financial resources limit their
access to certification.

Then group certification reduced the cost
of certification, opening a window of opportunity
for them to access world markets and obtain a
better price for their products.

The OCIA group certification policy is
attached to this letter as a referred to in the
folder. Understanding the social considerations
behind group certification, this policy uses
annual gross organic sales to determine the
inspection scheme.

Any individual grower making $5,000 for
two consecutive years is inspected annually.
Growers making $50,000 or more per year in
processing facilities are inspected annually.

Group certification has been used for
decades as a way of opening market opportunities
to disadvantaged communities. However, OCIA recognizes that as a certifier, we have obligations with producers and with consumers and that even healthy social motivation can not be a substitute for compliance with the standards. The good intentions of consumers choosing organic product should not be betrayed and the role of the certifier is key here. Our actions and decisions should be transparent to prevent the development of consumer cynicism and doubt about the organic claim.

OCIA and group certification, OCIA does not support the NOSB Certification, Accreditation, & Compliance Committee recommendation for certifying operations with multiple production units, sites, and facilities.

We request that NOSB reject the current CAC recommendation and consider developing a new recommendation that is limited to addressing the unique certification issues inherent to grower group certification.

OCIA essentially agrees with the suggested revisions by the Accredited Certifiers Association, ACA, to the 2002 NOSB recommendation for certification of grower groups.

Ideas presented by ACA could serve as a
basis for a new recommendation addressing grower
group certification. OCIA's observations to ACA's
comments to the 2002 NOSB recommendation for
certification of grower groups are attached in
Attachment 2 and again they're in the folder.
I'm on number 2. I'm not sure how my
time is doing.
Given the continued increase of
international trade and the just aspirations of
small holder farmers in developing countries, OCIA
believes the NOP needs to continue developing
regulations for group certification. OCIA
believes the NOP needs—I just read that.
These regulations will strengthen the NOP
and are necessary for determining compliance with
the standards in order to ensure the integrity of
the USDA organic label worldwide.
OCIA recommends that the NOP consider the
creation of a specific area of accreditation for
group certification. We believe that this will
provide the organic sector guidance to ensure the
group certification—ensure that group
certification follows consistent procedures,
strengthening the confidence of consumers on
organic products. This will also ensure that
certification agencies are evaluated according to
uniform criteria during the accreditation review of their programs.

FEMALE VOICE: DeEtta?

MS. BILEK: Yes?

FEMALE VOICE: You only have 3.5 minutes left of the ten.

MALE VOICE: Total.

MS. BILEK: Total? Okay. I'll stop there and then give Alex the rest of the time and questions whenever he's finished. Thank you.

[Inaudible] you want to continue reading or not?

MR. ALEX MORENA: Yeah. OCIA considers that a central body called internal control system, ICS, management system or quality system is essential to group certification. Therefore criteria needs to be developed to determine its functionality, sufficient qualification of the staff, and prevention of conflict of interest.

And I'm really willing to take any questions that you may have about our experience with certification of groups.

FEMALE VOICE: Does the board have questions? We have no questions at this time, but this is an open item. We're—it's a discussion item for here, for this meeting, so at some point
in the future, we may have questions. And Tracy
has outreached already through OTA and the
outreach will continue I would take it. Tracy?

MS. MIEDEMA: This item will remain on
the CAC committee agenda going forward. And it
would be wonderful if you would stay with us and
leave your contact information and participate in
the dialogue.

MR. MORENA: Sure. We were—we are more
than willing to help doing whatever to continue
with this certification.

MS. MIEDEMA: Thank you.

MS. BILEK: And thank you again for your
time.

FEMALE VOICE: Thank you.

MR. MORNENA: Thank you.

FEMALE VOICE: So up is Michael Sly. And
Gary Lean [phonetic]? Gary, are you here? Where?

MALE VOICE: He's right -

FEMALE VOICE: [Interposing] You're on
deck.

MR. MICHAEL SLY: Good afternoon. I am
Michael Sly with the Rural Advancement Foundation
International, RAFI USA. We're a nonprofit,
nongovernmental foundation dedicated to equity,
justice, sustainability, and diversity in
agriculture. We work both domestically and
internationally on the issues and opportunities
and challenges related to family-size agriculture.

I'm—I have come here today to also talk
about the issue of grower group certification.
And certainly I want to add my thanks to you as
well as a former NOSB alumni myself to the
dedication, the hard work that you have to put
forward to get this job done. And I know well the
personal and business sacrifices that you must do
to accept this call to duty.

I think it's quite important that we
focus in on this issue of grower group. And I
have six quick points that I'd like to bring to
your attention.

And the first one is that I think it's
quite important that we return to the original
NOSB currently approved position as the basis for
the dialogue. I think that we are going to make
our task far more complicated and confusing if we
bring in the issues of processors and retailers
into a historic grower group issue at this time.

So I think if those issues need to be
addressed, they should find a separate time and a
separate place. They have their own importance
and I well respect that. But I think if we return
to the existing position, it will give us a clearer focus as a way to move forward on the exact issue.

Secondly, I strongly urge you not to reinvent the wheel. As you well know, there are many, many organizations and organic stakeholders around the world who have worked very hard on continuous quality improvement in the grower group certification system. The International Organic Accreditation Service, many of the certifiers that you'll hear from here today, and the grower groups themselves have enormous expertise. And I strongly urge you to engage all of these in a dialogue about how to move forward on this very important issue.

I think the—some of the model of the fish debate and the pasture debate could play out here on the grower group debate as well and that we would support a broad-based working group that is transparent and accessible that could help to develop and shape this direction and recommendations.

Thirdly, we don't want to lose sight that this is about small farmers in locally-based cooperative controlled groups and associations. And we have to remember where this model came from
and that why it was developed and that the grower
group certification system predates the NOP,
coming out of Latin America in the early eighties
as a way for very, very low resource farmers to
market cooperatively and to get access to new
markets that they could not otherwise achieve.

This is a value-added farmer empowerment
and rural economic development system with a
proven track record that has demonstrated its
commitment to continuous quality improvement.

This certification is recognized in
Europe and by the FAO.

Fourthly, I urge us not to do harm. That
should be our first duty is to do no harm to these
vulnerable farmers and to continues to work to
find ways to quality improve.

Fifthly, we urge that you adopt specific
criteria for grower groups and that the scope be
identified for grower groups as it relates to this
for certifiers. This would very much help and
this should be tied to the continuing work of the
department in developing an accreditation manual.

And finally, we support the comments that
were submitted by the National Organic Coalition.
As a founder of this coalition, we support those
very detailed and considered technical
Thank you very much.

FEMALE VOICE: Thank you, Michael. Any questions?

MR. SLY: Thank you.

FEMALE VOICE: Thank you very much. Gary Lean, you're up with Katherine Cash [phonetic] on deck. Katherine, are you here?

MALE VOICE: Yes, she is.

MS. KATHERINE CASH: Yes.

FEMALE VOICE: Great.

MR. GARY LEAN: Thank you. There's a handout going around. Just like to introduce myself. This is Gary Lean from Cameron, Ontario. I'm currently chair of the IOIA board. And this is Katherine Cash, a member of the board of directors of IOIA as well. We'll try to keep our presentation relatively short if at all possible. Just as a way—by way of background, I come as a professional agrologist and have 20 years of experience as an organic inspector. And the paper I read is not my authorship, but rather an outcome from an ad-hoc committee that we'll talk about. Katherine will follow with a brief personal perspective.

I want to thank the NOSB for this
opportunity to present this position paper. Our goal is to be part of a participative process working towards solutions, policies, and procedures that help to build and maintain integrity in the organic food system.

Two IOIA members need special recognition for their contribution to the IOIA ad-hoc committee. They would be Masuare Gumiure [phonetic] from Nepal, the board liaison to the committee, and IOIA immediate past chair Luis Brenes from Costa Rica who chaired this committee. Masuare and Luis have extensive experience with CGG [phonetic] inspection in their relative areas.

So why is IOIA commenting on this position? In terms of history, most of you'll know, but for those of you who don't, we're a association of inspectors that inspect crop, livestock, and processors. And we were founded in 1991 by organic inspectors who recognized the need for uniform inspector process and protocols to build inspector skills and promote public confidence.

The mission of IOIA, part of it is to promote integrity and consistency in the organic certification process. We have more than 400
members in over 16 countries worldwide. And we consider I guess that we're the largest, most diverse and representative organization for organic inspectors in the world.

In our code of ethics and in our code of conduct, you'll find among other statements that inspectors support and encourage the development, implementation, and advancement of organic agriculture and also that inspectors should be sensitive to social, political, and environmental variables of their region when inspecting.

IOIA believes it can provide objective and credible comments given its respected role and lengthy experience in the organic sector. And we are commenting in order to contribute in a positive way to the discussion.

Organic production in developing countries often rests in the hands of organized small scale growers, i.e., community grower groups. And this is occurrence is a social and a cultural reality arising not from the creation of standards, but rather from deeply rooted traditional agricultural practices in these regions.

Thus since the beginning of organic certification—and this is an echo of the previous
speaker—that is not only the need to guarantee organic integrity, but also the need to adapt the certification procedure to such social cultural reality.

After years of refinement, there existed a audit techniques based on risk assessment that can reliably identify possible non-compliances. They are based on a two tiered system, an internal control system and an external third part inspection.

This is very similar to a quality-based system audit or to an organic food processing audit where the organic inspector is not present to audit every organic run as we understand is now the trend in other sectors of the food industry, like USDA meat inspection or APHA [phonetic] citrus handling.

Instead, the organic inspector reviews the management system, checks written internal procedures and records, and verifies these with sample audits.

For more than a decade now, IOIA inspectors have witnessed the development and refinement of internal control systems within community grower groups. The IFOAM/IOIA International Organic Inspection Manual of
December 2000, Pages 121 to 125, includes a chapter on how to inspect community grower groups. This chapter was based on an earlier printing of the IOIA Inspection Manual, number 2, in 1998. The written material greatly influenced the Criteria for Certification Of Grower Groups, NOSB 2002, and is cited literally as a guideline for an inspection protocol.

Before NOP final rule and to date, five years after its implementation, many American and foreign USDA-accredited certifiers have inspected and certified community grower groups based on an internal control system evaluation.

These certifiers have publicly written policies, procedures, or guidelines. In most situations, these documents not only follow the 2002 recommendation, but actually improve upon it. As one example, and it's just—as it was just mentioned, the Organic Crop Improvement Association has attached their CGG certification policy to its comments.

We are willing to contribute and provide perspective for these discussions as an independent organization. And we trust that our experience as inspectors, being the eyes, ears, and nose of the certifiers, that in most
situations, we are the only ones actually visiting the production units and sites where growers groups carry on their activities.

While on-site, inspectors are not representing the interests of the growers, nor the buyers, nor the extension agents. We're acting as third party independent professionals as outlined in federal regulation and ISO 65.

FEMALE VOICE: Gary, your time has expired.

MR. LEAN: Okay. Then I'll just finish up. Inspectors [inaudible] objectivity as a professional practice. We would like to recognize that our—the work put into the papers submitted from the Organic Trade Association, IFOAM, ACA, and NASOP and have all submitted public comments. And we see that there's a high level of agreement and few differences.

FEMALE VOICE: Thank you, Gary.

MR. LEAN: [Inaudible].

FEMALE VOICE: Okay.

FEMALE VOICE: Is there any questions for Gary?

MR. LEAN: I just would like Katherine to carry on [inaudible].

FEMALE VOICE: We'll give her five
minutes. So let's just -

MS. KATHERINE CASH: [Interposing] [Inaudible] going to need a couple.

FEMALE VOICE: You're only going to - that's music to our ears.

[Crosstalk]

FEMALE VOICE: Any questions for Gary before? Okay. Go ahead, Katherine. On deck I have Katherine DeMateo. Katherine, are you around? Do I see you?

FEMALE VOICE: [Inaudible].

FEMALE VOICE: Is Katherine DeMateo in the room?

[Crosstalk]

FEMALE VOICE: Oh, okay. Thank you.

MALE VOICE: She's so small [inaudible].

MS. CASH: As Gary said, I'm here today to kind of speak on a personal front. I'm speaking as an organic inspector. And I can say I've witnessed what happens when organic farmer groups are allowed to develop internal self control systems.

Often the end results seems to be and often to the surprise of the inspector a well oiled and organized machine with comprehensive farm plans, well functioning recordkeeping
systems, and in the end, audit trails that would make your grandmother do cartwheels if she happened to be an inspector.

So what I'm saying is that it's a system that works, at least from what I've seen. And it's a good option for farmers whose survival as farmers depends on the flexibility that grower group certifications afford.

Organics is growing. And you don't need me to tell you that. But unfortunately at the same time, the demand for organic products is increasing, we are losing farms at an alarming rate. The caveat is that at least in Virginia, studies show the numbers of very small farms are on the increase. And the surveys show that these small farms are mostly tiny mom-and-pop operations, sometimes out in the remote areas of the state, sometimes in places where no sane agribusiness consultant would ever even consider suggesting a farmer even think about trying to scratch out an existence on the land.

I'm talking coal country, tobacco country. These farms are joined by other farms that are facing their own challenges, challenges from encroaching development, from land prices that make selling out look a lot more appealing
than hanging on. The least we can do for these people is to continue the practice of a system that's already working, growers group certifications, albeit with some tweaks that Gary mentioned earlier.

In Virginia, we do see growers groups as a practical, viable options for small farming operations. We have several groups of Amish and Mennonite farmers who work together, often farm together, share equipment, loads of organic grain and the like. Working together means they can farm. The avenues open to them by virtual of growers group certifications can not be taken lightly.

We also have a group of farmers referenced earlier down in tobacco country down in Southwest Virginia. They sell to the same markets. They use the same types of inputs. They pack in the same packing house. And they all ship product together. They are organized, diligent, and earnest about what they do. They're committed to farming with integrity and they depend on the growers group certification system as part of the mechanism that gets their products to the table.

The public wants small, local, and organic farm products. Now is not the time to
make things even more complicated. The time is
right for us to fine-tune growers group
certification protocol and simply refine what is
already a functioning system.
The end result will be that many -

MS. CASH: - small, organic farmers will
be free to do what they do best, and that is quite
simply to farm.
And I thank you.
FEMALE VOICE: Okay. Thank you,
Katherine. Do we have any questions from the
board? Thank you very much. Up is Katherine
DeMateo? On deck is Leanna Hoods [phonetic].
Leanna? Are you here?

MS. KATHERINE DEMATEO: Thank you very
much. My name is Katherine -

FEMALE VOICE: [Interposing] Oh, hold on,
hold on. Hold on, Katherine. Katherine, I've
just got to get somebody on deck. Is Leanna here?

FEMALE VOICE: She's not in the room,
though. Why don't we go with Kimberly [phonetic]
-

[Crosstalk]
FEMALE VOICE: Oh. Leanna, you're on
deck. You just made it.

MS. DEMATEO: All right. thank you. My
name is Katherine DeMateo or DeMateo depending on
which part of the world you come from.

I am a senior associate at Wolf
[phonetic] DeMateo and Associates. We're a
consulting firm based in Virginia and
Massachusetts. I am also a World Board member of
the International Federation of Organic
Agriculture Movements. And for transparency and
making sure that everyone understands where I—what
hat I'm wearing right now, I am wearing the hat as
a paid consultant representing IFOAM, the
International Federation of Organic Agriculture
Movements.

We were engaged to help them track the
process on this group certification issue and to
lend our expertise and comments. So I am
representing their opinions, but as a paid
consultant.

And I want to thank the NOSB for taking
this issue up and trying to advance the 2002
recommendation. I want to thank the NOP for
allowing the 2002 recommendation of the NOSB to be
used as guidance in this interim process. It's
very important as you've heard from the other
people who have testified that grower groups and
group certification is an integral part of what is
happening today in organic agriculture movements
and in the industry worldwide.

I want to also state that IFOAM, we are a
worldwide organization representing 770 members in
108 countries. And as you may know, organic
agriculture is being practices in 120 countries
around the world.

We are not here as the voice of Europe.
We are not trying to impose a European viewpoint
on the United States or on the NOP or the National
Organic Standards Board.

That may—that is an assumption about
IFOAM that I want to just make public, that we are
an international organization. There is many
members of IFOAM in this room today. They are
based throughout the world. And our opinions come
from that.

We are also recognized as a standard-
setting organization by the International
Standards Organization. So we have a lot of
expertise behind us.

And our written comments have been posted
and I hope that you have them in your booklets. I
didn't re-do them for you.

I will just try and hit the highlights.

I think you've heard already that there is large agreement among the groups that have testified.

And I am pleased that this is now a discussion recommendation as opposed to one that will have a decision today.

And I do hope that IFOAM's suggestion and others that a working group perhaps be put together of those with expertise in this area, and as you can see that there's a number of groups that have offered very good and specific comments that if we could come together, we could help you develop a recommendation that would meet everyone's needs.

The group certification system is based on sound accreditation, inspection, and certification norms that are recognized by ISO, the International Standards Organization.

We do also suggest and agree with other presenters today that there should be a category in your accreditation for group certification because it does require—the system needs to work from the top down and the bottom up. It's not a—just about the growers or other groups doing this correctly. It's about the whole system working as
it should and having its checks and balances from accreditation through certification down to the production and handling.

Of course, IFOAM's past comments on—and papers and manuals on group certification were based for grower groups in developing countries. IFOAM has advanced our position and we now do see the possibility and the scope of group certification to include different size and types of organizations.

So I think I will end there. And I—and we are available to help. Thank you.

FEMALE VOICE: Thank you, Katherine. And your comments are in our books, so we do have them. And definitely have paid attention to those comments.

Tracy?

MS. MIEDEMA: Thanks Katherine. And I'm glad to hear you're getting paid because you've done an enormous amount of work on this issue. Katherine has been an enormous—just a tremendous resource with her historical perspective on this issue to the Certification, Accreditation, & Compliance Committee as we took up this issue in May and have worked on it for the past three or four months.
And, you know, there's a couple key questions that I would love to have more feedback from IFOAM and other stakeholder groups. And that is, you know, the construct of the ICS has come up in nearly every comment on this issue so far and I expect it will continue. And if we can just explore further what are the limitations of this construct, what are the benefits? We know that it's being used in—throughout the supply chain, throughout the organic supply chain, hence multiple production unit sites and facilities. And, you know, just trying to understand why it may work under one sector of the organic industry and not for others.

And I guess I want to set aside the argument of well, it makes the issue more complex. That's a given. But what are the limitations of the ICS in that it can't be truly embraced in these other sectors?

MS. DEMATEO: Well, I don't know that you really want me to answer that question right now. But IFOAM does recognize that it can be. It—the basic principles of an internal control system or an internal quality system should be able to work regardless of the operation. That's its purpose. It's purpose is to have internal
controls that are functional and that then can be
audited during an inspection process. Because
inspection's not just about observing what's
happening, but it's also auditing the paperwork
and the control systems that happen, whether
that's in a grower group situation or on an
individual farm or in a handling facility.

So we believe that it, you know, it can
be applied.

MS. MIEDEMA: Thank you for that. I
don't expect we're going to come up with a
solution here on the spot either. It's an open-
ended question and I appreciate you taking a stab
at it.

MS. DEMATEO: Well, thank you.

FEMALE VOICE: Other comments from the
board? Thank you, Katherine.

MS. DEMATEO: All right.

FEMALE VOICE: Up is Leanna Hoods with
Kimberly Easson on deck? Kimberly?

MS. LEANNA HOODS: Good afternoon, all.

I'm Leanna Hoods. And today I am representing the
National Organic Coalition. The National Organic
Coalition is a national alliance of organizations
representing farmers, environmentalists, other
organic industry members and consumers concerned
about the integrity of national organic standards.

The goal of the coalition is to assure that organic integrity is maintained, that consumers' confidence is preserved, and that policies are fair, equitable, and encourage diversity of participation and access.

You all have the National Organic Coalition comments on growers group—grower groups. I'll recap a few of the points in a minute. I did want to bullet some other items.

First kudos to the Aquaculture Working Group. I think the symposium was—the parts of it that I heard were excellent. And I think the—to the whole board, that symposium model seems to work really well to really bring depth and information and I encourage you to continue that with other issues.

Regarding NOP accreditation procedures, we've continued to for years talk about that the National Organic Program's compliance with international quality systems would provide the level of consistent oversight of the program that's really expected by consumers and the organic community worldwide to protect organic integrity. We encourage the NOP to become ISO compliant as required in the regulations and
produce a quality manual. And we understand that's moving forward and we appreciate that that is.

Regarding the issue of TAP reviews, we believe that TAP reviews should be required for all materials, 606 materials included. Budget shortfalls notwithstanding, no materials should move without these independent reviews. We think that the information provided is vital and that if necessary the materials if there's absolutely no money, maybe the materials need to stop. But barring that, I think that a commitment from the department high up to support the finances—the financial needs of the National Organic Program is paramount in that and it can't—we can't be stopped in doing rigorous review of materials and so TAP reviews should be required.

And finally on these bullet points regarding pasture, real enforcement of the pasture requirement as written today is necessary for the integrity of the label. In addition, the promulgation of a pasture rule is necessary to provide a clear direction in the future. The longer this delays, the more the entire—the integrity of the entire organic label is threatened. We see that out there all the time.
The consumers are so, so concerned about this issue, this entry product. And I can't say it enough. And I know there's, you know, the whole realm of bureaucracy behind why it hasn't gotten done. It—the longer it delays, the more serious it is for the label itself, for the ability of that label to bring that high quality.

In regards to the grower group issue, we'd like to thank this CAC for the thoughtful consideration of this important issue. However, we do believe the draft proposal does go well beyond the scope of the problem it intends to solve and, in fact, proposes major change in the scope and nature of organic inspection that is not warranted and will be harmful to the integrity of organic certification.

That means that the issue is really about grower group inspections. We recognize that the NOSB has identified unresolved issues related to voluntary certification of retail handlers, but we believe this topic requires additional guidelines or rulemaking and should not be included here with the original issue of concern, whether a cooperative type of farmer-based grower groups can be certified under USDA NOP.

We appreciate that NOP has endorsed the
previous NOSB recommendation of 2002 as current policy pending further clarification of rulemaking.

We further recommend strongly that NOP consider certification of grower groups as a separate area of scope for accreditation of certifiers. This will provide the extra assurance that certification agencies have the necessary policies and expertise to perform this type of review and will require witness audits by USDA of actual grower group inspections. This will help maintain consumer confidence in this form of organic certification.

We reference USDA, the IFOAM accreditation criteria for insight into evaluation of internal control systems by certification agencies.

We support the comments of the Accredited Certifiers Association. We find that inspection of production units rather than all individual farm members of a grower group would ensure the integrity of organic products. We have some details on that in our comments as well.

And that's basically—and finally, we do encourage the ongoing investigation of this grower group issue through active discussion with small
holder groups and others directly involved with this method of certification and other stakeholders. We think that's a really good idea.

So I'll stop there.

FEMALE VOICE: thank you, Leanna.

MS. HOODS: Thank you.

FEMALE VOICE: Board members, questions? Comments? Bea?

MS. JAMES: Thank you.

I read through your—the National Organic Coalition comments and I was wondering if you could elaborate a little bit on the position and the statement that you made about the importance of annual inspections across all sectors.

MS. HOODS: In general that the annual inspections of production units is vital to the program. It is how we can maintain the integrity through actual viewing what's going on. There's—
is no better way than to be—annually go see.

In terms of, for instance, internal control systems, you know, that's often more than annual review—inspections that happen. And in some cases that is needed. So there's variation. I was learning about grower group issues, surprised to see how detailed it can be about assessing the risk of noncompliance to make that a
part of your decision-making and how often the 
review, the inspection should occur. And so I 
think that's important.

But the minimum should be as the rule and 
I believe even the law suggests that it is annual 
for production units. And as we described, 
production units can mean different things and I 
think we need to hone in on that. But the idea 
that it—annual is the minimum and then we move 
from there.

FEMALE VOICE: Any other comments or 
questions? Thank you.

MS. HOODS: Thanks.

FEMALE VOICE: So next up is Kimberly 
Easson with John Foster on deck. Before you get 
started Kimberly, I just want to kind of check 
with the board. Are we okay go to a little bit 
further or do we need a break?

MALE VOICE: [Inaudible].

FEMALE VOICE: Move forward? We're going 
to move forward. Kimberly?

MS. KIMBERLY EASSON: You're impressive.

You have an awful lot of work, so I will be short. 
I'm Kimberly Easson. I'm the Director of 
Strategic Relations at TransFair USA. We do fair 
trade certification and we work with over 1
million small family farmers around the world, mainly for coffee, but also other agricultural products—fresh fruits, sugar, rice, tea, etc. Eighty percent of the coffee that's brought into the US right now is also organic certified. And we actively encourage organic certification of all of the grower groups that we deal with under fair trade certification. The—we also have 600 business partners that help to manufacture and distribute fair trade products across the country.

And secondly, I'm a representative of the Specialty Coffee Association. That's a 3,000-member trade association representing businesses throughout the global coffee industry. Everyone is anxiously awaiting a word from this meeting. And I am understanding that maybe there isn't going to be a resolution from this meeting this week.

I think people are relieved that there does appear to be some kind of consensus that grower groups certainly can exist under the NOP and the inspection protocols and that there is a recognition that organic—I'm sorry, internal control systems or internal quality systems can provide the foundation for the rigor that is
needed in order for products to carry the USDA organic label.

Obviously there's still a lot more work to be done. We—my comments are informed by the excellent work by a number of groups—obviously you all, the NOSB, and the CAC. The—I participated but in a limited way on the Organic Trade Association Task Force. I have to highly commend the work that was done on those calls and the recommendation that was made.

I—TransFair USA does support the OTA recommendation with regard to group certification of producers and producer handlers. We do not as an organization nor do I personally possess the expertise to be able to say more about the inclusion of multi-site production or handling operations.

I think many people agree that what we need to do first and foremost is address this grower group issue and be able to move forward.

With the OTA recommendation, I think it's key to understand that the definition of a production unit, which has been missing, is as comprised of subunits. I think that some of the work around additional definitions is really key for helping us to understand how grower groups can
be included in the NOP.

There are a couple of other issues—the issue of how inspectors use the standard risk analysis and sampling, initial versus annual inspections, and the—I think that—excuse me. I got lost on my notes here. Some of the—some of those issues can be clarified by bringing together some kind of a task force to help to put together what the best practices would be for working with the OCS under grower groups.

So I think that's it. Obviously there's a lot of good input that you've all received and I appreciate the work that you all do to help come to the best decision. And TransFair and I know also other members of the Specialty coffee association, there's a lot of support, people willing to participate to help make sure that the decision is going to be workable for everybody, especially the grower groups and the industry that depend on their supply.

So thank you very much.

FEMALE VOICE: Thank you, Kimberly. Any questions for Kimberly? Thank you very much.

MS. EASSON: Thank you.

FEMALE VOICE: Up next is John Foster with Sue Baird on deck. Sue, are you here?
MS. SUE BAIRD: Yes.

FEMALE VOICE: Thank you. John, what's your affiliation? Who are you with these days?

MR. JOHN FOSTER: It's hard to keep track sometimes, isn't it? I know.

Yeah, I'll be very clear about that. I'm going to sacrifice spontaneity for actually fitting it in five minutes, which as those of you who know me know it's hard for me to do.

I'm John Foster. I am Senior Manager of Organic Integrity for Earthbound Farm. We are a grower, packer, shipper of organic salad mixes, fresh fruit, fresh and dried vegetables—sorry, fresh and dried fruit, fresh vegetables, baked goods, snacks, things like that.

My job just so you kind of know where I'm coming from is to ensure the organic integrity of all products supplied to Earthbound Farm. So it's pretty broad and sweeping.

I appreciate the opportunity to provide comment today. I certainly appreciate your time and effort and sacrifice on the board here to benefit us all.

In addition to our own organic integrity, the processes we have in place just for us, we really rely on the integrity of the organic seal
as a reliable currency and symbol that our customers can look to and depend on inasmuch as possible to make sure that those products are grown and handled to their expectations along with consistent with the regulations.

We think that working to maintain the integrity of organic products and process, all operations should complete the certification process, including individual, once-yearly inspections and that every location should submit to the process of an annual inspection.

My experience is that most consumers kind of expect this if they have a thought about it at all. They kind of expect that every place has been looked at.

Because of this primary importance on the integrity and the perceived integrity of the organic goods, we might argue against all group management under the NOP, but at the same time recognize and appreciate the historical precedent, the significance, the economic necessity, and certainly standard of practice over the last couple decades at least with respect to grower group management.

Really have no issue with that in the real world even though it opens the door to
inconsistencies to say the least. I think that it's a practice that's okay. Not perfect, but it certainly is manageable. And I think when it's controlled appropriately with internal systems, I think work—can work fine.

While we have faith in handlers' abilities to implement internal control systems and to operate in this way, really don't feel like any of the retailers or handlers are going to have certainly not purposefully misused this.

We're much more worried about the appearance of implementation of or expansion of this grow—sorry, group management system to other contexts.

That's really it, problems with perception more than anything else, not problems with actuality. I have had the opportunity to see how grower groups work and I've seen how group management in retailers work in prior experiences. And I've seen both work really well and I've seen both work not so well. I know it can be done, but there are a lot of pitfalls as well.

I'm not suggesting that organic integrity will necessarily be undermined if this extension were formalized. But it will allow claims to be levied—maybe inappropriately and maybe from less-
than-informed perspectives, but levied all the same. And my observations of the industry in the recent past are that I would rather not see that again. So if we can do something to avoid that, we should.

We've heard—in the context of aquaculture, we've heard and I've experienced with our consumers, thank you, that consumers are looking for more oversight and more scrutiny I think. They want more certainty. There are a lot other examples where retailers and handlers are inundated with audits and inspections. And I can—

I understand the argument that we don't—they don't want one more.

However, on the whole, I would—I—my observation is that the value of an unquestionable process for retailers and handlers exceeds the relatively small economic or monetary cost, the differential that a site that 100% inspection would incur.

Lastly, just want to—I want to encourage the—you to consider the reality and the perception of organic integrity as an essential, pivotal component in charting our collective course of action.

FEMALE VOICE: Thank you, John. Joe
MR. SMILLIE: Well, as always, John, I appreciate your comments. And I think you hit the nail on the head. That's—was one of the main moving forces of why we pulled it back from a recommendation is again if a perception is out there and it becomes widely believed, then it does become reality. And we have to look at that just as if it was real. And in my mind it's not. And our committee, we looked at it very carefully. And it was a—the committee was very much split on the issue. We wanted to move forward. We wanted to find a solution. But I think that the way we're going through it now is going to be better. Basically the crisis has abated. Grower groups are continually being certified. We'll come to a solution. We'll take time. We'll hear all of the opinions. We'll go back. We'll go back to work. And the comment you made is I think just right on. We'll definitely take that into consideration.

I do want to remind everyone that, you know, the hot button issue, the elephant in the room, is that the group certification would go to retailers. And I personally don't think it's a bad thing. But, you know, if the community
doesn't want that to happen, you know, that—we'll try and reflect the will of the community.

I do want to remind everyone that retailer certification is voluntary. It's not mandatory. So the retailers that do seek certification, either individually or as a group, are doing it of their own free will. And they're actually adding to the integrity of the system, certainly not diluting it by being voluntarily certified.

However, we heard the community speak very loud and very clear and we'll go back and continue working on the issue.

MR. FOSTER: So no question in there, right?

FEMALE VOICE: There was just a comment, not a question.

MR. FOSTER: Okay.

FEMALE VOICE: But is there anybody else? Tracy?

MALE VOICE: [Inaudible].

MS. MIEDEMA: Thanks John. I do have a real question.

MS. MIEDEMA: When you mentioned annual inspections, you know, one of the things this
recommendation attempted to do was shine a light on something that was uncovered, which is that there really does seem to be a difference in not every inspection looks the same. An initial inspection, for instance, might have land history reports, etc., that aren't carried out, you know, at a renewal inspection.

So when you say annual inspections and you talk about consumer perception of inspection, are those one and the same? Do you see them as different? Just any comments there?

FEMALE VOICE: That was a question, John.

MS. MIEDEMA: [Inaudible].

MR. FOSTER: I think by and large—I think they're—well, they are different things. They're different beasts. I've done a lot of both of them.

But I'm not sure that that distinction is—I'd—it's certainly not well understood by consumers. And even if it were understood that that happened, I don't know that that would have any meaning for them.

In the world of, you know, our generation of sound bites, you'll never be able to explain that. It's not going to have any traction because it's—there's subtleties and nuances and—that are—
it's not that consumers can't get it. It's that they generally don't. I mean, that's not the world they're used to. They're—they need quick information. And I think that's—I could be wrong, but—I have been more than once. But I think that would be a very difficult distinction to make clear enough to have any meaning to them.

But functionally, yes, they're different. But it would—I don't think it would address the issue of perception and how that could be—how the perception can be shifted in away that—that's it's a negative for the industry. I think that would be very hard to—argument to fight against.

FEMALE VOICE: And is there any more comments or questions? Bea?

MS. JAMES: Just one comment, and I'm not insinuating that anybody said this. but just because retail certification is voluntary doesn't mean that those standards should have any—I mean, once you volunteer for certification, you're under the same guidelines and expectations as anybody else who goes under certification.

So my question is do you agree with that?

MR. FOSTER: Yes.

FEMALE VOICE: Any other comments or questions for John? Thank you, John.
MR. FOSTER: Thank you.

FEMALE VOICE: Sue Baird up now with Pat Kane on deck. Pat, are you here? Great. Thank you, Pat.

MS. SUE BAIRD: Hi. I am Sue Baird, technical manager at QAI. I wanted to speak briefly to you on multi-site operations certification.

QAI applauds the NOSB committee for providing the first step for providing legal jurisdiction to be able to do organic certification for group management system plans.

QAI applauds careful dissection. I really liked the way you did that. From—being from a past governmental agency and doing—writing laws and things, I thought you did an excellent job of dissecting 205.43.(a)(1) [phonetic] to be able to discern that there is a regulatory text difference between initial, as it says—let me read it to you—initial onsite inspection of each production site, unit, and facility that produces and handles organic products. And then you go ahead and you dissect that the annual thereafter onsite inspection specifically only addresses the certified operation. Great work and I applaud that.
QAI also applauds that the NOSB committee recognizes that the organic system plan with any internal control system manual or any other kind of documentation that's additionally submitted is the key management tool that a certifying agent must use to determine compliance to the NOP.

I don't know how many of you know, but many of you do know that I worked for several years as a quality assurance manager for a large poultry processing plant. I worked both pre-NOP and post-NOP—I'm sorry, pre-HASSOP and post-HASSOP, 1995 and thereafter.

I remember back when HASSOP was first signed into law by President Clinton in 1995. And at that time, the responsibility for taking on food safety issues was taken from the complete responsibility of FSIS USDA and placed into the hands of us as the plant employees QA departments. We were appalled. We just knew by having to take all that responsibility and operate under an HASSOP plan that food safety, foodborne illnesses were going to skyrocket because there was no USDA oversight. They were taken from the overseer to the auditor of the plant's plan.

Instead of foodborne illnesses sky-rising, they significantly decreased. Why?
Because we as that plant took control of our own destinies. We wrote our internal control systems. We monitored it and we implemented it.

I tell you that because internal control systems work. They work whether it's for a HASSOP plan. They work whether it's for group management systems for multi-site operations. They work because there's more oversight to assure organic integrity instead of less oversight.

I've heard it said that multi-site operations—and I've heard it here today. And I want you to know that QAI certifies not only for group management—and I'm sure you guys know that—not only small groups of producers all over at least South America and in Europe, and in the United States, but we also certify retail stores by group management plan.

And I've heard that's not right. This was only designed for the small farmers. And my heart [inaudible] small farmers. I spent years in Missouri working to develop and help small farmers stay on the farm.

But no federal law can be written to only give privileges to one economic class of people without extending that law to all US citizens, and not only US citizens, but anyone else, any citizen
of the world who can adhere and will comply to that law. It is—can not be a one-class law.

I've heard it said that it will be used for retail stores. And we're telling you yes, we do use that same model to certify retail stores. They are excluded from the law; 205.101.(b)(2) says that any store or anyone—let me read this. Any retail store that only processes and serves previously certified products that's been processed on their own premises—am I out of time?

FEMALE VOICE: You are out of time. I'm sorry.

MS. BAIRD: Oh, my goodness. I've got two other things [inaudible] y'all get to talk about me.

FEMALE VOICE: Thank you, Sue. Any questions for Sue? Tracy?

MS. MIEDEMA: Just a really quick comment, Sue. As a primary author of this committee's recommendation, I want to thank you for allowing my chair to be cool for a minute and I will prepare to listen to the future comments.

MS. BAIRD: Well -

MS. MIEDEMA: [Interposing] Thank you.

MS. BAIRD: - thank you. I made one
other comment, which said that I appreciated the
courage it took for you to do this and stand
against the maybe others' opinions. And thanks
for the courage. I know what it is to stand
behind the mudslingers.

FEMALE VOICE: Thanks.

FEMALE VOICE: Pat Kane, you're up with
Tiffanie Husan Labbe. Tiffanie, are you here?
Thank you.

MS. PAT KANE: Hi. My name's Pat Kane.

And I'm the Coordinator of the Accredited
Certifiers Association. I'd like to thank the
board for all of the work you do and the
opportunity to speak today.

I'm speaking on behalf of the Accredited
Certifiers Association. And I'm also going to
read some comments from the National Association
of State Organic Programs. I also brought
comments from Montana Department of Agriculture
and the Washington State Department of
Agriculture, which are being circulated.

Regarding recommendation for the
certification of multi-site operations, ACA
submitted written comments pertaining to this
recommendation and they're posted and I believe
you have them.
The ACA appreciates the committee decision to move this from recommendation to a discussion. We did not support the committee recommendation for the certification of multi-site operations. In our comments, we requested that the board return and focus on the 2002 NOSB recommendation. And we did provide specific revision information on that.

I'd like to read the comments from the National Association of State Organic Programs. The National Association of State Organic Programs, NASOP, represents 17 NOP-accredited state organic certification programs and two approved state organic programs.

NASOP does not support the NOSB Certification, Accreditation, & Compliance Committee recommendation for certifying operations with multiple production units, sites, and facilities. NASOP believes the CAC recommendation if adopted would severely reduce the integrity of certified organic products in the US and in turn reduce consumer confidence in the organic label, our member certifiers, and the NOP.

NASOP does not believe that the CAC recommendation accurately reflects the intent or letter of the Organic Foods Production Act, the
current practice and vast majority of NOP-accredited certifying agents, nor the expectations of organic consumers. Rigorous annual third party inspection of all organic production and handling operations by USDA-accredited certifying agents is a fundamental tenet of organic certification and a requirement of the law, OFPA.

This flawed CAC recommendation fails to recognize these basic tenents. And NASOP strongly urges the NOSB to reject the current CAC recommendation.

On the other hand, the minority opinion included with the CAC recommendation presents a sound basis for reaffirming the integrity of organic - of the organic certification process as authorized under OFPA and defined by the NOP rule. NASOP recommends that the NOSB issue a recommendation to the NOP based on the minority opinion. They also have some specific recommendations that you can read in your information.

I'd also like to say that the Montana Department of Agriculture and the Washington State Department of Agriculture did not support the recommendation and did provide some recommendations in their written comments.
So that's all I have to say except if I could make an announcement that the accredited certifiers are going to have a meeting tonight from 5:30 to 7:00 and certifiers are welcome.

Thanks.

FEMALE VOICE: Well, I believe that we'll actually be listening to public comment at that time.

[Crosstalk]

MS. KANE: I know you will. And I'm sorry.

[Crosstalk]

FEMALE VOICE: I'm so sorry, too. And the—there is a question about where that meeting is.

MS. KANE: Eisenhower Room.

FEMALE VOICE: Okay. Joe?

MR. SMILLIE: Just a quick point of clarification—NASOP and Montana and Washington do not support group certification anytime, anywhere, anyhow? Is that correct?

FEMALE VOICE: [Inaudible].

MS. KANE: No, they want you to go back and look at the 2002 recommendation.

MR. SMILLIE: Two, okay, thank you.

MS. KANE: Yes, yes, yes.
FEMALE VOICE: Any further questions for Pat? Thank you. And thank you for bringing us all the states. We like that.
MS. KANE: You're welcome.
FEMALE VOICE: I actually made a mistake. Gwen, you're next, Gwendolyn, and then on deck is Kim-Tiffanie, I'm sorry. Oh, I guess I'm trying to rush through the list. I shouldn't. I apologize. So Gwendolyn, whenever you're ready, you can get started.
MS. GWENDOLYN WYARD: That's okay, thank you. Okay, good afternoon. Madam Chair, NOSB members, NOP staff, and ladies and gentlemen of the gallery, my name is Gwendolyn Wyard, and I'm speaking today on behalf of Oregon Tilth Incorporated. We're a nonprofit membership organization representing approximately 1800 members and certified clients. Our mission statement is to support biologically sound and socially equitable agriculture through research, education, advocacy, and certification.
I serve as the processing program reviewer for the certification arm of our organization. And we do have these really slick beverage coasters. You should get one. They're going to become collector's items. They're on the
My comments today are on the CAC commercial availability guidance document. Oregon Tilth thanks you for the opportunity to comment on this recommendation. And we thank you for your efforts to help ACAs with this very complicated issue.

My written and expanded comments have been given to Valerie today. These are going to be brief and you'll want to have the recommendation in front of you for reference.

First we'd like to say that we agree with and currently practice several of the itemized steps for ACAs in Part B, including incorporating commercial availability documentation into the OSP and annual audit process of each certified party.

However, we do not agree with and/or offer the following suggestions for Part B of the recommendation, ACA's role in determining commercial availability.

The first point should be revised to include test data as one form of evidence to support the operator's claim. The words test data, the implications there, test data may not be the only way to support a documented claim.

Including the phrase supporting evidence followed
by examples such as test data, growing season reports, extension research, etc., would allow for all relevant documentation to be reviewed. The exact wording of the text changes we proposed are in the written comments.

Point number two, the word multiple is a vague term. It's generally thought of as at least three. However, the number of companies that are contacted should be relative to supply. One may be enough, or five might not be enough. The word multiple should be removed and the phrase commensurate with known supply inserted in parentheses after the word results.

And point number three, point number three is for certifiers to notify the applicant or certified operator with proper lead time suggested at six months to notify the applicant of sources of information listing organic seed materials or ingredients.

This point is completely unreasonable and should be removed altogether. The certifier's responsibility is to determine compliance and assist operators in understanding what is required by the regulations. We're not allowed to conduct operator-specific research and provide individual consultancy services, which is where this type of
requirement falls. Providing operators with
general sources of information is an optional
service that can be provided upon request. As a
requirement with a designated lead time,
certifiers become liable for providing information
that is not uniformly accessible. This could lead
to unfair competition amongst certifiers, as well
as irate clients. This type of information needs
to be accessible from a neutral party or a
privately hired consultant.

And point number four, point number four
suggests that a list of all granted allowances be
reported to the NOP. While Oregon Tilth supports
the concept of transparent allowances, we have
corns as to the logistics behind the reporting
system. How can a standardized reporting system
be developed that will account for the various
subjective details that led to a particular
allowance? From a database design perspective, it
would be very difficult because of the standard
allowances because of their very unique detail.
And will that detail be a part of that list? If
it's just a list without detail, what meaning will
it have? And who will be collating and
maintaining such a system? We're concerned that
we'll be required to spend time on an effort that
will not be taken up by the NOP. Our concerns stems from the fact that the NOP to date has not had the time to launch the database of certified parties that was promised some years ago.

And point number five, while Oregon Tilth certainly supports proactive efforts to generate organic seed materials or ingredients, we don't see where in OFPA, the preamble, or the regulation certified operators are required to generate them. It's a huge task for operators to extensively search, document, and submit their attempts, let alone have time to promote or money to fund development. It's up to research and education organizations, the OTA, and other organic consumer groups, concerned individuals, certified operators, and industry entrepreneurs to rise to the occasion at will. The market should bring availability to the operator. This guidance goes too far and creates a new burden on the operator.

And finally on point number six, with respect to the first sentence in five and all of point six, Oregon Tilth sincerely hopes that there's not an accredited certifier out there that's not incorporating commercial availability into the OSP and the annual audit system.

Once again, Oregon Tilth would like to
thank the NOSB for their ongoing work and your
commitment to the organic industry.

FEMALE VOICE: Thank you, Gwendolyn.
Joe?

MR. SMILLIE: You gave a copy of your
comments to Valerie. Do you have any other
copies?

MS. MYARD: I don't.

MR. SMILLIE: You don't.

MS. MYARD: I tried to get in on your
account at the front desk because Mark said that
there was some money up there.

[Crosstalk]

MR. SMILLIE: Oh, for the lack of a
horse. Yeah. Well, if we'd like to get a copy.
We'd like to take a closer look at it and we may
have some committee time to see if we can respond
before -

MS. WYARD: [Interposing] Sure.

MR. SMILLIE: - because we are voting on
this one on Friday.

MS. WYARD: Okay.

FEMALE VOICE: Very good.

[Crosstalk]

MS. WYARD: Oh, I'm Gwendolyn, G-w-e-n-d-
o-l-y-n. The last name is Wyard, W-y-a-r-d.
FEMALE VOICE: Are there any other questions for Gwendolyn?

MS. WYARD: No. Well, I—for 10 cents a page, I could.

FEMALE VOICE: All right.

MS. WYARD: I said you would.

FEMALE VOICE: Thank you, Gwendolyn.

MS. WYARD: Thank you.

FEMALE VOICE: Tiffanie, you're up with Jake Luhan [phonetic] on deck. I think we're in certifier row here. Is Jake in the room? Thank you, Jake.

MS. TIFFANIE HUSAN LABBE: All right. Thank you, Madam Chair and NOSB members for participating in this forum and for the work that's been done.

I am Tiffanie Husan Labbe with Oregon Tilth. I'm the farm program manager and livestock inspector. I'm here to comment on the multiple site grower groups.

Oregon Tilth generally supports the NOSB CAC committee recommendation for certifying operations with multiple production sites, units, and facilities. We particularly welcome provisions in the NOSB recommendation to include definitions and language in national rule
specifically addressing the use of internal control systems.

ICS means a written quality assurance system included in a master organic system plan that sets forth the practice standards, recordkeeping, and audit trail requirements applicable at each production unit, facility, or site and that identifies the internal verification methods.

The—as the NOSB CAC majority position correctly elucidates, the organic system plan is the forum through which the producer or handler and certifying agent collaborate to define on a site-specific basis how to achieve and document compliance with the requirements of certification.

[Inaudible] agrees with the opinion that OSPs are the key management document for certified operations. Additional documentation may be ordered by the certifying agent to ensure the OSP is consistent with OFPA and NOP.

Oregon Tilth further agrees that this is adequate authorization to use the organic system plan as a vehicle for development of internal control systems that improve the results of third party inspections by bringing the various units and sites under one governing compliance scheme.
that may reduce or eliminate the need for direct
observation by inspection of each unit or site.

Oregon Tilth also believes this
acknowledgement is long overdue and is consistent
with the NOSB's 2002 position on grower-on
community grower groups.

We also strongly and categorically
disagree that the position taken by the CACA that
participation in grower groups only be available
to growers producing less than $5,000 in organic
sales and the assumption that growers earning over
$5,000 in sales should be able to afford
individual certification.

Based on our over 11 years of experience
working closely with grower groups in Mexico, OTCO
[phonetic] believes that this would limit—this
limit would place a huge and unnecessary burden on
these grower groups and would negate many of the
positive social and economic effects these
projects are trying to achieve. As was pointed
out by a representative of such one group, $5,000
a year is still poverty income, even in Mexico.
Inspection costs alone on an overseas project,
particularly for the class of skilled bilingual
inspectors necessary to adequately assess these
kinds of operations, can easily range upwards of
$400 to $500 per day or more once the travel costs are included. Even under a system where a percentage of parcels are inspected, the cost of certification represents a major hurdle for small holder groups. Placing a $5,000 cap on these—on the use of these—of this model would further increase the cost. OTCO is ambivalent with respect to the inclusion of the retailers and large processors under this system of certification, believing that the NOP will in the end rule that the regulation must be implemented evenly without respect to scale and can not grant special considerations to one scale of operator over another.

OTCO believes that the certification of larger US-based retail and processing operations under a rigorously enforced and verified ICS system as defined by the current NOSB recommendation and including the annual inspection of a statistically significant percentage of individual locations would not pose a significant threat to organic integrity.

Our experience with community grower groups in the developing world leads us to predict that if the recommendations of the NOSB and CAC are adopted, there would not be as some have
predicted a large-scale rush of retailers and processors to seek this model of certification provided certifiers maintain rigorous standards with respect to the evaluation and enforcement of the ICS as laid out in the OSP.

The logistical and organization requirements of maintaining a very homogeneous production and quality control system in multiple locations and of demonstrating the compliance of those systems with the ICS are a significant burden on any organization. Thus we suspect that many entities will choose to stay in their current system of certification rather than adopt a system that by its very nature would put all of a company's operations at risk of suspension or revocation if one single location or facility failed to comply with the rule.

Thank you.

FEMALE VOICE: Thank you, Tiffanie. Are there questions or comments for Tiffanie? Bea?

MS. JAMES: Thank you for your comments today. What is your definition of rigorously enforced? On 205.403, onsite inspections, onsite inspections shall be conducted annually thereafter for each certified operation that produces or handles organically-organic products for the
purpose of determining whether to approve of request certification.

MS. HUSON LABBE: I'll have to go out a little bit of a limb because this was a collective document. So I would say that rigorous does have something to do with someone actually being onsite annually, which would go back to their ICS within their OSP. So we do a thorough analysis of their reporting system for their internal control, so someone is actually visiting all sites all year, and then we do our statistical selection and inspect those. So part of that rigorous is making sure their internal quality control systems are in place and are being adhered to within their greater organic system plan.

FEMALE VOICE: Any other questions or comments? Jeff [phonetic]?

JEFF: [Inaudible]. Yeah, Tiffanie, I was curious about your comment and I understand what you're saying about scale neutrality. But you were inferring that there should be no dollar limit then on whatever size operations can pull together to form a grower group. Is that correct?

MS. HUSON LABBE: That's correct.

JEFF: So anybody could form any size grower group anywhere and not—and avoid annual
inspections?

MS. HUSON LABBE: Well, our experience has been that a lot of these groups are often also marketing cooperatives, which we view as two separate things. But often a grower group is a marketing group. And the fee gets totaled on the gross percentage—or a percentage of the gross sales, so it's collectively they share the burden, both ways.

FEMALE VOICE: Hold on, hold in, hold on. There's people in front of you, Katrina [phonetic] and then Tracy.

KATRINA: Thank you for your comments this morning, or this afternoon.

MS. HUSON LABBE: You're welcome.

KATRINA: My question has to do with what happens after the annual inspection. So I'll give you a hypothetical situation.

MS. HUSON LABBE: Okay.

KATRINA: So say there's a grower group that has 500 individual farmers -

MS. HUSON LABBE: [Interposing] Mm-hm.

KATRINA: And you go in and do some percentage assessment against their internal control system. So you look at their internal control system and then you decide to do onsite
inspections at say 50 of their 500 farms. And you
find that half of those 50 have some
noncompliances.

What actions would you take after that
inspection finding?

MS. HUSON LABBE: Well, I believe the
non-compliances would be able to be resolved, just
like if they were an individual group.

We can kind of speak to the fact if they—
if we have to move to suspension or revocation,
then the whole group is at risk for that.

But, you know, through formal procedure,
any noncompliance will have a chance to be
corrected.

KATRINA: Would you not then say that
perhaps—that there's a chance that their internal
control system is then not working because 50 of
your—so then you —

MS. HUSON LABBE: [Interposing] I'm sure
that would be something we would look at. I mean,
if we're following a trend and we're seeing a
trend or actually it would to back to if part of
their OSP is this ICS and we feel like they're not
following it, then that in itself is a n on-
compliance and we would address that would them at
that point.
KATRINA: Thank you.

FEMALE VOICE: Tracy and then Bea.

FEMALE VOICE: Okay.

MS. MIEDEMA: You mentioned the statistical metric of how many units you decide to expect on site. Can you share with us what are your determinates there, what are the metrics -

MS. HUSON LABBE: [Interposing] Sure.

MS. MIEDEMA: - and the statistics.

MS. HUSON LABBE: Right now, we practice initial inspection for every site. And then following yours 20%, rotating so that everyone gets inspected within that percentage, so a different 20% every year so that in what do you say, five years, everyone gets inspected, but in—headquarters gets inspected every year.

MS. MIEDEMA: So no over layer of say a risk-riskier operation [inaudible] -

MS. HUSON LABBE: [Interposing] Oh, we will do that if we see that that's a fit. I mean, it's kind of a per-basis situation, but it - as an overall theory, 20%. And if someone, you know, is a specific risk or we've had a bit of an issue or we feel there might be concern, we would probably go over our 20% and go back and check a few of risk to us.
MS. MIEDEMA: Thank you.

FEMALE VOICE: Bea?

MS. JAMES: I just am looking for some clarification because earlier when I cited the rule that producers and handlers needs to be inspected annually and you mentioned that you do do that and now you just mentioned that you would approve or that you would suggest that a percentage of sites being inspected would be adequate. So that would mean that you would not be able to do annual inspections in all the sites.

MS. HUSON LABBE: I'm sorry, yeah, I will clarify. Their internal quality control system should inspect every site every year. We are doing a sample of that, of their total sites, so that 20%, but their internal quality control system should be monitoring all sites all—every year.

MS. JAMES: So let's say for instance that you have a group of retailers, 500 retailers that are certified through you and you would inspect a certain percentage of those, how long would it take you to get to the rest of the locations? Do you have a criteria say that, you know, is somebody—if the list is so large that how would you manage getting to all of these sites in
a reasonable amount of time.

MS. HUSON LABBE: I'm not sure actually. My experience has been with a lot of the farms who are in a general region, so they can be done in on trip, so over a week or ten days. I'm not sure about a national scale for a retailer.

MS. JAMES: But you were suggesting that retailers, producers, handlers, should fall under the same criteria as grower groups, correct?

MS. HUSON LABBE: Correct as far as if their internal quality control system is deemed compliant within their OSP, then yes.

FEMALE VOICE: Any further—Katrina?

KATRINA: A follow-up question, and this is perhaps asking for a gut instinct.

MS. HUSON LABBE: Okay.

KATRINA: What is your gut on how your peer certification folks so they operate similarly with grower groups as far as percentages? And in particular, how they would react if they found a lot of non-compliances at their sample percentage.

MS. HUSON LABBE: I guess I would have to say on my hope, maybe not my gut, that that would be the case. I've spoken to only a couple that are familiar with kind of this type of situation and we unfortunately didn't talk about -
MS. TIFFANIE HUSON LABBE: ...you know proposed suspension or revocation issues. I would assume that the noncompliances would all be handled in a similar fashion, a chance to comply and if it had to go further that they couldn’t comply or couldn’t resolve them, then it would move to that and the whole co-op would be in jeopardy.

MS. HUSON LABBE: Thank you.

MS. BEA JAMES: I’m sorry, I am not. I’m sorry I’ll try and help. You’re doing really good, you’re doing really good. I’m trying to understand if the rule says annual inspection of a production facility, how do you justify only inspecting a percentage of those? Or how would you justify only inspecting a percentage of those?

MS. HUSON LABBE: I hate to keep repeating myself. It would still go back to what their quality controls are. So if we feel, after the initial review of the sites, and a part of the initial review is that you know when we are looking at everyone, does everyone use the same inputs, the same management tools, you know they’re not in control of their own production and
that's the difference for us between a marketing group and a grower group. A grower group, to speak very generally, they have a management system who dictates how they produce so what inputs are used, how they’re used, when they’re used is usually a collective effort of planting and harvesting, these type of things, which is different then someone who markets together because that is individual producers in charge of their own production. So in that case those people would need an individual audit because it’s its own production site different from their neighbor even though they market together. So a growers cooperative where they have one central location who manages that, dictates all that product that’s part of that internal quality control that we feel like if we’re auditing that and they’re doing what they say they’re doing with that, then we don't need to be at every site every year. And it goes back too that they should be there every year at every site within that internal quality control so someone is on site it just may not be us every year.

MS. JAMES: Any other questions, comments? Thank you.

MS. HUSON LABBE: All right, thank you.
MS. JAMES: Jake you’re up. We have Sam Welsh on deck. Sam are you in the room? Sam don’t get too excited because we’re going to take a little break after Jake. I just want you to be aware. Jake come on.

MR. JAKE LEWIN: I’m the one keeping you from your break. Okay, small point of order. I’m holding a proxy for Z.S. Sonabund. I’m going to try to get through all this stuff and maybe we can save you a few minutes. So my name is Jake Lewin. I’m the Certification Services Director for CCOF. We’re a, we’ve been involved in Organic certification for over 30 years. At this time we certify about 1,300 farms, about 500 handlers, and at last count almost a half million acres of organic ground. So I’m going to talk a little bit about the grower groups.

We’re really happy that this has been moved to a discussion item and kind of don’t want to flog the horse too much but we are concerned about the CAC recommendation covering the multi-site operations. CCR larger supports the Accredited Certifiers Association position statement on this issue. We see this as a strong reflection of the overall standing and opinion of U.S. certifiers and it’s important that ambiguity
in the regulation is reduced whenever possible. We’ve seen this in a number of areas of the standard. Fundamentally we wish to see clear guidelines for grower group certification that are unambiguous and clearly limited to growers in specific and extremely limited situations.

Unfortunately the current recommendation does not serve the needs of the organic marketplace. As written it creates tremendous leeway for application of grower group concepts to processor, retailers and others. We see this as an unacceptable slippery slope that will create a race to the bottom among U.S. and foreign certifiers. Certification’s a competitive enterprise and we don't really want to see one of the fields of competition how few inspections you can do. Therefore we are extremely concerned about the direction and substance of this recommendation. CCUF does not currently certify any grower groups and requires 100% inspection of all production sites for both large and small growers and processors, 100% inspection is the gold standard for certification that should be maintained wherever possible.

What we would really like to see is a recommendation come back that addresses the key
issues that are important to grower group certification, how it should be done, what the sampling rates should be, how growers, how they qualify and how many failures within a sample system result in a failure over the entire group. Clear guidelines for how this will happen at grower locations, if it’s going to happen. And we really appreciate the concern the NOSB has placed on this issue, the concern the NOP has placed on it also and we also recognize that a lot of energy has been put forward by good people and fundamentally really appreciate the work the NOSB does. We’re pretty busy around my office and I can’t believe that all you have the time to do this so we really, really do appreciate it.

Regarding materials, we would really like you to take into account the previous work that’s been done on materials and move the ball forward within the existing paradigm that we have wherever possible and watch out for reworking away from the years of effort that have been put into this. Regarding Sunset materials, we support the re-listing of the grower and processing material that are being Sunsetted and apologize for not commenting earlier on that.

With the seed commercial availability we
have some significant concerns with this. With
1,300 certified organic farms growing hundreds of
crops and untold thousands of varieties the
current recommendation to maintain an ongoing
database of allowed non-organic seeds is
untenable. We support a positive database of
available organic seed but believe that trying to
maintain an ongoing database of every allowance of
non-organic seed will just create an unacceptable
paperwork burden for our clients and for
ourselves, it’s just a monumental task it’s a
systems approach. We inspect operations and they
need to be able to demonstrate compliance onsite
not report to us every single seed that they buy.

Finally, just in terms of the new
materials the potassium silicate, we believe that
we have growers who would be interesting in
experimenting with this. We don't have too many
that have told us that they really want it but
nobody’s had an opportunity to try it as a disease
or pest control and so with all the growers that
we work with, we believe that there are some that
would have an interest in looking at it further.
And that’s it.

MS. ANDREA CAROE: Is that for your proxy
as well?
MR. LEWIN: Yes.
MS. CAROE: Well exciting. Any questions?
MS. JAMES: Yes.
MS. CAROE: Bea.
MS. JAMES: Thank you for your comments today. Do you think that part of the overwhelming feeling around keeping a database of allowed non organic seeds is because not enough of the people that you certify are actually using organic seed?
MS. LEWIN: It’s the sheer volume. It’s the sheer volume of the information. We are constantly finding ways to try to do certification in a way that’s meaningful and not all about just the paper and trying to maintain a database of when we’ve got farmer’s planting everyday of every year, thousands of varieties to try to constantly track exactly which one was organic and which one wasn’t, isn’t something that is going to be possible and we do not want to see that paperwork burden to be the barrier to organic compliance.
