MS. JAMES: But you said that you thought that if it was organic seeds, that it would be manageable database.
MR. LEWIN: Yes because there are fewer organic seeds certified and if there was a
positive database of certified organic seeds, it would be very much appropriate for growers to have to go to that and look for the seed.

MS. JAMES: Right which is the goal.

MR. LEWIN: Yes.

MS. CAROE: Any other questions or comments? Katrina?

MS. KATRINA HEINZE: I want to make sure I heard you right. You support the relisting of processing and handling materials.

MR. LEWIN: Yes.

MS. HEINZE: And had no comment on handling on materials. Did I hear that right?

MR. LEWIN: No we support the relisting of all the materials up for Sunset.

MS. HEINZE: Okay. Then I have a follow up question.

MR. LEWIN: Okay.

MS. HEINZE: Glucono Delta Lactam.

MR. LEWIN: Yes.

MS. HEINZE: We received very few comments on that material.

MR. LEWIN: Yeah.

MS. HEINZE: Do you have any input on how industry is using that and what the impact on industry would be if it was delisted?
MR. LEWIN: It’s it I remember correctly and I’ve moved up away from handling the files every single day, it’s used in tofu and frankly it’s one of the items that I see used relatively commonly and therefore my expectation would be is that that would be quite a blow to those who lost it.

MS. HEINZE: Thank you.

MS. CAROE: Any other questions? Okay.
Thank you Jake.

We’re going to take a break. It is now 4:25 and if the Board can be back by 4:35, I know it’s only 10 minutes but I want to eat tonight.
Okay Sam, are you ready? Okay whenever you’re ready we do have a quorum present. Board members can you pay attention; we’re going to get back in.

MR. SAM WELSH: Okay, my name is Sam Welsh, I’m from OneCert and here are my comments on private label certification.

In October 2006 NOSB recommended guidance on the retailer private label certification that contradicts the NOP rules by creating interpretations where none are necessary. The language of the rule is clear on this points.
Here are some of the problems that have been
created by some certifier’s business practices that are not in compliance with NOP labeling rules. I won’t read through these now, I just want to point out that the labeling guidance has created unintended confusion that has resulted in errors of certification. Errors that could be avoided by following the rule as it is written.

Since most private label products are manufactured for retailers I want to make a key point about retail certification. Notice the exception in this definition which is in bold.

Final retailers that do not process are specifically excluded from the definition of handler. Other private label companies may never even touch the products that carry their name.

The manufacturing and distribution are often contracted to others.

The answer to question two from your 2006 recommendation was incorrect because it would change the definition of handler that Congress included in OFPA. The correct answer is no. The definition of handler clearly states such term shall not include final retailers that do not process agricultural products. It would take an act of Congress to change the definition.

I want to point out here that the
exemption or exclusion from certification for retailers and distributors that do not process is distinct from the exemptions and exclusion from certification from those who do process. There are six categories of exempt or excluded operations. Four categories involve processing and have specific labeling requirements. The exemption and exclusion for retailers and distributors, the ones who do not process, do not contain specific labeling requirements. None are needed because the products they receive are already finished products. The current practice of some certifiers to grant certification to exempt retailers and excluded distributors solely for the purpose of getting that certifier’s name on the label has absolutely non justification in the NOP rules.

The use of imprecise terms can often create unnecessary confusion. The term final handler does not appear in the NOP rules. The Rule uses the terms handler of the finished product, and operation producing the finished product. Co-packers are the handler of the finished product. Subsequent handlers are exempt or excluded.

What certifier must be identified on the
label? The answer is easy when you read the rule. The label must identify the certifying agent that certified the handler of the finished product. Keep in mind that paragraphs B2 in sections 303 and 304 are mandatory requirements. Such a mandatory requirement cannot be changed by voluntary certification of subsequent handlers.

Here are some of the known problems that occur when the so called certifier of the private label approves the label for a product that claims to be certified by that certifier when in fact is another certifier that is inspecting and certifying the co-packer that actually makes the finished product. This is a typical listing from a certificate issued to a private label retailer or distributor. Such certification is voluntary and could be dropped at any time without penalty; this is the NOP definition of processing. These are not part of the definition of processing but even if they were, they are not the final step in the making of a finished product. When the label is applied it is a finished product.

I want to point out that creating formulas, sourcing ingredients, designing labels are activities that are often done by consultants. Consultants do not get certified for these
activities. On the other hand certification of
the co-packer is mandatory because they actually
make the finished product. Their certifier can
only verify what has happened up to the point
where the product is packaged and labeled.
There’s no way to verify at that point what will
happen in the future.

As I pointed out earlier paragraphs B2 in
sections 303 and 304 are mandatory requirements.
Voluntary certification subsequent handlers does
not change who is the handler of the finished
product. It also does not change what certifier
must be identified on the label. Any questions?

MS. CAROE: Hold on. I actually, Joe
Smillie is not here you know because he’s not back
from the break yet so I just wanted to respond to
a couple of things. One the Committee when they,
when we looked at this do not feel that private
labelers meet the definition of what a retailer is
in the commissioning of a label and the marketing
of a product that is their product essentially
through label. So that’s were we diverge from
your assumption that retailers are excluded from
the, wrong wording. I apologize, exempt from the
process so that is one part of this that I want to
talk about. And then the other is the definition
of processing which includes and otherwise
manufacturing and packaging is another area that
we construed the commissioning of a product and
the production of a label as you know our
interpretation is meeting a processing function.
So there are a couple of areas that you know we
have considered what you have written and I’ve
actually seen your comments before Sam. I wanted
to explain that there was a rationale and it
wasn’t flagrant disregard for what was written but
a different interpretation for these unique
operations that don’t necessarily you know meet
these broader category titles.

MR. WELSH: I appreciate the explanation
but I did include both the category that is exempt
retailers and excluded distributors neither of
whom have any labeling requirements because
neither are doing label, because neither are doing
processing which is why they’re exempt and
excluded. So to try to give those operations
through a voluntary certification rights to
determine what certifier is on the label certainly
has no foundation in the law or in the NOP.

MS. CAROE: And again in the
commissioning and the production of a label, we
certainly believe that these private labelers are
labeling a product.

MR. WELSH: But they are not the handler of the finished product because the finished product is made by their co-packer.

MS. CAROE: I believe that we can continue on all through the night with this but clearly this is not a clear issue.

MR. WELSH: I beg to differ which is why I brought this up. It is a very clear issue if we simply look at the rule. Perhaps there’s others who have questions I don’t mean to.

MS. CAROE: I will, Bea and the Hugh.

MS. JAMES: Thank you for your comments Sam. My questions are a little easier. I want to understand, are you asking the Board to go back and revisit the private label recommendation that was submitted last year?

MR. WELSH: Absolutely, I think it should be resented it has that, that is one illustration of inaccurate or you know areas where it contradicts what’s in the rule.

MS. JAMES: And Valerie I don’t recall seeing Sam’s comments in the meeting book? Are they posted on the website for this particular—

MS. VALERIE FRANCES: There was a group of six comments at the back of your Meeting book.
MS. JAMES: They’re not listed on the Table of Index of all the people that submitted.

MS. FRANCES: Right. And it should be there.

MS. JAMES: Okay.

MS. CAROE: Hugh?

MR. HUBERT KARREMAN: I just want to thank Sam for laying out a very clear case I believe by reading the citations and definitions from OFF but I, actually finally understand this issue now. Thanks.

MR. WELSH: You’re welcome.

MS. CAROE: Okay now, is there any other question before I move on? Sam has another testimony that was supposed to be yesterday that was flip flopped with another commenter so he’s going to continue but I want to get on deck Maury Johnson. Are you on the room? You’re on deck, you’ll come next.

MR. WELSH: Okay thank you. I have comments on a couple of different topics. I’ll try to keep this brief.

On commercial availability although the definition applies to both seed and ingredients listed in 205-606, the type of information required for each is different, it’s as different
as a farm is from a food processor so I suggest that any guidelines that be written be written for each of those separately. I will discuss a little bit further the 606 because it has only 38 items whereas seed has hundreds if not thousands of different varieties.

There is a new website available that was designed with some input from different certifiers that would become a database of all the available suppliers of commercially available organic ingredients that are currently included on 606. It’s a free listing, it’s designed to facilitate finding, answering the question is it commercially available because any supplier of a commercially available organic product listed can simply register. The site is 606organic.com. It will accomplish a couple of the items on your NOSB proposed criteria for example items two and three with some additional development it could even facilitate the record keeping items that are discussed in four, five, and six.

Evaluating whether or not an appropriate form, quality, or quantity is available in organic form is the critical decision for certifiers. We need to be sure that specs for organic ingredients are not manipulated simply to avoid using organic
ingredients that are available under 606 which is an issue that’s occurred in Europe and other places where things keep getting switched and specs keep getting switched simply to avoid using things that would work perfectly well in organic form but they don’t want to spend the money to do so.

On grower group certification I am in general agreement with OTA, the ACA comments on this. I worked on both of those task force or committees. I do what to stress that I think no new guidelines are needed for multi-site handling operations because the rule is very clear. Each facility and site must be inspected annually. When it comes to production units I think even there in OFPA it says every farm must be inspected annually. I think it’s unfortunate we weren’t forced to stay with the original guidance from the NOB that we inspect 100%, I think it would have been a worthy challenge for us to come up with ways to it affordably and maintain the integrity.

What’s failed to be mentioned and failed to be discussed are some very real issues in group certification. We’ve heard many people talking about what happens when it works well. What we’ve not heard about is what happens when it does not
work well, when it’s actually being abused by those who create these groups. Not all groups are cooperatives or associations, some groups are formed by buyers or exporters. A worst case scenario I’ve seen is when an exported organized a group, told them it would take three years to go through transition so for three years they got conventional prices even though the exporter got certification after one year.

So if we’re concerned about growers, we need to start looking at what are the things that are going wrong with group certification and address those in the new guidelines. The guidelines are great for those that are working well; the things we’ve heard today are for ones that have the necessary expertise and resources to make it work. That’s not the case in all circumstances and in many parts of the world there are certifiers who do not have sufficient staff even to do the kind of sampling we’ve heard about today and are still granting certification. Those are all issues that need to be brought up and discussed as we develop better guidelines for group certification.

I think I’ll stop there in the interest of giving you an extra minute or so.
MS. CAROE: Thank you. Is there any comments or questions from the Board? Oh, Bea.

MS. JAMES: Sam, I really appreciate the time and the effort that you put into your comments. And for whatever reason they didn’t get into our meeting book and so I really want to make sure that we, the Certification Accreditation Committee gets an opportunity to see the documents that you worked on.

MR. WELSH: Okay.

MS. JAMES: So I’m just requesting that those get maybe emailed to us directly.

MR. WELSH: I did bring copies today and I–

MS. JAMES: Okay thank you.

MR. WELSH: All right, thank you.

MS. CAROE: Kevin.

MR. KEVIN ENGELBERT: Your most recent statement about certifiers that you know of that do not have the personnel to properly inspect an operation but still certify them, what steps do you take if you know that has happened if any?

MR. WELSH: We make sure that the governing authorities are aware of it and in many cases this happens in Countries where there is no official oversight so it’s something that other
then you know it would go to the U.S.D.A. And I know a number of things not just from me but there are other certifiers who’ve also shared concerns so if we can’t address it with the agency involved, then it gets brought to the attention of the NOP. And as we know you know they need more funding but that is certainly you know an issue and that’s partly what you know well, never mind, I won’t digress here.

MR. MAURY JOHNSON: Good afternoon. My name is Maury Johnson and I am production and sales manager and part owner of Blue River Hybrids Organic Seed. Blue River Hybrids is independently owned and operated and located in central Iowa about 25 miles north of Des Moines.

The sole focus of Blue River Hybrids is to produce and sell field crop organic seed to farmers on a national basis and into Canada. My comments today are in regard to the commercial availability of organic seed, specifically organic field crop seed which is the area in which I work. I’ve been involved with the organic seed since 1999 and I’ve seen significant progress but I
also, in my comments want to alert you to a significant challenge that’s now facing organic seed, especially field crop seed.

In terms of the positives I believe that there is now or soon will be within the next two to three years, more than adequate capacity to produce sufficient supplies of organic seed corn, soybeans, sedan grass, and alfalfa to meet all domestic demand. In the case of Blue River Hybrids we had a very good year last year, very significant sales growth and yet we only sold about 60% of our available corn inventory. We are only using a part of our production and conditioning capacity for organic seed, we could do a lot more. It is my experience that other organic seed companies whether they are located in Illinois or elsewhere have the potential to increase their production and distribution of organic seed.

Secondly, there are mechanisms in place to deliver organic field crop seed to almost any and every grower in the United States. Blue River Hybrids is selling and delivering organic seed to farmers in more than 35 States and 4 Canadian Provinces. We have over 150 seed dealers and distributors throughout the United States. We
have dealers from Pennsylvania to Oregon and from Texas to North Dakota. We offer not only one variety for a given maturity but often several varieties or hybrids to choose from for a customer.

A third issue that is also talked about with regard to commercial availability is the performance of the organic seed and whether or not it is equal to or hopefully better then conventional untreated seed. To demonstrate the equivalency Blue River Hybrids is testing its seed in more then 70 locations throughout the mid-west and east coast areas. Our test plots include organic and convention untreated seed that is currently being sold to organic farmers. We also put our seed in public trials that are sponsored by State agencies or universities and that information is public. We also have a very liberal policy providing at little or no charge seed for testing to customer or dealers and even potential customers much of our test plot data, whether it’s our data or with other companies is available on our website.

But all of this progress is being threatened at this time by the fact that the conventional suppliers of organic germplasm in the
United States are rapidly transitioning from convention seed to trait or GMO seed. This progress is undermining our work with non-GMO organic seed. In the past, many organic seed companies relied on these suppliers for seed stock and testing of new varieties. However, these suppliers are transitioning from non-GMO research to the production of GMO seed stock and testing. This trend began several years ago but is rapidly accelerating. Our choice through these normal suppliers is greatly limited.

In order for organic seed companies such as Blue River and any of the other companies doing organic field crop seed to survive, we need to come up with sufficient resources to adequately support our own product development programs.

Farmers who—

MS. CAROE: I’m sorry your time has expired.

MR. JOHNSON: Okay.

MS. CAROE: Is there any questions for Maurey? Jerry.

MR. GERALD DAVIS: What are you requesting specifically from this Board?

MR. JOHNSON: We generally favor the rule that you are looking at as far as encouraging
farmers to use organic seed. That’s our general position.

MR. DAVIS: And that would help you in your efforts to have enough volume and the resources to maintain non-GMO lines?

MR. JOHNSON: Right.

MR. DAVIS: Okay.

MR. JOHNSON: It’s not a matter of us surviving as a business as much as it is having the resources non-GMO inbreds that are rapidly disappearing and not just us. But whether it’s other seed companies or you know whoever. But the non-GMO inbreds whether it’s for corn or for soy beans, those are decreasing fairly rapidly.

MS. CAROE: Bea.

MS. JAMES: So, just for clarification, you’re supporting the commercial availability recommendation that includes the sourcing of the seed?

MR. JOHNSON: Yes, that’s correct. Now the one thing I do want to emphasize, is I recognize that with field crop seed it’s a lot different then when we’re talking about vegetable seed. That’s almost a completely different realm. Vegetable seeds you’re starting to talk about taste and texture and processor demands and a
whole realm of criteria that we don’t deal with on
tfield crop seed. So I recognize that that’s a lot
different. And in some respects our job on the
field crop seed is somewhat easier. What makes it
more difficult is the looming cloud out there of
GMO hybrids and seed that’s being used, that’s
what makes it difficult for us.

MS. TRACY MIEDEMA: You mention having an
abundance of organic I think it was corn seed and
we know that commercial, there have been
exceptions granted for instance to farmers who
can’t find that seed.

MR. JOHNSON: Right.

MS. MIEDEMA: So my question is how do
you promote that availability so that we don’t
have certifiers out saying it’s not available when
you know you’ve got it right there in your barn?

MR. JOHNSON: Well there’s a number of
things that we do. We are listed on the OMRI
organic seed list. We did do a mailing of
approximately 4,000 postcards to organic farmers
in August and September letting them know we were
there. We’re at conferences and trade shows you
know annually across the United States. You know
we work with our dealers and distributors who are
just about everywhere. So we, and we work through various trade associations and we haven’t you know done a mailing for instance to certifiers or to necessarily inspectors but we’ve tried to do a lot to contact directly growers and let them know that we’re here.

MS. CAROE: Any other questions? Thank you so much for your comments.

MR. JOHNSON: Thank you.

MS. CAROE: Up next Marty Mesh and on deck Emily Brown-Rosen. Emily? Is Emily here?

FEMALE VOICE: Yeah, she’s right over there.

MS. CAROE: Thank you.

MR. MARTY MESH: Madam Chair I have a proxy from FarmSoy Dairy I mean FarmSoy Tofu. Good afternoon, this one’s going to be brief and try to help you makeup some time. I’m going to first read you a comment from, about calcium sulfate from somebody that I had suggested that they petition the materials years ago if they wanted to utilize it and then they saw that it was scheduled for Sunset.

Dear NOSB members my husband and I own and operate the FarmSoy Company a small manufacturer or organic soy products which began
as the farm community soy dairy in the early 1970’s and under our management has produced only certified organic product since 1992. I’ve recently learned that calcium sulfate is scheduled to be soon dropped from the approved list and this is my official request to keep calcium sulfate on the improved ingredients list. Our tofu operation has always used calcium sulfate as the coagulant for making our unique tofu and it’s functionality cannot be replaced by another coagulant. We and many dedicated customers much prefer the taste of this style of tofu compared to tofu with other coagulants and she goes on. Then even though I have no office help in November of 2000 I did the work and filed the necessary papers in a timely manner to get calcium sulfate on the approved ingredients list. These documents included MSDS product analysis and other materials. I’m going to skip part of it, and a list of its many food applications. And besides tofu manufacturing it is kosher certification calcium sulfate is a salt that is mined from the earth and is purified to food and pharmaceutical grade. Just as the variety of organic soy bean used affects the taste quality and texture of
tofu, so does the coagulant. There’s no reason why calcium sulfate should be removed from the approved list and the existence of FarmSoy Company would be in serious jeopardy if that were to happen.

She talks about the, her marketing efforts. And then I trust the NOSB will exercise common sense in keeping this ingredient on the approved ingredients list for food manufacturing.

Thank you for your time and consideration.

I assume that you’ve received that already in your packet but for the record you’ve heard it again in an abbreviated form.

So you know just to introduce myself to whoever I might not know, Tina’s first meeting I probably don’t need to introduce myself to you. My name is Marty Mesh I’m the executive director of Florida Organic Growers, our certification program, quality certification services. I started farming organically in ’72 and have been involved with FOG and our certification program since ’89. I serve on the Board of Directors of the Organic Trade Association. My comments never, ever reflect the official position of the Organic Trade Association, and I serve on the Board, Karen’s here. I serve on the Board’s of the
Southern Sustainable Agricultural Working Group and various other Boards and policy committees.

I want to start by thanking the USDA and the NOB for the Agriculture Symposium and the Agriculture Working Group for its work. And now once again as usual as I’ve done up here for the last approximate six years I’m begging to get something done and move forward.

I’ve requested many other time we start with the low hanging fruit, shrimp and tilapia. Those that were certified at one time under the program and then that ability to use the USDA logo was withdrawn by the program. It seems like that’s easy to move forward. In fact this time I found it interesting in public comments by Consumer’s Union, the Center for Center for Food Safety, Salmon Safe, all of those consumer and environmental organizations that have caused me untold grief over the last six years, now they’re all in agreement by saying get shrimp and tilapia done. Get it out of the way. Get that going and maybe that would be a source of fish meal in the future. So I would really ask that you focus on the low hanging fruit and get something done in a timely manner and so that organic agriculture can move forward as maybe some of the other more
complicated issues are considered.

I want to take a minute and thank Andrea for her service to the Board. I know and I take responsibility for a comment years ago which was focused on the Federal process and not personality but I fear at the time it may have been misspoken or misinterpreted. I hope it’s okay to make a personal comment once again since it’s your last meeting. I’ve valued my professional relationship with you for years. And though we’ve made, although we may have differed in opinions we were always cordial and professional and on behalf of the community and the industry and me personally, thank you for your time, your energy, your competency, your integrity, and your service.

Having been part of the discussion of grower groups, I want to state the obvious that there are many who care about this issue. The industry is dependent upon many products produced by those least able to afford the escalating cost of certification and inspection fees and that a solution is vital. There should be resolution to the grower group issue for certification so that the smallest of agricultural producers can continue to access the organic marketplace. I think that to marry the certification of those
grower groups with multi-site processing and
handling facilities is problematic, I disagree. I
think with maybe OTCO’s position that you can’t
separate them.

You know the regulation treats growers
and production units different then it does
handlers and the materials list is different. The
NOSB recommendation which the industry is supposed
to be operating under dealt with grower groups not
multi-site processing and handling facilities and
so I would hope that, my sense is that there’s no
major disagreement anywhere in the industry or the
community about trying to move forward with the
resolution for grower groups and urge that to come
to a completion.

I’m concerned with the ever increasing
paperwork burden associated with organic
certification especially for the small, is Dave
awake, especially for the smaller scale operators.
I don’t want to see them give up on the National
Organic Program and the organic label. The
recommendation about documenting the use of
untreated seed seems burdensome for certifiers,
and seems burdensome for producers and beyond the
scope of our responsibilities for our certifiers.
The seed database referred to by others should be
done by others and not certifiers. It should be done by those who market seeds or sell seeds.

Potassium silicate, I think in general Florida Organic Growers is, would recommend all the materials be relisted that are up for Sunset, potassium silicate that recommendation out of the crops committee needs to be reversed. This was a material as I remember that was petitioned, reviewed, the Crops Committee approved it unanimously pending its EPA registration and now years later after EPA registration is received all of a sudden the Crops Committee reverses its recommendation. I urge the Board, either the Committee to reverse its position or for the Board to do the right thing and approve potassium silicate. You heard from others. Jake I mean with CCOF, you’ve heard from other grower organizations as well about its usefulness.

I’m concerned about the process. The process that tells manufacturing, tells a petitioner that yes after you get your EPA registration you know it’s approved. That’s all 10 minutes? Okay. Man, you guys will love me then before I get done. So anyway fix the potassium silicate and I can stop now.

Let’s see it think. Oh, Kathleen and
Willy’s suggestion on humane treatment, I really enjoyed it and if Kathleen Mafken [phonetic] is willing to donate her time and you know to help the program or the Board in coming up with some recommendations, I would jump on it. And I would urge no task force. I’ve seen what the agricultural working group that did such good work, how long it took. I would want you guys to issue as soon as possible a proposed rule and let the community you know give feedback on a proposed rule. Task forces you know the past year’s stuff, it’s all taken so long that I fear that we may loose consumer’s confidence if we string this stuff out too long. And with that, you have more time.

MS. EMILY BROWN ROSEN: Okay do I have the five minute from Melanie Saffer too that was, I was going to speak for both of us from PCO, we both signed up in a row there.

MS. CAROE: Actually I thought Leslie told me that Leslie and herself were being switched to tomorrow.

MS. BROWN ROSEN: All right, well I
probably can get through this in five minutes.

MS. CAROE: Thank you.

MS. BROWN ROSEN: I don't think I have that much. Thank you, I’m glad to have a chance to speak to you and echoing everyone else. Thanks for all the hard work. This is a tremendous agenda you’ve put together here, tons of reading and the agricultural symposium also was very impressive. I learned a lot so it was a good experience so wish you well and sleep well at night when you get done with this.

I’m going to talk mostly about materials since that’s my main thing. As far as the Sunset materials PCO does support the relisting of all the Sunsetted materials on the list, agar agar [phonetic], calcium sulfate, carrageen, and glucono delta lactam cellulose and also I believe tartaric acid is on that list although it has never been mentioned anywhere, so that one you should make sure to recommend as well. It was just a glitch that it didn’t get listed anywhere. All these products had detailed reviews when they were originally approved and we are unaware of any concerns related to their use in organic food processing. It’s too bad we weren’t able to get a notice posed in time but I know things were crazy
this spring also but in the future it would be
good to have like just a brief Federal Register
notice saying Sunset you know have it even three
or four years ahead of time and these are the
items so we can all be ready to work on them.

The crop Sunset materials, we also agree
with the committee’s recommendation to renew all
the current listings, calcium chloride, ozoning
and gas, parasitic acid and the list three inerts
for use in pheromone dispensers. One question on
the copper sulfate although we have zero
experience with rice production in Pennsylvania, I
could say that we noticed you missed, there’s
another listing on copper sulfate. One for
algaecide use, one for tadpole control in shrimp
so you need to recommend it twice for each use I
believe. Both listings do have the annotation
about using once every 24 months. I think this is
being used so that people can use it once every
year since they can claim different uses so maybe
in the future you might want to reconsider that
but that’s just a point of references. You do
need to renew that one.

On the new materials, potassium silicate,
I read the TAP review, it’s nice that there was a
good TAP review on this and it was you know an old
issue that’s come back. I you know it looks like
to me it hash a lot of benefit in organic crop
production. We have in the east, we have very
humid climate unlike out west and fungal diseases
are one of the main problems for organic produces,
fruit crops, vegetable crops and that’s more my
specialty. I’m sure it’s other crops as well.
But this seems to have a very benign environmental
profile, it’s now EPA registered. Our only
alternatives really are cooper and sulfur and
those have you know toxic qualities and negative
aspects about their use. They’ve been
historically allowed in organic production. It’s
one of those things that came back from before
1990 and we’ve always been looking for
alternatives and haven’t had very many. So this
is one I would urge you to reconsider your
recommendation here. I think it would be of value
to have an addition material so we can reduce the
use of these other products.

The one other product mentioned in the
TAP review was this bacterial bacilli subtilis and
I did a seraphine good efficacy report on a lot of
these biological controls and that one really
rated poorly across the board in most fruit and
vegetable applications as far as peer review tests
on efficacy so I wouldn’t say that’s a great alternative, that would be like serenade as a trade name.

Then one of the new materials you had recommended on processing, the grape seed extract. We’re concerned that you have continued to remove some materials without a TAP review. I know at some point along the line you decided that you didn’t need TAP reviews for 606 items. I think this is a mistake. Maybe they don’t all but certainly a lot of them do and this one does. It should be tabled for further review. You did not have the TAP review and or an independent technical review and my concern is that the only reason to add it is for added nutritive value that would not otherwise be present to meet consumer expectations but you’re adding a none organic ingredient to an organic product for a marketing purpose. I saw no information about how it was extracted. Is it haxin [phonetic] extracted ’cause it was CBI all the information was withdrawn? There’s, the way they, the argument they used that it was not commercially available was that it’s so concentrated it takes 100 to 1 volume to produce it, they couldn’t possibly have it organically but my question is well what about
pesticide residues, have we looked at that from conventional grapes and we’re going to be putting this in organic food so I would take another look at that.

MS. CAROE: Thank you Emily. Board member questions? Hugh.

MR. KARREMAN: Regarding the copper sulfate shrimp that you mentioned, does that have to go under livestock then?

MS. BROWN ROSEN: It’s for Rice, it’s under crops.

MR. DAVIS: It’s for use in rice to control a pest, tadpole shrimp.

MR. KARREMAN: Oh, tadpole shrimp.

MR. DAVIS: Yes.

MR. KARREMAN: Okay, cool. That’s fine. But then also on copper sulfate it’s only for crops supposed to be applied once every year or two something like that, did I hear that? That’s not my realm.

MR. DAVIS: Once every 48 months.

MR. KARREMAN: Okay but it is used in livestock as a footbath sometimes and those footbaths go out on the land, so I’m just wondering how that’s reconciled.

MR. DAVIS: Well as Emily alluded to
there is 24 months, excuse me, yeah 24 months.

Every 24 months for tadpole shrimp and also every
24 months for, as an algaecide so it does, if you
claim it as an algaecide one year, you can use it
and if you claim it for tadpole shrimp the next,
you can use it again.

MS. CAROE: This is a great discussion
that we will have during the recommendation part
since we’re not engaging Emily here. But if you
do have questions for Emily, let’s ask her. Okay
so we’ll discuss that further when the item comes
up for discussion among the Board. Thank you
Emily. Oh Tracy?

MS. MIEDEMA: Emily I appreciated your
comment about the need for TAP reviews and Jerry
maybe you could weigh in on this too. In our
discussion about substances for crops, it came up
that you know tight budgets, we don’t necessarily
have money right now to do TAP reviews on
everything and so the discussion came up that
maybe there should be a threshold if there are,
there’s information in the petition that precludes
this from any further consideration, then we
wouldn’t expend resources on a TAP review. Sort
of a sure no, we wouldn’t use money for a TAP
review.
MR. DAVIS: Well that was one way to avoid TAP reviews if we expected the material not to have any chance of passing. We wouldn’t worry about expending the money. But for example a grape seed extract, that wouldn’t apply to that example at all. You know obviously it’s—

MS. MIEDEMA: Well you wouldn’t had to recommend it, yeah.

MR. DAVIS: Yeah it’s recommended to be added to the list.

MS. MIEDEMA: Right, yeah.

You know I just wanted to mention that for the sake of transparency in that this was something that was kind of uncharted territory, making a decision to not do the TAP and you know it may be an item that we need to go further.

MS. CAROE: Dan?

MR. DAN GIACOMINI: Hi Emily. This is specifically not a question. So but, I don't remember seeing a comment from you on the definition of the materials. Want to just ask you at some point in time to take a look at that document and get something to us.

MS. BROWN ROSEN: I have more here on that if you want to hear about it.

MR. GIACOMINI: Okay, I do.
MS. BROWN ROSEN: I also signed up, actually I also signed up for some time on Friday and what I want to do there is give you a little Power Point with all, what I’ll briefly say is that we think you have a lot of tools available already to do this. I think you know I appreciate that it’s tough to start up with this, it seems very complicated but it’s not as hard as it looks or seems and we think that with all the flowcharts you’ve already developed especially the March 2006 Framework on Synthetic Non synthetic, the various versions of the Ag, Nonag one, we can put it altogether. I’ll try and run you through a few examples and show you how it’s really not that hard to do and we think we can move forward on that and we would like to do that.

MS. CAROE: Any other questions? Thank you Emily. And we have Grace Marroquin up and we only have 20 more comments for today. Grace when you’re ready.

MS. GRACE MARROQUIN: I’m back.

MS. CAROE: Oh, wait a second. Before Grace Gershuny you’re on deck. I saw Grace earlier. Did she leave the room?

MALE VOICE: No, I’ll get her.

MS. CAROE: Thank you.
MS. MARROQUIN: Before I start I want to say thank you Andrea for all your great work and you know you’re going to be missed by everybody. And also want to thank the Board and the NOP. But I’m back and it’s your fault. No. I’m joking, joking.

My name is Grace Marroquin and I’m president of Marroquin International Organic Commodity Services Inc. My company is based in Santa Cruise, California and we import, distribute, and develop organic ingredients for the national food industry. I’m here once again to support the classification of yeast on the national list as an agricultural product.

We believe that this change would contribute to the raising of the organic standards. Organic processors presently are not required to use organic yeast because yeast is not listed as agricultural. This change would make it a requirement that organic foods use organic yeast instead of conventional yeast. Organic yeast is unique in that it is the only commercially available organic ingredient that processors do not have to use. We want to make it clear to the Board that this is a loop hold in the organic standards that we believe can be closed.
Organic yeast is far superior to conventional yeast for organic products. I know that you’ve all heard this before but there are some new folks here that haven’t. Organic yeast is grown on a substrate of organically produced grains, all organically produced grains. Furthermore there are no chemicals used like the ones used to make conventional yeast. There’s no ammonia, no sulfuric acid, no caustic soda lies, no synthetic vitamins, no synthetic anti-foaming agents. In conventional yeast production the waste water must be treated before disposal to avoid harmful pollution. In organic yeast production the waste water is a raw material for further organic production. Because of the chemicals used in making conventional yeast the organic movement in Europe realized that conventional yeast was not compatible with organic farming or food processing. In 1980 a German manufacturer Ograno, began to develop an organic yeast production method and in 1995 Ograno began marketing Beoreal [phonetic] organically produced yeast and our company began importing Beoreal into the United States in 2002. Our position is that yeast be moved from
non-agricultural to agricultural status so that under the NOP yeast can be a preferred organic ingredient subject to commercial availability. We’ve been pursuing our position with the Board now for three and a half years. We first brought this request to the Board in the summer of 2004. The Board, at that time the Board wanted to have an overall policy to decide which materials would be agriculture as opposed to non-agricultural.

One year ago after much hard work the Handling and Materials Committee offered a joint proposal for the October 2006 Board meeting. As part of this proposal both committees voted unanimously that yeast was an agricultural product and thus should be listed on Section 205-606 but not so, it didn’t happen. So there was public comment urging the Board to go slow. The Board voted to postpone further action so that it could study the points raised and there were two principle points raised. One was that there were no standards for organic yeast production. The other was that making yeast an agricultural product may have a negative effect on the yeast used in organic livestock feed. The Board said it was going to study the points so they could then revisit the basic proposal, the one that both
Handling and Material committee had already approved, it’s in the transcript under the October 2006 meeting, pages 75 to 77.

I would like to point out that in regard to the organic yeast the discussion document does not make any reference to the work that the Handling and Materials committee produced in October of ’06. The discussion document does not return to the agenda that the Board laid out in October of ’06. Now we have a discussion document that goes far beyond ag, non-ag area into the synthetic, non-synthetic area and the way it appears is that it’s moving further away from being able to address the question of yeast.

I want to leave the Board with a couple of points and one is June 28, 2007 the E.U. adopted, the E.U. adopted Council Regulation number 834-2007 and it gives full express recognition to organic yeast in food and feed. It provides general rules for the production of yeast. There are standards that apply to the processing. U.S. certifiers …

MS. MARROQUIN: …have wanted to have the yeast operations certified and they’ve been asking
for these processing standards. With this E.U. action the organic role is moving towards yeast as an organic ingredient and today there are many organic food products exported from the U.S. to Europe that contain yeast. If the U.S. organic standards continue to allow conventional yeast in organic products, this will setup another trade barrier for U.S. products being exported to the E.U.

And in regards to the livestock issue, I’ve been in this industry 16 years and have operated under the idea of organic preference and I know that presently there are some very large organic yeast companies posed and ready who are watching this issue and how we’re dealing with it. And you can bet anything that they’re going to be in this industry with organic yeast along with our supplier who is just waiting for a decision to be made to come here and setup production in the U.S.

I want to thank you all for your thoughtful consideration to this issue.

MS. CAROE: Thank you Grace.

MS. MARROQUIN: Thank you.

MS. CAROE: Questions for Grace? Joe and then Jerry.

MR. JOSEPH SMILLIE: As you know Grace I
support your position and it’s unfortunate but trust me that the yeast issue which you feel is lost in the newer discussion, it didn’t happen in a way that was prejudicial to your case and then the idea of yeast. The more and more we looked at this material the more and more we were faced with a conundrum of the synthetic nonsent [phonetic] that had gagged non-ag which Emily says is simple and I can’t wait to hear her explanation tomorrow. But we thought we had to deal with the whole thing holistically but on your issue I absolutely support it and I’m hoping that this Board can address that situation.

MS. MARROQUIN: Thank you. Think of it as low hanging fruit.

MR. SMILLIE: It is a fruiting body after all.

MS. CAROE: I think they’re coconuts but Jerry.

MR. DAVIS: Thanks for sticking with it Grace.

MS. MARROQUIN: Thank you.

MS. CAROE: Any other comments? Dan.

MR. GIACOMINI: I work in livestock; I consult with dairy farmers that work in, that treated a large amount, a fair amount of yeast to
their cows and one of the problems is the fact is that it’s a very small amount of yeast. I’ve talked to two of the major feed yeast companies and they really don’t want to have to go there and they are not looking forward to the possibility of needing to be, go through organic certification through international manufacturing and everything else. Could you list the companies you’ve talked to that are ready to go that currently supply feed yeast to the livestock industry?

MS. MARROQUIN: Well Midwest Bio Lag in Wisconsin, they did this several years ago. They actually produced organic yeast and they bought the equipment, they went through the OCIA certification and because of this loophole and no enforcement on it, they finally had to close down shop, they lost a lot of money. They actually at the time when I spoke to them over a year and a half ago they had not sold the equipment yet. It was in storage somewhere in hopes that maybe something might change. But it I think they you know they may have given up and they’re watching. Some of the other yeast companies are more from the food end. You know I haven’t, I know that they’re out there and they’re waiting. I think, again I want to point to organic
preference that is what got this industry to be
what it is today was if someone produced an
organic product had it available, we would have to
use it and it changed the industry, it changed
the, it kept raising the bars. Every company,
every product that’s here is because of that
preference. My company for the last 16 years has
been operating under that and has risen to that
challenge, enjoy the challenger and feel that
we’re a contributor to where the industry is. And
I think that they may not like it, sure. But it
think they’ll, it just takes one of them to get in
it and the rest will follow. I know that ‘cause
I’ve seen it for 16 years now.

MS. CAROE: Any other comments or
questions for Grace? Thank you.

MS. MARROQUIN: Thank you.

MS. CAROE: Let’s bring up another Grace.

Grace Gershuny are you in the room? There you
are. Brian Baker are you in the room? You’re on
dock.

MS. GRACE GERSHUNY: I was telling
people, I’m a virgin at this. I’ve been, never
have given a public comment at an NOSB meeting so
I am making this comment on my own behalf. I’m
listed as Gaia Services, that’s my consulting
name. I do consult for various people here in the industry and I had some hand in drafting some other people’s comments that you have already heard. But I am going back to my roots here. I am speaking as one who crafted some of the early organic definitions including the 1985 OTA guidelines for the organic industry and as one who served on the NOP staff for five years from 1994 to ’99 where I had a major role in drafting the regulations. Before this I was actively involved in grassroots advocacy on behalf of organic farmers where my ideas about the meaning of organic developed and I would add I’m also writing a book which this plays into.

I really appreciate the thoughtful analysis including acknowledging the areas of confusion in the document about the discussion of the definitions. And I want to contribute this in the spirit of joining the discussion rather then expecting anything to come out of it. What I really, it’s really kind of a radical proposal, radical idea in the sense of getting to the root of the confusions which has to do with the term synthetic. The root of confusion which is enshrined in our law and I want to tell a little bit of a story about how that came about. And I’m
going to try to be as brief as I can so I don’t go over the five minutes so I’m condensing some of this material. I’ll be glad to expand upon it in other conversations and discussions.

Essentially I believe that the basic premise of defining organic production and handling by the absence or non-use of synthetic substances is fundamentally flawed and I think that you know we’re not going to get away from that anytime soon but we could change the definition of synthetic. And my story includes coming to draft the document that’s appended to this comment which was created by the NOP staff in 1995 and was actually reviewed and approved by the NOSB with a couple of slight revisions. But this is a set of principles and a definition of organic agriculture that was used as a basis for drafting the regulations. And I want to point out that the term synthetic doesn’t appear in it anywhere and I believe that basing the law on this concept was a mistake whose consequences continue to unfold in public controversies and confusion about what organic means and should mean.

I went on to explain a little bit about Joe Smillie and I worked on drafting the OTA’s guidelines back in 1985, pulled together a lot of
principles and definitions from everybody and found that there were a couple of disconnects between what is feasible on the farm and what consumers believe and expect. We and what this did was promote a simplistic false dichotomy between synthetic as bad and natural which is good. Although many consumers clearly believe that organic meant chemical free or non-synthetics, we argued that the credibility of the organic label required us to educate consumers rather than perpetuate their ignorance.

Essentially I’m going to cut to the chase and tell you what I think the definition of the synthetic would be, it would solve a lot of the problems that have come up.

MS. CAROE: Well we definitely want you to continue and tell us what it will be. You can’t leave us hanging right there Grace.

MS. GERSHUNY: Okay. I think my modest proposal involves amending OFPA to define synthetic in a way that more accurately reflects both the basic principles of organic production and the really bad things that consumer’s thing of when they hear the word synthetic. This definition would narrow the meaning of synthetic to refer only to substances that are derived from
petrochemical products, i.e. synthetic organic compounds. Criteria for including petrochemically derived compound on a national list could also eliminate novel molecules that are not known to exist in living cells.

I’ve given a lot of thought to what the implications be, it would certainly make it possible to use things like potassium sulfate that were byproducts of manufacturing and not have to only buy mined potassium sulfate, things like that. There are a lot of, there’s a lot in here.

It is not a proposal to weaken the standards and I wanted to say that a lot of people would probably see it that way but most of us don’t have any interest in weakening the standards and I would just say that the definition should be shifted away from the idea that it’s a negative that it’s an absence of bad things onto the positive focus on ecological production systems whose primary goal as written in this document, which I’m very proud of, is to optimize the health and productivity of interdependent communities of soil life, plants, animals and people.

MS. CAROE: Thank you Grace. And I appreciate the comment, this is very interesting and I especially like the part where you put blame
on Joe Smillie. I share that sentiment. Is there comments or questions for Grace?

MS. HEINZE: I just wanted to thank you for your comments. You know it was the intention of the Handling Committee when we put out our initial thoughts to generate comments to help us as we continued in this process. I know you’re the first of many people who will have comments for us this week and I do appreciate it.

MS. CAROE: Thank you Grace. Now you’ve done it once, you can come back. Brian Baker you’re up. And you have a proxy Brian?

MR. BRIAN BAKER: That’s correct I have a proxy for [unintelligible] [crosstalk]—

MS. CAROE: Do you want two five minute sections or one ten minute runt them through?

MR. BAKER: Well I yeah, I think I can handle it all in less then ten minutes.

MS. CAROE: Excellent.

MR. BAKER: I’ll shoot for less then five.

MS. CAROE: Okay.

MR. BAKER: Hopefully, I don’t want to take up too much of your valuable time.

MS. CAROE: Okay and Rose Koenig are you in the room Rose? Yeah, you’re on deck. When
you’re ready.

MR. BAKER: Yes, Brian Baker, research director, Organic Materials Review Institute. I appreciate being before you again and also want to mention that I once sat where you are. I was on the NOSB for all of one meeting as a rotating certifier representative at the first meeting where synthetic and non-synthetic substances were voted upon in Orlando, Florida hosted by the illustrious Marty Mesh and that was perhaps a pivotal meeting where some of what Grace just mentioned was discussed. I was also wanted to mention that I’ve served as a TAP cord and technical advisory panel coordinator and TAP reviewer for the NOSB and have been working on these difficult issues. Most of my comments, I’m a materials geek working for the organic materials review institute and most of my comments will focus on the discussion of definition of materials. And it’s something that I think is vitally important and really appreciate you giving some thought to that and raising some fundamental questions, it’s important to not take some of these things for granted and certainly wanted to applaud some of the positive suggestions that you made. For example the elimination of the
definition of non-agricultural, it just gets in
the way. It’s not a negation of agricultural and
it complicates rather then clarifies. There are
other things in the discussion document that
really had a hard time understanding and just try
to work through what was intended by the
discussion document. And I just, we get questions
at OMRI everyday from organic farmers and their
suppliers, from certifiers and inspectors, from
suppliers, vendors, handlers, and we need to be
able to determine the status of a formulated
product clearly, consistently, and in a timely
way. This is vital for the continued growth and
prosperity of the organic sector and we are, we’ve
worked closely with the NOSB over the years in
helping to develop what culminated in the decision
tree that was posted in March of 2006 and ask that
you revisit that rather then starting anew and
departing on a new path and build upon the solid
work that’s been done by the NOSB over time.

I mean we did debate over using the basis
of synthetic, non-synthetic and agricultural and
non-agricultural as the basis or the foundation of
the standards and that, things have moved on since
then and we have to, we have many unresolved
issues that need attention. But creating new
unresolved issues is not very helpful.

Briefly I wanted to mention about the whole question of how agricultural products are added to 606. OMRI believes that all the items on 606 need to be evaluated against the criteria in the Organic Foods Production Act. The conventional farming practices of how those agricultural products are produced and their environmental impacts, their human health impacts are crucial to be understood before voting on them. And we believe they need to be independently evaluated by TAP reviewers and that the information needs to be publicly available and redacted as confidential business information.

We need also clarity on the meaning of commercial availability. We’re getting applications now from vendors and formulators of combinations of agricultural and non-agricultural ingredients and those formulations are requested to be confidential and it’s very difficult for us to explain under what conditions those formulated products can be used. So the meaning of commercial availability of those ingredients, the form, function, quality and quantity of the different ingredients that are going into the formulated products that we evaluate is very
difficult for us to communicate to the industry. And so we need further clarity on commercial availability. And so until TAP reviews are done and until there’s clear guidance on commercial availability we ask for a moratorium for amends to 606 and have some suggested language for the, for what can be recommended.

We ask that if we’re recommending that any non-organic agriculture ingredient be added to 606, the NOSB shall consider the criteria in the Organic Food Production Act for that ingredient in particular the impacts on the environment, human health, and the soil of the non-organic production practices used to produce that petitioned ingredient. The NOSB should consult with technical experts who are independent of the petitioner to determine the availability of organically produced and handled alternatives and the sustainability of those non-organic production practices. So that’s something we think is very fundamental in anything that goes on the national list. So similarly with aqua-culture, we expect the national list process to be respected for synthetics used in aqua-culture as well and are withholding comments in general on aqua-culture until we see something more about what’s proposed
there.

Briefly wanted to mention sodium carbonate proxy hydrate which has been petitioned, it’s something that when it’s used according to the label makes two things that are on the national list, hydrogen peroxide and sodium carbonate. So the difference is that the reaction takes place not in the factory but on the farm. And it’s our believe that the limitations and restrictions of the national list apply not, are relevant to what’s applied to the crop and not what’s put on the tank but we encourage the petitioner to petition for clarification and look to you for guidance. It’s just one example of the many kinds of questions that we have to deal with and face.

So with that I offer myself as a resource if you choose to explore this further. If you want to form a task force, OMRI stands prepared to support your work in anyway possible. I know it’s not easy and just I’m offering my assistance and I thank you.

MS. CAROE: Thank you Brian. Questions? Katrina and then Jerry.

MS. HEINZE: I want to thank you Brian in particular for your written comments and the
historical documents you provided. Had an opportunity to read them last week and they were particularly helpful as I think about this definition in materials. I was hoping you could speak a little bit about this idea of synthetic agriculturals because we’ve had quite a bit of discussion about that on the joint committee. And I will say I’m perplexed about the idea that a material can exist in both of those places particularly as it applies to how we would handle petition materials. So some thing is agricultural and it’s synthetic and someone petitions it, does it go on 606, does it go on let’s say 605B, does it go on 601, how are we?

MR. BAKER: Or it doesn’t go on at all.

MS. HEINZE: Right or it doesn’t go on at all.

MR. BAKER: I mean it depends on the application use but more fundamentally it depends on the source and manufacturing process. I use the example of ethylene gas. Ethylene is produced by apples or kiwi fruit. You can call that agricultural quite clearly. I mean everybody thinks an apple an agricultural product right. Okay, you can get it from and most of what’s commercially available comes from a petroleum
refiner so that’s clearly synthetic right? You can also produce it by evaporation or distillation and as a byproduct of ethyl alcohol in the process of splitting it off from ethyl alcohol this Board considered that to be synthetic when it was petition so that was a petition for a specific application for the greening of sprouts. It was a petition to put a synthetic on 601 okay, not even for use post harvest handling. So that’s one example.

You’ve got two things that are on both 605B as synthetics allowed in processing and 606 depending on their form on function. One is bleached lecithin and unbleached lecithin.

Bleached being reactive with hydrogen peroxide which is on the national list or benzoic peroxide which is not on the national list, either one’s okay as a bleached lecithin but you see and going back to histories and organic preference which is a term that sounds great but you know the reality of implementing it is not so great.

This Board recommended that there be a hierarchy created. If there’s an organic ingredient, you got to use it. If there’s not an organic ingredient that has that form, function, quality, and quantity, then you can use the non-
organic agricultural source. If you have a, if you don’t have the organic or the non-organic agricultural, then you can use a non-agricultural non-synthetic and only if you exhaust the organic the non-organic, and the non-synthetic non-agricultural, only then can you use the synthetic non-agricultural and so you can have a given ingredient depending on the source and manufacturing process be agricultural or non-agricultural, be synthetic or non-synthetic. It’s not the substance and that’s because organic is a process based standard not a—

MS. HEINZE: [Interposing] So then is your proposal that as we look at a decision tree or whatever format we end up putting this in, that we would focus our questions on the process?

MR. BAKER: That’s right. What is the source? What is the manufacturing process?

MS. HEINZE: Thank you.

MR. BAKER: How is it derived?

MS. CAROE: Jerry did you have a questions?

MR. DAVIS: When you mentioned sodium carbonate for peroxhydrate, give me your point again on that, I missed it just a little bit. What were you saying?
MR. BAKER: Well the point is that the active substance is not what the farmer sprays out or actually what the farmer applies through an irrigation cleaning system for example. It’s the sodium carbonate peroxyhydrate goes into solution and creates hydrogen peroxide and sodium carbonate and so by going into solution, by being used according to the label it then, the active substance that’s actually formed because it’s in dry state, right? It’s just, it’s a way of shipping hydrogen peroxide without shipping all the water so it’s a more concentrated form.

MR. DAVIS: The end result of the breakdown of that formulation becomes two materials that are already on the list.

MR. BAKER: That are already on the list but we’re seeking clarification because we acknowledge there are differences of opinion. Some certifiers say yeah, sure that makes sense and other certifiers are saying wait a minute, I don’t see sodium peroxyhydrate on the national list so yeah rather then spin the manufacturer around in circles, we said well go to the NOSB that’s you know if they give you a clear answer, then that’s what we’ll live with. But the precedent is that we see that if it’s used
according to the label, it’s producing two things that are on the national list.

MR. DAVIS: Right and the sodium carbonate actually would be a mined material actually from what I’ve read.

MR. BAKER: Right but it’s a mined material that has been reacted with hydrogen peroxide.

MR. DAVIS: Right, right.

MR. BAKER: In a reversible reaction so and then dehydrated.

MR. DAVIS: Correct. Okay thank you.

MS. CAROE: Any further questions for Brian? Dan.

MR. GIACOMINI: That is a consistent interpretation I guess would be the word, on the livestock side we have the same type of thing in the formulations of teat dips. The things that they make after they’re mixed are on the list. A lot of them have not been allowed because of the source material that’s used to make the solutions.

MR. BAKER: Yeah, I can think of a few. Well the, yeah the iodine products. But the other confounding factor of course with teat dips is they usually have excipients. And one thing I forgot to mention is that the, we look forward to
the docket on livestock materials and further clarification of what excipients are allowed in organic production. We desperately need that.

MS. CAROE: Any further questions for Brian? Gary non? Thank you Brian.

MR. BAKER: Thank you.

MS. CAROE: Rose you’re up. On deck Judy Thompson. Are you in the room?

MS. JUDY THOMPSON: Yeah.

MS. ROSE KOENIG: Hi, I’m, wakes everybody up. My name is Rose Koenig and I’m an organic farmer in Gainesville, Florida. Good afternoon and thank you for your service on the Board. I sat on the Board from 2001 through 2006 and during that time two issues that you’re dealing with today were somewhat, I thought, resolved or at least parting thinking that it would be a consistent retention of at least the ideologies of the previous Board. But however upon looking at the agenda and reading some of the documents I saw a difference of kind of opinion in terms of what was happening. So henceforth I’m here. That’s how you get me to come to these meetings again.

The first issue is potassium silicate. I was on a Crops Committee at that time when the
petition came forward for both the soil amendment and as a disease control product. That Board also as I think you’re Board viewed the product as a soil amendment a no-go. But in terms of disease control as the many members of the audience have stated, we could, we were in favor of listing that product for disease control. However, at that time there was no labeling, EPA label of that product so for us putting it on the list at that time it was like superseding the authority of the EPA because that’s their, you know they really have to determine whether something’s you know an efficacy or a type of product that can be used in disease control. So we told the company get the label and we’ll differ it at this point. So that is the history and I can go into more history if it is needed on that product but there was a consensus of the Board at that time that it should be on the, listed on the for crop use, for disease control and now I see it’s been labeled also for insect control. And I think you know at least in my opinion that it would be consistent for that also as it presently is petitioned.

Some of the reasons that I believes and I think that the Board believed it was as other people stated the existing materials, in fact
materials that are on the list things like copper and sulfur do have issues that if you go through the OFPA criteria, probably wouldn’t meet OFPA criteria as well as this product does. There’s heavy metal issues that occur when you use copper. There’s also resistance among pathogens, they can become resistant to coppered fungicides when they’re used repeatedly. That should not happen based on the mode of reaction or if it does happen, it would be a not I guess a more rare occurrence. If you know the mode of action, which will be explained on this particular product by the next series of speakers so I’m not going to go into that. But I just want to make the statement that I do think that this product is much more consistent with the OFPA criteria based on the products that are on your list and really I certainly, for people who know me, was not somebody who liked to list a lot of products. I don’t believe in that the synthetics list should be this thing that everybody you know petitions and voila their product becomes it. But I do believe that when there are products that meet the criteria and in fact when there’s products that are probably more environmentally friendly then those on the list they should be heavily
considered by the Board and should probably be listed. So when Sunset does come around there are other alternatives now on the list that you can kind of weigh the data of efficacy, data on these products to see if those products can be taken off.

It’s especially true of disease control products because as you know that you know farmers even you know I’m plant pathologist, I have a PhD in plant pathology and I’m also a farmer and I try to use systems management as the rule states that we’re supposed to do a series of hierarchy steps before we go to that you know last step which is your input, your chemical input. But even as an organic farmer there are instances where things just blow into your system. There’s air you know wind born type pathogens that are going to come into the systems and I do think pest control tools are a must if you’re going to list anything, you should really look at those very heavily.

I really wanted to do some conversation on also the materials document although my five minutes is coming close. What I just will mention about those documents is that this work also historically had been done. I did a lot of work in my last couple years on the Board trying to
further clarify the definition of synthetic 'cause basically we were told that materials were at a stalemate, we couldn’t go forth because we kind of got involved in soy protein isolate under the Crops Committee petition and we realized that it wasn’t easy with the present definition to make a decision on that. So we worked heavily on further defining synthetic. And then the NOP after I left actually did a great job, I think they worked with their lawyers from what I can see in terms of their evaluation. You know kind of taking our document and working into I think a much more legally defensible type of document and I really believe that you should go back to that document.

I think that that should be your starting point in terms of the process.

MS. CAROE: Thank you Rose.

MS. KOENIG: You’re welcome.

MS. CAROE: Questions for Rose, comments?

Thank you for making the trip back. We’ll just have to keep on throwing out controversial things so you keep on coming back.

MS. KOENIG: That’s all right [unintelligible] [off mic.].

MS. CAROE: Next up is Judy Thompson and on deck is Lawrence Datnoff.
MS. JUDY THOMPSON: Hello, I’m Judy Thompson with PQ Corporation and we are the petitioner for potassium silicate. And Rose has already covered some of the history. I just wanted to clarify why a pesticide registration is needed for a product like potassium silicate. OFPA’s definition of a pesticide refers to the FIFRA and according to that and I’ll use a fungicide as an example; if a material in any way controls a disease, then it falls into the fungicide category. In the case of silicon it actually helps the plant, at least part of the mode of action is to help the plant defend itself. You could think of it as the vitamin C of the plant kingdom so for that reason it needed to be registered as a pesticide.

Over the years I’ve provided updates to the NOP as far as the status of potassium silicate and as I knew it was going to come back before the Board and so I consolidated all those updates along with the 2002 petition and that is the document that is the 2006 petition. So the 2006 petition has the, more information on efficacy as well as the lasted research that’s been published on the mode of action and I had also added the insecticide use.
The TAP report is from early 2003 and this has some very good information in it however the 2006 petition really has a more complete, is more complete with respect to the latest research on salable silicon. In the Crops Committee recommendation one reason for failure was that it says here synthetic soil applied fertilizers are not compatible with organic farming regulations and I understand that. The 2006 petition actually petitioned a plan amendment for hydroponics use only but in an effort to clarify potassium silicate and to perhaps focus it, I’d like to withdraw that for consideration. So I’d like to take the plant amendment off for consideration. I think the people who have spoken in support of potassium silicate have done so for pesticide uses so I’d like to keep the disease control and insecticide uses.

The EPA registered potassium silicate as a biopesticide specifically in a biochemical pesticide category and this is because as I said silicon is used by the plant to help defend itself. Pesticides are given a signal word. It might be poison, danger, warning or caution. Our end use potassium silicate product has a caution word which means it’s the friendliest type of
product. It also has a tolerance exemption and if you’re not familiar when you register a pesticide you must document to the EPA any pesticide residue, how much of that can be tolerated by humans. In the case of a product that is benign and friendly such as this one, you can receive a tolerance exemption and that would be due really because the potassium silicate would be indistinguishable from potassium and silica that’s already in that environment.

The reentry interval is four hours. Some pesticide products could have a reentry as long as thirty day. This is the amount of time you have to wait before you go back into the field. Some products might be one day, twelve hours. This is four hours which is the lowest time. Also it has a zero pre-harvest interval. This is the amount of time before you can apply the material and then harvest the product. And again all this speaks to the benign nature of potassium silicate. And I also like to tell organic folks that potassium silicate is odorless.

Potassium silicate shows activity for both disease and insects and as such it may lower the use and frequency of less desirable control measures such as sulfur and copper. And lastly
potassium silicate is made the same way as sodium silicate. Sodium silicate is on the national list for fruit floatation and it was reapproved in a Sunset review I believe last year.

And lastly I’d just like to thank the Board and the NOB especially Bob and Valerie for their good and hard work on this process. Thank you.

MS. CAROE: Thank you. Just a quick question for you. Will you be in the meeting tomorrow.

MS. THOMPSON: Yes.

MS. CAROE: And on Friday?

MS. THOMPSON: Yes.

MS. CAROE: So if we have any further questions you’re available to help us with that.

MS. THOMPSON: Yes.

MS. CAROE: Okay any other Board? Jeff.

MR. JEFF MOYER: Yeah I just want to verify what I heard you say. You’re amending your petition to not include it as a plant and soil amendment?

MS. THOMPSON: Correct. I’m withdrawing that for a consideration so I would like to restrict it to the disease control and insecticide uses.
MR. MOYER: 'Cause that was one of the big issues that the Committee had with the product was that it becomes a synthetic fertilizer. Thank you for that clarification.

MS. THOMPSON: Thank you.

MS. CAROE: Any other questions, comments? Jerry.

MR. DAVIS: Real quick comment on the recommendation because of that problem with soil amendment versus the other uses, we did split it out into three separate categories so we expected the soil one to be rejected and not voted positively so it’s already setup to where it’s no problem, it doesn’t need to be amended. We’re going to vote on the three separate uses independently.

MS. CAROE: Any other questions, comments? Thank you Judy. Lawrence Datnoff you’re up and I have Lawrence Marais.

MR. LAWRENCE DATNOFF: I have a proxy so which would be Jay Levin so I’m going to take his time, is that ten minutes.

MS. CAROE: Jay Irvine?

MR. DATNOFF: Jay Irvine, yeah thank you.

MS. CAROE: All right, thank you.

MR. DATNOFF: Okay so just for the record
my name’s Lawrence Datnoff, I’m Professor of Plant Pathology at the University of Florida and I’ve been conducting research on using silicon for plant disease control for over 16 years. So the next slide.

So just to let you start out with terms about what silicon is as an element. You know it’s found in the Periodic Table just below carbon. Silica is SiO2; you also know it as sand. Well, you walk on beaches, that’s silica. Silicate is a compound with silica plus potassium. It could be also calcium or sodium. And then silic acid is this form right here. Next slide please.

And you’ve read in the TAP report about silicon, it’s the second most abundant element on the earth’s crust after oxygen.

Next slide. And you know we know a lot about nitrogen mineralization, we know about phosphorus dynamics in soil, how it gets into plants but when it comes to the natural dynamics of silicon in the soil and how it moves into the plants it’s not as well studied. But here’s some ideas of what we think goes on.

You do have minerals in the soil and that is released into a form silica acid. You have
these iron aluminum oxides that will bind up the
silicon so that they can be released over time.
You can also have polymers from plant materials
that can be released from irrigation water and
then this silica acid is what the plant takes up.
Next slide.

And probably the best study so far has
been in rice and last year AMA from Japan found
two transporter genes, LSI1 and LSI2. And what
happens is it will take salicylic acid from the
soil matrix, move it across the casparian strips
into the ion for loading, once it’s loaded and
moves up becomes deposited in the leaves and it’s
basically immobile once it is deposited. And in
rice you’ll get these silica bodies forming.
Here’s with silica, without, you can see. And
this is sort of X-ray microanalysis just showing
the amplification of silicon deposition in the
leaf surface. Next slide.

But what happens in this whole system you
can have some natural leaching. Okay. Next
slide. And there are soils that go through a
weathering sequence. This is what soil scientists
use, these soil orders to describe the horizons,
the texture and contents of clays and sands. And
basically they can go through a weather process so
it’s a de-silication so silicon is not available to the plant so not all soils are equal in their content of plant available silicon. Next slide.

And so you’ve heard about tropics. You can see there’s just millions of hectares of these soils so they are low and lemoning [phonetic], they’re out there. Next slide.

But even in the U.S. we have soils, the sandy antha [phonetic] soils, hista [phonetic] soils, organic soils, high organic matter, incepta [phonetic] soils you see and ulta [phonetic] soils that are just like probably the ones in the tropics, they are very low and lemoning. So again plant medium is low in lemoning and a lot of times there’s not enough silicon available to that plant. Next slide.

So also plants differ in their capacity to accumulate this element. So wetland grasses on a dry matter basis will be around 5% to 7%. Dry land grasses like sugarcane cereals turf about .5 to 1.4 on average and dicots [phonetic] about .2. Next slide.

And so these are plants that I just kind of listed, they’re in the literature. They show where silicon either can suppress disease or improves some type of plant growth and
development. And you recognize a bunch of crops here, some are ornamentals and turf grasses. Next slide.

And so when you look at silica in the literature there’s a lot of things this element can do. It does impact on plant diseases. Best studies are rice blast and powdered mildew pests and also can alleviate a lot of different stresses like metal toxicity, lodging, draught resistance for an example. Next slide, next slide.

Okay so enhancing resistance. So here we have, this is rice blast it’s the most important disease of rice in the world. We have three cultivars. This is resistant, this is partially resistant, this is susceptible. As you increase silicon you can take a susceptible cultivar, push it to partially resistance level and take a partially resistant cultivar and push it to complete resistance. This is very important for something like hair looms or land races to enhance that resistance. Next slide.

Similarly here is sheath blight, the second most important disease of rice in the world. Susceptible, partially susceptible, highly resistance without silicon, blue is with silicon you see you get that great suppression. But
what’s interesting is you can take susceptible
cultivars, moderate susceptible and push that
level of resistance just like high partial
resistance. So it can really enhance the
resistance of the plant. Next slide.

So what’s going on? You know is it
structural, biochemical? Well here’s a scanning
electron microscope showing deposition of silicon
just below the cuticle right here. And this is
the sidasol [phonetic], then here’s the cell wall
they control. Next slide. And what happens is a
spore will land. Hit that please, hit advance.
Okay, germ tube and this is silicon deposition.
Hit it one more time, one more time. And so you
have no infection. It blocks the ingress of the
fungus being able to penetrate that cuticle ’cause
the deposition of silicon. Next slide.

And here is an example where you took
this even further. This is 96 hours after
infection, big lesion here, very little lesion
here, you cut it you know look at it on
transmission electronic microscopy. Here’s a
fungal cell very normal growing, the cell walls
starting to dissociate. Here’s a fungal cell in
the presence of silicon, it’s like a huge vacuole,
it’s empty and you had this amorphous material
that we’ve identified to be phenolic in nature. Pheno is produced in plants or defense responses in plants. We also phytoalexin compounds and these are also low molecule [phonetic] compounds that have antifungal activity. Next slide.

We’ve also extracted a messenger R N A. You know R and A is a transcript factor in building proteins and enzymes and you can put this on gelled and through electrophoresis move the messenger RNA and get a banding pattern. You can see without silicon 36 hours you get, not as big expression a we do with silicon for beta one three gluconace [phonetic]. Well fungi have glucon in their cell wall. Beta one three gluconace is a an enzyme that attacks that cell wall so it looks like in the presence of silicon you’re producing this enzyme to attack cell walls. Next slide please.

Also peroxidases as you can see it is 60 hours, here’s our control. It kind of starts to shut down but it’s still being strongly expressed. Peroxidases are involved in the production of lignin. lignin helps fortify cell walls to protect the plant. Next slide.

And also we have what we call PR1 proteins. You can see it starts to be expressed
at 60 hours in the controls, with silicon it’s strongly expressed. PR1 proteins are proteins known to have anti fungal activity also. Next slide.

So here are some examples of potassium silicate on grey leaf spot on turf. This is work we did a number of years ago. You can see the number of lesions just sort of infecting the plant. Fewer here, we cut it in half. Well, almost half say about a 42% reduction. Next slide.

This is work coming out of Canada with that batritise [phonetic] development on strawberry and again potassium silicate versus the control, you got over 42% reduction. Next slide. And more recently with wheat potassium silicate for powdery mildew and it’s about a 50% reduction. Next slide.

So does how does silicon enhance disease resistance. Well here’s what we think is going on. It’s probably, it’s a passive role. You’ve got deposition; it makes it very difficult for that fungus to get through. Okay it’s not always uniform but when it does get through it slows it down enough to where maybe silicon’s eliciting or amplifying the signal in the plant to produce these
defense related compounds. Next slide.

And so basically you know if silicon can play this type of role and the media can be lower limiting and it should used for suppressing plant disease and it shouldn’t just be for biological thinking or experimentation, it should actually be implementation and the Board has, I you ask me, a great opportunity to bring this to fruition for organic growers based on some of the reasons that Dr. Koenig and Dr. Thompson just mentioned. Next slide.

And these are just some pertinent references that we’ve published over the years going back from 2001 on rice primarily. And this was not in the TAP report but let me go back to that TAP report just a little bit.

One of the things they said well you know you can use green sand. Okay, well green sand it does have 25% silicon in it but it’s totally immobile, it’s not available. It does not weather and so it’s not available to the plant. There’s another similar silicon source, magnesium silicate. If you look it up in the chemistry handbook it’ll tell you it’s insoluble in water, you have to use hydrochloric, hydrochloric acid, it also has 26%. And there are people out there
unfortunately trying to sell some of these materials and say oh yeah, we have silicon. But is it available to the plant and in this case they’ve done a great job in showing that this has great efficacy across a number of fungal species, on a number of crops and you know organic growers are looking for other ways to manage plant diseases.

MR. SMILLIE: I appreciated it. I enjoyed it Dr. Datnoff. It’s nice to get back to what organics is all about and certainly the role of silica in plant health has a very long history. You know as being bio-dynamically trained Rudolf Steiner one of the founders of organic thinking pointed out the important role of silicon in plants and I think it’s nice to see the modern research showing scientific reasons for what has been passed off as organic mythology in the past. So I really appreciated the presentation.

MR. DATNOFF: Thank you.

MS. CAROE: Any other comments or questions from the Board? And will you two be around the rest of the meeting to [unintelligible] [crosstalk]–
MR. DATNOFF: I’ll be here all day tomorrow.

MS. CAROE: Tomorrow.

MR. DATNOFF: But I have to go back tomorrow evening.

MS. CAROE: Okay so you’re available?

MR. DATNOFF: So if you have any questions related.

MS. CAROE: Tomorrow is the more important day during the discussion period.

MR. DATNOFF: Right exactly. So again like some of the other products that are mentioned in that TAP report like milk and whey I mean they’re really, they’re not registered, they’re not available, there is concerns about efficacy and the spectrum of activity is very narrow and here you’ve got some very broad spectrum.

MS. CAROE: Thank you very much for your comment. Moving on Lawrence Marais and then on deck Scott Hutchinson. Is Scott in the room? I’m sorry? Oh, John okay thank you.

MR. LAWRENCE MARAIS: Ready? I’m also a plant pathologist. I am an R and D manager for Monterey Ag Resources. We distribute potassium silica to ag industries in California. I’m very excited about this product.
I’m not going to belabor what Lawrence has explained there and Judy as well. What’s exciting about this product particularly if one looks at the problem that organic growers have with perennial plants, tree fruit crops to contend with soil born diseases, they do not have any organic products that are available to control these diseases. And we know that there’s a lot of documentation of potassium silicate being used to control disease like root rot in other avocados, citrus pythium and of course bacterial rot of tomatoes but discellium and ferrcerium [phonetic] are two diseases that are very prevalent, there aren’t even chemicals available to control these disease and we know that potassium silica does a good job of doing that when is applied as a soil drench. So this is very exciting.

Another thing nimitoad, nimitoad pests are extremely important as far as reducing crop yield. They don’t kill plants but they reduce yield and there aren’t any organic nimiticides [phonetic] of really any worth out there. And this potassium silicate does a good job of controlling citrus nimitoad and fretilancus [phonetic] and hellicadillancus [phonetic] in sugarcane, that’s been documented.
Another thing replant disease in perennial crops are really caused by a combination of nimitoads and sorgun [phonetic] fungi and you know that conventional growers use methyl bromide to get rid of that, to alleviate that problem while organic growers can’t use that. Methyl bromiders also could be leaving the market pretty soon and the combination of using potassium silicate to control nimitoads and sorgun pathogens, it’s a wonderful tool that organic growers have and that is something that one really needs to emphasis.

Insect pests in California and Florida of course you’ve all heard about the greening disease and in California we have Pierce’s diseases. These are vectored by insect pests and at the moment we only have some conventional chemicals like Admire that are toxic of course to the environment but are very good chemicals to control these vectors but organic growers don’t have that. The application of potassium silicate which is very good pesticide will help the wine grape growers who are organic and organic table grape growers to contend with Pierce’s disease. And in citrus, Asian greening disease which is transmitted by the citrasilla [phonetic] which is
also another disease, another vector that can be controlled by potassium silicate. So if one looks at potassium silicate as a fungicide for sorgun pathogens and pests that vector disease, this is a very important tool that organic growers can use.

Another fact that one has been looking at that’s been documented, the environmental stress that can be alleviated by potassium silicate, what happens is that when you’re applying potassium silicate as a [ unintelligible] spray or even as soil drench, we find that the amount of silica gel that is associated with the cell wall’s sililoes [phonetic] in the epidermal cells results in a reduction in transference. So during times of water deficit like we’re going through a period of draught, Georgia is, California next year our irrigation is going to be cut by almost 30% and growers that have perennial crops are going to need something they can apply that’ll reduce the amount of transference in their plants and this is one of them. Both conventional and organic growers can do that.

So just in summary then, this potassium silicate falls really extremely important issue in organic agriculture where no organic products for the effective control of sorgun disease and of
course nimitoads. There aren’t any organic products registered to control nimitoads at this stage, there are some biologicals but very inconsistent results. The maximum residue levels that are imposed on the products that are imported or exported to the European Union you know that every year they are imposing more, they’re increasing the maximum residue levels for post harvested yeast control. Potassium silicate is used to control post [unintelligible] diseases in cherries, avocados, bananas and if any organic growers are using organic substances or products to control post [unintelligible] diseases, they need to have something that has very low residues and potassium silicate is one of them that can be used. Thank you.

MS. CAROE: I’m afraid your time is expired? Rigo.

MR. RIGOBERTO DELGADO: We understand clearly what the mechanism of control in the case of diseases is, can you explain how it works for the case of insects? Is it similar?

MR. MARAIS: Insects?

MR. DELGADO: Yes.

MR. MARAIS: The insect, with insects there’s two modes of action, the one that Lawrence
explained as far as physical barrier. Aphids for instance cannot, they cannot probe because they start [unintelligible] very sensitively tender, they can’t probe cells that have been, that have the layer of silica in the epidermal cells, that is preventative. As far as I think the glassy winged sharpshooter for instance, that’ll be the same thing. You know that glassy winged sharpshooters probe right through the bark of vineyards and so on and they feed on the silon [phonetic]. Now the silicon, the potassium silicate is going to also form a physical barrier to probing and when insects feel that they find difficulty in probing, they move away. It’s not a toxic thing it’s just it’s mainly a physical barrier as far as insects are concerned. And also desiccation of course if you’re applying potassium silicate to an insect it’ll also desiccate that insect as well. In other words they die from desiccation.

MS. CAROE: Thank you. Other questions? Thank you so much for your comments.

MR. MARAIS: Thank you.

MS. CAROE: John Hutchison and Dave Martinelli are you in the room? And you have a proxy as well. You’re on deck.
MR. MITCH JOHNSON: Hi, I’m not John Hutcheson. I’m Mitch Johnson. John had to catch a plane a few minutes ago so I’m substituting for him.

Good evening, my name is Mitch Johnson and I am manager at Intervet Animal Health Company a part of Schering Plough Corporation. My purpose today is to introduce you to fenbendazol a material that was petitioned in February for addition to section 205-603 of the national list as a paracide [phonetic] to be used as an emergency treatment in dairy and breeder stock. While the TAP review has not been formally completed for this material we want to provide you with some information on fenbendazol and why we know that it is much more compatible with organic agriculture then the existing material on the list which is ivermectin. Specifically fenbendazol is an anathetic capable of causing the evacuation of parasidic intestinal worms important to cattle production and cattle health.

Fenbendazol was approved by the FDA in 1983 and is marketed under the trade name Safeguard. It is a proven treatment in control of several types of gastrointestinal worms including lung worms, stomach worms, and intestinal worms.
MR. JOHNSON: There are several specific reasons that fenbendazol is compatible with organic agriculture. First it is not a microlite antibiotic. Second it does not harm beneficial insects particularly the dung beetle as well, earth worms, plant life, fish, and micro organisms. Thirdly cattle internal parasites are increasingly developing resistance to the approved material ivermectin as well Safeguard fenbendazol addresses an important need in organic livestock production of welfare concerns. Quite simply a dairy heifer or a dairy cow parasitized is a sick unwell animal.

Fenbendazol is not, let me go into these points with a bit more information. Fenbendazol is not a microlite antibiotic but is instead a member of a well known and widely used class of compounds called the benzimidazoles. According to the Merck Veterinary manual the wide safety margin of benzimidazoles is due to their greater selective affinity for parasites rather then for mammalian tissues. In our early launch meetings with Safeguard back in the ‘80’s our technical services team would tell producers there’s a reason
why we called it Safeguard.

Fenbendazol’s activity is specific to gastrointestinal parasites. Extensive studies have demonstrated that fenbendazol will not have a negative impact on dung beetles, fish, earthworms, microorganisms or plant life. We have summarized some of those studies in a separate handout that I believe that you have received.

The emerging issue of parasite resistance to ivermectin is an increasing problem throughout the cattle industry. It is critical that an emergency treatment allowed for us in organic agriculture be an effective treatment. Fenbendazol has a different mode of action than ivermectin and the macrolide antibiotics therefore it is an effective dewormer in herds that have selected for ivermectin resistant parasites.

Unlike the USGA organic approved material, ivermectin, fenbendazol is administered orally and it does not become systemic in cattle. Studies have shown that fenbendazol is completely excreted within seven days of administration thus accounting for the short withdrawal period when used in slaughter stock production and a zero milk withhold in non-organic dairy production. The lack of an effective and organic compatible
parasidicide stands today as one of the key limiting factors in the growth of the organic livestock sector.

Current non-synthetic substances, synthetic substances on the list and alternative cultural practices are not adequate for the problem. For example diatomaceous earth has not been demonstrated to affective in controlling internal parasites in scientific studies and as you know the approved material, ivermectin, the only approved material is a macrolide antibiotic and has demonstrated negative impacts on dung beetles in particular.

In closing fenbendazol is not an antibiotic, it is safe to the environment, it affectively deals with the emerging issue of anathematic resistance in cattle production, it is good for supporting animal welfare and animal wellbeing and as important Safeguard and fenbendazol is being requested increasingly by organic dairy producer customers of Intervet as a viable option for controlling cattle parasites.

Thank you for you attention and I’ll entertain any questions.

MS. CAROE: Thank you. Questions? Huge?

MR. KARREMAN: I have a few but first I
want to thank you for bringing up fenbendazol again. I did not know it went for a TAP or submitted in February, I think I became aware of it in June or July something like that.

MALE VOICE: When we would have got it.

MR. KARREMAN: That’s when we got it.

Okay so, yeah. And at that point we kind of had out plate full with the agriculture symposium and what not so I didn’t want to give fenbendazol short shrift and I wanted to have it, I want to have it come up for a recommendation vote in the spring.

MR. JOHNSON: Thank you.

MR. KARREMAN: Okay so it’s going to be on a work plan. I’m glad it’s not a macrolite antibiotic. I know that and that’s very good. I just wonder if it’s available over the counter and there’s no milk withhold in the conventional world, that raises a few problems potentially just with it being used on the sly so to speak. I hope that wouldn’t happen but that would be one thing you know I’d be kind of, a little bit worried about but there’s other over the counter things as well like penicillin and we’re hoping that’s not used on the sly of course.

As far as the resistance of the
ivermectin, understood, I got that. That’s especially in goats and sheep actually not so much cattle yet in the U.S. But you know I don’t think that that’s really germane to the organic herds because they’re not using ivermectin routinely it’s like on the one animal. And as with antibiotics and organic antibiotic resistance of the pathogens, mastitis pathogens in organic herds, their resistance actually goes down when they’ve done some studies in Wisconsin and Michigan about resistance for the same bugs in a conventional versus organic herd. Anyway that’s me just blabbing away but I’m glad you’re going to petition it again. I want to support it and we will work on it between now and in the spring.

MR. JOHNSON: Thank you. We would welcome providing any information addressing any questions that the Board may have concerning the petition.

MR. KARREMAN: We will.

MS. CAROE: Right thank you. And we appreciate, the Board always appreciates Hugh’s expertise blabbing, yes. Thank you very much.

MR. JOHNSON: You’re welcome.

MS. CAROE: Up next is Dave Martinelli and Dave you have a proxy so you’ll have 10
minutes. On deck we have Barbara and Tom Elliott. Not here? Okay moving on it’ll be Kelly Shea on deck. When you’re ready.

MR. DAVE MARTINELLI: Okay. I need my Power Point here. No it’s the only file on that. It’s on that CD. While Valerie’s getting that up I apologize in advance, I’ll need every bit of my ten minutes. I’m trying to stuff 20 pounds of walnuts in a 10 pound back here so.

My name is Dave Martinelli and I’m with Petaluma Poultry/Coleman Natural Foods but actually today I’m speaking on behalf of the methionine task force. I’ll give you a little brief, if you can hit the next slide Valerie. I’ll give you a little brief overview of the methionine issue just very quickly. What the task force has done to date and kind of what we’ve determined on some different alternatives and what the next steps might be.

Methionine again just to kind of hit old ground here just again very quickly, is an essential amino acid. If poultry don’t get enough methionine in their diet they’ll exhibit a number of these characteristics that are shown there. We’ll have excessive mortality, poor performance in the field in terms of body weight or egg size
and in worse case poor feather development and actually the birds exhibiting signs of cannibalization and feather picking.

The current annotation to use synthetic methionine expires in October 2008 which is right around the corner and just as a point of reference from and inclusion rate standpoint a certain amount of the methionine in the diet is provided by corn and soybean meal. In synthetic methionine it’s out at the rate of five pounds per ton of feed so it’s approximately one quarter of one percent of the overall diet.

Methionine Task Force has been around for approximately six years. Individual members of the Task Force have been at this issue for much longer then that conducting field trials and the like. But within the last 12 months the Committee has kind of really re-energized again and a significant departure is the fact that we have asked for funding from different members. We felt a lot of research that needed to get done wasn’t getting done so we’ve kind of self imposed an assessment on our members and have raised a significant amount of money to cover a number of initiatives that I’ll kind of walk you through right here. This is kind of a quick overview of
them but we’ll discuss in some detail each one of
these items.

The first was a literature review. To
our knowledge it was the first review of its kind
conducted that both look at the methionine needs
of poultry as well as the national, international
organic standards and also discusses the viability
of certain alternatives. This review was
conducted by Dr. Bonnie Burns Whitmore at the
California State Polytechnic University in Pomona,
Cal Poly Pomona. And it’s really a tremendous
document. I would more then welcome the
opportunity to provide any member of the NOSB with
a copy of the Executive Summary which is in and of
itself about 100 pages long. The report is
approximately 60 pounds. If you’re interested we
can send it to you but it’s quite a bit of
reading.

Some of the key findings in it that we
found particularly interesting is that obviously
more research needs to be done both around the
feed requirements for the birds and also on
genotype. Interestingly enough there’s some
evidence from some of the historical that’s been
done that suggests that the leaner breeds may have
a methionine demand then a breed such as broilers
which tend to be a little fattier but interestingly enough heritage breeds do not have a lower methionine demand then commercial flocks. European practices are quite frankly unclear. It’s very obvious that methionine is not allowed in diets in Europe, in organic diets but in the discussions that Dr. Burns-Whitmire and her staff had with European producers there seemed to be some ambiguity at the producer level about whether synthetic methionine was allowed. We’ll get into this point a little bit later on but it’s very important that a number of the alternatives that are listed and are touted as being higher in methionine while they are indeed higher, they typically don’t have sufficient methionine except when included at very high rates in the diet which creates other imbalances in the diet. And we’ll cover that in a minute. Another initiative that the Task Force has been engaged in this last year are farm trials. There have been, there’s a number of broiler trials that have been completed and one that’s ongoing currently at Penn State. There’s a broiler trial, excuse me a layer trial that is being done through Organic Valley in conjunction with the University of Minnesota that is in
process and there is discussion about starting another layers at Penn State. None of these trials are peer reviewed, I should point that out as well.

The Coleman trial, I you can hit the next slide, the Coleman trial is interesting because actually the trial suggests that you can raise birds without methionine. The interesting part was, or the downside of this is the fact that meat yields were poor and the flock performance was not as strong from a feed conversion standpoint and the real, the sixty four million dollar question here is whether we can replicate those results on a commercial scale. This was in an isolated instance on an isolated farm with very small number so our next intent is to really try this trial on a larger scale. The other interesting point is that our best performance in the trial was using corn glutton meal on a diet which is not currently available in organic form either.

The organic value University of Minnesota trials really focused on using high methionine corn, they did not run a no methionine group so that is one of the things that the Task Force needs to look at in the future is potentially a layer trial that has no methionine in the diet and
no high methionine corn. And then obviously we need to have some turkey trials at some point. There isn’t a strong turkey representation on the Task Force so at some point we need to rerun trials to represent that segment of the industry. The organic rally results did show good performance on the layer side using high methionine corn and we will talk about high methionine corn as well right now.

The Task Force has been, had a strong dialogue with the Micro Field’s Agricultural Institute, Dr. Walter Goldstein. He’s given us a presentation. High methionine corn is attractive because it comprises a significant part of the diet. Corn’s approximately 60% of the diet of organic poultry and while it has two to three times in methionine levels of convention corn or normal I should say organic corn, that’s not a high enough percentage to provide all the methionine needs to the bird. Another issue not so much from the poultry side but from an agronomic perspective, farmers have been very reluctant to grow high methionine corn, there’s a concern about yield drag and high moisture content in it and those issues need to be overcome if this is going to be produced on a commercial scale.
But to try to get a little bit of the ball rolling in terms of getting high methionine corn out there, the Task Force has funded two different trials, they are currently underway. One trial is in Chile and a second trial has just been approved to start in Hawaii. The intent is we will generate and do some more hybrid experimentation, propagate some more seed stock, bring that back to the U.S., to the Midwest, get that planted in the spring of ’08, and then hopefully have some better data and some better results by harvest of ’08.

I alluded to this issue a little bit earlier that a number of the alternatives are commonly touted as being viable alternatives or products higher in methionine. Yes, they are higher but they don’t typically contain sufficient levels of methionine and the next slide I think really illustrates this. This is provided courtesy of Dr. Jackie Jacobs at the University of Minnesota. It lists a variety of feed ingredients; you probably can’t read them all from here. But the item at the very bottom of the list looks like the homerun item is casing.

The thing I would point out on this list is this is a scale from zero percent to three percent so that means that casing has
approximately 2.6%, 2.8% methionine. So to get
the equivalent of what five pounds of methionine
to get this we would have to include casing at the
diet at at least the rate of 10%. Now that’s
going to create significant other imbalances
within the diet that would probably not be able to
overcome and that’s casing which is the most
promising product. We haven’t even talked about
commercial availability just from an inclusion
rate perspective we have a lot of dietary
imbalance issues that would need to be addressed.
Next slide please Valerie.

When we talk about commercial
availability corn glutton meal I think is a very
promising product. It’s not available in organic
form and I’m not carrying any dialogue, actually
Dr. Bonnie Burns-Whitmore has interviewed people
in her report that claim to have used it and claim
that it is available in organic form. I’ve
canvassed everybody I can think of that we buy
feed from and I’ve no takers on anybody that can
produce organic corn glutton meal. If somebody
knows of one, please put them in touch with us.
Interestingly enough we have located a source of
sesame meal to at least do some trials with
organic sesame meal clearly a long ways away from
having that available on a commercial basis but I think for some trials we can pull some good data. Fish meal I don’t need to bore you with anymore aquacultural related issues probably today but nonetheless I think there are some significant hurdles there both in terms of the preservative that’s used, ethoxyquin and some of the other issues. Next slide please.

Pasture very quickly, pasture is considered to be one alternative. Earthworm meal on that chart was 1.6% methionine so earthworms and insects although quote unquote “rich” in methionine would need to be included in the diet at approximately 30% inclusion rate in order to make the diet balanced from a methionine perspective. It’s felt that if all the chickens could access that much earthworms and insects to balance their diet and get sufficient methionine needs. We talked about the Heritage breeds.

I’m running out of time so I’m going to hit these very quickly. These are three items the Committee’s really focused on: high methionine corn, genetic selection, and naturally fermented methionine. I will tell you that all of these are in the R and D phase and literally years probably five to ten years away from being available on a
commercial scale. I do think they hold tremendous amount of promise but if we can advance just a couple slides?

I just want to close with this. Just hit another slide or two Valerie. This is the final slide. We are well aware of the fact that the October 2008 deadline is right around the corner. We would like to come back to the Committee some point unfortunately with a petition. There’s a variety of paths we can take that are outlined there but what we’d really like to do is engage the Livestock Committee in some sort of dialogue around a potential solution. We think we have viable alternatives we simply are not going to have them available by October 2008.

MS. CAROE: All right. Thank you Dave for your comments.

MR. ENGELBERT: Real quick please?

MS. CAROE: Absolutely.

MR. ENGELBERT: How many years has methionine added to poultry rations?

MR. MARTINELLI: Six years I believe.

Synthetically you know with the annotation?

MR. ENGELBERT: At all in any—

MR. MARTINELLI: At all?

MR. ENGELBERT: Yes.
MR. MARTINELLI: I’m going to take a stab at it and say 40 years.

MR. ENGELBERT: How were their needs met prior to that time?

MR. MARTINELLI: Well that’s a great question. I don’t think you were getting the same sorts of feed conversions and performance and probably bird size, meat quality that you’re getting today. Whether that would be acceptable to the consumer I just don’t know. On a commercial scale everything we’ve determined in our C values etcetera, you need to add synthetic methionine to the diet.

MS. CAROE: Hugh.

MR. KARREMAN: Thanks for coming in Dave. We’ll be definitely staying in touch over the next year I know that. Did you see the fellow, the presentation from South Carolina with the insect meal earlier today, he was in here linked into agriculture.

MR. MARTINELLI: Yeah I need to get in touch with him. I did some quick calculations of what he kind of looked at in terms of run rate and availability. Obviously if that’s feasible and that’s a possibility. He would need to produce a significantly higher quantity then the amount he
was talking about at full run rate. I think he
was saying two hundred twenty tons a week. That
would not even be enough to do more then probably
20% of the broiler industry let alone layers and
turkeys. That aside, that sort of solution could
potentially be the answer. Again that won’t be
here by October 2008.

MS. CAROE: Dan.

MR. ENGELBERT: Well, no, I can let it
go. That’s fine. It’ll be more discussion. No
that’s fine really.

MR. GIACOMINI: As a rumen nutritionist
where I’d work with about half conventional
there’s a tremendous number of feed availability
and if I’m to use the best tools that I can and
consider that the perfect fox for making a ration
for nutrition, I don’t think I’ve ever made an
organic ration where I didn’t have to shave some
corners. I’m at the very least glad that this is
a not a Sunset item, it’s got a drop dead, it will
only happy with a petition. And the only thing I
would suggest right there is that if you want a
petition looked at in a timely fashion, you file
it tomorrow and that’s being a little dramatic.
But don’t think about looking into the future at
some point of time of when you’re doing it because
it’s only doing to delay things. Now that’s not saying whether it’s going to pass or not but if you’re going to be wanting to present a petition even with the data and the things you’re working on, start working with the NOP and that’s not working with us, that’s getting it approved with Valerie and Bob.

MR. MARTINELLI: You know if I could just, I appreciate the feedback. You know we’ve really frankly tried to avoid the whole petition discussion. I mean we’re much more focused on getting a solution then doing petition. I think we’re now coming to the realization thought that we aren’t left with a whole lot of options so we will put it in high gear to get something before you quickly.

MS. CAROE: Thank you. Any further questions from the Board? Thank you so much.

MR. MARTINELLI: Thank you.

MS. CAROE: Kelly Shea you’re up, on deck. First, let’s another call for Barbara or Tom Elliott, are you in the room? Okay then Harriet Behar for Joyce Ford, you’re on deck.

FEMALE VOICE: Barbara and Tom Elliott were Marty Mesh’s, he combined those earlier 'cause he was their proxy.
MS. KELLY SHEA: In the interest of time and because you’ve already received my comments in printed form, I’ll just be really brief and touch on three main points. Point number one, I’m with White Wave Foods Company and you probably better know us better as Horizon Organic Dairy and Soy Milk. In regards to the document that the NOSB has put together seeking comments on making determinations of ag. non-ag. and non-synthetic and synthetic, I would like to put forward a strong suggestion that NOSB look at convening an industry wide volunteer task force to collaborate on the issue. It’s a really crucial issue, there’s a lot of institutional knowledge and experience out there from former Board members, Trade association, groups such as OMRI. And I think that the many years of discussion and learnings really need to be captured in any final recommendation. It also would take a little weight off the shoulders of the Board and the program to let the organic community take this in our hands, spend you know six months, four to six months on it and come back with some work for you that you can then refine. So I’d like you to take that under consideration. And I know even in the room today a lot of people have said they’d be
happy to you know push up their sleeves and get involved in that.

The second thing is in regards to Sunset materials. We would very much like to see renewed carignan, agar agar, and cellulose. And in the written comments that I provided to the Board I gave you information on the original TAP reviews and the original Board votes for these materials. Carignan was approved in 1995, thirteen members in favor, one member absent. Agar agar which is obtained from seaweed vegetarian extracted using hot water that was approved in ’95 also, twelve in favor, one abstaining, one absent. And the same with cellulose, that was approved in 2001, ten votes in favor and four abstentions. Since the call for Sunset comments I believe the Board has received no information from the public about these materials being harmful in any way or problematic in any way. And I will be here tomorrow as well as Friday if you have any particular questions about those materials and I do have a lot of information as well as the original TAP’s and Board information.

And then lastly I don’t know if the Board is going to be considering gellan gum, it’s been a little complicated for me to follow. Though we
don’t use the product today, I believe that it is a product that fits the criteria. There are other similar but different products on the national list now and I think it would have some really good uses in organic food manufacturing. So if that was added to the national list, I believe it would be a tool that we would make use of. Thank you.

MS. HARRIET BEHAR: [Off mic]

[Unintelligible] then right after.

MS. CAROE: I’m sorry?

MS. BEHAR: Lianna is right after?

MS. CAROE: Yes and Lianna for Jim Riddle.

MS. BEHAR: Well she’s going to start and then I’m going to finish is that okay? ’Cause we’re bringing the same, we did this because Jim and Joyce will have a long amount.

MS. CAROE: Okay so you want ten minutes.

MS. BEHAR: We each have already had five minutes.

MS. CAROE: So you want ten minutes?

MS. BEHAR: Yep, but she’s going to read
1 half and then I’ll read half.
2 MS. CAROE: I don’t care how you do it.
3 MS. BEHAR: We were trying to follow the
4 rule.
5 MS. CAROE: I just want to know what to
6 set on the clock. Ten minutes okay.
7 MS. BEHAR: Ten minutes.
8 MS. CAROE: Actually.
9 MS. LIANNA HOODES: I just want to say
10 ahead of time that I am reading Jim Riddle and
11 Joyce Ford’s comments, these don’t reflect any of
12 the positions of the National Organic Coalition or
13 the National Campaign for Sustainable Agriculture.
14 Greetings I apologize for not attending
15 an NOSB meeting for the first time in over six
16 years. Joyce and I are taking a three week
17 vacation in South Africa. I continue in my
18 position as the University of Minnesota Organic
19 Outreach Coordinator and Joyce continues her work
20 as an organic inspector while volunteering as
21 President of the Board of the Midwest and Organic
22 and Sustainable Education Services. We submit
23 these comments on our on behalf.
24 First we’d like to congratulate Andrea
25 Caroe on completing your term in NOSB, kudos to
26 the NOP on your investigation of Aurora Dairy and
the well documented statement of fourteen willful
violations contained in the notice of proposed
revocation. Shame on those at USCA who undermined
the NOP’s good work by negotiating and issuing
consent agreement M005006, it is truly a bizarre
document which bares no relationship to OFPA, the
final rule or the violations identified in the
revocation notice. By refusing to hold Aurora and
its certifiers accountable for willful violations
the USDA had undermined consumer and producer
confidence in the Department’s ability and or
willingness to enforce Federal organic standards.

We have reviewed the agenda and draft
recommendations; commend you for your hard work
leading up to this meeting. We support proposed
changes to the Board policy and procedures manual
and are gratified to see that it continues to
serve as a living document. We are extremely
concerned that code of conduct and conflict of
interest provisions are being ignored and along
with former NOSB Chair Dave Carter submit the
attached formal ethics complaint regarding the
behavior of one NOSB member.

Proposed changes to the new member guide
make sense and should be adopted. In order to
familiarize new members with the Board’s standing
recommendations, the NOSB should add to the new member guide an explanation and link to the NOSB final recommendations table housed at and the URL is listed there.

Two points should be changed in the joint policy development Crops and Livestock Committee’s draft. Guidance on the certification of operations involved in crops research, the second sentence of line A2 on page two should be rephrased to read quote “per regulation all land treated with prohibited materials must undergo transition prior to certified organic status subject to the procedures found in 205, 202,” unquote. On page three of the same document the third sentence of quote “answer four” should be rephrased to read quote “land exposed to prohibited materials, practices, and or excluded methods will require a 36 month of organic management prior to regaining organic status,” unquote. The attached paper, Organic certification of Research Sites and Facilities recently presented by the American Society of Ogronomy is offered for consideration by the NOSB to further enhance and clarify your final recommendation.

The Joint Committee’s guidance on
Temporary Variance for Research should be adopted with no changes. The Materials and Handling Committee’s discussion document on the definition of materials is clearly a work in progress. As written it does more to confuse rather than clarify the issues at hand. On this issue we differ to comments submitted by the Organic Materials Review Institute who have extensive reviewing synthetic and non-synthetic materials used in organic production and handling.

We offer no comments on specific petition substances and Sunset materials. While the CAC’s draft on standardized certificates is good and should be adopted it does not address the issue of no expirational and renewal dates appearing on certificates. Certificates from suspended, surrendered or revoked operations continue to circulate since certificates only indicate the date of issuance and not a date of expiration or date of renewal. This deficiency handicaps buyers, inspectors, and regulators and increases opportunities for fraud. The CAC’s draft Further Guidance of the Establishment of Commercial Availability Criteria jumbles the issues related to determinations of commercially unavailable agricultural ingredients with issues related to
organic seed sourcing. The draft should remain at Committee level and be rewritten so that the two issues are articulated for separate but consistent consideration.

By far the most inappropriate draft recommendation being considered at this meeting and possibly in the history of the NOSB is the CAC’s Certifying Operations with Multiple Production Unit Sites and Facilities under the National Organic Program. This document appears to be nothing more then a veiled attempt to justify one agencies spot inspection program for retail chains by extending grower group inspection protocols to cover retailers and processors. The Committee’s draft proposes an illegal framework. Under a section titled Legal Background the draft makes no mention of OFPA 6506A which states quote “a program established under this title shall, five provide for annual onsite inspection by the certifying agent of each farm in handling operation that has been certified under this title,” unquote. OFPA defines handling operation as quote “the term handling operation means any operation or portion of an operation except final retailers of agricultural products that do not process agricultural products that” A receives or
otherwise agricultural products, and B, processes, packages, or stores such products” unquote. Farm is not defined in OFPA or in the final rule.

Harriet?

MS. CAROE: You can keep going.

MS. HOODES: All right. OFPA is very clear at 6506A5 that every handling operation must be annually inspected. The retail operations are not required to be certified under OFPA in the final rule. Once they choose to be certified, they are certified as handlers and must comply with all the applicable certification requirements for handlers. While handling operation is defined farm is not. This provides the secretary with some discretion to certify grower groups as farms. If a grower group is certified as a farm and the farm is annually inspected by an accredited certifying agent, then the requirements of OFPA are fulfilled.

To preserve consumer confidence and protect organic integrity while providing market access to small scale producers the NOSB should decisively reject the CAC’s draft. To respond to concerns identified by the NOB the NOSB should revisit the Board’s 2002 recommendation to strength the 1, inspector qualifications; 2,
conflict of interest provisions; and 3, risk assessment protocols to determine the percentage of production sites inspected by the ACA.

Further the NOP should consider the establishment of a separate accreditation category for ACA’s who conduct grower group certification as suggested by Lynn Cody [phonetic]. As always we appreciate the opportunity to comment and support the work that you do. Best regards and have a great meeting. Jim Riddle and Joyce Ford.

MS. CAROE: Thank you Lianna.

MS. HOODES: Sure.

MS. CAROE: Not that we could ask Jim or Joyce any question. I thank you very much for presenting that. Greg Nemec are you in the room? Greg? Okay, moving along. What? Then I have David Cox? Not here. Okay. The last one, Will Fantel [phonetic]? Will?

FEMALE VOICE: He is going to not speak tonight in the interest of time and I think one or both, somebody is signed up tomorrow morning between Will and Mark and they will speak then.

MS. CAROE: Okay you had me at he’s not going to speak tonight. So we are done with public comment. So with that we will recess till 8:00 A.M. tomorrow morning which is way too close.

CHAIR ANDREA CAROE: We’re going to go ahead and start our session.

CHAIR ANDREA CAROE: Our first order of business today with the Policy Development Committee, Rigoberto Delgado, chair. And three items that should be presented. So I will go ahead and turn it over to you Rigo.

MR. RIGOBERTO I. DELGADO: Thank you very much madam chair. As you said we do have three items for the PDC team, from the PDC team. The first one includes updates to the policy and procedures manual. We essentially have seven changes that are highlighted there on the first page of your handout. And those include the following. I must clarify that the purpose of these changes is to keep this document a live and helping us be better members and function better in duties.

So on that note I also would like to point out that I did forget to list the first change which is found on page five of the document. And that’s just the note that we added
to recommend new members to become familiar with
the Organic—with OFFBA and also the rule.

The next change that is presented there
on the list is the introductory paragraph found on
page six, this first section. On that same page
we have also a description of the [unintelligible]
mission of our board. We also have two edits to
the mission statement. And then an updated, an
update to the OFFba section, section number for
the following, the content on the sections called
duties of the board and officers.

I also needed to include there that on
page 33 of the, of the document we made a
correction on a typo. It, we, it had OFPS and now
OFFBA, minor change there. Going on with changes
listed. Those are found on page 45 and includes
changes the place of the committee recommendation
form to the front of the decision matrix that we
use. And [unintelligible] materials.

The second change was to the actual form
itself. We included a section—the top is just an
area to specify the use of the, of the material.
And we did make some changes on the layout of the
form. We think that this is a better looking form
and [unintelligible] and straightforward.

On page 54 we added a section that
highlights the process or the requirements for deferral. Clarification for deferral’s called and we, we said four points that one should serve as guided to committee members as to when, when we should be deferring decisions. and also on the second paragraph you’ll find several points that highlight the reasoning that you have two percent when you explain to the rest of the board why you went with a deferral decision.

The final change to that PPM is found on page 62 and it includes an addition to the list of parliamentary procedures. We added the definition for [unintelligible] motion and [unintelligible]. The specific clarifications on who and when motion can be done.

That includes our changes for the PPN. We did receive public comment supporting the changes. We appreciate the public comment. And I’m open to questions from the board members. No. hear none.

We move onto the next update which includes the new member guide. Again, this is a living document. And the changes, updates that we are presenting are meant to help us be better members, more effective. And essentially we have two. These changes were suggested by board member
in our last meeting.

And the first one includes—you’ll find there that it’s a section, additional section, 2.E. You’ll find it in two places. Right after the first page describing the summary of update. And you can also find it on the actual document. So you’ll see what decision that change will take within the document. And that section essentially highlights or describes the process for regulation making. Okay.

The second change is in addition of fifth chapter. And it’s addition in, I’m sorry, it’s additions to the fifth chapter and it’s a section called tracking changes in board documents. It’s part of the best practices. And it’s essentially a way of handing tracking changes in Word. We were not intending on promoting this software feature but we do find it very useful when we’re exchanging our emails as we conduct our business over the phone. So it is important for new member and old members, young and old, to be familiar with this tracking mechanism.

We did receive a public comment. Again, we are very grateful for it. A very supportive comment as well. And, and one the specific recommendation from the public was to add a link
to the final NOSB recommendations table. And that was it.

The final item we have is a, it’s an update on proof of, proof of concept. It’s a, a table or database of recommendations history or icon. And the update is as follows. We have had some proof of concepts going back and forth between Valerie and Bea and myself. And we do have a pre-beta, XL base, database of recommendations. We’ve been working on making something that is useful, practical, that everybody can have access to. It has a number of pull down and drop downs that allow you to locate and track recommendations quite, quite easily.

And, but the benefits are, we think, as follows. First, it’s going to be an archive that you can use as reference when you review your materials. And refer back to prior decisions if it applies, or similar decisions and so forth. But also we think that it can become a, a tracking mechanism so you, every member will be able to understand at one stage of the process is from the initial point of review at the committee level all the way up to the regulatory review process.

So that’s the update. I did omit to give enough time to the members to prove questions on
both the changes to the new member guide. And you
get to do so now. So you have any questions?
Yes.

MS. TRACY MIEDEMA: We got—this is out
there on the margins, a minor detail. I sent to
you about nine copy edits just cleaning up some
language. And I just—this is the first time I
looked to see and I don’t, I don’t think they were
incorporated in this draft. And—I’m sorry for the
new member guide.

MR. DELGADO: New member guide, okay.

MS. MIEDEMA: And I’m absolutely fine,
you know, waiting till the next meeting to
incorporate those. They were copy edits not
material.

MR. DEGADO: I apologize Tracy, I must
have misplaced those. But you’re right, it is a
living document and we’ll have a chance to update
those and incorporate those.

Any other comments, suggestions,

MS. BEA E. JAMES: Yes, I was wondering
if we could talk about—maybe with Valerie’s help
too—how long it will take to actually get that
database that we’re working on for all the
recommendations to the point where we can actually
look at it.

MS. VALERIE FRANCES: It was an over December last year project that I spent a lot of time on and then had to sit aside to, you know, do the ongoing stuff during the year. And I [unintelligible] get really back into it again hopefully during December when it’s a lot quieter and start working on refining the language and figuring out what additional fields we need and how to make it useful internally as well as externally. And move it along. So it’s really a time thing. and I’m happy to work with both of you on it, so.

MR. DELGADO: Thank you, Valerie. I do have to clarify that this is a joint effort with NOP and members of the BDC group. So appreciate your time and your help and your effort.

FEMALE VOICE: Just as a follow-up I want to acknowledge Valerie for all the work that she put into that preliminary database document. And because I know that there were technical changes that are taking place we weren’t able to share it. But I know that it was a lot of time so thank you.

MR. DELGADO: Andrea.

CHAIR ANDREA CAROE: Just a clarification on the format of what this is going to look like.
You’re talking about just an Excel document, you know, two-dimensional? Or are you talking about something like our materials which have actual links to the tabs and, and, you know the database on materials has a little bit more depth. Can we have that also included in this and actually have the recommendation?

FEMALE VOICE: Right now it has all the links built in. The challenge is that they keep talking about migrating the entire website. And I’m talking to my webmaster folks to about how to migrate, migrate those links within this document. And they’ve taken a look at it and they said they’re going to help me. So whatever point this web migration occurs, which I know they tried to do already. It, it, but that has been definitely a factor in how to manage this project.

MS. FRANCES: But right now all the links to the recommendations are all built in. They go back to the very original board meetings. Back to ’92 even. So it goes by meeting all the way up in reverse chronology. So you know.

MR. DELGADO: It sounds easy. It’s been a lot of work. Those links are there. We were very happily surprised when Valerie produced that Excel. But at the same time I must say it’s
Excel. It’s very simple to use. And again, I’m not championing any Microsoft product [laughter]. But, yes, Tina.

MS. KATRINA HEINZE: What, what level of information will this include. So, it will have just the former recommendation or will it include some discussion as to how those recommendations came to be? you know what level of information’s going to be included here?

MS. FRANCES: Right now it’s more, it’s kind of by topic. As things come up in our discussions it helps me see what sort of topics we need to bring forward. And some things are really deeply imbedded in ancient archive minutes that are not as pulled out and user friendly as our recommendations are now. I think, you know, over the years they’ve gotten better at having particular documents at our recommendations verses everything imbedded in our minutes. So the older ones are more difficult to really pull up.

And I know there’s some missing links to addendums and all kind of stuff that I would love to sort of fill in the gaps in and work with people who may have some of those documents. Even historically if we don’t have them I do find broken links in some places. So I, I, it’s going
to vary over time. but as we get better and
better at it I think we can continue to refine it.

MR. DELGADO: And also we will—once it’s
done and we’re happy with the beta version we’ll
send it out to all the members to to get their
feedback and see how it works. Yes, Bea.

MS. JAMES: I think the goal is to have a
chronological order of recommendations that are
still out there. And that they would be sorted by
date as well as by all committee. So we’d have a
chance to look at them that way.

MR. DELGADO: Any other questions? That
concludes our PAC presentation Madam Chair. Thank
you.

CHAIR ANDREA CAROE: Thank you, Rigo. So
you will have two vote items tomorrow. For the
new member—for the changes made to the board
policy manual and the new member guide and the
collaborative effort with NOP for this
recommendation database is an ongoing process.

MR. DELGADO: That’s correct. It’s just
an update.

CHAIR ANDREA CAROE: Okay. All right
moving on. thank you very much, Rigo for your
work on that continued maintenance on those
important documents. Next is the joint policy
development crops and livestock committee. I don’t know who’s taking the lead on this. We have Rigo from policy, Jerry from Crops, and Hue from livestock. Who wants to take the lead on this discussion?

MR. DELGADO: If it’s—
CHAIR ANDREA CAROE: [Interposing] Rigo.
MR. DELGADO: --all right with my colleagues I’d be happy to take the lead or the blame, however you want to see it. But essentially we do have two, two items. The involve agricul—research in particular. And the first item is called the guidance for certification of operations participating in crop production and research. The intent was to provide a, a clarification of how and, and who can do research and, and especially when it comes to the use of prohibited materials.

We believe this is applicable to research operations involved in crop research because of the nature of the prohibited materials. If you recall the section 290 allows for variances with the purpose of, of research. This, because it involves prohibited materials, doesn’t fall in that concept. So we more or less created a parenthesis to that.
The guidance, as it says in the summary there, is targeted to [unintelligible] optimal production practices and input on the certified organic conditions. And just as a matter of background, if you were to apply prohibited materials to any part of a certified field, you would lose your certification status and that will create a great deal of expense and problems for organizations, research organizations. Elevating the cost of research.

So that was the intent of, or the goal of this document. You’ll find that in the recommendations section we have three areas. The first one provides—and that’s on page two—provides the limits or the application of the, of the actual, the variance, if you will. And also provides for the allowance of isolated plants within the field. That can be used for research.

We also, in the following section, provided the proper buffer zones created around the, around that research lot. We provide the necessary justification or materials that need to accompany a request for, for, for a research variance in this case. On section C on page two, we provide a description of the, the process to assess that request.
We did get public comment, favorable public comment. Specifically there was a suggestion to modify the following wording on point A2. It suggests that we replace the second sentence ‘per regulation all land treated with prohibited materials will be considered to be.’ And the suggestion is to ‘must undergo transition.’ Adding the work ‘prior’ to certify organic status, subject to the procedures found in 2052 too. Otherwise we did not receive any other changes. At that point I open it to comments from my colleagues from the livestocks and crops committee if they want to. Or questions from the board members. Yes, Jerry.

Mr. Gerald A. Davis: Also there is the, that one word addition in question, answer four of that document also.

Mr. Delgado: That’s, that’s correct.

Mr. Davis: The word prohibited.

Mr. Delgado: That is. You’re absolutely right. It’s found on page three. It’s the answer to question four. And it’s the last sentence. ‘Land exposed to materials’ as we have right now. And the recommendation is to add the word prohibited. ‘Materials [unintelligible] land exposed to prohibited materials, practices, or, or
excluded materials.’ Good, good [unintelligible].

Thanks for that. Yes.

MALE VOICE: I, I think we should include
that, both those suggestions. I think they’re
both good suggestions.

MR. DELGADO: [unintelligible] so none?

Very well. Any other?

CHAIR ANDREA CAROE: Just we may want to
do that tomorrow when we have a motion on the
floor. Amend the motion to put those two things
in and then vote on them. Since it’s already gone
through a committee. At this point it now needs
to be a board action to make those changes.

MR. DELGADO: Right. Yes, I agree.

That’s the proper procedure and we’ll follow that.

any other questions, suggestions? Leave that—
Kevin, questions? No. Okay. So [unintelligible]
we’ll move onto the next item. That is called
guidance on temporary variance for research. And
again, this is clarification for research
operations. And, we, we spend a great deal of
time with this, but we essentially provide enough
framework to assess research variance requests.
And we’re presenting a set of general principles
that first of all provide the, the, the
justification. Or if you will the, the, the logic
behind approving a request for variance. And having said that I’m moving on straight to the deliverable in this document which is found on page four.

That is the actual recommendation. Follows pretty much the logic that we had in the previous document. We start with the scope on point A where we specify where it’s applicable and to what. Second followed by the set of requirements that a requester needs to fulfill in order to request a variance. And then the last point highlight the criteria that must be considered in determining the validity of a variance request.

And final requirements on points D through F involve general publication and sharing of results of the research. This item is also going to be presented for voting as a recommendation. And I open the floor for additional comments from my colleagues in livestock and crops if they want to add anything else, or questions from the board members. Yes, Andrea.

CHAIR ANDREA CAROE: Well I just want to clarify to those that are here today, this board has no authority to grant a variance. The
variance is, can only be granted. Research variance can only be granted by the administrator. This is simply a information to provide a format for that, that request. Also the regulation’s quite specific over which pieces of the regulation could possibly be varianced, or more specifically, which ones cannot.

So there—although this is a helpful piece of information, this is format information, this is the intent of what that request should look like. And there’s a limit to how far we are able to go. This is clearly through the regulation, not within our authority. But in doing so it was, it was a, kind of a, I guess a black hole that we, we added some clarity to how the process works.

MR. DELGADO: That’s correct. I agree with that. an emphasis on the word framework for decision-making. Yes, good point. Any other comments from Hue? Jerry? Okay. Questions from [unintelligible]? Yes, sir.

MALE VOICE: I’d just like to say that we did put a lot of time in this. And we depended a lot of Jeff given that this was his life’s work. and he was invaluable in what we came up with.

MR. DELGADO: Absolutely, yes. I [unintelligible] to that, yes. His participation
contribution was invaluable. And also from the public we did have some very good comments. No changes so that means that they liked our work. they’re proud. So, well, on that note Madam Chair, we conclude our presentation.

CHAIR ANDREA CAROE: Thank you again, Rigo. All right. Next up is our materials presentation as is become our tradition we, the materials chair will give a presentation on the process that a, a petition material goes through on it’s way to the national list. So, Dan Giacomini is chair of the materials committee and therefore he has the, has the stage for the presentation.

MR. DANIAL G. GIACOMINI: Thank you, Andrea. I’ll try to stay far enough away from the microphone so that we don’t have problems with it today. Hopefully with the bigger tables. And thank you to the program for giving us a little more space [applause]. The national organic materials update, the outline for our talk today is to look at the national list of allowed and prohibited substances. To review the petitioned and sunset review of items. And really all of the items that, that have come to, gone through the process where they are at least ready to come onto
our doorstep. They do not include all of the
items that are still being processed by the NOP
that have not been completed, but ones that are
very, at least very close.

We will look at the material review
process. We will look at the national list
criteria, the sunset review criteria. As an
overview of the materials committee, a very brief
mention. There’s, they’ll be a more extension
discussion on definition materials, but just a
brief mention of it here. And then any final
notes that we have.

The national list—next slide—
[unintelligible] percent of materials under crops.
Section 601 is synthetic substances. And I will—
you know most of these but I’ll, I’ll just
summarize them as we go along. So 601 is the
synthetic substances that are allowed in crop
production. 602 is the non-synthetic,
quote/unquote “natural” substances that are
prohibited in organic crop production. Section
603 is, and 604 are livestock with 603 being
synthetic substances allowed, 604 being non-
synthetic substances prohibited

Handling is slightly different in that
everything needs to be on the list. 605 is non-
agricultural, non-organic substances allowed with section a being non-synthetic substances allowed and section B being synthetics allowed. Section 606 for handling is non-organically produced agricultural products that are allowed as ingredients in or on processed products labeled as organic.

Petition and sunset review items.

Current recommendations for section 601, potassium silicate, sodium carbonate peroxyhydrate, and sodium pharic [phonetic] hydroxate EDTA. Under 606 is grape seed extract.

Sunset items at this meeting for recommendation, consideration are listed there. For 601 two of which have two listings on the national list. 602 for calcium chloride. 606a there is some debate on three of those items and— I’m sorry 605a—and handling will deal with those issues when they get to, when they have their discussions. And 605b cellulose.

Petition items that I’m listing here as consideration. Those are the ones that are somewhere in that process of being very done or have been sent to us or, or, or have been—well we’ll just leave it there. Listed there for 601, 603, 605b, and 606.
Additional items that are still somewhere on the table. Items that have been, substances that have been returned to the NOP and waiting for additional information. Some of which may be clarification on their status relative to the definition of materials issues, ag/non-ag, synthetic, non-synthetic. Or also they’ve been sent back to the program requesting tap reviews.

There are also the four items listed there that have been fairly recently, at some meeting, where the most recent petition was deferred by the petitioner. There’s no additional action or consideration at this time on those items.

Livestock there are no petition or substance sunset items on the docket for the livestock committee for this fall. But do want to mention again, the finding that the nature of the invitation at the end of the—with an end date with the finding makes this item not eligible for sunset. In order for this item to stay on the national or be, to be replaced on the national list this substance must be petitioned for that process to occur. Okay.

FEMALE VOICE: I just want to add a little bit of clarification to that. It, it, just
add some depth to what Dan is talking about. Meaning that a sunset is a continuation of a regulation.

MR. GIACOMINI: I get that.

FEMALE VOICE: We could sunset methionine, but methionine has an annotation that says it’s no longer used, you can no longer use it. So in essence sunset is not applying. It’s irrelevant. So just a little bit of—I know there’s been a lot of questions about that and there’s been a lot of confusion. But there is a specific date in there that even if the regulation continues, the way it’s written it’s saying that it’s not, you can’t use it.

MS. ROBINSON: I just want to say I, I appreciate that presentation. That’s the best presentation materials that I have ever seen a board put up in all the years that I’ve been sitting at one of these. Thank you [applause].

MR. GIACOMINI: Well thank you, Barbara. But I’m not done yet so hopefully I don’t disappoint you and change your mind by the end [laughter]. The material review process. This, this portion of the program, I was told a number of years ago that if you take something from someone else you should reference it about the
first three times that you use it before you claim it for your own. So I think this is the second time I used this so I will still give Kim Dietz credit for this portion of the program. I stole it from one of her old presentations on the issue.

The minimum time from for the national review, list review, material review is 145 days. The first portion of this process is with once the petition comes to the NOSB, the petition is first reviewed by the NOP and reviewed for completeness. Received by the NOP and reviewed for completeness. And on determination of the completeness by the NOP, the petition is forwarded to the NOSB materials chairperson.

Materials chairperson forwards that petition to the chairperson of the designated NOSB committee, whether that be crops, livestock, or handling. The petition is reevaluated for completeness and to determine if it will be forwarded back to the NOP for a tap review. Currently there are no taps for 606 items. Tap reviews are completed and returned back to the NOSB. The reviews are posted on the NOP website for review and public comment. And committee recommendation are posted for public comment. Then the 30 days—yes.
FEMALE VOICE: Really it’s six weeks at this point with the change—

MR. GIACOMINI: [Interposing] yes, yes.

FEMALE VOICE: In [unintelligible]. I just want to make sure you understand that.

MR. GIACOMINI: Yeah, we get there.

FEMALE VOICE: Okay.

MR. GIACOMINI: Within the 30 days prior to the meeting—and that, that should be 60 days now with the new processing of posting—public comment is accepted by the NOP and posted on the website.

At the NOSB meeting committee recommendations are submitted. Further comments are accepted from the public. And all public comments are taken into consideration. And actions taken by the full NOSB regarding committee recommendations.

During the entire process all communication between petitioners and the NOSB should go through the NOP office. National list criteria in general. Number one potential for such a substance for detrimental chemical action with other materials used in organic farm systems. Number two toxicity and mode of action of the substance and of it’s breakdown products of any
contaminants and their persistence and areas of
centrone in the environment.

Number three the probability of the
environmental contamination during manufacture
use, misuse, or disposal of such substances. Four
the effect of the substance on human health.
Number five the effect of the substance on
biological and chemical reactions in the agro-
ecosystem including the physiological effects of
the substance on soil, microorganism including the
salt index and solubility of the soil, crops and
livestock.

Number six the alternative for use, the
alternative to using the substances in terms of
practices and other available materials and it’s
compatibility with a system of sustainable
agriculture. And that’s coming from the federal
registered docket listed there.

Regarding processing age and adjuvant,
the substances can’t be produced from a natural
source and there is not organic substitute. The
subjects manufacturer’s use and disposal do not
have adverse effects on the environment and are
done in a manner compatible with organic handling.

MR. HUBERT J KARRAMAN: You use the term
adjuvant is that specific to processing right here because adjuvant are used in livestock medications which have now been addressed by that docket.

FEMALE VOICE: [Off mic].

MR. KARRAMAN: This is specific to processing. Thank you.

MR. GIACOMINI: Yes. Number three the nutritional quality of the food is maintained when the substance is used or and the substance itself or its break down products do not have an adverse effect on human health ads defined by applicable federal regulations. The substances primary use is as a preservative or to recreate or improve flavors, colors, textures, or nutritive value lost during processing except where the replacement of nutrients is required by law.

Number five the substance is listed as generally recognized safe grass by the FDA when used in accordance with the FDA’s good manufacturing practices and contains no residues of heavy metals or other contaminants in excess of tolerance set by FDA.

And number six substance is essential for the handling of organically produced agricultural products. And that comes from federal, the rule section 606b. I mean 600b, excuse me. Regarding
606 items, agricultural and potential commercial unavailability NOSB will consider a: why the substance should be promoted in the production or handling of an organic product. B: the current product industry regarding availability of and the history of unavailability of the organic form in the appropriate form, quality, and quantity of the substance.

Industry information includes by is not limited to regions of production including factors such as climate and the number of regions. The number of suppliers and the amount produced. Current and historical supplies related to weather events such as hurricanes, floods, and droughts that may temporarily halt production and destroy crops or supplies.

Four trade related issues such as evidence of hoarding, war, trade barriers, or civil unrest that may temporarily restrict supplies, and other issues which may present a challenge to a consistent supply. And those items come from the federal register docket listed.

Sunset review criteria. Sunset review criteria from, directly taken from OFBA is that no exception, I’m sorry, no exemption or prohibition contained in the national list shall be valid
unless the national organic standards board has
reviewed such exemption or prohibition, as
provided in this section, within five years of
such exemption or prohibition being adopted or
reviewed. And the secretary had renewed such
exemption or prohibition.

Sunset review criteria. Sunset includes
the opportunity to revisit the continued need for
the regulation of the substance and the review
finds, if the review finds that the initial
condition still exists the regulation is renewed
for an additional period of time. This comes from
a 2004 NOSB guidance document, sunset and the
national list of allowed and prohibited
substances.

Sunset process is not used to petition,
to add a new substance to the national list, nor
is it used to change an existing annotation.
That’s from that same document.

Exemptions which are national list
listing are accepted because the evidence
available showed substances were found not harmful
to human health or the environment, substances
were necessary because of the availability of
wholly non-synthetic alternatives, and the
substances were consistent and compatible with
organic practices. That’s similar to what I mentioned earlier. But just summarizing it down into three points.

Sunset is a repeat of the national process. NOSB will solicit information and comment to reevaluate the substance against the same criteria that substances were found not harmful to humans or the environment, substances were necessary and non-synthetic alternatives were available, and the substances were consistent and compatible with organic processes.

Regarding the definition of materials I just wanted to leave one thing here. It’s a quote from a songwriter, from a song that I know; “The art of simplicity simply means making peace with your complexity.” This is a very complex issue and we are trying, the committee was trying to look at it from not a radical approach, but maybe a new approach.

Final notes, public comment. All public comment is now handled through www.regulations.gov according to federal registered docket and the governmental agency. It’s an effect, an effort to bring processing of public comments to an equal level of efficiency across departments and agencies. And the new process sets deadlines for
having comments posted. All public comments received by the NOP will be made available to the NOSB members for review in advance of the respective vote whenever possible.

The, I was, one of the things that I was charged with in making this presentation was a review of the posting process of making a public comment. With all due respect of everyone involved in that program, it’s, I think it’s generally accepted that that is a very difficult website to manage and, and—

FEMALE VOICE: [Interposing] navigate.

MR. GIACOMINI: --navigate. And in trying to, as briefly as possible, come up with an explanation of how to do that I will be very honest with you, we have a very simple four or five step procedure for just getting to look at your public comments, that Valerie has put together for us. And half the time I can’t get there. So it, it’s a very complicated thing. and I could simply not come up with a summary of that in this brief amount of time.

Finally, for the relevant website listings were listed there and now they’re gone. AMS, the NOP website, the NOSB website, and public comments regulations.gov thank you.
CHAIR ANDREA CAROE: Thank you, Dan. Is there any, any questions for Dan on the process? Hue

MR. KARREMAN: Just one, one thing Dan. On, you quoted one of the regulations for like the seven criteria that we review materials. That is directly, actually from OFFBA isn’t it. Isn’t that right in OFFBA, those seven items for review. Just, I saw it was in regulation two, but I do believe it’s right out of OFFBA. Barbara has it.

FEMALE VOICE: Not for processing, Hue. The, the general criteria are, are from OFFBA. But the, the criteria from processing aids and adjuvant those are from the NOP regulations because there weren’t any—when OFFBA was written there wasn’t any contemplation that there would be a national list for processing.

CHAIR ANDREA CAROE: Any other questions? It, it is important though to recognize the difference between those general criteria and the processing criteria. Especially as you’re looking at materials. The confusion may be trying to apply those processing criteria to materials in which they don’t apply. Which we can’t do. and so remember that those are processing criteria for, for processing aids and adjuvant. Barbara.
MS. BARBARA C. ROBINSON: That’s why we came up with that. I think we gave you those forms and you’re using those.

CHAIR ANDREA CAROE: That’s correct.

MS. ROBINSON: But we identify which criteria applies whether you’re evaluating a material for crops, livestock, or handling and which criteria you should evaluate it against. Right?

CHAIR ANDREA CAROE: I absolutely agree. And when the committees are filling out those they are right on track. But when the committee—the board starts discussing it we’re not necessarily staying on track with the forms.

MS. ROBINSON: Right.

CHAIR ANDREA CAROE: And so as the discussion is, is evolving I just want to make sure that it’s not evolving around criteria that is not applicable to the material.

MS. ROBINSON: Right, right.

CHAIR ANDREA CAROE: Because there is a little overlap but—

MS. ROBINSON: [Interposing] Yeah you do have to sort of be careful there.

CHAIR ANDREA CAROE: That’s what I was pointing out. Gerald.
MR. GERALD DAVIS: Regarding the regulations.gov website, Valerie or someone from the program, do we have a breakthrough in sight as far as more easier manipulation of that website as far as some sort of instructions or something that will put an end to the difficulty people are discovering.

FEMALE VOICE: Barbara just, you want to [unintelligible]?

MS. ROBINSON: I talked with Kris Sarcoat [phonetic]. Lock Key Martin [phonetic] runs that sight and I guess we— you know I’ve gone back and forth with, with Kris because I didn’t realize how much, how much trouble you all were having. And we’re—I’m going to work with her some. She, she didn’t realize. In fact the last time you all were having trouble with it apparently the— everyone was having trouble. You weren’t the only ones. Then we got a message that, I guess, the thing was down or something. They were having technical difficulties. So you weren’t the only ones who were having problems with it. But then they failed to send out the right kind of message to tell people that no one could get on.

So Lock Key Martin [phonetic] anyway, has the contract for one more year. And hopefully
enough people will complain that they’ll either
get the message that they need to make this thing
more user-friendly or they’ll lose the contract.
So in the meantime, I think, between Valerie and
I, I think we’ll continue to work with Kris and
see if we can’t, you know, get our voices heard a
little bit more. But apparently, you know, Kris
says that she has trouble with it too, I guess.
And, and it is just not, it’s just not user
friendly, you know. And, and I apologize for
that, you know.

She has trouble finding, finding our
comments. We’re the base, we’re like the second
largest agency for regulations in USDA. So it,
it’s really important that we do be able to use
this thing easily. I’ll keep working on it is all
I can tell you. and see if I can’t come up with a
more user-friendly set of instructions, at least,
so you can get into it. But I don’t know, I don’t
know what else to tell you right at the moment.
FEMALE VOICE: And I’m truly concerned
about the future of those comments as an archive.
MS. ROBINSON: Yeah. I know. I know.
I’m sorry is all I can tell you. it’s out of our-
that is really out of our control too.
CHAIR ANDREA CAROE: Bea, you had a
question.

MS. JAMES: If I could make a simple suggestion, I’ve had to coach people that I know that are trying to get in and look at public comment, how to do it. There’s no simple instructions or like a header posted anywhere: here’s how you actually find your public comment or public comment. If that could be posted somewhere that would really help.

FEMALE VOICE: You’d never find it [laughter].

MS. JAMES: Well even if it was on that NOSB website under public comment and then directions for accessing public comment. that would be great [laughter]. And I’m not a techy. So if I can figure that out.

CHAIR ANDREA CAROE: Okay. well we appreciate, we appreciate the effort you’re making to help us out with this. And we appreciate the frustration that you also must have with this. But again, we’ve expressed the urgency. And these public comments are fundamental to the work we do. So I think, I think this just highlighted that for us, how important it is for us to be able to see these comments. And how nice it was to see them in actual paper [laughter] when we got to the
meeting. With that, any further questions for Dan and the material process? Joe.

MR. JOSEPH SMILLIE: Yeah, I’m not sure if it’s the right time or not, but Dan, you, you said that there is no tap reviews required for 606. could you elaborate? Is that just a—

[Interposing] [off mic].

MR. SMILLIE: That’s a board decision. Dan.

MR. GIACOMINI: My understanding on that was that that was a program decision that no tap reviews were required on agricultural products.

MR. SMILLIE: Required, but suppose we would come across material that we think merits a tap. Is that, I mean, financial considerations aside. Is that, is that a hard and fast?

MR. GIACOMINI: We can submit a request and see what happens.

MR. SMILLIE: Okay.

CHAIR ANDREA CAROE: I’d like to go ahead and recognize Kim Dietz on these. She worked on the sunset process better, you know, more intimately than any of us. so, Kim, if you’re willing will you give us a little bit of the background on that?

MALE VOICE: Not sunset, 606.
CHAIR ANDREA CAROE: 606, I’m sorry, 606.

MS. KIM DIETZ: Good morning, Kim Dietz.

Thanks Andrea. The decision to, to not do tap reviews on 606 is really up to you. The rule office says the board may convene a tap review for anything that you want. It’s really up to your discretion.

However, based on the complexity or non, non-complex material that’s really something you have to evaluate. In the past 606 material is, should be an agricultural product with minimal processing. It’s something—if it isn’t then that’s certainly up to you. But really the funding is what, why we decided not to do that. so it’s really at your discretion.

CHAIR ANDREA CAROE: Thanks, Kim. But could you explain to us what an agricultural product is [laughter].

MS. KIM DIETZ: I was going to do that in my comments [laughter].

MALE VOICE: And what was your definition of minimal again [laughter].

MS. DIETZ: So, anyways, what a tangled web we weave. This is all, all quite tied together. And I didn’t understand what you were saying, Joe. And there are these, these materials
that we’re—it’s, it’s questionable whether they’re agricultural or not because of the amount of processing that goes into—or manipulation that goes into the products. And it certainly would be nice to have the resource of the 606, I mean, of a tap review to look at them.

And one of the one, one of the one things that—one of the first things we get out of our tap review is the, is the categorization of the material. The tap reviews tell us if it’s synthetic or non-synthetic, agricultural or non-agricultural. Sometimes that in itself is the value of the tap. So there, there will be situations that I think it will be appropriate for us to request tap.

CHAIR ANDREA CAROE: Any other materials, questions, or questions for Dan? Hue.

MR. KARREMAN: Not really for Dan, I’m just curious. What—since we’re talking about taps—how much is in the coffers for doing taps? A big fat zero. Till when? Like—

FEMALE VOICE: [Interposing] we’re on a—

MR. KARREMAN: --can’t be forever.

That’s what we’re here for.

FEMALE VOICE: Well you know we’re on a continuing resolution. Right now through the
middle of December. I don’t expect to get out from under the continuing resolution until March really, really. To be realistic. And the chances are pretty good that we could, you know, I don’t know when we’re going to see a budget.

If we got our new budget we could get another million dollars in this program. Which would practically double the NOP budget. Frankly, we don’t have any discretionary spending let in the NOP budget. What we have is about $60,000. period. That’s it [laughter].

FEMALE VOICE: Bake sales.
FEMALE VOICE: Yeah, car washes and bake sales guys, for taps.
FEMALE VOICE: Right [laughter].
CHAIR ANDREA CAROE: All right, any other questions?

MS. JAMES: I have a question for Dan.
CHAIR ANDREA CAROE: Bea.

MS. JAMES: Dan, I was wondering if you could have that presentation posted under our agenda? That would be great. It’s currently not. so that would be—thank you.

MR. KARREMAN: One more question.
CHAIR ANDREA CAROE: Hue.

MR. KARREMAN: Not to get into whole
budgetary things because that’s a whole different,
you know, world. But is, is there any possible
way for tap review money to come in from some
other neutral source or must it come in through
the USDA?

FEMALE VOICE: You mean like a gift?

MR. KARREMAN: Yeah, some philanthropist
or something. Is that possible or not?

CHAIR ANDREA CAROE: You know, you’re
not, this is not the first time that’s been
brought up. In past years previous boards have
said what if, what if someone was to give you
money just for taps. And so that’s not such an
odd question. But we can’t accept, we can’t
accept money is the short answer.

MALE VOICE: We have user fees though.

FEMALE VOICE: Dan.

FEMALE VOICE: If we have user fee
authority that would be great.

MALE VOICE: User fees to do—

[Off mic]

FEMALE VOICE: Yeah, yeah, I did.

MALE VOICE: Is that, is that, is it the
user fee that makes it different between for
instance the FDA where the companies submitting
the drug?
FEMALE VOICE: Yeah, basically.

MALE VOICE: Are we not, are we not able to do that.

FEMALE VOICE: The reason we are poor is we’re an appropriated program, exactly. If we had user fee authority we would be charging our certifying agents. Of course then they would be charging a lot more to the certified operations. Yeah, but then we would be a lot richer because we would be charging by the hour.

MALE VOICE: But what if, what if the company’s submitting—what if the petitioner—

FEMALE VOICE: [Interposing] we would also charge the petitioners.

MALE VOICE: What if they paid for the taps?

FEMALE VOICE: Well, we’d be doing a lot fewer taps I can tell you that right now because people would be petitioning a lot fewer materials to go on the national list.

MALE VOICE: But if that was an option. Right now we’re not doing any taps and, and—

FEMALE VOICE: [Interposing] right.

MALE VOICE: --substances are starting to—could potentially get backed up. If a petitioner wanted that tap done and was willing to
do that is that an option?

FEMALE VOICE: No, because we don’t have any user fee authority is the problem. Here’s the problem.

CHAIR ANDREA CAROE: Okay. actually, Kevin I want to get to you but I see either Kim or Rose to get some board historic perspective, I think, is valuable at this point.

MS. ROSE KOENIG: I think first of all that maybe the board isn’t utilizing—the fact that a lot of times the petitioner will provide you a lot of technical information. you know a good example is the potassium silicate petition. So if you go back—and I don’t know if you still give the folks the petition. I know a lot of times it’s on the web, but you’re looking at the technical report.

So the first thing is you do have a body of information. Now that information may be bias because it’s being submitted by the company. Additionally, there’s a thing called Google [laughter]. But you can access—you know it does take extra work from the board, but it’s not that you can—you know your hands are tied. You yourselves can do some minimal research on those things. A lot of it is just technical research
and you can just say alternatives to some.

So I don’t think that you have to feel like because there’s not money to actually pay for a technical report that the committees can’t go forward. You know as you do that you might feel that you’ve gathered at least sufficient amount of information by doing a Google search yourselves.

Like for example, on this soy protein isolate, when I started getting through even the tap reports it wasn’t sufficient to answer the questions that the board actually came up with in terms of whether this thing was synthetic or non-synthetic. So at that time there was folks that, you know, every time I would do a Google search there were people in the university community that actually had expertise in food science. And you can utilize those folks.

But again, it’s going to put extra work on you guys. Which, you know, and you’re already, you know, with a lot of work. But, you know, if people on the board have that energy and that inclination, you know, it is possible for any individual that has some common sense and can read and do a little bit of research to kind of get those answers. But it’s not, certainly, as efficient as a tap report.
CHAIR ANDREA CAROE: Rose, just before you leave, I think, specifically I know of a situation where we have a material where it’s about the process and technique.

MS. KOENIG: Um-hmm.

CHAIR ANDREA CAROE: And that, not necessarily can— I mean some of that’s confidential business information that we’re not really being able to get.

MS. KOENIG: But the thing is, when you’re putting the material on the list you’re not putting that—it, it doesn’t matter who produces that generic material. There’s usually multiple ways. And it’s very rare that there’s a proprietary way. And even if there is you still have to look at all the ways that it’s being produced because in a way the only way you can exclude a way of something that’s producing is by those annotations that we all have learned to love, right.

So I’m just saying you have to remember you’re not putting that product on for that individual company. Once it’s on that list as a generic it doesn’t—you’re in a way saying, okay, it doesn’t matter how it’s produced; we consider it synthetic and all of it’s all right unless we
annotate it. So a lot of times the proprietary—if
you can’t get that information you still probably
could get information on all the other ways it’s
manufactured and it may help. But remember, we’re
not doing this…

[END MZ005018]

[START MZ005019]

MS. KOENIG: …for individual companies
though. It’s not their product that we’re putting
on the list.

CHAIR ANDREA CAROE: I, I, I agree with
everything you said, Rose, I mean whole-heartedly.
I just, I think that some of the information is a
little bit easier to access online then others. I
mean definitely information about the material.
But it, it falls short a little bit on some of the
processes and technologies.

FEMALE VOICE: [Crosstalk] but don’t
forget there is this thing called confidential
business, CBI.

CHAIR ANDREA CAROE: Yeah.

FEMALE VOICE: And sometimes we, as a
board don’t even have access to that information.

CHAIR ANDREA CAROE: Exactly. That’s the
point. That’ the point. That’s where we’re
[unintelligible].
FEMALE VOICE: And they’re not [unintelligible] on pass [unintelligible] when that confidential business information came up. As a board you have to put it on knowing that you can never access that information. If you’re not comfortable with that then it’s really not an [unintelligible] criteria, but you can say there’s insufficient information of how it’s manufactured. That doesn’t make us feel comfortable. We don’t know if it meets the criteria on that.

CHAIR ANDREA CAROE: Kevin and then Hue.

MR. KEVIN ENGELBERT: I’m just curious, Barbara, the money that certification agencies pay to become accredited every year and reviewed, doesn’t that come back into the program or is that already figured in as part of your budget?

MS. ROBINSON: No, that doesn’t, that doesn’t come to the NOP first of all. That goes—well first of all they’re not paying every year, okay. They pay every five years and it goes to the arch [phonetic] branch. It goes to the auditors. And they’re paying a user fee, they’re paying travel and perdeium. But nevertheless, it doesn’t come back to NOP.

And it’s not like a profit that they’re making, okay. It’s a cost recovery basis. So the
auditors that go out there, say to audit CCOP, let’s say—

[Background talking].

MS. ROBINSON: Or Nofum [phonetic] New York, whatever. For the time that they spend out there reviewing the documents they’re being charged on an hourly basis by those auditors for the salary that it takes to recover, you know, to pay for those two guys that spend all that time out there. So there isn’t any extra money floating around. And those guys work for Jim [unintelligible] shop. So it doesn’t come back to the NOP.

Now I do want to say something about tap reviews too. Another source of this information—previous boards have always resisted it—but for crops is EPA. There’s also the FDA as a source. And previous boards have sometimes resisted those federal sources of information. But you know they’re, we think they’re trustworthy sources of information. It depends on how you feel about them I guess. But you can find scientists at those agencies. And you can find valuable information about a material, probably, there, you know. And as Rose says, there is, you know, quite
a vast amount of information out there on the Google search engine.

It is true that there probably is a lot of information, particularly for 606 stuff. And the other thing is, is why not move to have—force the petitioners to at least provide the cast [phonetic] numbers. I thought we were going to move to a point where we were not putting anything on a national list that didn’t have a CAS number. That that’s what we were going to—that’s how we were at least annotate things so that you didn’t have these problems down the road of people, you know, saying it’s, it’s not really this material, it’s this material. We’re going to eliminate that confusion and we were going to get away from these complicated annotations. We were just going to identify material with a specific CAS number. But that would also help in evaluating some of this.

CHAIR ANDREA CAROE: Hue.

MR. KARREMAN: I, I, I guess I would just caution to, that we move, that we not move away from third party review. I, I just really think, you know, just like the way, I’ll just say how Amrey [phonetic] reviews things is very thorough. They have CAS numbers. Just—I think we do it internally in the board, we’re all very
intelligent here except we all have our areas of expertise. And it’s going to get to be like where different certifiers review different materials. And there doesn’t seem to be always that much overlap. And there’s not going to be—I just think it’d be cleaner with a third party review. And I understand the financial problems with doing that. but I, I, I don’t want to rely on Steve to go Google something for I don’t know what. And then I get different information and it’s not, we’re not all on the same level playing field to make our decision.

FEMALE VOICE: Well let me ask you this.  
MR. KARREMAN: I just want to say that.  
FEMALE VOICE: Let me ask you this, what if, you know, AMS has a—we have scientists, you know, we have laboratories and scientist, you know. And what if in the short run, you know, when we’re backed up like this and we don’t have any funds is a third party review, what if we went to our scientists? I don’t even know if our scientist will do it because, you know—  
MR. KARREMAN: [Interposing] I guess—  
FEMALE VOICE: They can say, well, where’s your money. because they operate on a user fee basis too. But if we could—if I talked
to, like another deputy administrator, my counterpart who runs the science and tech programs in AMS, and say, you know, can your guys evaluate some of these materials for me. Take a look at them and give me some sort of sense, you know are the synthetic, non-synthetic, ag, non-ag. And give me some analysis of them. Would that be a possibility? Would you consider that as a short run placeholder?

MALE VOICE: I, you know, I wouldn’t be apposed to that except that, you know, it has to be within the OFFBA criteria or the other criteria.

FEMALE VOICE: Oh, no, obviously.

MALE VOICE: But obviously, no, but just case in point on that is, actually the FDA center for veterinary medicine has asked me to come in and talk to them next June about organics because they want to learn about it. And so I don’t know if I would, you know, I don’t know if they’re up to speed yet except for that docket, you know, just about organics in general, to be a good source of information for us as a board perhaps. Maybe they would be but maybe not. but I would say—I wouldn’t be apposed to that. rather than us individually having to go mine out information
from wherever we can. That, that would be better.

CHAIR ANDREA CAROE: Just, just, I mean just to put in perspective, I mean I have two filing cabinets at home filled with taps. And I look at them and every tap reviewer is inconsistent with every other tap reviewer. So to say that the work we would be doing is inconsistent and that’s why we should go to the outside, I don’t buy that because I’ve seen some really wacky taps that we’ve gotten over the years.

So I, I don’t know that there’s—I understand what you’re saying Hue, but I think you’re idealizing what the tap reviewers bring in. because in reality they’re just as inconsistent as the information that we would be getting.

[unintelligible] Hue and then go to—Dan, are you still waiting? Hue and then Dan.

MR. KARREMAN: Dan’s nodding his hand, okay.

MR. GIACOMINI: [Off mic].

MR. KARREMAN: Yeah. Well I’d say, gee whiz. Oh, yeah, on the tap reviews, like from— I’ll just say Amery [phonetic] again because they’re kind of the gold standard out there I believe—that you know yeah, you look at each
reviewers, the three reviewers notes and they may be all over the place, but there is one consensus note that is submitted. And that’s, that’s what we usually look at as the board, I believe. Although we may look at different individual, you know, ideas from reviewers. But we do kind of put some weight on that final analysis.

CHAIR ANDREA CAROE: I’m going to go with—Dan do you have something?

MR. GIACOMINI: I have a clarification.

CHAIR ANDREA CAROE: Yeah.

MR. GIACOMINI: Just to clarify, I’d forgotten my—regarding CBI, the, the sub-committee meeting that we had in February, we found out how invaluable the CBI information was. We could not have done the 606 materials at the spring meeting without having access to those. One of the items on the materials work plan is working with NOP, mainly with Bob, to figure out a way—confidentiality statements, whatever it may take to allow someone, possibly on the board, to have, to potentially have access to those as necessary. Bob was, my last information with Bob was that he had, was in contact with, I believe with OGC and finding out what the legal implications and criteria for that would be. We ran out of time
for proceeding on that for this meeting. But it, it is still on, it’s still definitely on the material work plan.

CHAIR ANDREA CAROE: Bea.

MS. JAMES: I don’t think it’s an either or situation with looking at more information on a petition or if you want a tap. I think, I, I’m actually pleased that Barbara offered that there’s internal people that would be able to do more additional research for us. and that really helps the collaborative process and it also helps the diversity of the type of information you can look for. And if—I would leave it up to the intelligence of the committee chair that if we really needed a tap review or we needed further information we could get that. But that—it seems like you would want to take advantage of trying to do your own research. And if you needed more diversity of opinion you go to the NOP and you say, you know, what can you do to help us to bring more information to the table. So just throwing that out there.

CHAIR ANDREA CAROE: Okay, I’ve got Rigo and then Dan.

MR. DELGATO: I, I too like Barbara’s idea. And I think it would be also useful to
compliment that with a way of trying to reach out to universities and other research institutions. It’s always good to have a wide pool of scientist or people involved in this to provide input. And I, I think it’s useful and necessary to have taps. Case in point is potassium silicate. We probably would have done it different—or followed a different route—if we had enough information like the one we saw yesterday.

But I think it’s also important that, that, that we realize that public comment is also another important tool in our decision-making, so.

CHAIR ANDREA CAROE: Dan.

MR. GIACOMINI: I, I, I’m very concerned about something that could come up in the future. I’ve talked to the program people about it and some of the board members about it. And in regard to taps and that the, the, the infamous Applegate letter is, is, is—explains the programs interpretation of things on the national—synthetics on the national list being able to be combined and the new things that they create are all automatically okay. my concern in the taps that I have looked at going—I haven’t certainly looked at all of them, but a number of them going back. The potential in what things can be made
into was not considered. And I, I’m very concerned with where that road could take us as, as we go head towards the next major, 90% of the materials [unintelligible] sunset period.

FEMALE VOICE: That’s why if you put things on the national with their own CAS number you would stop that from happening. That was the point of, you know, we, that, that’s why we asked if you would do that. because if, if a material is identified strictly by it’s CAS then you can’t do this, this, you know, Chinese menu thing anymore. you know one from column A and two from column B. and you know, and mix and match and, you know, come up with something else that you like. You wouldn’t, you wouldn’t wind up with that.

But as long as, as, as something is on the national list there is no way to restrict that from happening. But if you would say to the petitioner, what’s the CAS. And that is the only way it’s going to get on this national lists, with a CAS number, then you would stop that from happening.

CHAIR ANDREA CAROE: Hue.

MR. KARREMAN: Does everything—well so far historically, would everything that’s on the
list right now have a CAS number? because I’m not
certain that everything would when it comes down
to—well some of the natural things wouldn’t have
to be on the list. Does everything have a CAS is
the question.

FEMALE VOICE: No, I don’t think
everything does have a CAS. It’s, it’s about
moving forward. And 606 certainly doesn’t. but
who—you know I don’t think you need to worry about
606.

CHAIR ANDREA CAROE: Just, we need to
wrap up this discussion so we can move on. I
think this is all good. And I think Dan, if you
were taking notes you got a couple work item for,
for your committee. Specifically we should look
at what are the resources that we have. And then
possibly build some mechanisms in order to reach
out to those. Barbara, if those scientist in AMS
are accessible to us, how do we access them? We
need to figure out how that’s going to happen. If
we’re going to outreach to universities how’s that
going to happen? So I think, perhaps, that, that,
that might be valuable work for the materials
committees to have some mechanisms and some, you
know, not relying strictly on the taps, but what
other resources do we have and how do we get
there?

MR. GIACOMINI: That’s fine. We’re not working on anything else at the time, so…

CHAIR ANDREA CAROE: [laughter] all right, I’d like to wrap this up. Gerald, do you want to go ahead? One more.

Gerald: Rigo, I’d like to recommend that this discussion about sources of information that several, you know, committee chairs, you know, after you’ve done it a couple of years you learn places you can go to get additional information beyond the tap. If we work towards at least collaborating with you for the board policy manual or new members guide, that type of area of including some of these areas of suggestions. So as old members go off the board what they’ve learned over five years is not lost. Is it already there already?

FEMALE VOICE: [Off mic].

Gerald: Oh, no, no, no, no.

FEMALE VOICE: She’s young.

Gerald: I understand.

CHAIR ANDREA CAROE: All right, so without any further questions on this matter let’s take a 15-minute break. It is—we are exactly on schedule. It is 9:30 right now so we have until
9:45 coming back. And joint materials handling committee will be doing their report.

[Background noise].

CHAIR ANDREA CAROE: Board members, we can reconvene. Okay. moving on with the agenda. Our next item is with the joint materials and handling committee. I believe that Dan, you’re going to present this issue which is the national list clarification of definition of materials

MALE VOICE: What’s number ten [off mic].

MALE VOICE: Six I believe.

FEMALE VOICE: Six.

MR. GIACOMINI: Recent boards have repeatedly attempted to deal with the issues of non verses non-ag and synthetic verses non-synthetic in separate documents. Many of which, for various reasons, failed to reach voting action by the board. The, and, and there are many lingering issues that have been overhanging the board on determining the classification of materials for a number of years.

While the work of the past NOSB boards is considered invaluable, the fact of the topic has been worked on by the board for 15 years without a true, full resolution. It lead the giant committee to want to consider the possibility and
the need for maybe a slightly new approach. Since the issue has not been resolved by looking at it from a ag verses non-ag and a synthetic verses non-synthetic position the joint committee thought that it could be constructed to simplify the process into two simple questions.

Question one is whatever substance we’re looking at. Is it agricultural? And if not, question two, is it synthetic? We ask the industry to view this new paradigm with an open mind. We ask you to, if that does not work, show us why it doesn’t work and where it doesn’t work. and we are open to that discussion.

This was intended and prepared for the meeting as a discussion document and no one on the joint committee considers any part of it final. We ask the fellow board members, the industry, and the public to consider the new idea with an open mind and offer, hopefully, constructive comments on it’s progress.

In examining the paradigm it lead the joint committee to the development of a visual aide with we titled and presented to you as the universe of materials. The concept and the diagram is accompanies, is accompanied with a decision tree that consists of two parts.
The first part, is it ag? Which may or may not be based on a development, on further development from the decision tree in the ag/non-ag document of 2006 which never reached full board action. And the second part of the is it synthetic question still needs to be fully developed.

The board, the committee members have certainly heard the comments so far and read the public comments. And in informal discussions we support the incorporation of all historical perspective. All prior [unintelligible] board documents and the minds that created those. We were not trying to throw anything out. but when you ask the same question and you continue getting an answer that you can’t reach full resolution with, maybe there’s just a little tweak that needs to be done in the question. And that’s what we’re looking at.

We’re open to those minds, all of those documents to if this paradigm can work to be used to implement those two recommendations that will be used to serve the industry into the future. We ask for your open-minded consideration for looking at this new approach to an old problem.

We also acknowledge that there was a very
short posting date on this document. It was a discussion item. It was not an action item being a vote that required the same amount of posting date. And it’s not—and, and we did not hold back this document in any way to avoid your, to try to get around from the public examining it. It was simply a matter that as we were reaching the point in time of documents being needed we had been working on this process and the potential development of the trees and different items going through the trees—of which we really had only really achieved only a template of the first question.

We reached a point in time where do we post anything at all or do we post nothing. We acknowledge the complexity of the issue and we acknowledge the new approach that we are trying to look at in solving these complex problems in what could conceivably be a fairly simple, a more simple fashion. And it is simply a matter of the documents was posted when it was completed.

So we—it’s an unfortunate we’re—for any shock that this caused. But the document was posted when it was done. We did not have—we don’t have the requirements of the deadlines because of it not being an action item. Thank you.
CHAIR ANDREA CAROE: I would just like to add to that a little bit, Dan and talk about the purpose and why, why this is important; why we’re going through this exercise. And you know the obvious, the obvious reason is that we need to, when reviewing materials place them appropriately on the national list. This has always been a case-by-case analysis that’s been done through the materials process. This is to add some criteria to that so it’s, it’s repeatable and consistent.

The second implication that is a little bit less obvious is the implication on feed which has the 100% requirement for the agricultural feedstuffs. And what is that, what are those agricultural components and what are not agricultural components. Certainly there’s implication there that we need to clarify before our industry grows to the point where it’s hard to fix.

We just talked about that yesterday with, with other issues that—as a [unintelligible] industry we have the capability to correct things before we’re too far down the line. So I just wanted to add that little bit.

There’s been a tremendous amount of work. and, and sitting in on some of you meetings and
watching this evolve has been very interesting. This is not started with this board. This has been started for a long time. But I think this, this board, and Dan your committee, and Julie, have, have pushed it forward to actually get some paper on this going. So that’s—I commend you for that. At this time I would open it for questions from the board. This is only a discussion item today. But this is a good opportunity for those of you who may not have been involved in the process to ask your questions and, and again, forward this work. Katrina.

MS. HEINZE: I thought for the benefit of board members who haven’t had an opportunity to see our pictorial aide it might be worth a couple minutes explanation. The idea with this is that any material exists somewhere on this page. And then what happens, you take the universe of materials and then there’s a bucket, shall you say, that you can put agricultural products in.

So once you’ve done that—so that’s the green circle here on the, the picture. Once you’ve done that you have agricultural materials and you have things that are not agricultural materials. From the non-agricultural you can then take a second bucket, the synthetic bucket, and
put things that are synthetic within that. and so
those are the two, obviously, largest.

   Everything else then exists in the white
of page. So it is then non-agricultural and also
non-synthetic. So from this picture the, one of
the recommendations that we made in our discussion
document was that we would recommend eliminating
the definition of not agricultural because we
think that’s where a lot of the confusion comes
from. In general the public comments supported
that recommendation.

   MALE VOICE: Or at the very least
amending it.

   MS. HEINZE: Yeah, or amending it. I
would say that where we have had more difficulty
and need to spend more time with some of the
historical documents is how to convert this
pictorial aide into a series of questions that
help define those buckets and make sure that
things are appropriately placed within the
buckets.

   So that’s where we appreciate all of the
public comment that we have received and we
continue to receive. And then input from the
board as well.

   CHAIR ANDREA CAROE: Any other questions?
Bea.

MS. JAMES: Katrina, you mentioned that you wanted to put this into a pictorial flowchart of questions. And I’m wondering if you looked at the documents that was submitted by the materials committee, I think it was two years ago, that I believe Rose and Nancy worked on, that actually has a series of questions that actually take you through a graph and a flowchart.

MS. JAMES: Actually, I think Dan, you’d like to answer that.

MR. GIACOMINI: There, there’ve been, I believe at least two different flow charts that have been proposed and worked on in the past. There was an ag/non-ag flowchart. And there was a synthetic/non-synthetic flowchart. The committee at this time has worked through portions, a significant portion I would say of the ag/non-ag, the is it agricultural side of the question. We haven’t gotten to the synthetic/non-synthetic side of the question hardly at all. The questions and the boxes that we put on the decision tree that is in the document were essentially placed there just to get some—continue with the discussion.

CHAIR ANDREA CAROE: Bea and then Julie. Did you? Julie.
MS. JULIE WEISMAN: Yeah, and I guess it was, it was, Dan had briefly mentioned it, but I, I wanted to throw out to the board that the, the recommendation that was presented two years ago was very far along. And the fact that it didn’t become a recommendation, it was on very discrete issues. And I think that we—probably the very, you know, I think the very early task after this meeting, for the joint committee should be—although, you know, we have—are the other pages on this slide?

MALE VOICE: Yeah.

MS. WEISMAN: Can you go to the next, can you go to the next page? This, this was a product of our own discussions. I suspect—it’s already been pointed out to me that there is a glaring hole on the way to something being called an agricultural product that we, that is not addressed here. But having to do with where do ingredients that are allowed for handling fit into this? So there is certainly—if we use this as a tree for agricultural certainly another box would have to be added before the final oval.

But I would also ask my, you all, my colleagues to give serious consideration to just keep the tree that was part of the 2006 proposed
recommendation. because that was an excellent documents as well. And then yes, we do have to mind all those historical documents and the minds that created them to have a really good tree for determining synthetic.

CHAIR ANDREA CAROE: Dan.

MR. GIACOMINI: One of, one of the issues in the 2006 document, which was the ag/non-ag document revolved around, revolved around the issue of changing yeast to an agricultural product. One of—that got sidetracked in public comment on the impact that that would have on the feed issue.

The reason that that got sidetracked at that point in time was because of a slightly inconsistent input from some of the program. and not meaning to point fingers at the program. But when the issue—we did discuss the impact this would have on feed. The initial input from, from a member of the program was that if it was on 606 you could still use that as a feed. That interpretation was changed, modified, clarified, that no it wouldn’t. that’s a handling list. If it’s an agricultural product and deemed an agricultural product. and on 606 then it would have to organic. It was there was a tremendous
amount of public comment on that point. It had been discussed.

But it was—the reason, the real reason that it got derailed was, it had a lot to do with the fact that our input, the input that we had from the program—and again, not pointing fingers at the program—but that had changed slightly. So I’m a little hesitant to say, well, we’ll take that tree and plug it in when we still have, that’s still the—

FEMALE VOICE: But that’s not an issue, that’s not an issue, the tree.

MR. GIACOMINI: It’s an issue with the agricultural side of the tree. If you’re looking, if your recommendation is just to take it, blank it.

CHAIR ANDREA CAROE: It would be. but before that I just want to point out to everybody who’s watching, this is work in progress. This is not a final product. this is a discussion item. And so as you’re looking at that understand that we know that this is not where it needs to be yet. Bea, you want to...

MS. JAMES: I just wanted to acknowledge that I thought that Amery [phonetic] submitted some pretty good feedback on your recommendations.
And one of the comments that they made was that they were hoping that you might consider a working group to finalize the recommendation and I was wondering if you were considering that?

CHAIR ANDREA CAROE: Dan.

MR. GIACOMINI: The, the, the members of the committee that I’ve talked to—and I think everybody involved—will be, is very interested. And I thank you for using the term that you used. If we use the other T word that was used the other day there are implications to it that we really may not want to get into. But yes, that, that is certainly part of the process that we’re looking at.

Also, regarding the public comment, there was a tremendous amount of extremely valuable public comment. There was some public comment though that address the issue that we, that this can’t be looked at in one universal thing. It has to be looked at as—from the livestock perspective and from the crops perspective and then from the handling perspective. And, and we cannot find the support for that. Granted there may be historical documents in NOSB that, that reviewed things from that light. We can’t find the historical support for that within OFFBA and the rule.
There’s one definition for agricultural product. There’s one definition for synthetic. We’re not getting into the details of how something is put on the list; we’re simply looking at the determination of what category something goes into. We also need to recognize the fact that while we are talking—could you go back to the university materials please?

We also need to recognize—and I’m hoping that, that this is not too radical for some people to consider. But there is the possibility, as this industry has moved forward, that where something falls in any of those buckets or on the white page is a factor of the processing that went into that particular version of that substance.

As example, we currently have cellulose up for sunset on 605b. I can not even find the way when you look at this process from the two dichotomy questions which do not touch ag/non-ag verses non-synthetic, how that made the jump from coming from an agricultural product source and ending up on the synthetic side of 605b. It’s with the continuum that I can, that I can understand that.

What we do, using that as an example, it is possible that new technology could develop that
would derive that substance in a form that would
quality—that would not place it in the synthetic
category. There is, it is possible the technology
could develop that could still keep it in an
agricultural product. It is then possible that we
could have organic cellulose while at the same
time it’s currently on 605b, synthetic.

So things can be in more than one place
at the same. Not there—as one person put it—this
beaker will go in a particular place. Well there
may be two beakers with the same thing in them but
the process which they came from may place them in
different buckets.

CHAIR ANDREA CAROE: Bea.

MS. JAMES: Thank you, Dan. I think that
it’s going to be difficult to try to come to
resolution on finalize a recommendation this
complex if you are continually considering the
possibilities of the future. Because technology
and how things are going to evolve and change
could make it so this will never get done. So I
just want to point that out.

CHAIR ANDREA CAROE: Julie.

MS. WEISMAN: Yeah, I, I also, I wanted
to go back to the issue of, of involvement and
tapping the resources outside this board to move
this process forward. That has also been very consistent in public comment. That, that suggestion has come from many, many, many commenter. And there have been many offers to participate in that process. And we’re going to, we want to be, we do want to be inclusive. We do want all of the stakeholder and all of the people, the people who’ve worked on this before us, we want to capture. You know, have a way to capture what’s been done.

And what comes to my mind immediately is that somewhat was the process that happened in the grower group document that was produced. There was a lot of work by industry groups that the representatives of the board were invited to be part and hear what was going on those meetings. And then brought all of that discussion back to, back to CAC meetings on the topic. And I think that model worked very well. And I think that might be a model that we should consider in this arena.

CHAIR ANDREA CAROE: Okay. I’ve got Katrina, she wants to speak. And Rose, you, you’ve been wanted to be recognized. So as you work your way to the podium we’ll get Katrina and then Dan will come next.
MS. HEINZE: Hue, has his hand up as well. I just wanted to ask, we have gotten so much valuable public comment, as the board and the public considers this and offers us comments, to recognize that there are three pages in this kind of discussion document that have varying levels of maturity. I would say that I think that the joint committee has much more confidence in this first page, the universe of materials and this pictorial representation. The decision trees, I think we have less confidence in. We know we need to incorporate some of the historical documents.

So it would be particularly beneficial to me, as a member of that committee, if there are perspectives on that universe of materials that we have not considered, that we hear those. Because that’s, that’s the, or is it my hope that that can be the foundation for our decision trees. So if there’s a glaring error in it that would be important to know. Thank you.

MS. KOENIG: Okay. The first thing I want to do is acknowledge—oh, I’m Rose Koenig. I was the materials chair for a while. First of all, it is a very complex, you know, the, the important thing about materials is that it’s the only thing you have authority to, okay. So that
makes it very important. And the other thing is that it is a really difficult thing to just come into. because a lot of times there’s a lot of technical information. people have adversity to chemistry. I know, even though I’m a science, when I see a scientist, I see some of that stuff, it’s like, whoa.

   It is really a difficult thing. so don’t, don’t, you know, feel like you’re deficient. And it’s something that—this whole procedure in this industry has evolved over time. and if you look in the minutes there always were arguments. Sot it’s not something that is going to be difficult to achieve.

   But what, what we had, had kind of worked on is trying to achieve a process by which our recommendations could be consistent. because again, we’re doing this in a regulatory fashion. And these guys are responsible in a legal fashion for the decisions that are made. We’re, you know, it’s a federal program. So our efforts really were inspired by the NOP who said to us, you know, when we have issues from somebody who’s petitioned we need to be able to justify what you guys are doing. you know you have authority. But we need legal justification as to why you’re putting
something somewhere.

So I’ll talk about that, but I want to answer immediately Dan’s question in terms of what happens if something comes that now, you know, we might find in the future. There is a procedure—it has nothing to do with these definitions—just be aware of it. That is why you can petition to remove something, okay. and that is also why the sunset is there.

So if there is something that appears on a list that says, you know, this natural thing, you know, this agricultural cellulose is non-, is synthetic. And there’s now a new procedure where you’re maybe not using the same kind of manufacturing procedures, it can be taken off. So you can get consistency with the changing or the evolution of an industry through a whole different procedure in the materials process. And that’s called removing that. you know petitioning to move, or through the sunset procedure. So I hope that’s clear. So that, I hope, solves that whole issue of having to plan for the future.

CHAIR ANDREA CAROE: And also just to, to tag on that. petitions to remove have priority over petitions to add materials. So they get bumped to the top of the list for consideration.
MS. KOENIG: Okay. and there’s always, there’s always going to be issues in terms of agriculture, non-agriculture, definitions, okay. because the important thing is to get a definition and have clarity on a definition. And that’s where the problem has always existed. And that’s why for synthetic/non-synthetic the debate wasn’t necessarily to make the tree. The debate was, you know, what we were told by the NOP was, we need you to clarify that definition so that when you are making a decision you can justify it, you know, to that petitioner. It is synthetic because you have this X chemical reaction or you have a protein configuration change.

So if you actually go through our definition—and I’m not talking about ag/non-ag first. We separated those two for a good reason. because you, you know don’t want to take one thing at a time to find those things. Just like they’re defining the rule. And it—things don’t— definitions are definitions. They don’t necessarily have to make sense.

you know you have this idea that everything has to be grouped, like in your diagram. But in fact, definitions are definitions. Things have to meet definitions, is
the way I look at it. Not that everything has to come into a kumbyah [phonetic] moment and work together, okay.

so, but the other thing is, so, synthetic/non-synthetic we clarified as best we could the definitions in our feeble way. And we don’t, you know, acknowledging that we’re not regulators, nor are we lawyers. And we, in fact, that recommendation was a unanimous board vote that this was the best we could do. in the spirit of what we have written we think it’s clear enough. We acknowledge that we’re not regulatory folks at your expertise. And we don’t run the program. You have to.

So we, 13 to 0, took that document and acknowledged that we all knew that we were getting off the board. And we, you know, gave it to those guys. And said, please, you know, if you can, you know. But at that time there was a lot going on. there was a Harvey lawsuit. I mean there’s a lot of things on the NOP’s plate. And they came back in March 2006.

The great thing about that document—I mean we all should like raise our hands and clap—because it was a great accomplishment. They really didn’t change much of the content. At
first when I looked at there was a lot of nit-
picky thing where the grammar was wrong and I was
like, oh what. you know we didn’t-how could they
say that this wasn’t written well.

But what the document acknowledges is if
you really look through it the first one just says
this isn’t clear. And it’s not clear from a legal
standpoint. you know because they’re stilling
having to defend themselves. But what they
produced back was really not that different from
what we had produced. It was just put in a form
that they could utilize as a program management.

And in that, again, solves a lot of the
questions that you just had. It states that you
need to have a CAS number. It states in there
that you can’t combine two things on the list
creating a new CAS number without reviewing that
new CAS number.

So what I’m saying is that, I really feel
that it’s almost there, that document. They did
point that out-which again, was a great thing. I
think it was the legal team that pointed out that
there’s still areas of non-clarity in this
document that needs to be worked on. and that’s
where I think you should be putting your efforts.

Okay. let’s go on to the non-ag/non-ag.
That was a separate committee. I mean I kind of was involved in some of that discussion. The handling committee kind of took that over. And again, the frustrating thing, it’s a public process, was that there wasn’t that much—there was a few things that people never really understood why something was on there, you know, yeast and such. But there was a reason. you know you can go into the, the, to the minutes and understand that it was based on that definition that bacterial cultures were set aside. And there is justification. I mean I can, and I, I mean Joe’s kind of smiling. I took what was the, you know, the definition was there, and proposed a, you know, an argument as to how you can keep things in a consistent way, you know, it’s justifying what’s there.

Now it is up to the board if, if, and the industry. If they feel that that’s not a good enough justification or they want to switch thing, you know, it can be done. But you are changing, you know, rule making and such. There’s also, you know, so, so what I’m saying is that’s a separate definition. I think what has happened through the process if people have taken those two definitions and tried to work together with them. But they
really are separate issues in many ways.
And I, I think that, you know, if the ag/non-ag, that, that just never got to the point where the group could decide on. and that was in a less, less better form once most of the folks that were working on that left. But there also is some historical documents on that. But again, it’s not, you know, there’s a lot of people that want something to change in a program. That doesn’t mean it has to change. It doesn’t mean it has to change. Sometimes things are just the way they are and industry has to figure out, you know, more creative ways. And I’ve always said, well if yeast is an issue, if there is something, if yeast is now being produced in a way, say in an organic way, you can—I know the NOP doesn’t like to annotate it—you can keep everything the way it is on the list and have an annotation. They can petition yeast, okay, and say we want to petition it with an annotation grown only on organic sub straight [phonetic] with non-synthetic inputs. That could be annotated that way and that would suffice by saying, okay, now only yeast that’s grown on organic sub straight [phonetic] can be used without changing the definition of agriculture. You can work within the regulation
to do it that way if that is what needs to be achieved, without changing the definition of agriculture or non-ag. And I don’t know if that helps.

CHAIR ANDREA CAROE: Thank you, Rose.

MS. KOENIG: Or further confuses.

CHAIR ANDREA CAROE: Hue, and then Dan.

MR. KARREMAN: I just want to thank Rose for that because it answers my questions on that cellulose example Dan gave as far as petitioning things to come off when new processes come on. and just briefly I just want to say, I really like this kind of representation for my simple brain. This works very well. Okay.

CHAIR ANDREA CAROE: Dan.

MR. GIACOMINI: Well it, I just, you know, want to address the point that, you know, first of all, you know, on the one hand acknowledging that things can be in different categories. But one of the problems that we’ve had in—as we, as petitions have come to us, in deciding whether it’s even an appropriate petition for that category goes back to the definitions, and in some cases, you know, the looking at what the national list is, you know.

We have, you know, two examples. We have
gums specifically listed as a non-agricultural product. That’s in the definition. But yet we have organic gums and we have gums listed on 605b as synthetic. Pectin is specifically listed as a non-agricultural product but we have it in 606 and—

FEMALE VOICE: There’s a petition.

MR. GIACOMINI: Yeah, there’s another petition to list it. So even within the, the, the definitions that we have there has been confusion and there continues to be confusion. And it, it, we’re, we’re just, we’re not trying to change the world, but maybe just a new perspective n the foundation of what we’re doing. And maybe just a little twisting of the pieces.

We’re not expecting a big movement here. We’re not expecting a big change in the national list. There may be a couple things that need to be, will need to be altered as we really examine it. But if, if, if that is, if that is where this is going that is certainly not the goal of the committee by any means.

MS. ROBINSON: Well Dan—to address those things we could certainly—you know I’ve heard that many times. And, and I, I, I would just like to say for the program, you know, I, you know, I
appreciate Rose’s remarks. And i—as far as things like pectin or gums and certainly yeast, from the, from the perspective of the program, let’s solve the programs with, without—let’s tackle the problems first. And then reevaluate. Still—I’m not saying we can’t look at this.

But, but it sounds to me as though we’ve got two issues here. First of all we have some problems. We have, we’ve always had this problem with yeast. And, and, and it’s not going to go away. But the way to fix the yeast problem is through a petition. Someone’s got to do something with a petition. We keep saying this over and over and over again. And I think there was a petition at one point and then it was withdrawn.

Now, you know, address these problems. We can address the problems. The problems with pectin and gums can also be addressed. Either through, those could even be addressed through technical rule changes. you know we, we can, we could actually change the definition by taking, you know, gums out of the definition. Or, again, through, you know, petition changes to—if they need to be moved.

But let’s solve those particular, particular, or specific problems. And then you
can still look at, you know, the bigger picture of, you know, do we have an issue here with ag/non-ag, synthetic/non-synthetic. Have we got things skewed correctly or defined correctly. Are things out of—is the universe out of alignment here. But I guess my, my concern here is that we don’t, you know, we don’t look at this, you know, taking a telescope and turning it around and look at things from the wrong end of it. And say, whoops, we’ve got a major problem. Because we’re looking at the world from the wrong end of the telescope. If I’m making any sense here.

We’ve identified some very specific problems. But the way to solve them is by tackling those specific problems. Not by saying, well obviously our definitions are all wrong. Do you see what I’m saying? because we still will have the problems when we get all done.

CHAIR ANDREA CAROE: I agree Barbara and I think the committee is, is exploring all of this to come back to solving the problem. What is the problem and solving it. We’re going to have to wrap this up. But one of the things that Rosie said I just want to comment on. and that’s annotations.

Annotations are not a quick fix.
Annotations are specifically to identify the allowed material when several are available on the market. So an annotation maybe paprika may be smoked paprika only as apposed to sweet paprika. They’re both available. Annotations are not to impose organic principles on non-organic production. So I have to respectfully disagree with, with Rosie’s comment that you can have yeast on the list if it’s grown on organic sub-straight [phonetic]. That’s inappropriate for this regulation to go to the production of those non-organic components.

So my very first board meeting, or maybe it was the one before I came, there were materials considering where they were tagging on two and three annotations and trying, building these things. And as a certifier at the time I sat in the, the, the audience thinking, now how the heck am I going to implement this. And how am I going to find this to verify that this is an appropriate use of this material. It’s impossible to get those things practically implemented.

So I, I, I—well Joe will tell you, the little hairs on the back of my neck go up when I hear the word annotations. And it’s jut because once you get on the doing side of it, it falls
apart folks. So I’ll ask for any more questions although we really do need to move on. Is there any further discussion on this?

Okay. Let’s, let’s move on to the next item. Which is—thank you, thank you very much for the joint committees work, by the way. It’s an arguous [phonetic] task and I know you guys are working hard to get this resolved.

Next committee is handling committee. Julie you have—

FEMALE VOICE: [Interposing] [Off mic].

CHAIR ANDREA CAROE: --three recommendations and one discussion item, correct?

MS. WEISMAN: Actually our, there are, there are, there now exists three sunset recommendation, one recommendation on a petition material, and we do have this place holder for reconsideration of a possible petitioned material to deal with.

We also have a discussion item, pet food standards. And I, I would like to have permission, if I could, to depart from the order on this agenda ever so slightly to deal with pet food first.

CHAIR ANDREA CAROE: Is there any objection from the board? Okay. Let’s go ahead.
MS. WEISMAN: Okay. I just want to—mostly because there’s going to be a bit of discussion on the other recommendations and I didn’t want people waiting to hear about pet food to have to sit through all that.

As everyone knows, in April of 2006 the, an [unintelligible] body from the pet food industry that agreed to be a taskforce made recommendations...

END MZ005019

START MZ005020

MS. JULIE S. WEISMAN: We accepted those recommendations, uh, and at the time we were in the middle of Sunset and Harvey and, uh, uh, it, uh was really my hope, uh, that we would be addressing it fully and making recommendation at this meeting. And even as late as August, I was, uh, uh, uh, I was insisting that it be put on the agenda for this meeting as a recommendation. Uh, but, uh, uh, and the Handling Committee, uh, uh, address it over the summer but not to the extent that we were ready to, uh, vote. And what I just wanted to do right now is just briefly highlight what the issues are that were discussed, uh, and that we have to, uh, address, uh, uh, on the pet food standards as they were proposed to us.
Uh, one actually, uh, very, uh, timely in light of all the discussion that we had on Tuesday at the Agriculture Symposium, uh, one of the big issues is the question of using slaughter by-products in pet foods. Uh, and, uh, perhaps some of the discussion that took place in relation to agriculture will, uh, help us in our deliberations on that.

The, uh, second, uh issue that we need to resolve are, uh, the labeling categories for pet food. Uh, especially in light of the fact that there are well established labeling categories, uh, for pet food, and, uh, we, uh, we need to, uh, uh, decide how organic labeling categories, uh, fit and jive with, uh, already, uh, long established pet food labeling categories. And they’re very complex and I’m not going to summarize them here. Uh, uh, and then, uh, one other minor thing was that after the initial pet foods standards were, uh, put forward by the Pet Food Task Force, uh, there was, uh, a request for public comment in the pet food community and as a result of that there was a minor revision offered in September of 2006 simply clarifying, uh, uh, what kind of animals were considered, were and were not considered pets and to make sure that it
was clear that things like rabbits and, uh, uh, camelids and horses are livestock. They are not pets. Even though they are sometimes kept as pets. And also that zoo animals, lions and tigers and bears, are not pets.

FEMALE VOICE 1: Oh my.

MS. WEISMAN: Oh my. And so that is what I hope we will have resolved by the spring meeting. Uh, and, uh, I don’t really need to see any more, to say any more about the Pet Food Standards right now, although I probably, if, if anyone has a burning need –

MS. ANDREA CAROE: Burning desire.

MS. WEISMAN: A burning desire to, uh, ask a question about it, I’ll try.

MALE VOICE 1: He has a burning spot.

MS. CAROE: Hugh.

MR. HUBERT J. KERREMAN: Uh, regarding the definition of livestock, I do believe the AVMA looks at horses as companion animals these days. Just keep that in mind. And, uh, camelids I do not believe are livestock. Livestock are the traditional farm animals, cows, pigs, uh, that kind of thing. Just keep it in mind with the
horses, okay? They are companion animals by
definition of AVMA. And now I know Emily has a
better technical viewpoint on it. Can Emily come
up and –

FEMALE VOICE 1: Andrea, what’s a
camelid?

MS. WEISMAN: Llamas, camels. I’m sorry.
MS. CAROE: No, that’s not in my realm of
expertise.

MR. KERREMAN: Llamas, alpacas, camels
are camelids.

FEMALE VOICE 1: Llamas?

MR. KERREMAN: Llamas, alpacas and camels
are the common, most common camelids you would
think of.

MS. CAROE: They sound like livestock to
me. But, uh, Emily –

MR. KERREMAN: No, they’re...well okay.
You’re using two different definitions. And I
don’t know the definitions that well but livestock
is like a vernacular-type term. Camelid is an
actual like species or family or order. So keep
those things in mind. But horses is really,
every, you know, they are companion animals this
day and age.

MS. CAROE: Emily.
MS. EMILY BROWN ROSEN: Very briefly.

Emily Brown Rosen. Uh, AVMA may say one thing but the regulatory officials that control animal feed are the American Association of Feed Control Officials and they define pets and livestock that horses are livestock. So that’s, this is a basically a food regulation so that’s where we have to use that.

MS. BARBARA C. ROBINSON: Andrea?

MS. CAROE: Barbara.

MS. ROBINSON: Did you, did you, uh, did you guys consult with, uh, AFIS?

MS. CAROE: I was not part of the Pet Food Task Force so I have to –

MS. WEISMAN: We had FDA, we had a whole bunch of FDA people on the task force.

MS. ROBINSON: Does AFIS do anything with this?

MS. ROSEN: I don’t believe so.

MS. ROBINSON: Yeah, yeah. Don’t they run the Animal Welfare?

MR. KERREMAN: Uh, no, that’s under USDA actually. Animal welfare standards are under –
MS. ROBINSON: That’s what I’m talking about. AFIS.

MR. KERREMAN: Uh, they may administer it actually.

MS. ROBINSON: Yeah.

MR. KERREMAN: Yeah.

MS. ROBINSON: Yeah. So I’m wondering if, just to toss this out, they may have another definition is all I’m saying. Uh, because I know that, uh, uh, when I was down in OGC begging for your livestock medication docket –

MR. KERREMAN: Thank you so much. Seriously.

MS. ROBINSON: You’re welcome. I just wanted, I wanted another thank you. So when I was down there begging for your livestock medication docket...that’s your cue. Say “thank you” again. Uh, I notice they had, the only reason I say that is I noticed they had a bunch of folders on, uh, the attorney’s desk dealing with kennels. So that’s why I’m bringing that up. I wonder if there’s just another source.

MS. ROSEN: But we were strictly, this is pretty much a feed issue. For pet foods standards.

MS. ROBINSON: Well, I’m just talking
about the definition of who’s, what’s up with that. What’s a livestock?

MS. VALERIE FRANCES: I can offer some clarity here.

MS. CAROE: Valerie...hold one second. Valerie.

MS. FRANCES: I did do some research with AFIS and FSIS and everybody refers to FDA’s definitions regarding feed. They all refer to them.

MS. ROBINSON: Okay.

MS. CAROE: Alright. Okay. Any further questions on the pet food? Valerie?

MS. FRANCES: I just have one other issue I wasn’t sure you really brought it forward with the clarity that is involved in the labeling and this is when you have a “made with” product. If it contains, the pet food industry gets so into the minutiae regarding how they label different meat products, for instance, organic chicken versus organic chicken meal versus organic chicken broth. And I don’t think we have the same approach and so this is going to be one of the challenges is when someone says made with organic chicken that could be thought of differently in pet food. So that’s one of our challenges.
MS. CAROE: I think that’s the kind of detail that we’re going to challenge, be challenged getting this recommendation to a vote stage. But we’re not there yet. This is discussion stage on where we’re at. Bea, you have a...

MS. BEA E. JAMES: Just a quick comment. Not really a comment, just for clarity in case any board member is looking for more information on the pet food recommendation. It’s not in our book but it is on the NOSB website under NOSB recommendations, Handling Committee Final Recommendation October 2006.

MS. CAROE: Julie.

MS. WEISMAN: Uh, it’s also on the USDA website. Uh, there’s a section that says task forces. And if you click on that it will say pet food task force and if you keep clicking, it will bring you through to the recommendation.

MS. CAROE: Okay. Uh, anything further? Thank you and we, uh, we look forward to seeing the recommendation on that perhaps in the Spring meeting.

Uh, next for handling? I guess we’ll take it from the top now. So the next item that we’re discussing is Handling Committee has a
recommendation for the addition of, uh, grape seed extract. Uh, this is an item that was, uh, petitioned originally in the crush of items late in 2006, early 2007. Uh, and did not quite make it under the wire, uh, for us to be able to consider with the group that was dealt with at the spring meeting. Uh, and so we felt, uh, there are certainly other, there are certainly other 606 petitions that we have received over the summer but we gave this one priority because it had missed being considered this Spring meeting by such a small, uh, window. Uh, so I, uh, I think that, uh, uh, this is the documents that were posted, uh, uh, let me just move to the recommendation. Oh yeah, it’s not... wait. Yeah, the committee recommendation is not in the book. No, not that, that’s the... I’m sorry. I don’t like to take up the time. No that section is not what I was looking for. I don’t even have that. Wait, wait, wait. Uh, I’m sorry. No don’t take a break. No, no, no, no.

MS. FRANCES: My manual is actually missing, but Kat has it in her binder.

FEMALE VOICE 2: Half of them have it; half of them don’t?

MS. CAROE: No, I was looking; there was
a text committee recommendation.

FEMALE VOICE 3: On grape seed extract?

This is all we have. I mean, we just...I don’t recall. You don’t have it in your book? It just somehow didn’t get in your particular book.

MS. CAROE: I have an empty slot for grape seed extract.

FEMALE VOICE 3: It didn’t get stuck like in the wrong slot?

MS. WEISMAN: I looked. These were checked. Alright. You know what, I can...we’ll proceed. I mean the [cross talk] that’s okay.

No, no. That’s alright. Okay, I think, alright, I’ll go back. Uh, we, the issue with grape seed extract, it was being petitioned onto 606, uh, by a manufacturer because of, uh, it’s, uh, uh, uh, high anti-oxidant properties. And like some other non-agricultural, like some other agricultural ingredients that are, uh, that there had been interest in being used in the 5%, uh, added value that, uh, consumers, uh, wanted available in organic products. Uh, and, uh, on quite a, on being consistent with a number of other materials that were petitioned for this reason, and I’m thinking of fish oils was one that was, that we acted on in the Spring, that this was, uh, in
terms of, uh, that, uh, for 606 materials that it met, uh, it met the criteria, uh, uh, the evaluation criteria that it met, uh, that we felt that it met the, uh, evaluation criteria for a 606 on impact on humans in the environment. Uh, that it was, uh, information was given as to why it was not available in an organic form. It seemed mostly to do with the, uh, the, the quantity of raw material that was required to produce the ratios. It was like a 100:1 ratio of, uh, grape seed pulp to have one unit of, uh, grape seed extract. Uh, and that, uh, uh, that the, it was compatible and consistent with organic practices. Uh, we did have, uh, uh, some public comment was received on this petition. Uh, and we did have, it was actually one of the few materials where there was a comment opposing. Uh, and so I do think at this point that we should, uh, probably address that. I can either outline what that opposition was or I think that the...okay. One was, uh, there were, uh, questions about, uh, actually I’ll go to the comment controls.

MR. KERREMAN: Julia, I was just reading it.

MS. WEISMAN: Okay.

MR. KERREMAN: It’s basically from non-
conventional grapes they are heavily sprayed and
if you’re concentrating something, you may be
concentrating some of the residues of the
herbicides and what not. That was, I think, the
essence of the comment.

MS. WEISMAN: I think that was probably
the, that was one and I think the other, uh,
question that was raised was that, uh, uh, at
least from the material that was available to the
public with the petition, it was not possible, the
comment felt that it was not possible to determine
whether the, uh, extraction was, uh, uh, done in,
uh, uh, what kind of solvents were being used.
Uh, uh, I mean, we did have access, it is not my
belief based on the, uh, CBI information, uh, that
there was, uh, that synthetic solvents were being
used. So I’ll share that piece. But that doesn’t
address the pesticide issue, so, uh, I think that
maybe, uh, okay.

MS. CAROE: Again, you know, one of the
things that Rosie did say that I completely agree
with is that this petitioner may not be using
solvent extraction but if it is typically used,
that is something that you need to consider
whether that’s an issue or not. So regardless of
what their processing technique is, we need to
look at the broader processing techniques and
also, again, this is a conventional item used in
less than 5% of the product, is this enough of a
risk, or that’s, you know, solvent residue in the
production of that, is that enough of a risk to,
to, to alter your decision on the allowance. Uh,
Joe and then Dan and then Julie.

MR. JOSEPH SMILLIE: Repeating what you
said, Andrea, we’re not trying to, earlier, not
just recently, but we’re not putting organic
requirements on non-organic agricultural
materials. That’s the mantra we have to look at
these items through. We’re not, and we’re not
going to put annotations on it either. Are we?
No. No annotations. Uh, for solvent producers.
So, uh, I learned that one. Uh, so basically we
have to look at it the same way we looked at all
of the other 606 materials that we went through.
And we have to be consistent as a board and we
can’t, uh, because there’s only one material now,
we can’t dive into that and give it grade, you
know, give it a different approach than we took to
all of the other agricultural materials that we
considered. And hence, uh, the production of non-
organic agricultural materials can not be, does
not have to be in compliance with organic
regulations.

The second thing is, uh, something else that was mentioned earlier that I really want to bring to the attention of the board and it’s not news to me, but the importance of it is news to me. And that is that there’s a priority to petitions given to remove items from the national list. And once some one manufacturer comes up with an organic source for grape seed extract and we know for a fact that in California alone, there’s a lot of organic grape seed available, and once that becomes commercially available then that should be petitioned to get it removed, at that point in time. At this point in time, it’s not available and hence the committee voted as it did to, uh, to allow it to be put on 606.

MS. CAROE: Okay, Dan.

MR. DANIEL G. GIACOMINI: Uh, one thing that has changed since the, uh, February sub-committee and the March meeting though is the timing of the, the deadlines set on the court order. Uh, one of the efforts in those items and the reason they were all pushed and grouped together, uh, was to, uh, try and prevent any disruption in commerce that may be occurring. Uh, if there’s any disruption on this item, uh, it’s
already occurred. Uh, there is not a tremendous amount of organic wine on the market. Uh, that’s a wine issue. Uh, but there, I drive up and down the Napa Valley weekly and you can talk to Jake over there. There’s a tremendous amount of grapes that are grown organically. Uh, I, I, when this petition came up in February and March, I certainly supported the sub-committee. But looking at it now from the fact that if there was a disruption, it’s already been made and it’s not like there’s not an organic source for this material. Uh, it’s out there. So.

MS. CAROE: Uh, Julie, and then Hugh.

MS. WEISMAN: I don’t remember what I was going to say.

MS. CAROE: Hugh. Uh, gosh, you know, it sounds like a horrible bias to just, because we, because this petition is not lumped together with Harvey that we shouldn’t, you know, process this in the same way. I really would reconsider that thought process and, uh, again, all materials on 606 doesn’t mean that they definitely can be used. They still have to go through commercial availability justification with the certifier. So it’s not, uh, you know, I mean there’s, there is one extra piece in this. And I just, I just, I
think I, I mirror Joe on this one just because this one stands alone, we’re going to highlight it and put it through extra scrutiny? To me, uh, that, that’s not right. Uh, again, this is less than 5%, this material is used in very small amounts, uh, there’s not a whole lot of economic incentive for somebody to produce this organically. Uh, which is one of the limiting factors why a material like this isn’t making it to organic market that quickly. Hugh and then Julie.

MR. KERREMAN: I forget how I thought about it at the February sub-committee meeting, but organic grapes aren’t really available. And, and, and maybe we are looking at this differently because time has moved on, which it does. Uh, the other thing is that I buy herbal products from various herbal suppliers. There is organic grape seed extract available. And if we’re going to list it, it always comes back to the question of well, is there such incentive then to make the organic grape seed extract if they can, you know, derive it from conventional sources? And I, you know, grapes are their carrots, same thing as like with carrots, you know? I just, uh, I think I would have felt the same way back in February. I
forget how I was thinking or the committee votes
then, but anyway.

MS. CAROE: Julie.

MS. WEISMAN: Uh, yeah, I, I remembered
what I wanted to say before, and I also something
that I want to say that addresses Hugh’s point.
Uh, you reminded us that we’re talking about
weighing the risk for an item that’s being used in
5% and I wanted to remind people that, uh,
something, an ingredient like this in, uh, uh,
chips or whatever it’s going to be added into, uh,
have usage rates of, uh, .001 percent, .005
percent typically in the finished product. So
we’re not even talking about 5% of the finished
product. We’re talking about, uh, not that it’s,
I’m not saying that it’s nothing, but I just
wanted to, people to have a perspective on the
quantity of this that will be, that’s being used.

Uh, the second thing I wanted to say is
that the issue of, uh, the fact that organic
grapes are being grown and that there is obviously
then organic grape seed has only to do with the
availability of the agricultural product. A lot
of discussion at the spring meeting, uh, uh, uh,
uh, ended up highlighting the fact that just
because the agricultural product is available does
not mean that people who have the equipment to
process it in the form that is needed for, uh, a
finished product are willing to get their
equipment certified or that people who are
producing the organic raw material can make the
investment in purchasing that equipment
themselves. So there’s a difference between the
availability of the, uh, the agricultural raw
material, which we know is quite available, and
the, the equipment that is needed to process it
into the form that’s required.

MS. CAROE: Bea and then Joe.

MS. JAMES: Just a couple points of
clarification. I do believe that there is quite a
bit of organic grapes that are grown and there may
not be a lot of organic wine out there, but there
still is a lot of wine that is made from organic
grapes that is just not certified organic.
There’s a stigma around organic wine, uh, having a
certain profile and so a lot of producers have
chosen not to certify their wine organic even
though they’re using, uh, organic grapes.

And secondly, uh, I, okay, I understand
that at the last meeting we rushed through
discussing a lot of the petitions that were up for
review. But I’m of the opinion that the process
that we’re doing right now with grape seed is what we should have done with everything at the last meeting, but that we didn’t have the time. And just because we didn’t have the time doesn’t mean that that last meeting sets the precedent of how we should rush through or give, uh, uh, consideration to something that requires discussion less discussion because we didn’t do that at the last meeting.

MS. CAROE: Joe.

MR. SMILLIE: Well, Julie covered the main point. This is not a discussion of, of grape seed. It’s a discussion of grape seed extract and, uh, there’s a big difference. Uh, I specifically phoned three friends in the wine industry saying what do you do with your grape seed? Can you ever get it processed as an organic product? They said oh we looked into it. We’ve got lots of grape seed, you know, but basically they confirmed that you just couldn’t get it processed because of the continuous run needed by these types of plants.

The second thing is what Andrea said, we’ve all got to remember that putting it in the list does not make it available for use. It makes it available for consideration if there is no, you
know, commercial availability issue. So once again, we’ve got to remember we’re not allowing it’s use. We’re allowing it to be considered if, if organic doesn’t become available. And again, that’s the role of the certifying agent to determine if there is, uh, uh, commercial availability of that product on the marketplace. And number two, I just want to reiterate as soon as an, uh, organic grape seed extract manufacturer can get up to production, it becomes commercially available and number two, they can petition to have it removed.

MS. CAROE: Kevin, and then Tina.

MR. KEVIN ENGELBERT: Uh, one point I’d like to make that hasn’t been brought out yet is that I’m uncomfortable with the argument of allowing it because there’s such a little small amount that it doesn’t matter. Yeah, I know, but I’m just saying that.

MS. CAROE: Tina.

MS. KRISTINA ELLER: Uh, let me clarify something. Hugh said you’re buying organic grape seed extract?

MR. KERREMAN: It’s in the catalog. I don’t particularly buy it but it has OPCs in it. You can buy it for human nutraceutical use. Uh,
you can buy organic grape seed extract from Herb Vitality in Arizona and various other suppliers. Now it might be industrial size vats and that’s a commercial availability thing, but it’s, uh, it is out there and there is a process to make it. It’s like it’s not impossible to make.

MS. ELLER: Thank you.

MS. CAROE: I just want to comment... go ahead, Tracy.

MS. TRACY MIEDEMA: Hugh, you and I sat, uh, on the sub-committee together so I’ll remind you what your thinking was at the time. Which was our great hope was that when something was added to 606 that would be this flashing red light to the industry that there would be this opportunity, go forth and make this organic version and they shall come. And we still hope that that’s what really happens. I’m not sure if that’s getting communicated out there to the industry properly. That 606 is a great opportunity. It’s not a blank check for manufacturers to use a non-organic version; they have to leap the commercial availability hurdle every time and let’s as an industry put that hurdle and produce the organic version.

MS. CAROE: Julie.
MR. KERREMAN: I may well have said that, but I think just that my thinking has changed perhaps. And that, you know, you know if it’s more difficult to use the non-conventional source, non-organic, if it’s more difficult to use a non-organic source, the more incentive there will be to use an organic source.

MS. CAROE: Julie.

MS. WEISMAN: Following up to Tracy’s comment in the absence of a database of allowances that are being granted, this is the best we have to provide the industry with information about what ingredients are needed organically.

MS. CAROE: Uh, Dan.

MR. GIACOMINI: I, one other thing that is new since the March meeting is, uh, when we talk about will this be viewed as a growth potential or will this be viewed as letting things in the door? Uh, there was a tremendous, uh, I feel comment from sectors of the community that felt that the criteria that we used in March was, let’s say, a little liberal.

MS. CAROE: I’m just going to address that, and I’m going to address Bea. I have no regrets whatsoever over anything that I did in that spring meeting. Any vote I made and scrutiny
that I used in reviewing those materials. And I
will not say that, that any material was skated
through because we had a large group of them. We
just had to work longer. I don’t regret it. And
I, I guess I’m getting a little bit emotional
about this because, you know, that’s not the way I
work. Uh, we would have just not been able to
finish it if we couldn’t do it right. I felt we
did it right. I stand behind the process. So the
thought process that we would be consistent with
that process and somehow we should bump it up, I’m
in disagreement with. But you know, I’m one vote.
Everyone here has a vote on this material. But,
uh, I just want to go on the record saying that
nothing that happened, there was, I feel that was
the right process to go to to this day. I didn’t
change my mind in the least.

Jennifer.

MS. HALL: One quick point of
clarification, Julie. Is the petitioner, can you
remind me, is the petitioner the producer of this
item or a user of this item?

MS. WEISMAN: It’s the producer.

MS. HALL: So they have the equipment,
then, to make grape seed extract?

MS. WEISMAN: I believe that is true,
yes. And I believe that there’s one other manufacturer that they identified that also has the equipment to do this. So they size themselves.

MS. HALL: So they could choose to do this organically?

MS. WEISMAN: They could.

MS. HALL: Okay.

MS. CAROE: Dan.

MR. GIACOMINI: Jake, you got CCOF certifies a number of those vineyards. Are the wineries themselves, when they leave the vineyard and they go onto the winery, a number of them technically change hands. Uh, are they, are the vineyards, are the wineries, uh, are any of the wineries being certified there? Or would we, are we looking at something where a lot of what we think could be available would lose its?

MR. JAKE LEWIN: Uh –

MS. CAROE: State your name and your affiliation, please.

MR. LEWIN: My name’s Jake Lewin. I’m the certification director for CCOF and let me give you just briefly. We’re certifying right now about 18,000 acres of grapes. My guess is that 9,000 of those are wines so they’ve probably got
seed in them. About 4,000 are table, largely without seeds would be my guess. Uh, we’ve only got about 28 wineries certified. 9,000 acres, 28 certified wineries. So there’s not that many facilities that are certified. We’re probably losing those grapes to non-certified product.
Ingredient panel claim, that kind of thing. Not from panel labeling claim. But I’m sure that there is a lot of organic seed, you know. It’s probably just going to by-product or whatever.

MS. CAROE: Any more discussion on grape seed extract? Okay. Julie, why don’t you move us along.

MS. WEISMAN: Uh, the next item that we have on the agenda, uh, is a, uh, uh, is an opportunity, uh, to, uh, to reconsider an item, a petitioned item that was discussed and voted on at the spring meeting. Uh, we can only do this, uh, and the keepers of the Roberts rules can advise me on this, but I believe that we can only do this if someone who voted no at that meeting, uh, is the only, would be the only, uh, uh, member who could initiate a reconsideration. Is that...that is true. Okay. Right.

MS. CAROE: Want me to open it?

MS. WEISMAN: Yeah. Uh, there were, so I
guess my question is I know that there were four
people who were no votes. Uh, I’m going to assume
that you know who you are. Uh, I think only three
are actually at the table right now and so I would
like to ask if any one who voted no, uh, uh, would
like to, uh, has an interest in, uh, reconsidering
this? Uh, Jennifer?

MS. HALL: Uh, due to the fact that the
conversation that we had at the Spring meeting was
incredibly non-linear, uh, it skipped around, uh,
the questions did as well as the testimony and I
think that there were some hanging questions as to
whether or not, what the status of the ingredient
actually was synthetic or non-synthetic, that
there was a rush for time at the end, and the
confusion that I think still remains a little bit
on the board as well as in the public and
additional testimony that’s been received, I would
like to move that we reconsider gellan gum.

MS. CAROE: Is there a second?

MS. MIEDEMA: Second.

MS. CAROE: Okay. We have a motion on
the floor. Uh, any discussion on the
reconsideration? Okay.

MR. KERREMAN: Just wondering. Is that
motion for today or for tomorrow? Today’s
discussion, tomorrow’s the vote. I’m just
wondering.

MS. CAROE: We’re going to allow the
motion for reconsideration today but the vote will
be tomorrow with the materials. So this is just
to bring it back onto the table for
reconsideration. And I, you know, during this
discussion, I just want to remind people, you
don’t have to necessarily change your votes. You
can change your votes. This is just bringing it
back onto the table. That’s all it is, so the
outcome of this is, is, you know, is up to you.
So any further discussion on the reconsideration,
Dan?

MR. GIACOMINI: Uh, yeah. This was an
item, uh, as Tracy was saying, I mean, not only,
uh, was the day a bit non-linear, if I remember
correctly this is one where we had moved from its
previous voting location to the end for additional
information and then in the process, uh, two
additional members had to leave, uh, so that we
were down to four absent. Uh, so it was a, as
Tracy said, a non-linear day. Uh, I know things
like this have happened before. I know they will
happen again. Uh, I just feel this is a, while
it’s not a precedent, the potential of putting out
for reconsiderations, uh, is something that I think should be considered very carefully.

MS. CAROE: Certainly it is not a precedent. We have, uh, reconsidered materials before. Uh, Bea, you have a question?

MS. JAMES: Julia, I’m wondering if you, uh, received any further information that you might be able to share with the board about gellan gum based on the, uh –

MS. CAROE: You know, we can actually talk about that later in consideration. This is for the reconsideration.

MS. JAMES: Oh, okay.

MS. CAROE: Okay. I don’t mean to stop you, but we’re going to have discussion on the material as well. This is right now; we have a motion on the floor just for the reconsideration. We haven’t passed that we’re going to reconsider yet.

MS. JAMES: Okay so I’ll hold my question.

MS. CAROE: Okay, thank you. Any other discussion on the motion to reconsider? Hearing none. All those in favor of reconsidering gellan gum for additional to 20560 –

MS. WEISMAN: Right now, right now it
was, as of the spring meeting, it was to be petitioned to 605.b.

MS. CAROE: 205605.b. All those in favor, say “Aye.”

UNISON: “Aye.”

MS. CAROE: All those opposed same sign.

MR. KERREMAN: No.

So now, uh, Julie if you would like to present gellan gum as an item that we will vote on tomorrow.

MS. WEISMAN: Uh, yeah, I mean, I think that this is going to end up being, uh, uh, a joint effort to somewhat perhaps to reconstruct where we got confused during the last discussion that we were having about this material. But if I remember correctly, and I will ask you all to jump in if you, uh, have a different recollection, I believe that, uh, the, one of the, the turning point, one of the turning points on the discussion that we had was, uh, uh, uh, uh, when we asked, uh, Katrina raised a question about, uh, the solvent that was used in the extraction and, uh, had pulled up the tap review and, uh, uh,
which noted that, uh, isopropyl alcohol was the solvent. And based on that, uh, uh, based on noting that, uh, uh, it was assumed that because of that, that makes the gellan gum be a synthetic and, uh, I think that was, uh, an erroneous assumption at the time. And it’s relevant because obviously the listing of synthetics on the list have a different, uh, bar to meet than non-synthetics and/or agricultural products. So I, I believe that that is the, I think that we have to go back to that point and clarify, uh, and clarify that and proceed from there.

MS. CAROE: Any further discussion on this? Dan.

MR. GIANCOMINI: Are you looking then to amend the recommendation to 605.a?

MS. CAROE: I think that that’s something; I think that’s something that we have to resolve. I think that that’s something that we have to reconsider and resolve. Yes. Bea.

MS. JAMES: So just, I just want to be clear, Julie, there is no solvent extractions used in gellan gum?

MS. WEISMAN: Uh, you know, I am actually, I’m aware that the manufacturer is in
the room. And, uh, I am wondering, uh, if this is an appropriate time to ask a representative of the manufacturer –

MS. CAROE: You certainly can.

MS. WEISMAN: Okay, uh –

MS. CAROE: Is, can I ask the representative from the, uh, CP Kelco to please identify themselves?

MR. RICK GREEN: Here. Do you need me to go to a mic?

MS. CAROE: Yes, please. And please give us your name.

MS. FRANCES: Can I offer a point of clarification in your document here? You have the transcript embedded in here, of your discussion, so you can refer to that.

MR. GREEN: Uh, hi. My name’s Richard Green. I’m Director of Regulatory Affairs at CP Kelco. And the, uh, the issue, gellan is recovered with IPA and that is required under the CFR. If you look at 21 CFR 17265, it specifically states that have to process it that way. And it does set a residual limit. So in order for it to be food grade, it has to be manufactured. Does that?

MS. CAROE: Does that answer your
question?

MR. KERREMAN: Just what’s IPA? Sorry?

What’s the long name?

MR. GREEN: It’s isopropyl alcohol.

MR. KERREMAN: Oh.

MR. GREEN: that’s the solvent that’s used for extraction. Because the fermentation broth, when you ferment, it’s kind of a pudding-like substance. And in order to extract it from that acquiesce medium, you need to use a solvent. And it’s just that when it was approved, you know, the federal regulations required that.

MS. CAROE: Any other questions for the petitioner while we have them? Gerald.

MR. GERALD DAVIS: And when you mentioned there is a residue limit as part of that CFR, is there a residue of isopropyl alcohol in gellan gum.

MR. GREEN: Yes, there will be. The CFR states no more than 750 ppm. Now, you know, production can vary. We sell most of the gellan to, you know, in the market, we generally process at a much lower level. I would say 500, because that’s of course European and Japan limits are lower than U.S. limits. So that would be the amount in the gellan gum itself. And then of
course at the use level of any average use level is about .01 percent. So you’re looking at, you know, an extremely low level.

MS. CAROE: Just a translation. 700 ppm is .07 percent?

MR. GREEN: .075 percent maximum allowable.

MS. CAROE: Just, uh, any further questions for the petitioner while we have him here? Okay, thank you very much. And, uh, if you’re going to be around for the next day, we may have questions when we come to vote tomorrow and during our discussion. So it would be helpful.

MR. GREEN: Okay, and there is one clarification I would like to make is that the IPA is used as a processing aid. And so, you know, the residual is, you know, is basically required, you know for the processing of the gum under the code of federal regulations. And that the residuals are, you know, what the FDA has determined to be, you know, the suitable amount, you know, for residual processing aids in this kind of polysaccharide gum.

MS. CAROE: Thank you.

MR. GREEN: Okay, thank you.

MS. CAROE: Uh, I will remind the board
that if this is considered a non-synthetic that
the criteria listed in 205600.b are not
applicable. So look at those criteria because we
discussed those at the last meeting and I think
this is part of the basis that people may have
been concerned, or felt like this didn’t meet the
criteria. But this criterion does not apply to a
non-synthetic. Which, you know, okay. Any other
further discussion on gellan gum at this time?
Katrina.

MS. HEINZE: Not a discussion but a, uh,
request for assistance from my fellow board
members. Where are alcohols on the national list?
For a handling? Yes, I’m just not finding them at
this particular moment. I found them under
livestock but I can’t find them on the handling.

MS. WEISMAN: No. Can I... it doesn’t
need. This is not an organic ingredient.

MS. HEINZE: Right. I’m just trying to
understand it for my own personal edification.

MS. CAROE: Alcohol isn’t on the 605
list.

MS. HEINZE: So is it...

MS. CAROE: There is organic alcohol.

MS. HEINZE: Thank you.

MS. CAROE: Certified organic alcohol.
That’s what’s in the tinctures and extracts.

MS. HEINZE: Thank you.

MS. CAROE: Tracy.

MS. MIEDEMA: Just one quick question.

So we have moved to reconsider this for what list? Or is that still up in the air? What portion of the regulation?

MS. CAROE: Julie.

MS. WEISMAN: Well, I, I think I would like for all of us to, uh, to come to some clarity among ourselves and, uh, my understanding is that in a non-organic, in a non-agricultural product and a non-organic product that the fact that a synthetic solvent is being used does not compromise the non-synthetic status of this material. So I believe, I believe that this appropriately petitioned to 605.a.

MS. CAROE: Just to clarify a little bit, you know, from what I understand about the way this, this processing aid is used, it’s not a reactant. It’s used as a solvent which means it’s a means of separation. Which would keep it as a non-synthetic. Tracy.

MS. MIEDEMA: Yeah, I’m just having a little bit of a déjà vu on the Spring meeting in that we had, we had an open-ended question and
when we got to the vote, it confused the vote.
And so this is the time for discussion and
tomorrow’s the time for voting, let’s make crystal
clear what, what part of the role we are looking
at. At this point.

MS. CAROE: Joe.

MR. SMILLIE: My interpretation is that
it is a 605.a item and I think we should treat it
as such.

MS. CAROE: Bea.

MS. JAMES: Uh, uh, I guess I would agree
with what Joe just said, 605.a, non-synthetic,
non-agricultural because I also see agri-ager
listed in the same, uh, classification and, uh, I
know that ager is different but it does have
similar properties as far as thickening.

MS. CAROE: Any other questions?

Comments? Discussion? Does everybody feel very
clear? I mean this is the reason we’re doing
this, uh, revisiting of this material is because
we weren’t clear last time, so –

MS. WEISMAN: And we don’t want to have
to go –

MS. CAROE: This is the last time.

Katrina.

MS. HEINZE: I’m just opening up the
petition to clarify for myself what they, the
petitioner asked. What section it should go on?
So can I have 10 seconds?

MS. CAROE: You can, but - 
MS. HEINZE: The petitioner petitioned
for, uh, 605.b. And I believe our recommendation
is for 605.b, but I can go check.

MS. CAROE: It...okay. Just, uh...I’m
losing control again. Kim, come up and in the
meantime, Tina, you want to make a comment?

MS. KRISTINE ELLOR: I’m just wondering
would it be enough to ask the petitioner who’s
sitting right here if that would be, you know,
okay with them?

MS. CAROE: Well, in, yes. But you know
the board has done this before where a petitioner
has asked for a material to be in a certain place
and the board has determined it’s appropriate in
another place. So I wouldn’t get too wrapped
around the axel about where the petitioner feels
that it should go. Kim. Are you done?

MS. ELLOR: I’m looking at the
recommendation in our book and the handling
committee recommended for 605.b. So that’s just a
point of clarification.

MS. CAROE: Yes, I understand that and we
can actually amend that petition during the discussion tomorrow.

MS. ELLOR: I understand that. I just, to clarify for the folks on the board.

MS. CAROE: Okay. Kim.

MS. KIM DIETZ: Okay. Uh, when you go through your material criteria review, you have to make recommendation for one of the placements on the national list, but ultimately it’s the programs decision on where a material should go based on the criteria. So again, I wouldn’t necessarily focus on the petitioner’s request because they may not know what category it goes under. And I wouldn’t get so hung up on where you think it needs to go rather let the program decide that. Give them some guidance if it’s clear, but otherwise, you know, you voting on a material, not a section of the national list.

MS. CAROE: Kim, the only relevance to where the categorization is which criteria apply.

So –

MS. DIETZ: Right. But the criteria are the same for processing materials.

MS. CAROE: But not for synthetics and non-synthetics.

MS. DIETZ: Correct.
MS. CAROE: So that, that’s the
determination that has to be made. Board? Hugh?

MR. KERREMAN: I’m, I’m just a question.
Would it make any difference if they used organic
isopropyl alcohol, if that’s available? No such
thing. Okay. Stop.

MS. CAROE: They’ll use ethyl alcohol,
no? Any other questions? Bea?

MS. JAMES: I also recall, uh, at our
last meeting we talked a lot about what we’re,
what was the use and the properties of gellan gum,
what types of products were it used in and I think
that we received sufficient information about
that. And I just want to state that from the
research that I’ve done, I’ve also looked on Kelco
website, they have a review from 1990 that it
seemed like gellan gum from what I read is a
fairly safe ingredient and that, uh, it’s used in
a lot of products, uh, that I believe the organic
industry could benefit from.

MS. CAROE: Any other discussion on this
material? Katrina, you...oh, Julie?

MS. WEISMAN: Uh, along the lines of what
Bea just said, I want to point out that of all of
the handling materials that were up for public
comment, uh, this, I think if it didn’t receive
the most, it was the second most comments, uh, requesting it, uh, its listing because a lot of people would like it to be available for use in organic products.

MS. CAROE: Any other questions?

MR. ENGELBERT: One, Andrea.

MS. CAROE: Kevin.

MR. ENGELBERT: Would someone clear up again why the change from 605.b to a because the last statement in the testimony in March was from Julie saying, “I also see the extraction solvent as isopropyl alcohol which is a synthetic, which is further weight that this should be 205605.b.” So I’d like a little bit more explanation why the change now.

MS. CAROE: Julie.

MS. WEISMAN: Because I was pie-eyed by the end of that meeting and I could not think clearly about things that I’m normally I’m pretty clear about. That was, uh, that was, uh, that was an example of not clear thinking. And I apologize for the cost that this has had on this process.

MR. ENGELBERT: Thank you.

MS. CAROE: Okay. Questions, comments? Are we clear? Okay. Then we will move on to the next item.
MS. WEISMAN: Okay, the next item on the agenda is Sunset Materials. And before we proceed, I need, it needs one correction, uh, to what’s on the agenda. Right now, for whatever reason, on the agenda, calcium sulfate is listed, uh, as 205605.b. That has not ever been in question. That is simply a typo and I would like for people to know that calcium sulfate belongs in the 205605.a column with agar agar and Carrageenan and animal enzymes and Glucono-delta-lactone. Uh, that being said, uh, I feel I need to, uh, update, uh, the board and the program and just address a little bit, uh, uh, we had an unusual situation, uh, in having to make a recommendation in time for this meeting and public comment. Uh, in time to post our recommendations ahead of this meeting, and, uh, the, the notice of the Sunset of these materials did not take place in the same way, uh, that it had, uh, on the materials that were sunsetting in, uh, that just, that would have sunsetted this past October. Uh, so I believe that because of that anomaly, as of the time that we had to vote, there had been no public comment at all, period, on any of the sunset, the handling materials that were up for sunset. Uh, and the way the handling committee felt we had to deal
with it was that although we, uh, because we had industry knowledge, we believed that these materials were still in use, that nothing about their safety or toxicity had changed, that there were not new alternatives available that made them not necessary, uh, that we could not vote what we believed on the, in the face, in the absence of any public comment. That that did not seem like, uh, we, we did not feel comfortable, uh, just saying well that we recommend these because we just know they’re being used. Uh, so what we did was probably somewhat unorthodox and it was not meant to cause anybody anxiety, although I’m sure that it did. Uh, in, we did draft a recommendation that was phrased in the positive and that’s consistent with, uh, some previous decisions that we had made about wanting recommendations to be phrased consistently so that we were always clear about what our “yes” and our “no” votes were for. So we draft a recommendation in favor of the re-listing of these items and then we all voted “no.” And, uh, it was our hope that this would elicit the public comment that we felt so sorely in need of. And this is in fact what happened. Uh, in the eight weeks since these recommendations, uh, were posted we did get public
comment on every single one of them. Uh, and so, on Tuesday night, uh, at the conclusion of the agriculture symposium, the handling committee reconvened, uh, a motion was made and seconded to reconsider our committee level vote, uh, which was from, that, was made in the beginning of October, uh, and, uh, what came out of that meeting were, there had been two recommendations. There were actually, what came out of that were three recommendations. Uh, we voted unanimously five to nothing for the re-listing of agar agar, animal enzyme, calcium sulfate, and Carrageenan. Uh, and then because, there were some questions about Glucono-delta-lactone, uh, that we did not want to, uh, drag down the items that everyone was crystal clear on, so a separate recommendation was made for the re-listing of Glucono-delta-lactone on 605.a and that passed at committee level four to one. Four in favor, one “no,” no absent, no abstentions.

Uh, a third recommendation for the re-listing of cellulose on 205605.b. Uh, and that also passed unanimously, five to nothing.

Uh, so despite what is in the meeting books and what was posted ahead of the meeting, the recommendation that’s coming out of the
handling committee right now is for the re-listing of these six, of these materials. Uh, uh, so I want everybody to be clear on that. Are there any questions about that process?

MS. FRANCES: Would you clarify the first and seconds for me?

MS. CAROE: Who made the motion and who seconded it?

MS. WEISMAN: Uh, wait, I have it. I believe, uh, the, you mean the motion to reconsider or the motion on the recommendations?

MS. CAROE: On the recommendations.

MS. FRANCES: On the sunset materials.

MS. WEISMAN: I believe that they were [END MZ005020]

[START MZ005021]

MS. WEISMAN: Uh, let me, just...I have it here. Let’s go to the video. Uh, they were moved by Joe and seconded by Andrea.

Uh, I have one more, uh, annoying thorny item to bring up, uh, with regard to this. There is a material that we received public comment on that even as late as Tuesday we, uh, erroneously did not include on this list. Uh, and that is tartaric acid. Uh, tartaric acid was one of two items that were mistakenly included in the fall
2007 sunset and voted on two years ago to be re-listed by the board. Uh, and then I believe, however, that when it was realized that they should have been in the 2008 batch, uh, both of those items, uh, had since been deleted from the final rule for the 2007 sunset. That’s correct, yes? Right. Now, in addition to that, over the summer, uh, uh, there were, earlier this year, there were two other items that we also on this list that should not have been. Uh, because, uh, and those were potassium hydroxide and ethylene. And that’s because, uh, uh, the clock was being mistakenly set from when, uh, changes had been made in the annotation. And that should not have been the basis, uh, for their being included in the 2008 sunset. So those two items were removed over the summer and somehow at that time, tartaric acid dropped off our work plan along with those, even though it should not have. So, uh, the dilemma that we have right now is that tartaric acid belongs in this group. That’s the bad news. Uh, and it’s not on the current recommendation that we voted yesterday. The good news is that in, in, as recently as two years ago, the board did vote to re-list this and nothing about it has changed since then. So, uh, I am wondering if we
1 can...no? How can we proceed?
2 MS. CAROE: Was it posted in...
3 MS. WEISMAN: It was included in the, uh,
4 in the minutes of the March, this past March
5 meeting.
6 MS. CAROE: The announcement, not the
7 minutes.
8 MS. WEISMAN: It’s in the announcements
9 and the minutes. Well, I don’t know about the
10 announcements. It was in the minutes, it is in
11 the public record at the March meeting at the
12 conclusion of the meeting when I was asked to read
13 off my work plan, tartaric acid was on my list.
14 It is part of the official record.
15 MS.CAROE: It’s not on today’s agenda.
16 It’s not on this meeting’s agenda. Point of
17 clarification, without it being on the agenda, we
18 can’t vote on it can we?
19 MS. ROBINSON: You mean it was part of
20 the original 2007 sunset?
21 MS. WEISMAN: But it wasn’t supposed to
22 be.
23 MS. ROBINSON: It wasn’t supposed to be?
24 MR. KERREMAN: It was reviewed.
25 MS. WEISMAN: But it was reviewed at that
26 time and voted on at that meeting.
MS. ROBINSON: Wait, wait a minute. When was it added to the national list? Do we know?

MS. ROBINSON: 2003? So it should be up for renewal at all.

MS. WEISMAN: No, it should be in this group.

MS. CAROE: Katrina.

MS. HEINZE: Uh, I have in Jan’s magnificent presentation on the materials process and so Dan, this is a question for you. Doesn’t your presentation say that sunset materials must be reviewed within 5 years? So if the board voted in, on it early in 2007, hasn’t the matter been taken care of?

MS. ROBINSON: No, it’s going to come up; it’s going to come through on the 2008 ANPR.

MS. ROBINSON: It sunsets in ’08.

MS. CAROE: So it’s got to be –

MS. ROBINSON: It’s going to come through in the ANPR.

MS. WEISMAN: Well, unless we already voted on it.

MS. ROBINSON: Right, but –
MS. WEISMAN: Or a previous board voted on it.

MS. ROBINSON: You’ve already voted, but it’s not, as Andrea says, it’s not on your agenda, so you can’t deal, you can’t conclude that its business now.

MS. CAROE: Thank you. Thank you. But, okay, so let’s take it. Just bear with me folks. If we take this out of today’s meeting because it’s not business we can deal with, we can look at the possibility of being able to forward that vote that was done within the five years and -

MS. ROBINSON: Correct.

MS. CAROE: - and maybe -

MS. ROBINSON: That can carry forward to your March or whatever month your spring meeting is and you can conclude it, you know, it could be concluded perhaps in the spring and that would be one off of the list for sunset ’08.

MS. CAROE: So the salient point is we’re not dealing with it here.

MS. ROBINSON: Right.

MS. CAROE: Just so that board members have access to outside for lunch today, I’d like to kind of move us along so that we don’t have sandwiches brought in again.
MS. WEISMAN: Uh, that was the last thorny issue I had to raise.

MS. CAROE: Any question on any of the sunset materials? Bea.

MS. JAMES: Can you just, uh, restate exactly what we’re doing with tartaric acid? I’m sorry.

MS. CAROE: We’re not doing anything with it today. At this meeting; we can’t. We’re going to take it out of this meeting and we’re going to deal with it with the program, at committee level and at the program. It can’t, there’s no business we can do with it since it’s not an agenda item.

Any more questions? Comments?

MS. ROBINSON: I have one.

MS. CAROE: Okay.

MS. ROBINSON: How come in my book for tomorrow, for, uh, what am I looking at...cellulose. Julie, I thought you said you, uh, voted at the committee to...it says in my book that the handling committee recommends renewal but then the vote says “yes, nobody.” “No, three.” “Abstentions, two.”

MS. WEISMAN: Right. And we, what I was explaining earlier was that that was the vote that we felt, the way we were, that we had no choice
but to vote that way in October before we had received public comment.

MS. ROBINSON: Alright.

MS. CAROE: Bea.

MS. JAMES: Just for clarity tomorrow when we do the vote, Andrea, would you review why we vote on the sunset materials in a cluster instead of individually? That we will be doing that tomorrow?

MS. CAROE: It’s just for efficiency.

MS. JAMES: Alright. Does everybody understand that that’s how we’ll be voting on the sunset?

MR. KERREMAN: I understand the efficiency part, but maybe some people have an issue with one of the four? Sorry. I’m not saying I do, but maybe someone does.

MS. CAROE: During the discussion of that motion we can clearly amend it.

MR. KERREMAN: Okay, cool.

MS. CAROE: And we can have a second motion. We can deal with that, Hugh. We don’t want to, to, to tamp that down at all. So, it’s just, it they’re all, we did this with the first sunset. We had so many materials and they were all kind of in the same boat. So we just went
ahead and, uh, put them together and one vote, knocked a bunch of them out. But certainly if you have a concern, or anybody has a concern, we can break them off. Julie.

MS. WEISMAN: I, I have no wish to restrict, uh, our access to the outdoors. I did, though, want to address an issue that came up yesterday because this is the appropriate time. It’s the discussion of these materials. There was a question about the use of Glucono-delta-lactone. And I, uh, went back to the petition substances database and I looked at the petition and it, I wanted to confirm that it is in fact a coagulant used with soy milk in the production of tofu. Uh, so I just wanted to confirm that. And we had, uh, public comment requesting its continued use and we did not have any comment, uh, opposing that or raising any questions about it.

MS. CAROE: Okay. Anything further?

Alright. We are exactly on time. It is 11:45 and we will recess for lunch till 12:45. But please don’t be late because I don’t want to be long tonight. We’ve got public comment this afternoon, guys. Thank you.

If I could ask the board members to please take your seats so we can reconvene.
Alright. We’re back in session. We’re going to now go to the crops committee. Uh, you have, uh, three petitioned materials and sunset, and, uh, five sunset materials to consider, correct?

MR. DAVIS: Correct. The, uh, I’ll wait till she gets that loaded up. The first material, new petition, well sort of new, sort of old, uh, that we’ll cover is potassium silicate. We’ve had a lot of, uh, public comment concerning that this meeting. And this is the first item on the agenda. Uh, the crops committee considered this in, uh, well it was one of the first, it’s been several months ago. And we had a bare quorum that day; there were two absent members. So I don’t, I don’t believe we really had a full look at it partly because of, uh, the small amount of members we had to go over it. Uh, we split it, this material is petitioned as an insecticide and as a plant disease control and as plant or soil amendments for hydroponic use. Uh, public comment from the petitioner’s representative yesterday requested that we table the plant and soil amendment for hydroponic use, part of it; they’re withdrawing that. So we, that will not be a vote item today. Or tomorrow, excuse me.
The, this is broken into three sections. As insecticide, they’ll be a vote, as plant disease control there will be another vote and the crops committee voted it this way in separate sections. But we will not, uh, we are tabling by, per request of the petitioner the plant and soil amendments for hydroponic section of this recommendation.

Uh, pertinent things that I wanted to point out. There was a split vote within the committee. Uh, overall, it was voted to, uh, not be added to the national list. And, uh, uh, there was a, I wanted to read the minority opinion on that because I believe it reflects a lot of the public comment that we got yesterday on it.

Uh, as insecticide and plant disease control the material favorably satisfies criteria 1, 2 and 3, and should be added to the national list. Information provided in the tap report aptly supports prohibition of the material as a plant or soil amendment but does not or did not provide ample support for failing any of the evaluation criteria for the material as used for an insecticide or plant disease control agent. And some of the history I pointed out here, because I was the minority opinion, previous NOSB
crops committee in 2003 voted four to zero to approve, uh, the insecticide...well, no, the plant disease control aspect of this material. It voted four to zero to approve it. At the May 2003 NOSB meeting, the material was deferred for later vote pending eventual EPA registration, which they didn’t have at that time. So they didn’t vote until they could get that EPA question resolved. And, uh, there is a proposed annotation on it that no industrial by-products could be allowed in the manufacture. The material is as petitioned, uh, the manufacturer makes it from, uh, natural sand and reacts it at very high temperature with, uh, potassium carbonate, so it’s, uh, because the sand is providing the silica and there are numerous industrial by-products containing silica that could potentially be used so we thought it would be wise to annotate this to not allow any industrial by-products in the manufacture of potassium silicate.

At this point, I’d like to open it up to questions or discussion from the board.

MR. KERREMAN: So you’re going to have it so it only can be made from sand and potassium carbonate.

MR. DAVIS: Well, I guess technically
we’re not stating anything about the potassium carbonate part of it but we are saying the sand portion must be natural sand, not industrial by-product sand or silica, you know, slag.

MR. KERREMAN: Got ‘cha. Okay.

MR. DAVIS: Andrea.

MS. CAROE: Is that going to be apparent in the market? Is that, again, the annotations distinguishing how a product is produced unless it creates a distinctly different product that is marketed differently is inappropriate for this.

MR. DAVIS: Right. It does. Uh, the petitioner emphatically, in fact they changed their, their original petition in 2002, I believe, just called it potassium silicate, that the actual name of the substance being petitioned and voted on is acquiesce potassium silicate. And according to the manufacturer, acquiesce [phonetic] potassium silicate that can be stabilized in that way essentially can not be made from slags. But that’s part of what their petition states. And I wouldn’t mind getting a comment on that from the petitioner, if we could.

MR. KERREMAN: Well, is the petitioner here?

MR. DAVIS: Yes.
MR. KERREMAN: Here she comes.

MS. CAROE: Gerry, while we’re waiting for the petitioner to reach the mic, the only other question I would have is this, is this a branded product? Or is it, are there other manufacturers that are making this? Is this, uh, you know, in annotations and narrowing down, are we narrowing it down to a, you know -?

MR. DAVIS: I don’t believe so. I, I did a web search and there is at least one other domestic manufacturer that makes acquiesce potassium silicate.

MS. JUDY THOMPSON: Right. That is correct. That manufacturer -

MR. KERREMAN: Identify yourself, please.

MS. THOMPSON: Oh, excuses me. Judy Thompson with PQ Corporation. Uh, that manufacturer does not have a pesticide registration and we do. We do have a branded product but acquiesce potassium silicate is pretty generic. There’s lots of different acquiesce potassium silicates. And the reason I added acquiesce was when I’ve done literature searches, I’ve found a few articles that refer to potassium silicate. And then when I read that article I find, well, it’s not potassium silicate solution,
it’s been a slag material. So that’s why I added acquiesce in hopes that that would clarify the product.

MS. ELLOR: Would they have different CAS numbers? Acquiesce and –

MS. THOMPSON: Uh, probably. Right?

Yeah.

MS. ELLOR: Okay.

MS. FRANCES: Does anybody know what it is?

MR. DAVIS: The CAS number?

MS. ELLOR: It should be in the petition.

MR. KERREMAN: It is in the petition.

MR. DAVIS: Okay. Thank you.

MR. KERREMAN: Regarding –

MR. DAVIS: Uh, Mr. Datnoff, you have something to add to that?

MR. LAWRENCE DATNOFF: I just want to add something about slags.

MR. KERREMAN: Identify yourself, please.

MR. DATNOFF: Oh, sorry. Lawrence Datnoff, University of Florida. Uh, as far as slags go, as far as being silicone sources, uh, there’s, if you read the literature and then what we’ve used historically have been slags have either come from the still industry, when they’re
making pig iron, and that’s a calcium silicate material. And then there’s also, uh, slags that comes from the phosphate industry when you’re producing phosphorus that they by-product is also a calcium silicate slag. So those are the slag sources. These are calcium products. So, uh, I think those are completely different from, you know, potassium silicate and how that’s formed. So when you’re talking about slags, it’s really not, you know, what they have and what they’re marketing. Okay? So just to set that record straight.

MR. DAVIS: Right.

MR. DATNOFF: D, live in David. A-T, N like in Nancy, O, then double F, like Fred Frank. I spell it all the time, can you tell?

MR. DAVIS: And part of the...I’m losing my train of thought. In trying to understand the petitioner’s reasoning for changing the name of it to acquiesce potassium silicate is it’s a very purified form of the material that would just by the nature of that type of formulation of it eliminate some of our concerns about, uh, heavy metals, other things that are in there that other generic potassium silicate products that are not liquids could potentially contain with that
material.

Uh, Hugh.

MR. KERREMAN: I just wanted to address something that Andrea had mentioned about. You know the annotations and how it can’t be so narrowed down so it’s only become one company, but that has happened here. On, uh, I think it was, what... go ahead. I mean it has happened.

MS. CAROE: I mean, there’s a difference between one supplier and a, uh, patented or unique process that only one supplier could ever fulfill. If it’s one innovator, absolutely, we want to recognize those things. But if it is a, uh, proprietary product that only one, then it’s a little bit limited and it’s a little bit different. But even in that situation if a product is good, it should be allowed for organic. I was just exploring it more than anything.

MR. DAVIS: Yeah, I believe if the other major manufacturer that I know of in this country wanted to get a pesticide registration for a formulation of potassium, acquiesce potassium silicate, they could. Uh, if they so chose.

Dan? Oh, sorry.

MR. GIACOMINI: Just want to point out that, uh, Valerie did find CAS numbers and the two
listed, one’s for water and one’s for potassium silicate. Not a specific acquiesce potassium silicate.

MR. DAVIS: Okay. So I’m not sure what that would mean, as far as if we put on the, the official name of acquiesce potassium silicate, it would not have its own CAS number I’m assuming. Can you comment on that?

MS. CAROE: Gerald? I wouldn’t get, I mean ultimately we would like the CAS numbers and I think it will solve a lot of problems. But I don’t know that you want to get hung up about this to, you know, keep this material from being used if it’s consistent.

MR. DAVIS: Yes.

MS. THOMPSON: Do you need me to address that then, or no?

MR. DAVIS: If you have something to add.

MS. THOMPSON: Judy Thompson, PQ. Yeah, your statement is correct. There’s two CAS numbers for the material. One is water and one is potassium silicate. Excuse me? It does, yeah.

MR. DAVIS: Do we have any other comments or questions on this material?

MR. KERREMAN: Yeah, we’re not going to get hung up on the CAS numbers, but I would think
that the potassium silicate number in the future might be the one associated with this product. Even though water has the CAS number, if you had to pick one, I’d say the potassium silicate CAS number would be appropriate.

MR. DAVIS: Okay.

MR. KERREMAN: Anyway, that’s in the future.

MR. GIACOMINI: How different are we from putting water on the national list? I’m, I’m not sure, I mean, is that what we’re doing with this? I mean, how much, I mean is this, how different is this product that we’re looking at from potassium silicate to try and put it in solution?

MR. DAVIS: Rose, do you have a comment on this? Or Judy?

MS. THOMPSON: Uh, Judy Thompson, PQ Corporation. The product that we have registered is a 29% potassium silicate. Uh, the technical, so our end use product is a 29% potassium silicate solution. Our technical is potassium silicate flake product. It’s a flake glass; it’s a glass that can be dissolved in water.

MS. ELLOR: Can I ask her a question?

MR. DAVIS: Sure.

MS. ELLOR: Uh, you know what I’d really
like to know is, is the chemistry any different?
Is the chemical formula different for acquiesce potassium silicate than potassium silicate? Or is it a solution?

MS. DAVIS: The acquiesce is a solution. Potassium silicate, like this CAS number for potassium silicate, and you’ll correct me if I’m wrong, is just for the flake glass. It’s for, uh, a glass, I don’t know the exact composition, but the ratio of silica to K2O is 2.5.

MS. ELLOR: So you’re not actually –

MS. DAVIS: This glass can be dissolved in hot water and you get the solution of potassium silicate.

MS. ELLOR: Okay, but you can also take it back out of solution? So you haven’t changed the molecular structure of the potassium silicate to make it an acquiesce form?

MS. THOMPSON: I’m not sure if you want to go down this road. There’s, once you put potassium into solution, you have species of silica along with potassium ions.

MS. ELLOR: Okay. I see. Say no more.

MS. THOMPSON: Okay.

MR. DAVIS: Rose, do you have anything to build on that at all? Or?
MS. ROSE KOENIG: In my opinion, I wouldn’t, I mean acquiesce...oh, Rose Koenig, Eagle, Florida. Uh, acquiesce, if there’s two CAS numbers, I’m assuming, you know, one is obviously from water. It’s more of a, this is a, even though it’s not highly formulated, the acquiesce makes it a formulation where the potassium chloride silicate is the generic that you want to put on the list. If there are, it appears from what we’ve heard from the expert that there are no slag sources, uh, of potassium silicate. You know, I don’t know, I forget what the actual tap says. That’s the information you have before you. If you don’t, I mean, the only way to really feel comfortable, and I don’t recommend doing the annotation, is you could annotate saying not from slag sources. So it would be clear that potassium silicate could come from sources other than slag. Uh, or you can assume what has been said is correct and not put that annotation and potassium silicate, you know, would be allowed. The acquiesce, to me is more of a, is a formulation, uh. You know, again, once you put it on there, pesticides are going to be formulated. There may be products on the market other than, down the road, other than this product where it can be a
combination of inert ingredients as long as their 4Bs, you know, in a pesticide product. The difference here when you’re putting it down for disease control is, again, you can’t supersede the EPA. There’s going to be labeled products as long as they have potassium silicate in it and only list 4B inert, which water would be, uh, it would be an allowed product all the way. There may be potassium silicate products that end up getting formulated with different inerts that would be allowed, uh, as they’re active, but the inerts would know them out of the marketplace. I hope that’s clear. You know in terms of the final product. But the generic is the potassium silicate.

MR. DAVIS: Andrea.

MS. CAROE: It, it seems to me that, uh, you should be able to move forward with a bit of confidence on this if slag sources aren’t available on this potassium silicate. Uh, if that changes at some point in the future, that would be new information that could be considered during sunset, at the least. Or removal from the list for a more, uh, quick response. But if slag sources aren’t available and that’s your concern, then potassium silicate just listed that way, uh,
is not going to be from slag sources.

MR. DAVIS: But there could be, uh, smaller, you know, less high volume, uh, industrial manufacturing processes that could yield a potassium silicate that may be are not commonly known about but could exists that might have impurities and stuff that we don’t want to just generically say it’s okay to use it.

MS. CAROE: I can say that about anything on the list of, you know, you know, cellulose that’s on the market that has, you know, different process that is by a small manufacturer and is full of impurities. I don’t know that you could, uh, extrapolate down to that possibility and prevent a material that if it is consistent with organic, uh, agriculture should be allowed. I mean, weigh your risk, uh, you know. If, again, I’m not a crop expert and I’m definitely not a crops input expert, but from the presentations and the information that we’ve received on this material, it’s quite valuable to organic agriculture. Uh, is the risk of some unknown processor out there making this in a, you know, in a different way, is that possibility or risk outweigh the benefits?

MR. DAVIS: Go ahead.
MS. ELLOR: You know, maybe this could be simplified by the experts in the back of the room. What you’re actually taking from the sand is the silica, correct? So it’s the silica you’d be taking out of anything that you manufactured it from, presumably leaving all else behind? Is that fair to say? Yes? Okay. Okay. So that if it was manufactured using some other form of silica, say, what were we talking about, uh, calcium silicate, would the calcium be left behind? You would just be taking the silica, correct? Or not?

MR. DAVIS: Do you have something to add, Kevin?

MR. ENGELBERT: Yeah, I can’t bring it up on my computer but I remember the reason we discussed the annotation is that the tap review did state that it could be made from slag. So we seem to have a discrepancy between the experts in the room and the tap. And that’s what we were basing a lot of our thought on is the tap.

MR. DAVIS: I think what the tap said was more of industrial slags are used as silica sources in many countries. Not that it wasn’t making statements toward that it could be used to make this potassium silicate as much.

MS. THOMPSON: Right. I’d like, yeah, I
agree with that. Judy with PQ Corporation. Don’t
confuse what is a silica source for let’s say plan
amendment versus what is silica source for
manufacturing of potassium silicate.

MR. DAVIS: Rose? You guys better stay
up there, I think.

MS. KOENIG: Again, the tap was not
clear. A lot of times they were using, uh,
interchanging calcium silicate which is what’s
used in the by-product of the slag manufacturing.
They were using it interchangeably in that tap
report. Because it also, calcium silicate also
has properties that are, uh, you know, disease
prevention and such. Similar to potassium
silicate but it’s an entirely different CAS
number. It’s a totally different material; that
is not the material that is being asked to be
added onto the list. And I think that’s what the
confusion is. Potassium silicate is different,
like I said; Lawrence was talking about the slag
industry. That is the calcium silicate, uh,
product. Not the potassium and because a lot of
times in that tap it was being compared to that
product, because there’s quite a bit of
information, there’s a lot of historical data on
that particular product, that is why it is placed
1 in that tap. But you’re confusing some of the
2 benefits and adverse effects of that product with
3 potassium silicate.
4         MR. DAVIS:  Understand.
5         MS. KOENIG:  Which is a separate CAS
6 number, a separate generic. And calcium silicate
7 is not being petitioned.
8         MR. DAVIS:  Andrea. You’re suggesting
9 leaving the annotation off, just to make this
10 cleaner and simpler?
11         MS. CAROE:  I just don’t know why you
12 would even need the annotation. I mean, it
13 doesn’t even seem to make any sense to have it.
14 And any time you put an annotation on, you’re
15 adding an extra layer of verification at the
16 certification and that is a potential risk of
17 inconsistency. I, simplifying it does make it
18 cleaner.
19         MR. DAVIS:  And I guess if we are
20 eliminating talking about plant and soil amendment
21 part of this and all that’s left is for
22 insecticide and plant disease control, then EPA
23 labeled products would only apply. Which would
24 also clean up the situation quite a bit as far
25 as...correct?
26         MS. CAROE:  Well, rule number one is this
regulation does not pre-empt other regulations.
So it has to be labeled and registered for the use. So, that first. I mean, you’re not going to grab something off the shelf for medicinal purpose and use it on your crop to kill bugs. It’s not possible.

MR. DAVIS: Okay.
MS. CAROE: You know, that is, that is the first and only premise. First premise. I think you’re petitioner wants to be –
MR. DAVIS: Lawrence.
MR. DATNOFF: Lawrence Datnoff, University of Florida. I just, you guys have been going back over this. Let me just throw this slide up here one more time, okay? So when we’re talking about silicon, that’s the element, right? And then we talk about silica, like, uh, Dr. Thomas has been telling you how they manufacture potassium silicate, they use sand. Okay? Now let me mention one thing about sand. It’s definitely got silica in it, but if you know there’s a lot of beaches around, doesn’t weather, so if you just have sand by itself, it does not supply plant available silica to that plant. Okay? So just want you to recognize that. And then silicate, okay, potassium silicate, calcium silicate is a
compound. It has potassium or calcium or sodium along with silica. Okay? And then those, all those through hydrolysis will form silicic [phonetic] acid and that’s the form the plant takes up. Okay? It’s not different from if you take rock phosphate, P2O5 and you add that to the ground and then you get phosphoric acid and that’s the form the plant takes up. And it converts it and you have, you know, phosphate ion that forms to form ATPADP, right? Same kind of things going on here. But you have a source that you’re using to supply that element. And we always measure it in some type of elemental content. Okay? So hopefully that maybe helps clear that up a little bit better.

MR. DAVIS: Sure. Thank you. Point of order then. Is this the point where we would entertain a motion to remove the annotation? Or would that be tomorrow?

MS. CAROE: I would, no. It would not be today. Uh, when you have, tomorrow when we go to voting, somebody, assuming somebody makes a motion for this recommendation, we will have discussion and during discussion you can entertain a discussion to amend your recommendation. Or alternatively, you can take this to committee
tonight, redo your committee recommendation and bring it, a new recommendation tomorrow. Those are your options.

MR. DAVIS: Okay. Are there any other questions or comments? Okay. We’ll move on to the next material. Uh, which is sodium carbonate peroxyhydrate. Uh, the petition is to add sodium carbonate peroxyhydrate to the national list in 205601.a as an algaecide. The crops committee considered it and, uh, did not feel that it satisfied the evaluation criteria 1, 2 or 3. So we voted “no” that it did not satisfy any of those criteria. Uh, and, uh, so it was a unanimous vote to, uh, reject and not add it to the national list. Uh, material is a combination of sodium carbonate, which is a natural material or potentially natural material. It can be synthesized also but, and uh, hydrogen peroxide, uh, is pointed out by Army and Brian Baker that both sodium carbonate and hydrogen peroxide are on the list. Well, at least the hydrogen peroxide is, as it is right now. And he was questioning, I believe, that, uh, why did we reject this material when it’s really just a vehicle to supply hydrogen peroxide to the aquatic environment to use it as an algaecide, a safer vehicle than handling, you
know, caustic liquid hydrogen peroxide. Uh, I would entertain any comments or questions about that area, but I wanted to open it up to anyone that had anything to say.

Okay.

MS. CAROE: Hugh, that’s fine. I just want to make sure that we have a little bit of discussion on these materials. Uh, I guess I’m not quite sure why you’d want this material. Can somebody who would, you know, explain to me why you would want this? If you have the, the, uh...Tina.

MS. ELLOR: It’s my understanding and Emily, you probably could help me out with this, that it’s a safer, more stable way to get hydrogen peroxide and to ship it around.

MR. DAVIS: And it’s used, farm use is to control algae in reservoirs and ponds.

MS. CAROE: Okay. So it’s a safer form of handling these materials and it breaks down to the active, uh, parameters afterwards. Correct?

MR. DAVIS: Correct.

MS. CAROE: So, uh, you know, as I read through the recommendation, there’s concern over environmental risk when it seems to me that handling the materials that are on the list that
would be the alternative may be an environmental risk. I mean, if, just explain to me, can you weigh out the risk on these as a user of these materials which would present more of a risk? Bringing in those, those two already listed materials, which as Tina, you just explained, you know, or maybe it was you, Gerald, that there is a potential risk with handling those materials. Or taking this more stable material and letting it break down and, and also having the manufacturing process for that material...I mean, just weighing it out.

MR. DAVIS: Well, let me say it in a different way. And it may answer your question. I think with the committee makeup that considered this material, uh, it probably would have rejected hydrogen peroxide use as an algaecide also. So it, times change and things are a little different right now and, but, I think the petitioner is here, uh, if we could bring them forward to state their case a little bit at this time.

MS. KRISTEN KNOX: Hi. I’m Kristen Knox. We are the petitioner from BioSafe Systems. Uh, the petitioner actually went in prior to my starting to work for the company, I have since taken over all the regulatory and am here to
represent the company. In regards to the committee’s recommendations, we recently submitted a rather full response to your findings. Uh, we thought we addressed most of your concerns rather well. Uh, I’m not sure what you want me to defend right now.

MR. DAVIS: Uh...

MS. KNOX: Is there a specific question?

MR. DAVIS: This, most of our discussions in the crop committee focused on, uh, yes, hydrogen peroxide is on the list for use as an algaecide. Yes, this material would probably be safer handling than that. But we really, uh, focused on are there natural alternatives other than throwing peroxide into a pond to control algae?

MS. KNOX: But we honestly don’t look at it as just throwing peroxide onto a pond. It’s very widely used as an algaecide for reservoirs, it’s just not considered at this point organic.

MR. DAVIS: Right.

MS. KNOX: It is NSF listed; it’s two ingredients that are already on the national list. And as soon as it hits the water, it breaks down into hydrogen peroxide. We have very controlled doses and even at twice the limits, uh, the
recommended limits, we’ve shown that there was no environmental hazard.

MR. DAVIS: Go ahead.

MS. ELLOR: So maybe the question is if these things are already available on the list, what’s the advantage to this material over the ones already on the list?

MS. KNOX: You mean as opposed to just using hydrogen peroxide?

MS. ELLOR: Right.

MS. KNOX: Well, for one, for the shipping. Also for, uh, it’s actually stabilized as it’s in the water. It takes a slower, uh, release. Slower breakdown so the stabilizers that are there help it to stay in form to actually do its work longer. And as soon as the hydrogen peroxide hits the algae or the organic material, it then oxidizes it and then it turns into oxygen and water.

MR. DAVIS: Right so the committee acknowledged that. This is far safer for a farmer to use in their reservoir as far as applying it and you can simply broadcast this in pellet form over a reservoir and it will disperse itself versus trying to figure out how to pour or apply liquid hydrogen peroxide somehow in their aquatic
situation there. Andrea.

MS. CAROE: Okay. I don’t want this to sound blunt, but I mean, it just, so what I’m hearing is that this is a safer product than two listed products, but you’re not recommending it because you don’t agree with the original listing of the first materials? So you’re going to, in essence, the end product is you’re going to force people to use the listed materials, which you have just stated are, are actually not as good an alternative as this material. I don’t understand the logic here. I mean, I’m...

MR. DAVIS: Hugh.

MR. KERREMAN: I agree with Andrea, first of all. But also, uh, you cite tap line 233 through 241 that during its use there would be environmental contamination, talks about the Ph being changed in the soil or the water. Is this, I’m just curious, is this product being used like one time? Or is like every day?

MR. DAVIS: I would ask the petitioner that.

MR. KERREMAN: Well, not just one time but maybe, you know, once in a month or whatever, versus every day additions. That would make a difference to me on that tap review for what –
MR. DAVIS: That was part of the environmental consideration is what does that sodium carbonate portion of that do over time. To continually add it to, to that reservoir?

MR. KERREMAN: Well, peroxide would do the same thing, right? Or the other initial ingredient that makes these two that are already listed. But I’m curious, how is it used? Like in reality.

MS. KNOX: Either way. It can be used preventatively in smaller doses or it can be used as a curative. It has immediate knock-down. It doesn’t have any residual in the water as hydrogen peroxide breaks down into water and oxygen and the sodium carbonate breaks down into sodium and carbon.

MR. KEMMERER: And what kind of areas are, what, how strong are you using this and what kind of area? Like a little mud puddle or are you looking at a lake or what? I mean –

MS. KNOX: It’s usually irrigation ponds, uh, whatever a farmer would have.

MR. KERREMAN: Okay.

MR. DAVIS: Andrea, Bea, Dan.

MS. CAROE: I, I guess, Hugh, I understand the question you’re asking but the
alternative, if it doesn’t get listed, they can use hydrogen peroxide every day. I mean it’s on the list. Every day you can use it. It’s already there.

MS. KNOX: They can use sodium hypochlorite, too. I mean.

MS. CAROE: So, I mean, you know, this is about giving, giving organic growers better choices and I just don’t see why you wouldn’t give them this choice. I mean, I haven’t heard anything convincing to let me know that, that the alternatives that are already on the list are better. It doesn’t sound like they are, so, I’m missing something.

MR. DAVIS: Bea.

MS. JAMES: I guess I’m a little confused, too, because just in context of looking at another area, we’ve got agar agar, we’re looking at gellan gum, we’ve got cellulose, we have these different, Carrageenan, we have these different materials that we, we want to be able to provide because even though they do kind of, they can do kind of the same thing, the specific use needs to be applied for a particular, uh, product. So why wouldn’t we look at having this as being another alternative to something that might work
better?

MR. DAVIS: Right. Dan.

MR. GIACOMINI: Uh, your response on the sodium hypochlorite kind of deflated my question, but I’ll ask it anyway. Is there any measurable change in the sodium load over time?

MS. KNOX: No there’s not. And we have submitted under confidential business information the studies that show there was no change in Ph, there was no change in phytotoxicity or anything toxic to aquatic invertebrates.

MR. DAVIS: Go ahead.

MS. ELLOR: I’m going to have to say since I’ve learned more about this material, I think I will definitely support it because of the safety of handling and because the breakdown products are fairly innocuous and fairly safe. So, I’ve certainly learned more about it, and that’s why we have these discussions.

MR. DAVIS: Rigo.

MR. RIGOBERTO I. DELGADO: I wonder if the petitioner can comment on alternate natural, uh, approaches to controlling this problem of algae and so forth. That your product aims to, to control. For example, we looked at pond aeration devices or practices or the simple use of barley
straw inoculation. How well are those working compared to the efficiency of your product?

MS. KNOX: Well, it’s our understanding that none of those are registered pesticides to begin with. Any of those four other ingredients that are, we actually promote to use our product in conjunction with beneficial bacteria and enzymes as part of the IPM practices. Uh, alum, gypsum, limestone, and what am I missing, barley, the four are either used in concoctions together in different formulations, but you run the risk of the limestone, uh, if it’s going to drop the pH too much, that’s there to counteract the, uh, alum. But if it goes too low, then you actually create the phosphates that are going to cause more algaecul [phonetic] bloom, uh, and it’s my understanding, or our understanding as a company, that, uh, gypsum is not effective in hard water. So, and barley takes four to six months just to become effective. And we also submitted data on that. Uh, it’s got to sit there for four to six months to ferment before it even starts to take effect. It’s a good algae stat, but not an algaecide. Aeration practices, top aeration is just decorative. It’s not going to get to the algae that’s going to settle on the bottom of the
pond. Bottom aeration is effective between six to eight feet in depth. If it’s anything, if you have a deeper pond than that, it’s not going to get down to the bottom. And it’s also very expensive.

MR. ENGELBERT: Could you clear up one point for me that you made? You stated that the sodium does not accumulate. Where does it go if it doesn’t accumulate?

MS. KNOX: It’s such a low amount, it’s, uh, the scientific information that I have in the Harrah, which I hope you folks have access to, is that it just dissipates and breaks down into the soil but it does not have an adverse effect. They’ve done studies over a year and shown that there was no, it’s naturally occurring and it’s ubiquitous, is what I think the comment was put in the tap report. And our soda ash is actually mined from Wyoming.

MR. DAVIS: So for preventative use in irrigation ponds on farms, what would be the typical growing season, how often would they typically apply it, I guess, and how many times?

MS. KNOX: As you probably know, algae can thrive under specific circumstances, but it’s not going to be a constant thing.
MR. DAVIS: Right. I mentioned growing season.

MS. KNOX: Uh, correct. Uh, and one of the biggest applications that we’re looking at using this for is for the rice industry where there’s a very short timeframe. It’s only about a two-week timeframe where they are actually worried about the algae forming before the rice can grow up through the algae mass. If you knock it down then, the rice gets up through the algae mass and it’s fine. Uh, you only really need to apply once or twice. Rice people aren’t really going to apply preventatively, though the average person would probably apply it preventatively would be our farmers, and I have, somewhere, a copy of our label which gives the rates. And these are the same rates that, uh, our competition has as well. There are some other products out there on the market with the same exact active ingredient. We have, gosh, uh, two to nine pounds of the product per acre foot of water per application.

MR. DAVIS: You mentioned the use in rice. Your company is pursuing an EPA registration for algae controlling rice?

MS. KNOX: I’m sorry; I didn’t hear the first part.
MR. DAVIS: You mentioned using this product in rice. Is your company pursuing, uh, an EPA registration for that?

MS. KNOX: We have. We have actually received an amendment for that application.

MR. DAVIS: Oh, so you, that is an allowed use?

MS. KNOX: Yes.

MR. DAVIS: According to EPA at this time?

MS. KNOX: Yes.

MR. DAVIS: Because when we did our work a few months back, we checked with the California Rice Commission and I asked their regulatory person about that, about using this material. Could it be a good substitute for copper sulfate use in rice, organic rice production to replace copper sulfate? And she was like, boy, you’re really getting the cart before the horse, aren’t you? There’s not even any EPA registrations for that.

MS. KNOX: Well, it was approved this past May, and I actually have an amendment in before the state of California as well right now.

MR. DAVIS: Well, that’s some new information that, uh, if that had been part of our
committee deliberation would definitely have
influenced things because it would, at least in
rice production, for algae, uh, a better
environmental profile than copper sulfate. Bea.

MS. JAMES: I would like to request that
the crops committee take this form back and fill
it out again. So that it more accurately reflects
the true interpretation of the tap. And then
bring that back tomorrow.

MR. DAVIS: The board is free to over-
ride the crops committee, uh, recommendation if
they wish. Do you think that’s necessary?

MS. JAMES: But I’m confused because on
your form you’re saying that there is
environmental contamination during manufacture,
but what I’m hearing is that there’s not. And
because I’m not on the crops committee -

MR. DAVIS: No, that whole line is
manufacture use or misuse. Not just manufacture.
So it is, yeah, it is a problem in discussing it,
it’s probably a small environmental effect, but
that was the, we were splitting hairs as a
committee trying to figure out how small is this
and, you know. Andrea.

MS. CAROE: Well, you can take it to
extreme. Walking across the lawn is an adverse
environmental effect, you know. I mean, uh, I think you have to, you have to be realistic when we’re talking about, I mean, and didn’t the petitioner just say that there’s no change in the Ph? So I’m concerned. I just don’t feel, I think this like the worst case scenario extrapolating down to all possible, you know, situations that aren’t reasonable, aren’t what’s...Barbara is behind you.

MS. ROBINSON: Here’s my concern from the program. If what I’m hearing is that you’re going to change your vote on this, but this, uh, the form is going to be left alone; these are the kinds of documents that, uh, become kind of our historical reference. Uh, I don’t care if all you do is go through here, at least for us, I don’t care what happens to your forms, just to tell you the truth, I don’t, you know. But, you know, I can’t tell you how many times I go back through historical and look at what previous boards have done. It’s kind of like my bible and I get them out, I regurgitate them to the public, I give them back to you and say, previous boards said this. And it becomes the institutional knowledge, so if you’re going to change your vote, one of these things has to be corrected for the record. To
reflect whatever it is you are determining now to be, you know, the most accurate information bout this material. Uh, so that we’ve got something so that a year from now, five years from now, whenever it is, particularly when we get to sunset on this material, if in fact it winds up on the national list, but when we get to sunset, we don’t want to go back and say, how in good gosh did it ever get on the national list?

MR. DAVIS: Bea.

MS. JAMES: I guess I just want to second that because, uh –

MR. DAVIS: I agree with you.

MS. JAMES: Not only for the NOP, but there’s people on the board, myself, that I’m not on the crops committee, it’s not an area of my expertise and I rely on your expertise giving me accurate information.

MR. DAVIS: Right. Rigo.

MR. DELGADO: Well, don’t forget that this is discussion and we’re here to hear the comments from the petitioner, your comments and so forth. And, uh, as a committee we have the option of going back, reviewing those materials, those comments and changing our vote. And I think, or we may remain with the same one. We might be even
reinforcing our position. I think it’s a part of the process.

MR. DAVIS: As the crops committee chair, we can definitely, we will convene on this and go back over it and consider all this information.

MR. DELGADO: We do have new information that the petitioner has provided, so I think it’s, the process is working. That’s what I’m saying.

MR. DAVIS: And with the difficulties we had with retrieving public comments and things like that, I apologize. I did not see your comments until I got them in this book here at this meeting.

MR. KERREMAN: Just as a technical point, okay, so let’s say you have a sub-committee meeting and you feel reinforced and you’re going to stick with your vote, just theoretically. And then tomorrow, we as a board vote different than what you guys, let’s say with the sub-committee vote tonight would do. What happens, Barbara, because we are allowed to vote against their recommendation and you want all the right stuff in the –

MS. ROBINSON: We’ll meet them in the
back hall and beat them up.

MR. KERREMAN: I mean, you know, we can vote them down. And then, but they will have already recorded what they...do we change things before it goes to you, then? If the vote would go opposite of what a committee vote is recommending? Just wondering, really.

MS. ROBINSON: I don’t know.

MS. CAROE: Can I, we are getting a little off-track. This is kind of, kind of, yeah, we’re getting...we will make sure that there is appropriate documentation if nothing else but these wonderful transcripts to read about this discussion about how we got to where we got to. I’d kind of like to figure that out myself. But anyway...Valerie.

MS. FRANCES: You do also your final board recommendation and you have an additional form on top of your committee recommendation that you fill out and you can add additional stuff.

MS. CAROE: Thank you, Valerie.

MR. DAVIS: The crops committee will take all these comments and new information under advisement and be back with, uh, hopefully a different, uh, recommendation tomorrow.

Uh, moving on to the next material. I
don’t know; this one’s a little easier. Sodium Ferric Hydroxy EDTA. This has been petitioned, uh, to be added to the national list as a snail and slug bait. Section 205601.h. Uh, the crops committee, uh, voted six to nothing; we had everyone present at this consideration to reject this petition based on its potential impact on humans and the environment. Particularly the EDTA portion of the molecule was the deciding, the key area that bothered us. Uh, is it essential and available? We said, “No,” on that also because there is already another material, ferric phosphate that is not on the national list yet but it’s in the process. Uh, which, so there is another material with a little less, uh, a little better environmental profile that was approved by a previous board. And we didn’t feel it satisfied the criteria on criteria 3 compatibility consistency with, uh, organic rules in farming either. Uh, there was a lot of information on, on EDTA. It’s very commonly used industrial chemical in many, many things. And, uh, we really didn’t like that material. I mean, there’s nothing that killed this material in our, the committee’s mind quicker than, than having an EDTA approved on the national list. Uh, so, do I have any comments or
questions on that? Bea.

MS. JAMES: What was your, uh, committee vote?

MR. DAVIS: Six to nothing to reject it.

MS. JAMES: To reject it.

MR. DAVIS: Andrea.

MS. CAROE: Gerry, uh, without going through all the comments, did you receive public comment on this material, besides the tap and the petition? Did you have any other information that you were considering in your decision?

MR. DAVIS: Uh, I don’t know. Just to be brutally honest with you. I tried to go on EPA.gov and gave up. So I opted, admit that I’m not prepared to answer that question. Can you?

MS. ELLOR: Well, I mean as far as I can recall, and I did read all the comments posted, I didn’t see any comments about it at all.

MR. DAVIS: Hearing no other comments or questions, let’s move on to the sunset items. Oh, Kevin, go ahead.

MR. ENGELBERT: Before we move to the sunset, I’d just like to make one quick comment about in defense of the crop committee and they work that we put in on those three petition substances. We tried to attack our work plan a
bit at a time. Two items a month and we started right after the last meeting. And there’s obviously been information that has come on board since the time that these materials were looked at a long time ago. And we did our best at the time with what we had to work with. It may seem like there was no logic involved, but there was. We had to be convinced completely that these items were in the best interest of the organic community, the organic industry to be put on the list. And at that time, we were not convinced.

MR. DAVIS: What’s the first material? Calcium chloride? Uh, oh where are you? Let me see that. First material, calcium chloride. Uh, this material is on the national list as a prohibited non-synthetic substance. Uh, with the annotation that, uh, reading the brine process is natural and prohibited for use except as a foliar spray to treat a physiological disorder associated with calcium uptake. Uh, we reviewed this and voted to leave it on the national list as annotated. With, uh, some public comment, I’ll call it public comment but it, it comes from a California, uh grower, namely myself. With some concerns that I wanted to read and it’s merely, mostly just a call to someone who I think should
petition this material to try to fix it. It was petitioned last year to be, uh, have this restriction removed so it could have unlimited use as a soil amendment and it was voted down. Uh, for that purpose, but I wanted to read in my opinion the way it should be used. Uh, the present annotation I think is overly prescriptive in its foliar spray use guideline. Modest application rates applied with the proper methods in irrigation water can supply calcium nutrient without significant soil or water contamination and with less salt burn to the crop foliage than applying it foliarily. Particularly in sensitive vegetable and greenhouse crops. Number two, the current annotation does not address the fact that chloride is an essential plant nutrient and can be deficient in some situations. Uh, some irrigation waters in California and probably other places that are based on snow melt, which is very pure water with no minerals in it, uh, can really benefit from a small amount of calcium chloride added to it. It’s far better than adding sodium chloride or even potassium chloride. Uh, number three, the limitations on calcium chloride, uh, use are much more restrictive than the other mined natural chloride materials allowed in organic
farming at this point. The potassium chloride annotation reads, you know, that its prohibited natural unless derived from a mine source and applied in a manner that minimizes chloride accumulation in the soil. Magnesium and sodium chloride, although both high solubility mined substances, are not on the prohibited non-synthetic list at all. Some consistency is needed in how these materials are listed. Uh, one suggestion would be to, uh, to try to bring consistency within all the natural mined chloride materials is to, uh, try to clean up these annotations with, uh, more consistency with something such as, uh, calcium chloride or potassium chloride, whatever. Unless derived from a non-synthetic mine and/or brine source and applied in a manner that minimizes chloride accumulation in soils, sub-soils, surface waters or ground water. Uh, and thank you for letting me provide my public comment on that material. Uh, do you have any questions or comments on our vote on leaving calcium chloride on the list as annotated?

MR. KERREMAN: Question for tomorrow, I guess, would be if we vote yes for this, I mean, how does this, you will explain this because it’s
kind of like, uh, it’s like a negative negative, prohibited.

MR. GIACOMINI: The motion is to retain.

MR. KERREMAN: Retain.

MR. GIACOMINI: On the list on 602.

MR. DAVIS: What’s next on the agenda?

Copper sulfate in rice? Uh, copper sulfate in rice production as, uh, as an algaeicide and also as insecticide for tadpole shrimp control. Uh, we checked with the California Rice Commission and the biggest California Rice, Organic Rice producer and the situation has not changed with concerning this material as far as its need in their production system. Uh, the Rice Commission even stated the fact that there’s no replacement for it even in non-organically grown rice. It’s universally used. Uh, the information from the last petitioner that stood up here, if what they say is true and it can be used, there’s no, I guess in California they’ll have to prove that with their California EPA before this country’s rice production, organic rice production would use this type of material, would be able to use it. So that is new information that I was just informed of a few minutes ago obviously. Uh, but until I heard that, it was assumed that there was
not a replacement, it’s still needed and we voted
to, uh, retain it on the national list for the,
the uses mentioned. Any questions?

MR. GIACOMINI: I just want to make sure
this covers both listings?

MR. DAVIS: Both listings. We, uh, the
recommendation on the screen now has been
corrected. It was mentioned yesterday in public
comment that we had neglected to put the “as
insecticide” category on there. So it is
corrected now to include both, uh, categories.
The committee discussed both categories but
neglected to notice that it is two separate
categories and that it needed to be listed that
way.

Okay. Moving on to the next material,
ozone gas. Uh, it’s on the national list
currently for use as an irrigation system cleaner
only. Used in this way, this material would
typically be generated on the farm with equipment
designed to produce O3 gas, ozone, from
atmospheric oxygen and injected into irrigation
water. Uh, it’s a strong oxidizer. It kills
algae and bacteria and keeps irrigation lines
clean. Uh, in checking with a variety of
certifiers, some interest was found for keeping
the material and no strong feelings were expressed for removing from the list. Uh, did we receive any comments on ozone? Other than those? Okay. And there’s no comments that were submitted as part of the record for this meeting. So we voted, uh, six to nothing to retain this material, uh and renew it to the national list for this use only. Uh, as an algaeicide and for irrigation system cleaner only. Any questions or comments?

MS. MIEDEMA: I want to make one, Gerry, and that’s just because our process on the crops committee differed a little bit from Julie’s committee in handling. Julie told everyone earlier about the lack of public comments. Uh, their decision because of lack of public comments was to vote no to illicit the comments. Uh, we did the Google route basically and got on the phone and tried to beat the bushes and find out whether these were still useful materials. And, uh, vote to retain, you know. I’m thinking if we’d have said, “No,” we’d actually, we would have elicited the comments. So I just wanted to point out in case anyone had noted that incongruence.

MR. DAVIS: Uh, at the last round of sunset, I forget when that was, two years ago now? Uh, the crops committee tried that with a
material, which one was that? Hydrated lime, and
we got our ears pinned back. We didn’t hear any
comments. We didn’t think that anyone used it.
And boy did we hear about it at that meeting.
There were many, many comments. So we tried that
tact where we’ll, let’s just try it and just drop
this and see if we get any comments. And it is an
interesting way to get comments. Joe.

MR. SMILLIE: I don’t want to be a stick
in the mud, but once again, I think that copper is
one of those things that builds up. It can be
toxic, we had a good little discussion of it in
the marine world, and I think it’s one of those
issues in organic farming that we’ve just got to
keep pushing to try and find replacements for.
For a fact, I mean it’s not hard to –

MS. CAROE: I just want to remind people
that we are not –

MR. SMILLIE: [Inaudible]

MS. CAROE: No, that’s not what I was
going to say. Just give me a chance. We are not
evaluating this material for listing. This is
sunset. This is sunset; this is not about re-
reviewing the material. It’s are there any
changes; is it still needed? That’s it. Unless
you’re telling me, Joe, that they’ve come up with
alternatives, or unless there’s more, new
information since the tap was originally reviewed
by the board that put it on the list, you know, we
don’t need to go there.

MR. KERREMAN: I have a question. Or if
there’s new information about the material, right?
So like in livestock, using copper sulfate foot
pads that are put on the land all the time,
Cornell’s done studies in New York that you get
toxic levels of copper buildup on your farmland
pretty darn quick. Is that, but that’s livestock;
that’s not crops so I shouldn’t enter that, but
you know, we’re talking copper sulfate on land.

MS. CAROE: But exactly. That is the
type of information you look at during sunset, is
new information like that. But, uh, re-evaluating
old information is not the duty of this board
during the sunset process.

MR. DAVIS: And we might be backtracking
a little bit to copper sulfate, uh, the petitioner
that was up here for the sodium carbonate
proxyhydrate, uh, that might be an example where
when they do get California EPA approval of their
material for use in rice and when it is looked at
by the rice growers to see if it is effective,
then the next cycle might be an opportunity for,
in rice, we can get rid of that, the old dog. But I think it would be premature to do it this time around because, again, I didn’t realize that they were this close to getting at least the federal EPA approval of that usage, which California can come a year or two behind federal easily, as far as giving the approval for growers. So. Okay.

Next material.

The next material, Peracetic Acid. And that is for, uh, use as an algaeicide, disinfectant, sanitizer and including irrigation system cleaners and as plant disease control. Did we get comments on this? Uh, my crops committee secretary to my left tells me that she did not notice any comments provided in the public record for this meeting on this material. Uh, it is, uh, another way of delivering the sanitation power of hydrogen peroxide, uh, in a less caustic, safer to use form than straight hydrogen peroxide. It’s a combination of hydrogen peroxide and vinegar, acetic acid. Uh, this is for surface disinfection on equipment and seed, things like that. And as such is a viable and possibly more desirable material than the chlorine materials and also for controlling fire bacteria in apples and pears. I’m not aware of products on the market at this
point that include peracetic acid for use in
pears, but I am told that there are companies that
have, who work with this material that it is only
a matter of time before they get an EPA approved
product so we wouldn’t want to stand in the way of
that because it could be a potential replacement
material to use in conjunction with biological
controls to replace the streptomycin’s and
tetracycline use that are so, there is so much
resistance for using in pears. Uh, so the
committee voted to, six to zero, to retain it on
the national list. Any questions or comments?
Steve.

MR. STEVE DEMURI: Is this another one
where you had to call people that you knew to be
using it to find out if it was still being used?

MR. DAVIS: It is being used as a surface
sanitizer fairly commonly. Uh, I don’t know why
no one made any comments. Uh, there’s another,
uh, listed use, national list use for this
material that is, was only published in the
national register last year, I believe, for use as
a food contact substance also in like wash out for
vegetables and so forth in handling. Uh, when
you’re packing vegetables and so forth and fruit.
Why we didn’t get any comments, I don’t know. But
it is common knowledge within the expertise of our
decision-making body that it is being used. Go
ahead, Bea.

       MS. JAMES: Uh, two years ago we heard
from the state of Washington. They came up and
they were, uh, petitioning for the renewal of
streptomycin and tetracycline. And I think it’s
pretty exciting to know that there is an
alternative for that for fire blight on pears and
apples. And I’m wondering if you have any
information as to whether or not any of those, uh,
farms or crops in the Pacific Northwest are
currently using this alternative. And if it was
available for them to use two years ago?

       MR. DAVIS: there was not a, uh, EPA
registered paracetic acid material for apples or
pears registered at that time. And I’m not sure
if there is as yet. Uh, there are some contacts
that the committee has with the Pacific
Northwest/Washington Pear producers and who, they
are testing other alternatives to streptomycin.
Even on a conventional basis because they’re
always, the threat of resistance and problems with
the material breaking down not accomplishing their
controlled goals. Uh, we’ll just try to monitor
that, but as yet, it’s still, they’re testing the
biological, uh materials that would antagonize the
growth of the fire blight. Those by themselves
are not adequate; they get part-way there but the
disease is very devastating and it’s not nearly
good enough control by themselves. So, uh, in
discussions I’ve had with those people they say
yeah, wouldn’t it be nice if a company would
finally step forward and spend the money to get an
EPA registered material and that’s the hurdle.
That’s the difficulty is that it’s small use,
small crop and it costs a lot of money to register
peracetic acid.

Uh, the next category of materials would
be the EPA List Three Inerts. And I hate to put
you on the spot, Tracy, but do you want to take a
stab at this one since you did so much work on it?

MS. MIEDEMA: Sure. Okay, so this is
specifically, this refers to EPA List inerts used
in passive pheromone dispensers only. And they’re
referred to in 7 CFR Section 205.601.m.22. Okay.
Our decision was as a committee we vote
unanimously to retain these List 3 inerts on the
national list. And he quandary we were in is that
EPA is going through a, a new system of
decategorizing lists. And so we’ve had this
situation of lumping anything under one List 3.
And we needed to basically draw a line, grandfather things in and make the public very aware that future petitions to add, remove or renew an inert ingredient to the national list will need to reference a specific inert ingredient. And so there’s not this sort of blanket categorization of inerts. We won’t have that available to us.

MR. DAVIS: So to give a little more detail, the, I guess no one else is using these EPA List 3, List 4, those designations are gone. And they don’t really, aren’t being used other than this reference at this point. And, uh, that’s why we wanted to make sure in, with this recommendation and vote that it was clear that this can not be, uh, relisted the next go round again this way because it will be so far from, it will be changed so long ago by then there’s no way we can continue this List 3 Inert grouping in passive pheromone dispensers. Each material would have to be re-petitioned individually. Tracy, go ahead.

MS. MIEDEMA: And I guess I failed to mention our reasoning for, uh, the importance I guess of the passive pheromone dispensers and, yeah, this is another situation where we didn’t
have any comments to go on. No one was asking us
to keep this around and we really did just get on
the phone and we were calling orchardists and
talking to fruit farmers and anyone who uses these
traps. You know, how important are these? And
the general, uh, consensus among organic farmers
is that this was an important tool.

MR. DAVIS: Kevin.

MR. ENGELBERT: I just want to back up
what Tracy said. I called three small orchardists
that I know and they were all unanimous. They had
to have these to be able to continue to grow
organic fruit.

MR. DAVIS: Hugh.

MR. KERREMAN: Uh, is there any way,
maybe it’s like such a long list, but to actually
name the List 3 inerts? And if they get re-
classified and different nomenclature, fine. It’s
this listing of these three, whatever inert List 3
that we mean.

MR. DAVIS: I checked with, uh, CCOFs
materials expert, Sia Sonnebin [phonetic] about
this and she did some checking. Asked some of the
manufacturers of the pheromone traps what they are
using. As near as I can tell there’s about three
or four of them. And she gave me that information
in an email, and I can forward that to you. But it wasn’t, it wasn’t good enough to publish as a statement from CCOF. It was just an email say, “Yeah, it’s this one, this one, and this is what they’re doing with it.”

MR. KERREMAN: Well, I’m just wondering, could you canvas the certifiers that are certifying these kind of products and just, I know it’s homework and everything, but if the EPA isn’t using this nomenclature anymore and people want these products that are under this List 3, you kind of have to do something different than just say List 3 inerts because it doesn’t exist.

MR. DAVIS: Most people don’t even realize that these materials are in pheromone dispensers. They don’t have a clue. All they know is they need pheromone dispensers; they don’t realize there’s an issue with these inert ingredients that are part of the lure that releases the pheromone. So it’s such a disconnect that people don’t even know to comment. And I think the more direct way would be to go to the manufacturers and make sure they’ve seen this information and then they respond. Andrea.

MS. CAROE: From what your presentation has, uh, provided for us is that this is an
evolving issue. That EPA is working on, there’s changes being made, and I, although this is all very interesting where it’s going and it’s very helpful, but for today, uh, for this material it just seems that at this point re-listing is appropriate and that we understand that at some point in the future change may be needed. But at this meeting we don’t have the information to make that change. In order to make a docket to keep this from sunsetting, action needs to happen here. 

So –

MR. DAVIS: Right.

MS. CAROE: I don’t know, I don’t know that we need to spend a whole lot of time, uh, theorizing where this is going to go. The action, you know, just to keep us on track for what we’re doing here today, is it’s still needed. There may be some changes coming but it’s still needed. Let’s move along.

MS. MIEDEMA: And just to point out clarification for you, Hugh, basically the List 3 is a lot longer than is needed for the materials that are in these passive pheromone dispensers. But we kind of have to take this big, broad brush at this point, capture everything that was on there, that’s why we have this URL listed that
captures the moment in time when this changed, uh, rolled over and then in the future, it will just be the things needed.

MS. ROBINSON: We don’t have a petition for those materials. We have sunset for a present listing.

MR. GIACOMINI: I just have a quick question. When will this listing not make any sense to the government?

MR. DAVIS: It already does not make sense to the government. It’s a done deal. It’s over. We are lagging behind.

MR. GIACOMINI: I know, but if the list no longer makes any sense to the government, I, I, I don’t understand the, I understand we, there’s things that will be come unavailable. But I don’t understand the value of, I mean –

MS. ROBINSON: Yeah. It makes sense right now, okay.

MR. GIACOMINI: Okay.

MS. ROBINSON: It’s good.

MS. CAROE: Thank you, Gerald. Uh, okay, we are, of course, way behind already. Uh, certification, accreditation, compliance, compliance accreditation, certification committee. This is going to take a while. What time is it?
Alright. I’ll turn it over to you, Joe. You can get started.

MR. SMILLIE: Yeah. We’d like to get started because this may take a while. Uh, basically the certification, accreditation, compliance committee has a lot of things we looked at, uh, on our work plan. We decided on three specific items that, uh, two currently are recommendations and one’s a discussion paper. Uh, basically we’re going to look at standardized certificates. We’re going to look at, uh, commercial availability and we’re going to look at multi-site operation certification.

The first two are currently listed as recommendations. The third has been switched as of yesterday, two days ago to a discussion paper. The way we’ll handle it is we’ll deal with each item separately and the conversation will be led by the principal author of that paper. And I’ll provide sort of the background, uh, to the reason why it became a priority for us to deal with it.

So I think what we’ll try and do, Madam Chair, if it’s okay with you, we’ll do the standardized certificate one, and then if you feel we’ll break as necessary before one of the others, we can do that.
MS. CAROE: At your lead.

MR. SMILLIE: Uh, so basically with standardized certificates, uh, it became apparent in the industry that, uh, the, the wording and the specifications for a certificate were not adequate to, to provide the needs for not only certifiers but also for people getting these certificates. There was too much wide variety and I remember to my shock a few years ago when the program said no, they don’t even have to say the certificate implies the, uh, you know, under compliance of the 7 CFR Part 205. And I was in shock. I said well, it’s got to say that. Well, there’s no place in the regulation where it specified it has to say that. So upon hearing that, things started into motion and the result, basically at this point in time is what we are looking at as a recommendation for a standardized certificate. Uh, that’s the motivation for it. Uh, we need to have much more, uh, consistent information that’s on a certificate and, uh, at this point in time the committee has come up, uh, with this recommendation and I’ll let the, uh, principal author, Jennifer Hall, take it from there and walk the, uh, the committee through it, uh, board through it.

MS. HALL: So our committee, uh,
presented the recommendation for standardized
certificates the first time in fall of ’06, and we
were fortunate enough to receive ample, uh, public
comment that we took back and then re-presented
the recommendation as a discussion item last
spring. Following the feedback we got from that,
we did make some adjustments, uh, and in
205404.b.5, we changed, uh, our request for crop
names to basically list the common trade name of
the item. Uh, 205404.b.6, we added to request the
actual category of organic certification. And in
205404.c.1 was added, which was a request for it
to be written or translated into English. C2 was
changed, uh, and was just less prescriptive and
just said if we have additional pages are allowed,
if they are there, they do though need to have how
many pages there are so that there is a tracking
of what should be included.

Uh, so those were the basic changes. We
did receive some public comment, uh, a couple of
comments about the fact of just reminding people
that 404.b.3 effective date of certification is
just that. It is not an expiration date. Uh, and
so people were requesting reinforcement of
expiration dates which is something we actually
already discussed and approved for recommendation
to the NOP in a prior recommendation. So, uh, and
that was in fall, the fall ’06 meeting. So that
is already done and we are requesting that. So
this, those two issues are separated on purpose,
uh, by design of basically thinking there might be
some resistance to the expiration date item but
not so much to the items that we’re recommending
today.

So our understanding is that when this
gets modified, all of those things, the expiration
and the standardization things that we are
recommending today would come out in one thing
from the program.

Uh, the other comment related to 205404.d
and it was the very end of that sentence which
essentially is or should the certification be
allowed to expire, uh, and as we looked back, that
actually is a hold over. That phrase alone is a
hold-over from the expiration recommendation. And
so that will be modified in our recommended vote
for tomorrow.

MR. DAVIS: And further clarification,
the real issue, well, what seemed to be the last
remaining significant issue was how much
specificity about the crop and there was a wide
disagreement about how specific, and uh, different
sectors had different expectations. Uh, we went back to the ACA and the NASOP, I asked those two groups to get together and see if they could come up with something. We got pretty close. What we agreed is we couldn’t be too specific and we couldn’t be too general. The example we used was, uh, we didn’t want to see a certificate say, you know, and have someone selling blue corn chips and the certificate saying blue corn, and the certificate saying grain. Then we went through the whole genus family order of species and decided that was not going to work either. So we batted around a number of suggestions, talked a number of people and finally came up with, you know, basically a simple, common sense solution, the common trade name. So that when someone sells blue corn, they don’t call it corn, they call it blue corn. When they sell turnips, it’s not, you know, red and white turnip or purple turnip, it’s just a turnip. Uh, so even though it’s loose we think it provides enough specificity for the certificate to be read accurately but not too specificity that requires like the specific variety or down to such detail as it’s purple broccoli or pack-man broccoli or something like that because that would be putting too much of a
burden on both the certifier and the grower. So by going with the common trade name, uh, we think that that should solve, for most cases, the, the degree of specificity, uh, on the certificate.

MS. HALL: Is there any discussion? Yes, Dan.

MR. GIACOMINI: Uh, I just, I want to thank you for the work. I, I like what you’ve done with number 5. I remember, uh, a number of years ago the first time I saw, uh, a certificate on a dairy farm that had gone through the 8020 conversion so thus their cows were not anything that could be sold organic, but yet the only thing that was ever listed on their certificate was livestock. It wasn’t listed as milk, their milk was not listed but yet their livestock were not actually organic animals. They were animals that were able to produce organic through the 8020. So, uh, I think five will help on that. I have a question about the value in what is gained by number 6. Uh, the, the processor or whoever will have to, uh, get approval for any changes they make but, uh, are they going to need to get a new certificate?

MS. HALL: Julie.

MS. WEISMAN: Uh, that, I think for
handling and for process, multi-ingredient process products that has to be on the certificate because, uh, uh, not all, I’m trying to think of an example, but you could have something that could be the same common name, you might be selling just the same common name, but it’s, it’s becoming increasingly important for, uh, customers to know whether the ingredient that they’re buying is 95% or 100% because they have percentage formulation requirements that they have to meet. They have to know that.

MR. GIACOMINI: So the listing items in number 6 will be per item in number 5?

MS. HALL: Yes. Chair, did you have a comment? I saw Steve; you were first. Oh, sorry. Barbara.

MS. ROBINSON: I, I appreciate the spirit of this. I just, I have to raise some issues with you from the program on this. Uh, number one of course and I know that you’ve gotten this feedback before, uh, the regulations say that, uh, uh, certification does not expire. Okay? So, that doesn’t mean you can’t change it, of course. That you can recommend to have expiration dates on certificates. However, and you, yes, you can recommend to have all this stuff put on a
certificate. Now the consequence of this is, uh, pretty big burden on certifying agents. Uh, wait a sec; I’m not done. Uh, and then you will have a lot of non-compliances being issued. And I do mean a lot. Because anytime, anytime an operation, let’s just take your products to be listed, or categories of operations, anytime an operation decides to make a change, uh, any time they make a change, if they don’t hurry up and contact their certifying agent and the certifying agent doesn’t get right out there and amend the certificate, uh, and somebody complains, and complains to the NOP, they start the ball rolling here. And you can have non-compliances issued. And, if I’m going to truly do what I say and start ENOPing and putting all this up on the web, uh, how’s everybody going to feel when they find their companies listed for non-compliances because their certificate were out of date or because this happened or that happened. And what if the certifying agent doesn’t get out there and now you’re going to give me a grower group recommendation, and how are we going to handle that one? You know? I want you to think about this because you, the more, the more restrictions, the more information you put on this, I’m not
telling you we’re just going to reject it, I’m just telling you to think down the road here. The more you put on a piece of paper that binds a company or a producer, the more you are putting, you know, out there for potential non-compliance. That may be sort of a no-fault situation here; it may just be a matter of time. Something to think about.

MS. HALL: Andrea, and then Joe.

MS. CAROE: Alright. I’ve got to address a couple of things here. Uh, one is if an operation changes, uh, their operation as reflected in their OSP and they don’t tell their certifier, they don’t update it, they’re already in non-compliance. Uh, so they have to update that anyways. That’s already in there. Two in regards to expiration date, this board did already pass last, last meeting a recommendation to add expiration dates and to rule change and that work item was put on our work plan because of the urging of the program to do so. So I hear what you’re saying and, you know, that’s the premise that we were going on before and then things changed and we said, you know what, we were told expiration dates would help. We did the work, we passed the recommendation. Uh, this is to reflect
that OSP that is still current, uh, so we kind of went down this road. And, yes, I, I’m fully familiar that there will be non-compliances, but they’re out there already. It’s just that we don’t know about them. Uh –

MR. SMILLIE: Well to carry on with that, uh, basically it’s, uh, we feel that, uh, that these things...first of all, when you say you have to get out there, the certifier does not have to get out there for most of these changes. These are within an OSP. These can all be done via email. Certificates can be cut, when you’re working with a distribution or trading company, it’s a continuous operation. This idea of certification being a once a year event is only in a few people’s minds who don’t know what certification’s about. It’s a continuous back and forth between the client and the certifier. It never stops. Never, 24/7, and certificates are part of it.

The second thing is that for us not to have the phrase “certified as compliant with the USDA’s national organic program,” is absolutely unacceptable. Uh, we get certificates that have to specify –

MS. ROBINSON: I don’t disagree with
MR. SMILLIE: Okay. Well, uh, the common trade name is really important. We’re seeing a lot of activity going on with just too broad of a designation. Some certifiers have much more specific than this. Some have very little. And we’re trying to get some consistency. Uh, down to the products listing; that’s become a huge item because of the programs and continuous re-evaluation of, for example, what creates 100% product? And the program’s continual insistence on accurate numbers for formulation, meaning that if you sell a product to, uh, to, uh, a manufacturer, they’re not allowed to use that organic product under NOP’s instruction basically as 100%. They have to use it as like 95, 96, 97%. Talk about burdens. There’s one I’d love to cut right out. So the new things that we added we, we feel are, are pragmatic and practical and that certification organizations can accomplish it. We didn’t get a lot of feedback so, uh, I would like, uh, I would like to hear from my fellow certification agents, or from the community, uh, if this is overly burdensome. I think it’s necessary for the flow of trade.

MS. HALL: Any further comments from the,
from the room?

MR. DEMURI: I have one.

MS. HALL: Okay.

MR. DEMURI: Uh, as a large manufacturer that uses hundreds of organic ingredients from probably 50 or 60 different suppliers, I applaud this because it is a huge nightmare to keep up with the certificates on a daily basis. We have a couple people that that’s all they do. And the way they’re written now, that’s really, really tough. So the more information we can get on these certificates, the better off we’re going to be.

MS. HALL: Bea.

MS. JAMES: I would echo that. That if you’re, uh, under voluntary certification as a retailer to try to track certificates and interpret their meaning has, can be a real challenge. So even though the burden’s going to fall somewhere, and right now, the burden is really in the hands of people who are trying to interpret and understand and make sure that the certificates are actually accurate and still valid. So...

MR. KERREMAN: I have one thing also.

There was a large organic dairy auction in our
area about a year ago. And I had the fortune or
misfortune to be very involved with that. And I
saw certificates coming through from various
certifiers; it was a nightmare. So even when it
comes down to livestock stuff, not just handling
and all, it would be helpful.

MS. HALL: So hearing no further comment,
we’ll move to commercial availability.

MS. CAROE: How does the board feel about
a break? Or do you want to move forward? Okay,
hearing no objection, we’re going to move forward.

MR. SMILLIE: Uh, second item on the list
is, uh, commercial availability. And, uh, where
do we go on this? Basically, uh, this has always
been needed. We’ve always known right back from
the very earliest days of the board, Jay or Rich
are in the audience, commercial availability we
always knew was just one of the most toughest
things to deal with. It’s basically impossible
and we all do our best. However with the advent
of the Harvey law suit and the enriching of list
606, we realized that commercial availability
basically applies to two things in the regulation:
606 and organic seeds. So basically with the 606
list now being as, uh, small as it is, or as large
as it is, depending on your point of view, uh, we
really felt that, uh, we needed to get a recommendation out, another recommendation. There have been previous recommendations on commercial availability out because certifiers are now, right now, faced with deciding whether someone can use something off 606 or not based on commercial availability. And it’s really important for the certification community to basically achieve some sort of level of consistency on their interpretation of commercial availability. So this recommendation actually, in a certain sense, is motivated by 606 and motivated by the pleas of the organic seed community for help in enforcing that regulation and, uh, the need for, uh, some sort of consistent interpretation there also, as well as, 606. And it’s also basically designed to help motivate, uh, even with the financial considerations, the NOP to, you know, to move into action to create some sort of training for certification agencies on applying commercial availability. Uh, that’s the reason why we’re making this a recommendation. If there wasn’t that sense of urgency, I think we would rather have it as a discussion paper because we realize that there is a lot of issues in here, and we did get a lot of push-back. And I’ll ask Bea, the
principal author of this document, uh, to explain why we did what we did and some of the things that we see in the future for, uh, for how, the future of this document.

MS. JAMES: Thank you, Joe. Uh, so although our recommendations have been submitted to the NOP by the handling committee, and actually on January 18th of this year, the NOP did release a notice of guidelines on procedures for submitting, uh, national lists petitions, we’re still not quite there as far as clear enough guidelines so that petitions are submitted with sufficient information to the board. And I think that we all saw evidence of that at, uh, the March 2007 NOSB meeting in which many petitions submitted for the inclusion onto the national list were received by the NOP but not all of the petitions were eligible for consideration. And in part that was due to the fact that some of the petitions did not contain sufficient information as far as the documentation of commercial availability. And part of the reason for that is that there’s really, currently, not strict enough and clear enough criterion guidelines around that. Uh, and yesterday we did hear quite a few comments, uh, as far as having seed in the
document. So before I continue, I would just like to address the issue of commercial availability of seed. Uh, one of the difficulties of having seed in this recommendation is due to the fact that petition procedures for 606 are for agricultural ingredients used in handling and not for petitioning for the use of non-organic seed. And currently there are no requirements that farmers petition the NOSB to review and recommend a listing of varieties of seeds as commercially unavailable as, uh, organic. And we did hear from, uh, quite a few people and we also, uh, received several public comments, uh, as far as the idea of a database of, uh, commercial, commercially available or unavailable seed seemed to overwhelm many people in the industry. So, and, uh, so the CAC had many discussions about whether or not seed should be in the document. Uh, I actually take responsibility for pushing it through. Joe kept saying, well, you’re going to get it. And I said, yeah, but I think we want to because I, because it’s important to bring this up to the surface of the industry and really make sure that we do something about the situation of commercial availability with seed. So, uh, uh, we all understand the complexity of commercial
availability of organic seed but in the end decided that the accountability of sourcing and having guidelines for tracking organic seed is just as important as any other agricultural material or ingredient. However, we have also heard from the public and because of that, uh, we are looking at the possibility of reconsidering that in the recommendation. And, uh, yeah, I just have to say, kind of on a side note, is that, uh, I was very impressed at the number of comments that we heard, uh, for strict standards for aquaculture. Yet I’m also amazed at the number of comments that we have heard asking for not so strict standards for the tracking and accountability of organic seed. And I just have to bring that about because the burden of proof is not, in my opinion, this is strictly my opinion, the burden of proof is not a sufficient reason to not have a good regulation that demonstrates accountability. Uh, so with that, as far as the recommendation as it stands now, our committee vote was 5 yes, zero no and one absent. And, uh, the recommendation is in two parts. Part A which talks about as Joe mentioned, the importance of training procedures and process for ACAs and protocol on determining commercial availability
that would be spearheaded by the NOP. And then that would become part of the training process for certifiers. Uh, and then Part B is the ACAs role in determining a commercial availability and we do have a lot of things in here that are fairly prescriptive. And I know, uh, you know, we’ve heard from people, uh, particularly as far as the database and the tracking that there’s concerns around that. We’re re-evaluating how we can go about that proactively. Uh, so I’m not going to go through each one of these, Joe, unless you want me to.

MR. SMILLIE: No.

MS. JAMES: Okay, so, uh, the CAC stands by its recommendation for further standardized criteria to be used by ACAs and the organic industry at large when making commercially, commercial availability determinations, uh, for agricultural ingredients. However, uh, we would like to discuss with, uh, the committee the possibility to refer this recommendation back to the committee for further development with the crops committee to establish guidelines for seed. So thus we would be producing a handling committee recommendation for the Spring meeting that would establish guidelines on the establishment of
commercial availability criteria that is specific to 606, and then we would also product another document, uh, in conjunction with the crops committee so it would be joint crops and handling committee recommendation. I mean, I’m sorry, not...so joint crops committee and CAC committee recommendation on the criteria for the determination of commercial availability for organic seeds. Uh, and then I would also welcome any comments on the recommendation as it pertains to the ACA’s role in determining commercial availability.

MS. CAROE: Uh...

MS. ANDREA CAROE: Okay. I just want to reiterate the reason that this is so important and we want to get this out there, and we want to get this voted on so quickly is we now have a robust list of materials on 606, and we have been well criticized for having a robust list on 606, but as we’ve always said from the very beginning, just because a material is listed on 606 doesn’t mean that it’s allowed, it means it’s allowed for consideration if it is commercially nonavailable in an organic form. So in order to finish off
that second piece, to have that second layer which
will effectively keep organic growing, we need
this document to add consistency across
certifiers. So it is truly important that we do
this. The 606 list took priority to keep organic
commerce undisturbed, but at this point to protect
organic, we have to have a guidelines for what --
or establish an expectation on what that
commercial availability sourcing effort must look
like. So I have been -- I’m actually -- I
understand the comments that were received on
seed, I understand that this document’s not going
to move forward. I personally am upset that I’m
not going to be able to vote on this, because I
think it’s that important.

MALE VOICE:  What?

FEMALE VOICE:  Well, the Board --

FEMALE VOICE:  No, no.

FEMALE VOICE:  We were going to decide
that now.

MALE VOICE:  That’s not a done deal.

MS. ANDREA CAROE:  Okay. All right.

FEMALE VOICE:  Yeah.

MS. ANDREA CAROE:  Okay.

FEMALE VOICE:  We’re gonna

[unintelligible].
MS. ANDREA CAROE: I do -- I truly think that we need to move forward with -- on this, and that's not to move forward without a well thought out document, I think there's been a lot of thought put into this, but it's needed, desperately needed, very quickly in order to keep that standard where we need -- where we expect it to be.

MS. BEA E. JAMES: I would just like to ask --

FEMALE VOICE: [Interposing] Uh huh.

MS. BEA E. JAMES: . . . for comment from anybody on the Crops Committee as far as your opinion on the recommendations. So, yeah, Gerry.

MR. GERALD A. DAVIS: I would heartily recommend that we split out the seed and work together on it for a later meeting. I under -- I respect the need for the 606, the pressure that puts on it, and I agree. We need to pull the seed out of there. I mean, we could really stumble the seed industry -- the vegetable seed industry is the most complicated one, and we don’t want to do that. We want to proceed in a way that won’t hurt the industry, and we really could do damage if we’re not careful in how we craft what we’re doing. Or it would never come out of rule making,
for example.

FEMALE VOICE: Rigo?

MR. RIGOBERTO I. DELGADO: Just want to echo what Gerry was saying. We’re dealing with two different animals. Or seeds, or ingredients, whatever you want to call it, but for the purpose of having clarity I think it makes sense to create two documents and involve the Crops Committee in the seeds discussion.

FEMALE VOICE: Joe, and then --

MR. JOSEPH SMILLIE: No, I [unintelligible].

FEMALE VOICE: Oh, Tina.

MS. KRISTINE ELLOR: Yeah, I absolutely agree. I think it’s a much more complicated -- just in terms of sheer numbers, issue with the seeds, and it would be great to get, you know, a lot of input from, you know, certifiers who -- a lot of certifiers have talked and -- talked to us about it that we could separate seeds out and get the Crops to be involved, that would be a wonderful idea.

MR. JOSEPH SMILLIE: We agree. In fact, that was our initial thoughts, but because of the urgency we were handled -- or the CAC was handed commercial availability and I was going Gerry,
Gerry, where -- couldn’t find him. Anyhow --

MS. KRISTINE ELLOR: He was out on the farm somewhere.

MR. JOSEPH SMILLIE: With a chainsaw. I think he was getting the chainsaw repaired that day, if I recall. But anyway, but we’ve got some choices here, and neither of them are pretty. The one choice is to move ahead with this as a recommendation. We recognize that it -- there’s flaws, and there’s problems in it, but there’s nothing here that binds anyone, and I do not think that it does any damage. We don’t have statutory authority in this area and it puts it out there, and I guess it’s more of a question -- and then the other thing is to just, you know, back to committee, divide it up, and having nothing to move forward with. So I guess my question is, to those with more experience, is can we put this document out there, knowing full well there’ll be another document coming along later.

MS. BARBARA C. ROBINSON: What kind of -- setting aside the seed issue, what -- did you get favorable public comment -- did you get favorable comment on the rest of your criteria for the rest of your commercial availability? What sort of reaction did you get? I don’t --
MS. BEA E. JAMES: I think that there were mixed reviews. We actually had a couple of favorable comments as far as keeping seed in the recommendation.

MS. BARBARA C. ROBINSON: Well, I mean, did --

MR. JOSEPH SMILLIE: [Interposing] On the other hand --

MS. BARBARA C. ROBINSON: [Interposing] Was this going to be helpful to operators and to certifying agents? Was that the general feedback that you get? Aside from the seed.

MR. JOSEPH SMILLIE: We got some very, very good comments. The quality of the comments were really excellent, and it’s just -- if we would have had two days between getting these comments and putting out a recommendation I think we would have come up with a great document.

MS. BARBARA C. ROBINSON: Well --

MR. JOSEPH SMILLIE: [Interposing] Unfortunately we don’t have that time. It’s like we can only meeting until, you know, 2:00 in the morning kind of thing, but the --

MS. BARBARA C. ROBINSON: [Interposing] Because the reason --

MR. JOSEPH SMILLIE: . . . but the --
okay.

MS. BARBARA C. ROBINSON: ... the reason I say this is because I’m wondering if what we shouldn’t do -- because it sounds like what I’m hearing is okay, now we’ve got the list of materials on 606.

MR. JOSEPH SMILLIE: Yeah.

MS. BARBARA C. ROBINSON: But we don’t really have a good way to activate the list, is what you’re saying is where we are, right, Andrea?

All, you know --

MS. ANDREA CAROE: [Interposing] Actually it’s not activate the list, it’s temper it down.

MS. BARBARA C. ROBINSON: Well, we don’t have a permission -- we don’t have the levers --

MS. ANDREA CAROE: [Interposing] We need a filter.

MS. BARBARA C. ROBINSON: Right.

MS. ANDREA CAROE: We need a filter.

MS. BARBARA C. ROBINSON: Right. We need guidance for knowing when to use those materials. What I’m -- I guess what I’m getting to is maybe there’s a way we can still work with the Committee, you know, break out of here, get the seeds part out, and publish guidance here until you get back to something a little more formal,
but in the interim pull out -- pull the seeds portion out and publish it as guidance for the community, for operators, and for certifying agents to use.

MS. BEA E. JAMES: Yes. So we have two choices; one is to send it back to the Committee and reintroduce it as two separate recommendations, one on seed, one a cleaned up version of our recommendation with really taking into account the public comment that we got, or we can actually have a mini-working session tonight, we can remove seed, and come forward with the document as it is, and reintroduce it tomorrow.

MS. BARBARA C. ROBINSON: Well, I mean, that’s up to you, but it -- if you don’t do the working session tonight, we could probably do something to bridge the gap until you get to a new recommendation next spring, is what I’m saying.

MS. ANDREA CAROE: Barbara, we’re not -- I mean, this is not recommendation for rule change, it’s only for guidance anyways.

MS. BARBARA C. ROBINSON: I understand that. I understand that.

MS. ANDREA CAROE: So, I mean, but this is what I -- the option that I would suggest is if we can pull out seed, introduce this, vote on it,
it is a guidance, it can be reworked, you know, I mean, it’s not a rule change.

MS. BARBARA C. ROBINSON: Right.

MS. ANDREA CAROE: This is guidance and at least it gets something out there now --

MS. BARBARA C. ROBINSON: [Interposing] Right. Right.

MS. ANDREA CAROE: . . . to start building certifiers’ procedures to get them consistent.

MS. BARBARA C. ROBINSON: Right.

FEMALE VOICE: Julie.

MS. JULIE S. WEISMAN: Yeah, I also -- just while we were sitting here talking, went through this document and there are exactly four places where text needs to be deleted. We have done much more complicated things than that sitting in this room with this on the screen, so I don’t -- you know, it could be done fairly easily done tonight, it could probably even be done now.

MS. BEA E. JAMES: I’m comfortable with that decision if the rest of the Board is comfortable, and our Committee is comfortable with that. And then that way we take it back to the Crops Committee and we do a joint recommendation for next spring on seed, specifically. So we’d be
able to put forward guidance at this meeting for a vote.

FEMALE VOICE: Do we need to, like, find out -- vote?

FEMALE VOICE: No.

MR. DANIEL G. GIACOMINI: I would just like to request that either there be someone with livestock background on the Crops Committee, or you include someone -- you include the Crops Committee also -- I mean, the Livestock Committee also. You know, when these -- when dairy farmers and beef people are looking to reseed, they’re scrambling, you know, if they’re rotating with corn silage or some other crop, corn, soybeans, and they’re rotating that with pasture, there’s a period of time where they’re scrambling to, you know, fast growing grass, grow -- growing -- slow growing grass, legumes, a number of different things, it’s not an easy thing to just put together when you’re going to have to be doing it from a number of different sources, partly organic, partly not. I think it would be a value to have some of that perspective.

MS. JENNIFER M. HALL: There may be more,
but I know Jeff is on both Crops and Livestock.

MALE VOICE: Kevin’s a dairy farmer. I would highly suggest Kevin to be on that.

MS. BEA E. JAMES: We can determine that later, but I definitely will take that into consideration, adding in the Livestock Committee as well for the seed recommendation. So Andrea, at this time I guess I would like to leave it that the way that this recommendation stands is that it will go back for some editing -- deletions, editing, and I also want to just assure the public that we also are going to be looking at some of the excellent public comment that we got from many of you with your suggestions for this recommendation, and we’ll try to temper the database fear that seems to be out there with a lot of the certifiers, and with that, that concludes recommendation for commercial availability.

MS. ANDREA CAROE: Okay. It’s three o’clock now. I think we should take a 15 minute break. We are about 45 minutes behind -- well, about an hour behind and we can come back and do multi site which we should just, like, breeze right through, right? And then livestock and public comments. So 15 minutes.
[Audio interruption]

MS. ANDREA CAROE: Hello. Board members to the table, please. Okay. Let’s reconvene, and the next item on the agenda is multi site certification -- multi site operation certifications with the CAC.

MR. JOSEPH SMILLIE: Okay. Now for a nice, quick, easy, noncontroversial item. Multi site certification. Most of you -- I think a lot of people -- I won’t say most of you, but I would guess most of you understand the reason behind this, and I’ll let Tracy, the [unintelligible] of the principal author of our recommendation -- or discussion paper, I should say, give you more of the specific background, but needless to say, it caused great furor in the community, and I think quite rightfully so, because what we have here is a long established organic practice that people have felt worked well for years, and then we had discovered that it doesn’t always work well, so we’re between a -- between something that we really, as a community, believe needs to happen, which is multi site or group certification, as it’s often termed. Something that we really believe is needed that’s appropriate both politically, socially, and economically for a
fairly large segment of the organic community, and
we’ve got a situation where that way of doing
things has been abused, and that’s been improper,
and so what we need to do is go back and look at
it carefully, and find statutory and regulatory
foundation for continuing a practice that’s been
going on -- group certification I’ll call it -- in
the organic community for a long time. But we
need to find a statutory and a regulatory basis
for continuing that activity, whichever way is the
most appropriate. We also need to balance that
with what was, you know, has been well reported
from a number of commentators, we need to make
sure that we’re not just talking about the good
scenario, but also the scenario where that
particular style certification has been abused.
So we also need enforcement activity to make sure
that certification agents hopefully moving forward
with group certification -- ability to do group or
multi site certification, are in compliance with
the regulation and we’ve got a quality job being
done. So we have to balance those two
considerations and come up with a way that is not
only socially and politically just, but also is,
you know, has a statutory and a regulatory basis
so we can, you know, move forward on it and not
have someone else say well, you can’t do that
because OFPA says this, and a District Court judge
agrees with them.

   So that’s the charge we felt we needed to
move forward on, and we have got a number of
great, great comments and, you know, working
groups from OTA, IFOAM [phonetic], ACA, and others
who’ve really done a lot of work in this area,
have contributed a lot of expertise, and I think,
you know, with a sufficient amount of time we’ll
be able to utilize all that expertise and bring it
together.

   But I’ll let Tracy walk everybody through
the introduction, the background, and our current
thinking on the subject.

   MS. TRACY MIEDEMA: Thank you very much,
Joe. I would take exception to one
characterization; calling the comments an
uproaring or furor. I think it’s been very
vigorous and I think we’ve had some excellent
comments from all over the world pouring in, and I
think the real furor came when the plug was sort
of pulled on this construct last year, actually
about ten months ago.

   So I thought I would start out reading
just a little news blurb. This is from May 2nd,
2007, Sustainable Food News. Try to do my best
Dan McGovern voice.

Hoping to soothe anxieties of organic
certifiers and small scale coffee and food
producers in the developing world, the U.S.
Department of Ag’s National Organic Program said
Wednesday that regulations governing the
certification of grower groups remain status quo,
at least until rule making changes can be
discussed publicly this Fall.

So when we adjourned from our March
meeting, this topic was not on our work plan for
CAC. In fact it was May of this year before it
was kicked over into our direction and onto our
work plan. I’m going to continue here.

An OPE deputy administrator, Barbara C.
Robinson, wrote to certifying agents Wednesday to
clarify a recent appeals ruling by the
administrator of the USDA’s Agriculture Marketing
Service, Lloyd Day.

Many in the industry were discouraged by
the initial reading of the administrator’s ruling,
thinking it was the end to group organic
certification of small farmer cooperatives. And I
think many of the people in this room who have
submitted public comments or presented them
already were among this group that was really terrified that what they had relied on and seen built as a very robust, viable means of farming around the world go away.

I want to point out one other thing, and this goes back to October 2006, and this is sort of the precipitating issue.

At issue is an appeal involving a community grower group in Mexico that was seeking organic certification. The grower group was denied certification because among other things, the certifying agency’s policies and procedures were inconsistent, quote, within OP regulations. Instead of inspecting each production unit, and this is all going to be important as we talk a little bit deeper about the regulations.

The certifying agent selected a percentage of the producers in a community grower group for on-site inspection, the ruling read. The ruling said that was in conflict with the provision 205.403A(1) whereby each production unit must be inspected.

In January of this year that ruling was construed by our Associate Deputy Administrator as basically a reason to slam the brakes down on this construct of an internal controls system, serving
as a proxy for each individual site being inspected. You go to the first slide.

So I have a really short PowerPoint presentation. In fact, it’s just two slides, and for those of you who can’t see it, it’s a picture of a wagon wheel.

The internal control system functions from a central hub, and I guess, you know, what fell out of this I guess scary situation from October 2006 to May 2007 was a dusting off of the 2002 NOSB recommendation and Barbara’s decision, and please Barbara or Mark, correct me if I mischaracterize any of this. To enstate that as the tacit mans of certifiers being able to continue to certify groups.

But they knew there were some issues. The key issues, and the way Mark characterized this as we don’t have proper optics. We can’t peer into these, so we need to break these things down, we need to understand, we need to be able to break them into pieces, we need to understand percentages, what is a statistically significant percentage of sites, for instance. Looking at that hub, you know, how many spokes of the wheel need to get looked at each year.

As the CAC took up this issue, me and my
freshman Board member, Vigor, decided this looks very straightforward, looks very important and interesting, and I’m going to dive in and learn everything I can about group certification, and my first call when I first entered into this issue, and I mean we’re talking June 2007, not years ago or decades of experience like many of you in this room have, we’re talking this summer -- it immediately became apparent that internal control systems were being used throughout the organic supply chain.

You know, and I knew of certified organic retailers. IFOAM [phonetic] told me about processors and handlers that were using internal control systems, and I started to get a sense of how complex and how broad this construct is applied throughout the organic supply chain. You know, I founded some very nice, exhaustive surveys of their members, for instance, and we saw everything from 6,000 member Ugandan coffee farmers, to where we were seeing, you know, all the way to the opposite end of the supply chain, you know, retailer groups. And in all situations some basic rules had to be followed, and I, you know, I want to just go to the 2002 recommendation because these really have been the rules of the
road for what these need to look like. As far as I can tell.

There really needs to be -- these spokes of the wheel and these various units need to be very homogenous, they need to be -- and most situations have be geographically contiguous. They need to have constant training and education, and there’s many, many metrics that the 2002 recommendation put forth to help guide -- you know, the operating manual for what an internal control system could look like.

But that didn’t get us over this hurdle that 205.403 says that every site must be inspected annually, and we have a -- you know, we have sort of a language problem, so to me very early on it looked like we had a rule making issue. Really, you know, there was some language that was going to have to be changed, Barbara referred to that in her comments to certifiers, and it also was apparent to me that this construct can, should, and does exist throughout organic.

I was very compelled by Michael Sligh’s comments yesterday, and he said, you know, I want to tell you about the history of grower groups. This is not made for monied interests and people who can afford to get every site inspected, this
is -- this was for people who could not afford those inspections. Let’s go back to the traditional reasons why any type of clustering should ever occur. And I respect the history there, you know, and the motivation behind that.

However, that alone would never have been enough to justify those operations becoming certified organic. They still had to legitimately be organic, and some very complex grower groups have become certified organic, so the mechanism has become much more sophisticated.

Other certification programs around the world have gotten really good at this, and there’s, you know, there’s some information to be learned. Not that we want to mirror our program on anyone else, but we don’t necessarily have to, you know, reinvent this wheel and in looking at 205.403, for instance, IFOAM shared their training manuals and there are very rich systems around the country and training programs, et cetera, and so when I approached this recommendation I really thought we need to solve problem A, which is we have a regulatory issue.

We have a very vulnerable construct that’s important to a lot of people that the plug could get pulled on, you know, out of the socket
again based on one bad site visit to a country where, you know, the optics weren’t strong enough, et cetera. And the reason for that is the overwhelming -- I mean, this is -- has been nearly unanimous, I would say, that the construct does have value, and that grower groups should carry on.

So first and foremost, this recommendation says yes to grower groups, but, you know, we were looking at, you know, from the very beginning at more than just grower groups, hence this very wordy title that I think captures more the complexity of what internal control system really is, and these are multiple production units, sites and facilities mirroring the language that’s in 205.403.

So Valerie, if you can go two slides this time.

Another circular shaped object, a snowflake. The spirit of an organic system plan, and I really tried to bring this forward in the recommendation, is that organic system plans are structures that make sense, but every single one is unique. Like a snowflake, they are adaptive, they are responsive, and this is all very much on purpose so that the industry could grow, so that,
you know, we weren’t dealing with just a checking off boxes type organic program, we were really responding to nature, and crops, and in an extremely dynamic, growing industry. And, you know, I would absolutely posit that this structure of the organic system plan, this deal between an accredited certifier and a grower, a person as it said in the -- you know, and a person is going to be anyone throughout the organic supply chain, that the organic system plan is strong enough to meet the unique demands of the system that it’s looking at. And I guess at this point I’ll take the group through a little bit more of the details of the recommendation, as you know, the copy itself. So if you want to pull that up, Valerie. By the way, any of my fellow Committee members who would like to jump in at any point, you know go ahead.

MS. VALERIE FRANCIS: Is that the other document that you asked me to pull up --

MS. TRACY MIEDEMA: [Interposing] Yeah.

MS. VALERIE FRANCIS: . . . off your thing?

MS. TRACY MIEDEMA: Yeah, it’s just the recommendation exactly as it’s -- it was posted to the Federal Register.
MS. VALERIE FRANCIS: Oh, okay.

MS. TRACY MIEDEMA: I just added some highlights [unintelligible] as I wanted to emphasize.

MR. JOSEPH SMILLIE: One other document that did influence me in my contribution to it was the ISO document that I think primarily IFOAM forward to us, and then we got the newer copy, which is more updated, and the ISO approach on multi site, there was a very, very -- there was a lot of congruence between where the organic industry had grown to and the way ISO looks at it. Now, I understand it’s an NOP USDA regulation, it’s not an ISO program, but nonetheless that document was a really solid document, and we took a good look at that and found a lot of congruence, and again the title, which we looked at rather than grower groups, because we were looking at it more structurally and from a regulatory and statutory viewpoint, seemed to fit better and it also, as Tracy just said, fit with the language, which is in 403.

MS. TRACY MIEDEMA: It is. The ISO -- and this is ISO Guide 62 from 1996, and I know there’s an ISO 17021 that’s the more current, but it talks about multi site certification.
We know there’s a rich body of information out there to help us really build out the operating manual. I guess before I get into this I want to make sure people understand that I didn’t take it as our Committee’s charge in these last three months to build that operating manual. That is phase two of this process, and it’s much longer, and that’s -- this is the start of that conversation. It’s well underway, and in fact so many of the public comments gave great feedback on what the operating manual should look like. So, you know, we took a giant step forward but, you know, we still have to deal with the most germane question in front of us right now.

Okay. So if you could keep scrolling down, Valerie, I want to get to page 3 where we talk about the role of the organic system plan, and this is really just some language lifted right out of OFPA. It’s, you know, this is in your books, it might be kind of hard to read on the screen.

But the organic plans means -- the organic system plan is a plan of management that has been agreed to by the producer or handler and the certifying agent that includes written plans concerning all aspects of agricultural production.
or handling.

And Congress envisioned the OSP as a collaborative written management plan that reflected the unique characteristics of the operation. You know, those are -- we’ve got a lot of leeway to make this fit, and the question that I keep coming back to and I don’t feel has been answered yet is within that relationship of the organic system plan, what are the limitations of an internal control system? If it works for the 6,000 member Ugandan coffee farm, why can’t it work in other areas of the organic supply chain?

So I just wanted to point out, you know, what I believe was really Congress’s intent for the organic system plan, and I think OFPA supports that.

The organic system plan is the form through which the producer or handler and certifying agent collaborate to define on a site specific basis how to achieve and document compliance with the requirements of certification. The organic system plan commits the producer or handler to a sequence of practices and procedures resulting in an operation that complies with every applicable provision in the regulations. So while we have something that’s
very malleable, that’s very unique, it’s also very rigorous. I mean, this is holding people’s feet to the fire. If you can keep scrolling down, Valerie, to the role of inspections.

And as you can see from my slide, there – you know, I really wanted to focus this in on the organic system plan and on inspections.

Inspections play an important role in determining whether an OSP is being properly implemented, and Congress mandated that all certified farms and handling operations receive a, quote, annual inspection. And this is from 7 U.S.C. 6506A(5) and 6502, Definitions.

The statute does not define the word inspection, the statute. And the fact that it occurs but once a year indicates that Congress considered inspection more a part of the OSB collaboration between the farmer and the certifying agent, than as the government’s policing of, you know, of the organic label.

This is a really important point here. When we get to -- and I know there was a lot of public comment on that, and I’m still digesting it all as it’s coming in, but when we look at inspections in detail there really seems to be a difference noted in the regs between initial on-
site inspections and annual or renewal inspections.

Now, you know, I was just ignorant enough to think that all inspections looked the same, year after year after year. And I talked with some different certifiers who, you know, assured me that, no, initial inspections do not look like renewal inspections. Initial inspections have things like land history reports, and surveying of perimeters, et cetera, et cetera, and I’m sure there are people in this room who can so clearly articulate the way these initial inspection and renewal inspections look different.

But it’s really important because we need to find a way in 205.403 to make sure that we’ve got a way forward from a regulatory standpoint. And this distinction that’s made in discussing inspections, and the reality that already exists between initial and renewal inspections, means that we’re not rewriting history here in carrying forward with group certification or certification of operations with multiple sites production units and facilities.

We are already there in the spirit, and its very modest language changes needed. I think we’re -- I heard some pushback and I want to hear
more comment on this. I hope our Committee gets much more in the public record.

I actually felt kind of like we were shining a light on something that was a known, but not discussed fact about inspections; that initial and renewal inspections really do look different. But because of the way 205.403 is written, we haven’t really wanted to talk about that.

So you know, I am very comfortable pointing out that in my investigation they really, you know, they look different in many ways.

So if you can scroll down a little bit more, Valerie, to the recommendation proper, that would be on page 6.

What we as a Committee put forth in terms of an actionable item were new definitions added to 7 C.F.R. 205.2 and a clarification of on-site inspections. However, we know that we’re at the beginning of this conversation. We’re not going to pull back or withdraw this recommendation.

What we really want as a Committee is a more robust public record at this point. People didn’t have a lot of time to respond to this recommendation, and it’s an extremely important topic to many stakeholders all over the world. 45 days with a complicated electronic comment
collection system is not enough to solve this or
really, you know, get the kind of robust public
record we need. This might be something that we
end up working on during the whole time I sit on
this Board, frankly, bracing myself for a long
haul here.

But we’ve, you know, the engines are
fired up and it was really exciting to see the OTA
taskforce was way ahead of the NOSB or the NOP
and, you know, galvanizing their members,
gathering information, pulling together quite a
diverse group of stakeholders. IFOAM jumped in,
we had retailer community who -- they know they’re
going to be affected by the outcome of this, so
they’re going to absolutely want to throw their
opinion into the ring. People have really been
generous with their time and expertise, and this
is just really the start of the conversation, so
the way I see this going forward in Committee is
to leave the recommendation posted for more public
comment. For the item to remain on the CAC work
plan, and to take this issue up again in March
2008.

MR. JOSEPH SMILLIE: Do you want to --

MS. TRACY MIEDEMA: [Interposing] I guess
I better finish saying that --
MR. JOSEPH SMILLIE: [Interposing] Yeah.

MS. TRACY MIEDEMA: ... amongst our Committee members -- there were six of us, this was not a slam dunk. In fact, we had three yes’s, one absent, one abstension, and one no with a very strong minority opinion.

FEMALE VOICE: Two nos.

MR. JOSEPH SMILLIE: Two nos.

MS. TRACY MIEDEMA: Two nos?

MR. JOSEPH SMILLIE: Yeah, two nos.

FEMALE VOICE: Three.

MR. JOSEPH SMILLIE: Three, two --

MS. TRACY MIEDEMA: [Interposing] No, we didn’t.

MR. JOSEPH SMILLIE: One.

FEMALE VOICE: Yes.

FEMALE VOICE: Yes.

FEMALE VOICE: It was revised.

MS. TRACY MIEDEMA: When was it revised?

FEMALE VOICE: When Jennifer --

MS. JENNIFER M. HALL: On the website it’s 3-2-0-0.

MR. JOSEPH SMILLIE: One.

MS. TRACY MIEDEMA: Okay. Okay.

MR. JOSEPH SMILLIE: No, one.

MS. JENNIFER M. HALL: One. Sorry.
MR. JOSEPH SMILLIE: 3-2-1.

MS. TRACY MIEDEMA: Okay. At the time --

MS. VALERIE FRANCIS: Can I clarify the vote? Can I clarify the vote? Jennifer had voted. It was a day when our server wasn’t working properly for e-mails, and I didn’t get --

MS. TRACY MIEDEMA: [Interposing] No problem.

MS. VALERIE FRANCIS: ... a whole set of e-mails one Thursday afternoon, and that was one of them.

MS. TRACY MIEDEMA: Okay. Thanks for the clarification. Absolutely not a slam dunk. And, you know, that maybe should have been the point where we, you know, we knew this was a discussion item but, you know, this is an important enough issue that we want to move it forward, and we wanted to take action, and we wanted to get something out that we could collection, you know, opinion from 360 degrees, and that is happening.

MR. JOSEPH SMILLIE: Thanks, Tracy. I think it would be also useful to hear from the person that issued the minority opinion, so Bea.

MS. BEA E. JAMES: In the spirit of visuals I threw together a quick one slide to give the visual on the minority opinion, so I’ll just
let Valerie pull that up real quick.

Scroll down. It’s a -- there you go.

Yeah, the last one word. Don’t open one of my kid’s folders. Videogames.

Okay. So I think one of the big differences here, in case you can’t see that, that’s the internal control system ICS functions from a central plow, and that -- I think one of the things that we had difficulty coming to a consensus on was the idea that grower groups went beyond farmers, and that that’s really where a lot of the minority opinion is coming from, so I’ll just go through real quickly.

That the minority opinion is really looking for further consideration and clarity in the proposed recommendation for multi site operations, and that’s specifically to retain the scope of the 2002 grower group recommendation which focused and was limited to grower groups, farmers only.

And to require complete inspections of all sites annually, and facilities and protection units, with certain considerations granted to farms meeting specific criteria for grower farmer groups, as well as specific details to the criteria for grower groups to provide guidance on
internal inspections should be included and, as Tracy alluded, that this recommendation is not a manual, and that that is definitely something that I think the Committee all has consensus on, is that that’s one of the phase two components of this recommendation that we definitely need.

Next is that there are some assumptions made in what I believe is how the recommendation was phrased, and that’s not to say that I don’t give 100 percent kudos to Tracy, my colleague, for taking on such a huge task and trying to craft this recommendation in her first year. I give her lots of compliments for that, because it’s not easy, and that having this diversity of opinion and getting public opinion to help craft and shape a final recommendation is the healthy part. It’s not always the easiest, but it’s the healthy part of what we try to do as we discuss our recommendations.

So with that, I think that by saying, quote, in the recommendation it says it, in reference to an organic system plan, has also encouraged the participation of final retailers and organic certification, thus helping to bring all of the links in the seed to table organic value chain under one organic program. The use of
an internal control system as part of an organic system plan that integrates multiple sites and production units is consistent with OFPA and provides additional -- provided additional assurances are met, may reduce or eliminate the need for direct observation by inspection of each unit or site operated under an OSP.

And as a retail representative on this Board, I think that that’s where I struggle with this recommendation, because I think that it’s extremely important to certify the handling and processing units of every site, and that it would, you know, there’s different ways that we can look at how to dilute the organic seal and make sure that it really means something, and I think that by not inspecting all production and retail sites, that that would be one way of diluting our organic seal.

I also think that the following statement should be struck from the recommendation; that certifying agents have developed an implemented certification models that are tailored to the various types of operations seeking certification. At the NOP the certification models were based on the NOP’s 2002 recommendation, and are now extended to each -- to reach all links in the
I do not believe that the NOP has approved any new certification models, and that some certifiers may be using and developed, and I do agree that there are perhaps different ways that some inspection agencies are looking at recertification, but I think it’s very important that we acknowledge that annual inspections should be done consistently, and with the same criteria each year, and that a renewal is not a lessening of an annual inspection, particularly when you’re looking at a handling and a processing facility.

In the name of time here I’m not going to go through some of the OFPA sites which really I think would help clarify that this recommendation is not consistent with OFPA, but they are noted on the bottom of the multi -- of the minority opinion. And that’s all. Thank you.

MR. JOSEPH SMILLIE: The Committee would really like to hear from fellow Board members on this. I know a lot of you have heard about this issue, I know that a lot of you have been following the information and the public comments, so we’ve been talking among ourselves for quite a while, and the Committee all knows each other’s
opinions fairly well, and we would really like to hear from fellow Board members as to where you think you want to go with this.

MS. ANDREA CAROE: I hate to be the taskmaster here again. This is a discussion item, it’s not one that we’re going to vote on, it’s not one that we can take action on in this meeting, so I would suggest that we have some discussion, but more elaborate discussion is going to happen after this meeting.

MR. JOSEPH SMILLIE: I concur.

MS. ANDREA CAROE: Thank you.

MR. JOSEPH SMILLIE: I would like a little discussion though.

MS. ANDREA CAROE: Thank you.

MR. JOSEPH SMILLIE: Just to get some --

MS. ANDREA CAROE: [Interposing] Okay.

MR. JOSEPH SMILLIE: . . . you know, like -- I want to hear from my fellow Board members.

MR. DANIEL G. GIACOMINI: I really don’t see the difference between ICS and essentially what have been called I believe turnkey operating systems. That’s what makes Wal-Marts go, that’s what makes McDonald’s go, that’s what makes franchise chains all alike, and I’m very concerned
that something like this, as a mechanism to allow
for multi grouping of entities, just has people
rubbing their hands together.

I’m very concerned with that. My first
inclination in the overall picture is annual
inspections. I can understand situations of
grower groups of -- in a banana plantation in
Brazil or whatever they’re growing. But I think
rather than expanding that, I think we need to --
would be better off more clearly defining what
that exception is. If we’re not going to
absolutely require every plot, that we do define
the percentage of acres that are inspected per
year, the percentage of sites inspected per year.
That every site must be inspected within a certain
number of years.

But the possibility of expanding multi
sites into massive amounts of organizations of
both land and facilities in this country, I don’t
see that as the right way to be going for organic
certification and for the confidence of the
consumer.

MR. JOSEPH SMILLIE: Gerry.

MR. GERALD A. DAVIS: I echo his
statements. I think that the grower group -- the
beauty of what can be done with that should be
kept by itself and not be expanded to other types of operations here in the States.

Mr. Joseph Smillie: Katrina, then Tracy.

Ms. Katrina Heinze: As someone with a lot of experience with internal control systems, in theory I agree with your thought process, but it is my experience that they can either be very strong or not so strong. So I strongly concur with Gerry and Dan, that at this time they should be limited to farms, very -- we should have very well defined criteria for what is a grower group. I agree with -- I would like to see more specificity around the percentages that could be inspected on an annual basis -- of the one concern I have is the language on 403(ii). As I read that paragraph, I read it -- it looks to me like you could not inspect any sites in a particular year. So you may want to look at the language in that paragraph a little bit.

And then one addition. I have great concerns if a certain number of sites are inspected in an annual year, how that is used to evaluate the internal control system, not those individual sites. And so I would like to see something added on that. Thank you.

Mr. Joseph Smillie: Andrea?
MS. ANDREA CAROE: Tracy was next.

MR. JOSEPH SMILLIE: Oh, Tracy. Yeah, I’m sorry.

MS. TRACY MIEDEMA: Well, I guess I want to make what feels like a point of clarification to my colleagues, and I really appreciate the feedback.

This recommendation is not proposing expansion of the construct of an ICS or group certification to retailers. It’s already happening, and it’s happening by accredited certifiers that the NOP has accredited. You know, there seems to have been a tacit endorsement and that it’s working out there for some number of years, and the very first thing I thought was the amount of work that some of these organizations outside of the farming situation have gone through to apply the same principles of homogeneity and strong central management, and have gone -- are so rigorous, and what are we saying now, that we’re going to, you know, throw them overboard and the work that they’ve done because we want to keep this to the people who -- I don’t know, it seems like there’s a little bit of a politicizing of -- some people elicit our empathy more than others, and in a way that -- I just would like to make
sure that we’re looking at this in an impartial manner.

MR. JOSEPH SMILLIE: Andrea.

MS. ANDREA CAROE: The regulation, as it exists today, has one section for inspection, and one section for certification, and they are not operation specific. It’s not an inspection for a grower, inspection for a handler, inspection for a livestock operation, it’s inspection. Same with certification.

So if this group, and again this is all -- this work is going to happen after I leave, but if this group is going to carve out portions of the industry where this is appropriate and where it’s not, I suggest you spend a lot of time with justifying and carving out why it’s okay in one and not the other, when the regulation does not specify these things. So, you know, that’s one of the reasons why, in looking at multi sites, I was a proponent of looking at all of it instead of just a piece. Although typically this has been used with growers and not so much with the processors and the handlers, I was -- since we were addressing a section of the rule that did not distinguish it, for one, and at this point if you were to write this just for grower groups it would
be discriminatory.

It needs to be carved out well, and you need to rationalize why that is; what parts of the requirements cannot be satisfied with this type of construct, and why those requirements can indeed come from the crop section, the livestock section, the handling section, and various. But right now there is only one section for inspection.

MR. JOSEPH SMILLIE: Bea?

MS. BEA E. JAMES: I guess I would just like to reemphasize that if there are current examples in the industry where handling and processing operations are not being inspected annually in their entirety, that that is a violation of the rule and not a model for how it should be done. And that if we take into consideration what people are doing that may not be a part of the rule as a precedent for what should a rule -- what a rule should be, then how can we possibly have any kind of control over what people should be doing? To me that just seems like inconsistent and it -- and I think that in 2002, when the Grower Group recommendation came forward, that it did try to circumvent a model for why grower groups would be an example of a good focus for having grower groups inspected in a way
that would be conducive to making it reasonable
for an environment like that to be able to do it.
So I guess what I’m saying is that I disagree that
the recommendation does not -- is not trying to
push that through. I think the recommendation is
trying to push it through with retailers through
this whole idea that because it’s happening now,
that we’re just going to document it and say it’s
okay.

MR. JOSEPH SMILLIE: Barbara.

MS. BARBARA C. ROBINSON: Let me just
reiterate that currently we haven’t changed this
rule. Annual inspections of every site is
required. I don’t -- I’m not really too sure
about this so called tacit approval from the
program that something less than that has been
granted, because I didn’t grant it, so I don’t
know where that’s coming from.

MALE VOICE: [unintelligible] you’re busy
with FOIA.

MS. BARBARA C. ROBINSON: Yeah, maybe
we’ve been too busy with FOIA. But let me just
remind you of this; you know, all I -- and then
let me just suggest to the Board that you need to
really get back on schedule here. Far be it for
me to remind you of your own schedule, Madame
Chair, but it is 10 after 4:00 and you do have the public waiting here to comment.

But, you know, where I sit every day increasingly -- increasingly I am getting phone calls, letters, e-mails about consumer concern about imported product, you know, this program is taking every opportunity it can to weaken the standards. My goodness, you people can’t do your jobs. You seize every opportunity there is to weaken the standards, and I’m just, you know, it seems to me -- I just have got to go on record here but to suggest that what we should do not, at a time when the most visible step here is to at least require one inspection per year. One. Just one. And now you want to say well, the heck with the inspection. I mean, what do we do next, self certify? We say -- I think I’ve met all the requirements of the National Organic Program Regulations, so I’ll write to my certifying agent and say I filled out the forms, send me the certificate, here’s my money.

And I don’t -- I shouldn’t sound so snippy about this, but you know, I really shouldn’t but sit at my desk someday. I mean, these are the kinds of concerns that I get, you know, the integrity of the label, the integrity of
the standards, what does the seal mean and where’s your compliance and enforcement. It’s through the inspection process. It’s through -- somebody’s go to get out there and look --

MS. BARBARA C. ROBINSON: You know, we were willing to issue the temporary guidance, the 2002 Board recommendation as temporary guidance for grower groups, and even that gives us a little bit of heartburn, but you know, that’s -- those are for -- at least there we were talking about very, very small producers of contiguous farms and that sort of thing, and even there for some reason it’s okay for the coffee grower in Columbia, but the minute he goes over to China everybody has a heart attack.

So you know, now you want to bring him back to the United States, but the same producer in the United States, if he was an herb farmer, he would be getting an annual inspection. But not if he was a coffee grower in South America because apparently he gets to be -- he gets to get out from under it. But if he’s here in the United States he pays his dues.

So I have trouble following this logic.
MR. JOSEPH SMILLIE: Stay tuned.

MS. BARBARA C. ROBINSON: Anyway, I would suggest since -- I would like to suggest, since it’s not being acted on now, you know, maybe you continue to think about it. We’ll continue to think about it, but you might want to just keep moving on.

MR. JOSEPH SMILLIE: We are, and we’re not going to leave this issue in the near future, so Tracy, five years of hard time, no time off for good behavior.

MS. ANDREA CAROE: That concludes the CAC’s report. So we are moving on to livestock, and you have two items, on discussion item, one recommendation?

MR. HUBERT I. KARREMAN: Yes, and I will keep it very short actually. I believe I can. Two items, two minutes, how’s that? I get a piece of chocolate if I do good? Okay. I had my ice cream. Ooh.

[Background noise]

MR. HUBERT I. KARREMAN: They make the best chocolate. Okay. So we -- just a quick discussion item. Yeah, on the symposium, kind of a follow up -- wrap up. I think most everybody in the room would agree that we had a very
informative, very good, if not excellent symposium, so I want to thank the USDA for allowing us to have that, and our panelists who came, as well as the Livestock Committee for helping get that all prepared. And we will be working on those two issues of the feed and the net pens, and hopefully come up with a recommendation for the Spring meeting. It’ll definitely be on our work plan. Pretty much number one.

And the second item -- I’m sorry. If there’s discussion on that? I’m sure we’ll have some more public comment in a little while anyway.

Second item is that the Livestock Committee will be recommending tomorrow that we accept the aquaculture working group’s supplement to the interim final report for bivalve mollusks, which will set the stage for yet another symposium. No, it won’t. We don’t think so, but -- and that is a 13 or 14 page report here from the AWG, basically talking about bivalve mollusks in general. The organic system plan for their production. The origin of them. Forage production, contamination indicators, animal health care practices, living conditions, bivalve growing facilities, harvesting bivalve shellfish,
and handling and transport of them.

And the one issue that probably -- it seems like a fairly benign topic, but I think the harvesting practices brought up some questions because you are actually raking up, you know, the sediment, but I don’t think that’s insurmountable. But anyway we’re going to recommend to accept that tomorrow. And if there’s any discussion on that within the group. And I do know that George Lockwood is back there with a presentation, but honestly George, in the interest of time, if that’s okay, I’m sure you have a public comment, or hopefully you do. No? Okay. So if there’s any discussion on that bivalve mollusk document that we’re going to receive tomorrow, officially? We approved it six to zero. Oh, Bea has a question.

MS. BEA E. JAMES: We’re just voting to accept --

MR. HUBERT I. KARREMAN: [Interposing] Yes.

MS. BEA E. JAMES: . . . the -- yeah, we’re not --

MR. HUBERT I. KARREMAN: [Interposing] That is correct.

MS. BEA E. JAMES: Okay.
MR. HUBERT I. KARREMAN: That’s right.

Just like we did at State College for the big one that they gave us, yeah. And that’s it for the Livestock Committee.

MS. ANDREA CAROE: Thank you. I think you went 2-1/2 minutes, but being particularly benevolent that I am, I will give you the piece of chocolate anyway. Okay.

MR. HUBERT I. KARREMAN: Let’s move on.

MS. ANDREA CAROE: And in the spirit of being benevolent, I have two commentors that have airplanes to catch, and I’m going to let them sneak up to the front of the list. We’ve all tried to make airplanes so just, you know.

MR. HUBERT I. KARREMAN: Be late anyhow.

MS. ANDREA CAROE: Bring your goodwill.

So I have Peter — I can’t read your handwriting.

MR. PETER VAN WYK: Van Wyk.

MS. ANDREA CAROE: That’s you.

MR. PETER VAN WYK: That’s me.

MS. ANDREA CAROE: You’re up, and then on deck is Rob Everts. Yes, I need to actually read the rules of engagement or so — just hold on one second. I think it’s page 17 of the policy manual.

Okay. Oh, it’s not. See what page on
the manual do I find. Here it is. Okay. Quickly
I need to read the NOSB Policy For Public Comment
at NOSB Meetings.

One, all persons wishing to comment at
NOSB meetings during public comment period must
sign up in advance.

Two, persons will be called upon to speak
in an order -- in the order they signed up. Well,
we know I just kind of fudged that a little bit.

Okay. Three, unless otherwise indicated
by the Chair, each person will be given five
minutes to speak.

Four, persons must give their name and
affiliation for the record.

Five, a person may submit a written proxy
to the NOP or NOSB, requesting that another person
speak on his or her behalf.

Six, no person will be allowed to speak
during the public comment period for more than ten
minutes.

And seven, individuals providing public
comment will refrain from any personal attacks and
from remarks that otherwise impugn the character
of any individual.

Okay. With that, Peter.

MR. PETER VAN WYK: Okay. Thank you very
much. I appreciate your allowing me to go early and catch my plane. My name is Peter Van Wyk, and I’m a biologist working for a small start up coming located in Florida called Scientific Associates. And our company has been working for a couple of years to develop a system for producing marine shrimp in closed, recirculating aquaculture systems. Yesterday David Guggenheim of One Planet, One Ocean spoke of his epiphany that the future of sustainable aquaculture is in closed, recirculating, aquaculture systems. We are in complete agreement with David’s analysis. We have chosen this approach because we feel that closed, recirculating aquaculture systems offer the best opportunity to minimize the environmental impacts of shrimp farming and to produce a safe, tasty, and wholesome product utilizing sustainable production techniques.

Our goal is to provide consumers with an environmentally friendly alternative to the imported shrimp grown in traditional pond base systems, whose spotty environmental record is well known and well documented. We believe that closed recirculating aquaculture systems allow shrimp to be grown in a manner that is highly consistent with the goals of
the National Organic Program, and ultimately hope
to be able to market our shrimp as USDA
organically certified.

    We would like to take this opportunity to
voice some of our concerns to the NOSB before you
adopt a set of rules for organic aquaculture.

    My comments today have to do with the
national list, as it relates to aquaculture
production systems. We believe that as the NOSB
considers the organic standards to be used for
aquaculture, there should be a revision of the
national list to include certain substances that
are currently barred from use.

    Substances approved for use [clearing
throat] excuse me. We believe that there should
be a revision of the national list of substances
approved for use take into account that there are
fundamental differences between terrestrial and
aquatic environments, and also that the
environmental requirements of terrestrial crops
and marine or freshwater, aquaculture crops, are
distinctly different.

    Let me offer a couple of examples.
Currently calcium chloride and potassium chloride
may only be used in special situations such as the
treatment of plants with a physiological disorder
that limits their calcium uptake ability. I believe that the justification for the prohibition of these chemicals is their potential for chloride -- contamination of the soils with chlorides.

However, in the case of marine shrimp production in a closed aquaculture system, our crops are grown in a saline environment. Over the course of time, shrimp extract minerals such as calcium, potassium, and magnesium from the water, depleting the concentrations of these ions from the sea water.

We believe that we should be allowed to selectively replenish the supply of naturally occurring minerals in the sea water, using calcium chloride, potassium chloride, and other sources of inorganic ions.

This kind of use does not represent any threat to the environment, as these are tank based production systems with zero exchange -- discharge to the environment.

A second example of a prohibited substance is ozone. Currently ozone is prohibited except for the disinfection of irrigation tubing. In closed aquaculture systems ozone is the most effective water treatment for reducing bacterial
loading in the water, and its use makes it possible to maintain the health of animals without resorting to antibiotics.

Properly used, ozone is consumed as it oxidizes organic matter in the system. Ozone contact devices can be outfitted with ozone destruct units to ensure that there is no release of ozone into the atmosphere. This application of ozone was not considered when the standards were developed for terrestrial aquaculture products.

These are just two of the chemicals on the national list that have uses in aquaculture that are far different from their uses in traditional forms of aquaculture and which we believe merit further consideration. We’d be happy to assist the NOSB in identifying chemicals on the national list that have different uses from -- in aquaculture systems and different risk factors associated with their use.

We understand that we will need to file petitions for the addition of certain substances to the national list, specifying how they’re to be used in aquaculture applications, but we just want to make the NOSB aware of the fact that when an aquaculture organic standard becomes available, a whole new set of materials may need to be added to
the national list.

MS. ANDREA CAROE: Well, thank you very much.

MR. PETER VAN WYK: Thank you.

MS. ANDREA CAROE: And we are prepared. We understand that with the inclusion of aquaculture there becomes all new materials that we will expect to see in petitions, and that luckily we do have the mechanism already in place to evaluate these materials and list them. I’ll note, Hue.

MR. HUBERT I. KARREMAN: Yeah, I mean, they want there to be a petition, which you’re well aware of, and they’ll have to meet the seven criteria of OFPA, just like anything else. But also, like potassium chloride and calcium chloride, I’ve learned through calcium bora gluconate, and things like that, that they’re electrolytes so you might be able to use them anyway. Electrolytes are allowed for livestock. Learned that. Paralegal learning here. Anyway, just -- yeah.

MR. PETER VAN WYK: We look forward to working with you guys over the next, you know, few months to try to determine which chemicals actually need to be petitioned and which ones can
be used under existing regulations, and then try
to follow through on the petitioning process.

MS. ANDREA CAROE: We appreciate that you
are watching the process and are staying with us.
It’ll be a while before this is implemented, so
we’ll have some time to start looking at that, and
thank you very much. Any other comments?
Questions? Thank you very much, and I hope you
make your flight.

Do we have Rob Evert? Okay, Rob, you’re
up, and up next then is Joe Dickson with proxy
from Margaret Wittenberg. Joe, are you in the
room? Do you see Joe?

FEMALE VOICE: He was just here.

MS. ANDREA CAROE: Joe? He’s there?

MR. ROB EVERTS: Thank you. My name is
Rob Everts, I’m President and Co-director of Equal
Exchange, here to talk about the grower group
certification. Equal Exchange is the largest fair
trade company in the United States. We have
direct relationships with 33 small scale farmer
organizations in 19 countries throughout Latin
America, Africa, and Asia. Founded in 1986 we
were the first company in the country to offer
fair trade coffee. We now import over five
million pounds of coffee and several hundred thousand pounds of coca beans, sugar, and tea every year.

This year we also began selling organic almonds, pecans, and cranberries grown by family farmers in the United States. Certified organic products comprise nearly 90 percent of our sales, and the vast majority of organic coffee and cacao throughout the world comes from small farmers.

As a company, Equal Exchange prides itself on the direct, long term relationships that we’ve established with our trading partners. We’ve worked closely with some of these groups for 10 to 15 years, and can attest to the farmers’ hard work and dedication to protect the natural environment, improve the quality of life for their families, and provide consumers with the highest quality organic food products.

Each year we travel to source to visit with the cooperative members. We meet with the farmers, attend co-op meetings, participate in quality control trainings, and visit the farms’ processing centers, storage facilities, and dry mills. We stay in the farmers homes. We observe first hand the cultivation and processing methods used.
We have found that most farmers have assumed the organic requirements with considerable seriousness and a strong degree of pride in their accomplishments.

In some cases the farmers have shown us the methods they have adopted as part of their participation in the organic program. In other instances, however, the methods being practiced stemmed from cultural norms that go beyond the necessity of meeting certification requirements.

For example, in many indigenous cultures the farmers have a deep respect for Madre Tierra, Mother Earth, and articulate with tremendous understanding and concern the interrelatedness between farming practices, our health, and the health of the natural world in which we live.

Now our view on the proposed NOSB recommendations. We would like to thank the CAC for its thoughtful consideration of the grower group certification issue, and express our support for your attempts to protect the integrity of the organic label.

Equal Exchange is a member of the National Organic Coalition and is in agreement with the statement that the NOC is submitting for your consideration. We believe that the grower
group certification system has been working well for many years, and that additional guidelines could serve to strengthen it. A fundamental question is how do you certify large swathes of land, whether it’s owned by 400 people, 10 people, or 1 person. Most of the farmers in the cooperatives Equal Exchange works with own five to seven acres of land. The farms are in isolated areas where roads, electricity, and other infrastructure is limited or nonexistent. As we’re all aware, the organic requirements are strict and labor intensive, and due to the distances between farms, the cost to complete an inspection can be very high.

We believe that most of our trading partners have a serious commitment to organic production, but fear that rising costs could be a prohibitive factor in their facility to continue on this path. They have told us that without group certification, the increased costs associated with the need to have every farm individually inspected on an annual basis would in effect cause many of them to abandon their organic programs.

As nearly 90 percent of our sales are organic, we fear this could put us out of
business. We view the internal control systems as an additional layer of oversight for the grower groups. You are already aware, I believe, of the training, the inspections, and the documentation requirements. In human terms, the peer pressure is real. Knowing the people you inspect actually helps, and it’s harder to pull the wool over their eyes. The message is clear; if you cheat we all lose.

Further, since individual farmers do not know which farms will be inspected by the external agents, they must behave as if their farm will be selected in this sample, so we view this system as an additional layer of protection for ensuring compliance.

Still, if people are found to be out of compliance they must pay the price. This proves that the system works.

To conclude, organic agriculture provides some of the highest incomes for people in the rural areas in the developing world. Most of this is small scale. We strongly believe that the current requirements could be tightened, but that the system as a whole should not be eliminated.

We respectfully ask the NOSB to consider the extreme diligence that most small scale
farmers apply in carrying out the requirements,
the expertise of the certifying agencies in
determining the correct number of farms to be
inspected, and the importance of continuing a
certification system which will allow small scale
farmers to continue to supply U.S. consumers with
high quality, organic products. Thank you for
your consideration.

MS. ANDREA CAROE: Thank you. Comments?

Hue.

MR. HUBERT I. KARREMAN: Something I
thought of during that whole other discussion we
had, but since you’re bringing it up here and
you’re using the term that came through my head at
that point is -- and since you can’t discriminate
between, let’s say the developed United States,
and where we might not want to have grower groups,
but in the developed world I -- in the developing
world perhaps somewhere, if it’s ever written up
as a rule change or whatever, where there’s lack
of infrastructure, lack of basic things in
infrastructure, possibly there could be a grower
group type certification, such as what you’re ten
miles away from a main road, there’s, you know, no
electricity, blah blah blah. I mean, some kind of
definition, but hinge it on infrastructure, or
actually lack thereof. And I don’t think you’re going to find that in the United States anymore, but you will find it in other countries.

MS. ANDREA CAROE: I think that’s the type of work that needs to be done between now and the next meeting is that type of pulling those thoughts out and trying to sort them out. Is there any other comments? Bea.

MS. BEA E. JAMES: Thank you for coming today and your comments. I wanted to ask you about the organic almonds that you’re selling, and I’m curious if you’re purchasing pasteurized almonds.

MR. ROB EVERTS: We are purchasing almonds from Big Tree in California and they are in complete compliance with all the latest rules in that regard. That’s what I can say.

MS. BEA E. JAMES: Okay.

MR. ROB EVERTS: I saw some e-mails go back and forth between our person and their person, and I was copied on a couple of these things, and I know that we had to explain to our people why we’re going along with their recommendation, but they’re in compliance with whatever latest rules were imposed. I should -- I apologize for not having a first hand
understanding of that one.

MS. BEA E. JAMES: No, that’s okay, I just was wondering if maybe you were focusing on exempt smaller farm almond farms where you were purchasing, but it sounds like you’re just --

MR. ROB EVERTS: [Interposing] They’re --

MS. BEA E. JAMES: [Interposing] Yeah.

MR. ROB EVERTS: They’re pretty small scale out there, but yeah.

MS. ANDREA CAROE: Rigo.

MR. RIGOBERTO I. DELGADO: Going back to the topic of defining grower groups. In your mind what makes a grower group, and forget about finding that grower group in Chile or Peru or wherever. Even the United States. In your mind what makes a grower group different, and I assume this grower group owns collectively 1,000 acres. What makes that group different from a farmer who -- organic farmer who owns the same amount of land?

MR. ROB EVERTS: I think it should be very much in play that farmers who belong to, for example, an organized group in the United States like a cooperative -- dairy cooperatives, for example, who are in the same geographical area, who market through the same system, who process
using the same systems, who use the same inputs, we’re very fair game for groups like that in the United States made up of individual farmers to seek access to the group certification.

Individuals, I’m just calling random individuals, I mean they wouldn’t -- I don’t know who they’d be seeking group certification from, but I would say for people again, similar inputs market the same way, sell the same product, same contiguous areas, these are all the elements that come into play right in determining what’s appropriate for these definitions.

In our experience again working with the almonds and pecans just began earlier this year, so this -- our experience really is overseas, and it’s third world, and when I say organic agricultures provides one of the highest incomes, it is all relative.

MS. ANDREA CAROE: Dan?

MR. ROB EVERTS: It’s all relative.

MR. DANIEL G. GIACOMINI: Regarding grower groups, and in your experience, and the way you see the picture working, let’s say you have 100. I don’t know how many are in -- of individuals in plots are in your grower group. You have the organic certificate, correct?
MR. ROB EVERTS: The group has the
certificate.

MR. DANIEL G. GIACOMINI: The group has the certificate. If one of them in the group is found to be in violation, where is -- who is penalized?

MR. ROB EVERTS: The group feels threatened at this point, and other certifiers may speak to exactly what happens if 1 -- if there’s 50 people in a group, 1 is found out of compliance, is that person singularly thrown out? That’s where the risk assessment is negotiated between the certification agencies and the grower groups and what their internal control system looks like.

If that’s an area that should be tightened up in some way, based on communication between certification agencies or something like that, I think that’s all fair game for improvement, but the --

MR. DANIEL G. GIACOMINI: [Interposing]

How --

MR. ROB EVERTS: . . . internal control system itself would be the one --

MR. DANIEL G. GIACOMINI: [Interposing]

How many violations do you think you would need to
have on different members before --

FEMALE VOICE: This is not a
[unintelligible].

MR. DANIEL G. GIACOMINI: Well, but it is
a question. I mean, it’s part of this whole
grower group process. If Kevin has one cow that’s
a problem for her organic certification, yeah, the
cow’s thrown out, but so is Kevin. And if they
have -- if -- okay.

MS. ANDREA CAROE: I understand this is --
but you’re asking certification questions. I
mean, those are questions that we can ask the
certifiers that participate in group certification
or have in the past. But I don’t know that -- and
I’m speaking for you, but I don’t believe that
this is your expertise and what you’re coming here
to talk about.

MR. ROB EVERTS: Right. That’s where --
and given a place and a track record and history
of an organization where it’s recently been around
the block many times, large, small, they need to
negotiate within their organic plan. They make
the call on risk assessment, who’s -- maybe even
how those penalties, you know, happen.

MS. ANDREA CAROE: Is there any further
questions? Any further?
MALE VOICE: Kevin does.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Just quickly. I’ve been -- I’m a grower group newbie, so I thought it’s better to just be quiet until I learn more about this, but the thought has run through my head, exactly what Dan has said; what prohibits this from happening in the United States, and how can you write a rule that is so biased like that and doesn’t open up a can of worms with a co-op being able to certify all its farm under its banner with just certain numbers of them certified every year?

MR. JOSEPH SMILLIE: It’s got to be an identical OSP. That’s what is missing in this conversation. U.S. growers don’t have identical OSPs. They’re going to be different. They’re individuals, they own their land. Even if they’re part of a marketing cooperative and are very similar and good friends, cousins, brothers, sons and daughters, it doesn’t matter. They’ll have different OSPs for the farm. You’re looking at a situation that these farmers are identical in their OSPs; their organic systems plan. What they use, what they grow, how they grow it, there’s a significant difference.
If you took that criteria and applied it to even how to write a colony, which is the closest I’ve ever seen to it, then you would find different OSPs because U.S. growers have their, you know, some buy this material from that salesman, some buy different material. You’re looking at identical OSPs in the grower group situation that he’s talking about. There’s a distinct difference. It’s not a question of, you know, it’s okay for Colombians and not okay for Americans, this is different farming systems involved, and I think the key word is identical OSPs. But I know Andrea’s losing patience with this conversation, but I just had to say that.

MS. ANDREA CAROE: I am. I’m sorry. I know that there’s a lot to be discussed here, I wish we had more time for it, and Kevin, I really -- I don’t want to put this off but I’m really more focused now on our vote items, this meeting, and making sure that we get all that comment.

FEMALE VOICE: We can join the call.

MS. ANDREA CAROE: I appreciate you coming here and I would hope that you can make it to the Spring meeting, because this topic will still be there.
MR. ROB EVERT: Thank you very much.

MS. ANDREA CAROE: Thank you very much.

Next up is Joe Dickson. On deck is Mark Kastel. Mark, are you here? You’re Will Fantle. Okay. All right. Joe.

MR. JOE DICKSON: Hi. My name is Joe Dickson, I’m Organic Programs Coordinator at Whole Foods Market. I’m also holding a proxy from Margaret Wittenberg and I’d like to speak for ten minutes. I’ve just circulated three documents to the Board. One is a letter from one of our suppliers, one is a letter from Margaret, and one is a longer version of the comments that I’m about to give today.

First off I’d like to express our company’s support of the recommendation on standardized certificate information. As a certified retailer we verify and update certification files every year for every single organic product that we sell in its unpackaged form.

Without standardization these certificates are incredibly challenging to review and interpret. The Committee’s recommendation would directly improve efficiency in the flow of organic products and enhance the overall integrity
of the organic market.

My main comment today, however, is about the Accreditation Committee’s recommendation on multi site certifications. Whole Foods Markets strongly supports this recommendation, which proposes to update the existing and fully functioning certification protocol for organic operations that operate multiple sites.

I’d like to focus on two key points today. First, we have and we will continue to support small scale farmers which aggregate their products in order to process, distribute, and market these products. This recommendation will allow such operations, largely smaller producers in developing countries, to continue to access the U.S. organic market while maintaining organic integrity in their operations.

Second, as the country’s first national certified organic retailer we developed an organic compliance plan under which our retail operations are certified, using a strong internal control system as the backbone of the certification. This recommendation properly clarifies the role of an internal control system for handlers, and in particular retailers certified under the group or multi site certification model.
The Committee’s recommendation strongly defines the roles and responsibilities of a certified client’s internal control system as an integral part of the compliance system. The ICS enables the certifier to ensure that the organic system plan is being followed, and organic integrity is being upheld in all units of the system throughout the certification year.

I’d like to spend a few minutes describing Whole Foods Markets’ organic compliance plan and its internal control system to demonstrate that a well implemented multi site certification protocol provides just as much, if not greater, compliance monitoring and continuous improvement as a traditional single site certification.

Although the final rule provided an exemption from certification for retailers, we opted to forego that exemption. We believed at the time and now, that our customers would benefit immensely from knowing that everyone who had handled their food had been certified by a third party, rather than everyone accept the retailer.

We designed our organic compliance plan shortly after the implementation of the final rule in 2002, and tailored it to the specific oversight
mechanisms favored in the final rule.

We became the first national retail chain to be certified organic when QIA accepted our organic system plan, inspected our company, and a set of our stores, and issued our first certificate in 2003.

The organic compliance plan we designed ensures that the regulation is followed in all areas of our retail operations, including purchasing, record keeping, storage, preparation, merchandising, and marketing.

In general we designed an OCP that ensures that our employees in every department of every store are trained and equipped to preserve the organic integrity of everything we sell. The success of this system hinges on our -- and our certifying agent’s ability to monitor and address compliance at each of our over 200 stores. Our internal control system, the compliance monitoring program at the core of our retail certification, provides us with this ability.

The internal control system, as implemented at Whole Foods Markets, increases the value of the inspection process, and improves the integrity of the audit trail. It also establishes feedback loops that provide for continuous
improvement throughout the inspection year in a
way that annual inspections do not.

Each month every retail location is
visited by an organic compliance auditor. Over
the course of the three to four hour audit, every
department is evaluated on a number of criteria
which measure the store’s adherence to the retail
OCP and the national organic standards.

Criteria include the documentation of
sanitation practices, protection of organic
products from contamination and commingling,
training of employees, marketing and merchandising
practices, and the compliance of pest control
practices.

The auditor then files an electronic
inspection report with the leadership of the
store, the company’s regional leadership in charge
of that store, and my office. This report enables
the company to identify and address known
compliances and other improvement opportunities
immediately.

The auditors in my team also review
subsequent inspection reports to monitor for
repeat noncompliances and take appropriate action.

The auditors themselves are a group of
highly trained quality assurance professionals who
have all worked in our stores and have been
trained extensively by a team well versed in
organic compliance practices and NOP requirements.

The auditors maintain ongoing contact
with my office to keep my team abreast of
compliance at our stores, and they receive ongoing
guidance from my team on auditing criteria and
requirements.

The auditors, our retail operations, and
my team all function together as a well integrated
group with a shared goal of upholding organic
integrity in our stores.

Internal estimates for 2008 indicate that
these auditors will spend about 10,000 hours
auditing our stores for organic compliance, three
to four hours per month, in each of our 270
stores.

The work of this group of auditors
results in continuous compliance improvement in
our stores and in a strong audit trail which
represents conditions in each store throughout the
year. Our certifier then reviews a sampling of
these audit reports, along with the operation of
the overall system, during our annual inspection
every year.

Our annual inspection by our certifier
consists of three principal parts. The inspector randomly selected subset of our stores, they inspect our overall management practices for all facilities, and they inspect our internal control system by random samplings and by evaluation of the integrity and objectivity of the internal control system itself.

Twenty percent of our stores are visited directly on an annual basis. This year was about 40 stores directly audited by our certifier.

The store inspections consist of a thorough review of compliance to our OCP in every department. The inspection of our group management practices takes place every year with my team in our office in Austin. The inspector reviews the overall management and operations of our system, verifies that past noncompliances have been fully addressed, reviews purchasing documentation and certificates, and generally verifies that our systems are in place as set forth in our OCP.

The auditor also reviews our internal control system, reviewing a sampling of reports from our auditors, and verifying that individual noncompliances have been addressed. The ICS is then also evaluated as part of the retail store
inspections. When visiting a given store, the inspector reviews the recent audits for that location and looks at consistency in quality of the audits and the match between those audit reports and the actual conditions at the store. This is an essential part of the certification process, in that our certifier makes sure that our internal audit program is operating with integrity.

To summarize, under our certification program, a noncompliance in an individual store is reported and addressed almost immediately, whereas under a traditional inspection model it may not have been noted for up to a year. This feature; our ability to monitor and improve compliance on a continuous basis, is a key strength of the multi site certification model described in the Committee’s recommendation. Between the 10,000 hours of direct observation by our auditors, the 120 hours of direct observation by our certifier, and the additional verification of our ICS by the certifier, our system enables us to uphold organic integrity in our stores and facilitate continuous improvement of our system in direct, powerful ways.

Our multi site certification program
provides far more value to our company and to our
customers than one in which each site is visited
directly by the certifier on an annual basis.

The Committee’s recommendation preserves
the best of the existing approaches to multi site
certifications, while improving the overall
process, and truly supports a model that respects
producers and handlers of all sizes and types.

Whole Foods Markets supports this recommendation
and urges the Board to continue to consider the
certification of the many retailers and handlers
already certified as groups, in addition to grower
groups, in its recommendation. Thank you.

MS. ANDREA CAROE: Thank you, Joe. Are
there questions for Joe? Bea.

MS. BEA E. JAMES: Thank you for your
presentation.

MR. JOE DICKSON: Thanks, Bea.

MS. BEA E. JAMES: How many of your 200
stores are inspected annually?

MR. JOE DICKSON: This year it was about
40 stores. It’s generally 20 percent of the
stores, based on a formula derived from the IFOAM
criteria for multi site certification.

MS. BEA E. JAMES: For the stores that
are not inspected do you spend extra time auditing
those stores?

MR. JOE DICKSON: No. Given that, you know, each of those stores is -- undergoes a full audit once a month for three to four hours, we consider that sufficient.

MS. BEA E. JAMES: How do you determine what stores are inspected of that 20 percent?

MR. JOE DICKSON: That determination is made by our certifier.

MS. BEA E. JAMES: Are you given that information ahead of time?

MR. JOE DICKSON: Slightly.

MS. BEA E. JAMES: Uh huh.

MS. ANDREA CAROE: Any other questions for Joe? Dan.

MR. DANIEL G. GIACOMINI: First thing; when were you certified?

MR. DANIEL G. GIACOMINI: 2003. So we’re in five year -- have you ever -- how many of your stores haven’t been ever inspected?

MR. JOE DICKSON: You know, I can’t say off the top of my head.

MR. DANIEL G. GIACOMINI: That were in -- that were stores in 2003.

MR. JOE DICKSON: As of this
certification year, all of our stores that were
open in 2003 have been inspected. Stores that
have opened since that time may not have been
inspected.

MS. ANDREA CAROE: Any other questions?
Tracy.

MS. TRACY MIEDEMA: One of the most
compelling things I heard early in this
investigation was the idea of consistency and
continuity, and so will you speak a little bit
more to how you use some sort of central
management when, you know, your stores can’t
possibly all look exactly the same, but we’re
relying -- you’re relying on some sort of
management tool in the middle.

MR. JOE DICKSON: Yeah, I mean, well, I
think the most important feature is that we have
one single, very clearly defined organic system
plan. That, you know, while our stores are
different sizes, some may have a juice bar, some
may not have a juice bar, there’s all sorts of
configurations, we have a very clear set of
operating procedures for each of those stores and,
you know, a whole suite of training programs, and
sort of operating manuals, and audit criteria that
really do not vary from store to store.
And I think a key part of that too, and sort of keeping that consistency, is the group of auditors who actually do the audits, and you’ll hear from one of them and a few commentors, but it’s there, I think direct contact with the stores, and their sort of, you know, application of those audit criteria that really keep those stores operating on the same plan.

MS. ANDREA CAROE: Bea.

MS. BEA E. JAMES: In the letter that you passed out from Margaret, Margaret mentions in the second to last paragraph, she says, third, the recommendation treats every inspected and certified equally, whether a producer, a handler, or retailer, and the smallest and the largest organic operators are treated the same.

I guess I would disagree with that because if you’re a small operator, as a retailer generally you have less stores, you have less stores, every site has to be inspected, and if you’re a large retailer then you’re looking at 20 percent of your sites being inspected. So I just wanted to point that out.

MR. JOE DICKSON: I recognize that that might not -- that might seem unfair to the perspective of a smaller retailer.
MS. ANDREA CAROE: Any further --

Jennifer and then Hue.

MS. JENNIFER M. HALL: Do your internal auditors consistently audit the same stores, or do they move around to different stores?

MR. JOE DICKSON: They move around to different stores.

MS. ANDREA CAROE: Hue.

MR. HUBERT I. KARREMAN: Just there are statistically valid ways to randomly select out of a group who you’re going to check, I mean, just as far as that goes.

MR. JOE DICKSON: Was that a question, or --

MR. HUBERT I. KARREMAN: [Interposing] No, that was a response to Bea.

MR. JOE DICKSON: Oh, okay.

MS. ANDREA CAROE: Bea.

MS. BEA E. JAMES: My point in pointing that out was that if your -- 20 percent of your stores are given advance notice on inspection, then those 20 percent of your stores have a little bit of pretime to prepare for that inspection while your other stores that are not being notified, would be more likely to not have time to prepare, and so it puts a little bit of an
advantage onto the stores that are given the
notification in advance.

MR. HUBERT I. KARREMAN: That’s one thing
that I’ve never understood, is that on inspections
there’s always a lead time given to the farms. My
farmers know when the inspector’s coming. It’s
going to be in two weeks Tuesday, and I don’t
think there’s enough surprise inspections or
whatever. There’s different argument, but that
would go along with this group certification, it
would fit in.

MS. ANDREA CAROE: Not to get off the
reservation here too much, but besides annual
inspection there are unannounced inspections, and
they are just given enough time to make sure that
somebody’s there, but there is two types of
inspections that happen. Joe.

MR. JOE DICKSON: To that point real
quickly. You know, our internal auditors, their
audits are always unannounced. Those are
completely surprise inspections at our stores,
they don’t know they’re being inspected until the
auditor shows up, and that, from my perspective,
is one of the best ways we control for the
predictability of the annual certifier
inspections.
MS. ANDREA CAROE: Any further questions for Joe. Thank you so much for showing up and giving us your input on this.

MR. JOE DICKSON: Thanks very much.

MS. ANDREA CAROE: The next up, Will Fantle, I guess, and then Steve Peirce. Are you in the room, Steve?

MR. STEVE PEIRCE: Yes.

MS. ANDREA CAROE: Okay. You’re on deck.

MR. WILL FANTLE: I’d like to note that I have a proxy as well for a former NOSB member, Goldie Kaufman. And I would like to use her five minutes for that purpose, so I’ll be reading a portion of a letter that she provided to you members of the NOSB.

My name is Will Fantle. I’m the co-director at the Cornucopia Institute. I think many of you are familiar with our work, and we work primarily with farmers around the country and we attempt to voice some of their concerns on organic issues before this forum and before other forums. First I’d like to say that we welcome the announcement yesterday by the NOP that there’s going to be greater transparency. We think this is a step in the right direction to open and put out more of these documents for people to see.
I know the frustration that the secrecy and some of the mystery that has surrounded previous decisions and actions by the NOP have led to our organization filing FOIA. Yes, we are one of those groups that have done that. We haven’t done it a lot, and we haven’t been frivolous with that, and I will say up until June of this year we had not filed a FOIA for over a year. We again began filing FOIAs in June and we filed four, I believe, when the decisions were announced regarding some of the complaints that we had initiated with Vanderak, Aurora, and Horizon, and our puzzlement, if not befuddlement, on how some of those decisions were reached, so if this type of information were made available to us and I think the broader public, this would eliminate some of that confusion, and we welcome this step, and we hope it is a step that is implemented fully by the NOP.

I want to turn a little bit to different topic and something that we sent a letter to the Crops Committee on last month, and I hope that all of you have this in your packet. I’m not going to read the letter, but I’m going to talk a little bit about some of the highlights, and it concerns almonds, or as some of our growers in California
say, ammonds, and it’s a matter that we had to try
to sort out. Is it almonds, is it ammonds? I’m
still going to call it almonds, being from the
Midwest.

And in September of this year the USDA
implemented a mandate that affects all raw almonds
sold in this country. That mandate requires a
pasteurization process to be performed on those
raw almonds, and it identified two methods for
implementing that pasteurization rule.

One was the use of propylene oxide, a
toxic fungicant that we have grave concerns about.
The second is a steam treatment process that is
acceptable for organic almonds in the eyes of the
ABC -- the Almond Board of California.

We’re not convinced, and this is one of
the points we raised in our letter and we would
like some clarity on this; that propylene oxide is
prohibited for use in the organic sector, and we
would welcome some determination or discussion by
the NOP and the NOSB on that, and we think part of
that confusion stems from the rider that passed
Congress in 2005 which changed the classifications
of removed ingredients and substituted substances,
as the -- or lowered the threshold so that
substances were the process that we’re concerned
Propylene oxide leaves a residue on the nut, and it’s a toxic substance, and we are going to be talking about that as it affects all almonds, but not necessarily organic almonds. So I would encourage the NOSB, I would encourage the NOP, to look at whether or not propylene oxide is allowed. We hope not, and we encourage you to take that and make that statement.

Secondly, we want to get a further exploration of the steam treatment process; whether or not there are residues from that steam treatment process; boiler additives, those types of things, that may affect that pasteurization.

Finally, on the issue of almonds as we encourage the Crops Committee to look at, and that is the gaping loophole in this mandate that allows unpasteurized almonds to still be sold in this country, but only from imports. And that is what I want to turn to next. A report from the field, from the almond growers that we’re talking to in California, from retailers that we’re talking to around the country, and from our meeting yesterday with USDA officials on this matter. First I want to point to one of the pieces of paper that I passed out from an almond grower in California,
and an organic almond grower; Purity Organics. Steve Cortoff [phonetic] is his name. This is not the only report that we have received like this. This is perhaps the most dramatic.

And what Mr. Cortoff is reporting is that he has experienced losses this year from the pasteurization mandate of 45 percent of his business. Not in this letter, but what he told us was that that means $450,000 in losses he has experienced this year from the pasteurization mandate. His customers don’t want it. He is seeing on store shelves where his almonds used to be, foreign almonds in its place, and that is a dramatic impact, and as I said, that’s not alone amongst the almond growers that we’re talking to. This is an important issue for the NOSB to look at, for the NOP to look at. I’m not convinced you were, and I think you will agree, you were not consulted on this by the broader USDA when they were looking at this rule and its impact.

Secondly, I want to turn to the letter from Goldie Kaufman, who I’ll also note is the newest Board member of the Cornucopia Institute. She served until the end of 2005 on the NOSB and she is the Education Director for PCC Natural Markets in Seattle. For those of you that don’t
know, that is the largest cooperative grocer in the country. They have sales in excess of $110 million on an annual basis, 40,000 members, they have removed domestic almonds from their shelves because again their customers don’t want domestic raw almonds that have been pasteurized, so they have Spanish almonds on their shelves. And she says this is a no win situation, utterly unacceptable to us. Necessitated because of the outrageous collusion between the management of the Almond Board of California and the USDA. The National Organic Program and the National Organic Standards Board must act decisively and immediately to intervene on behalf of the organic stakeholders whom they are charged with serving, including organic growers, and all the way to the organic customer. I expect the NOSB to speak out on this issue and to demand a thorough review and investigation of this entire and unnecessary fiasco.

I hope you will listen to those words from Goldie.

Lastly I’d like to say there is a compromise on this and something that your voice I think would be helpful in supporting. We think that much like there are juices sold in this
country, fruit juices that are unpasteurized that carry a warning label on them for those consumers that may be concerned or susceptible to potential diseases from an unpasteurized juice product.

We think something like that could be done with almonds that would allow farmers like Mr. Cortoff and others to continue to sell their product and put that warning label on it so that consumers in the marketplace can still make that choice.

The other report I want to note is from our meeting yesterday with Lloyd Day and two other people in the USDA to talk about almonds. They seemed open and receptive potentially to this option. And again, I think this is something that you can help push along. If this Board were to make that recommendation and to work with officials to encourage that there is a compromise that can be reached on this that will help all of us, will help consumers, and will help our farmers around the country, particularly in California who grow almonds -- or ammonds, as the case may be, with a resolution to this problem. And that concludes my remarks. Thank you.

MS. ANDREA CAROE: Thank you, Will.

Questions for Will from the Board. Bea and then
MS. BEA E. JAMES: Thank you, Will, for your discussion on the pasteurized almond situation. I did want to point out that we actually, within the NOSB, have been discussing this briefly, and I believe that the Crops Committee is looking at getting more information on pasteurized almonds and how it potentially might be harmful to organic farmers, if I’m -- am I correct on that, Gerry?

MR. GERALD A. DAVIS: Yeah.

MS. BEA E. JAMES: Yeah. And I also just wanted to bring up another point; that the raw foods movement on the West Coast is growing between -- according to Spence, which is like the A. C. Nielsone for the natural food industry, between 27 and 30 percent annually, and that the raw food consumer is a very educated consumer and so on the cooperative side of the retail industry, the NCGA is hearing a lot of complaints about pasteurized almonds and the discontinuation of almonds that are grown in the United States which unfortunately does affect our local farmers, and so I appreciate the work that you’re doing.

MR. WILL FANTLE: Lloyd Day told us yesterday that the Secretary’s office is hearing

Dan.
about this issue as well. He said that half of all the comments coming in to the Secretary’s office today are on almonds, and it’s rather startling that the educated and motivated consumer that you’re talking about really does care about this.

MS. ANDREA CAROE: Dan.

MR. DANIEL G. GIACOMINI: Being from California I just have to stand up for the California farmer. It’s really very simple; they’re almonds when they’re on the tree, and when they fall off it knocks the L out of them.

MR. WILL FANTLE: Thank you for that explanation. I appreciate it.

MS. ANDREA CAROE: Any further questions, comments? Thank you so much. Next up is Steve Peirce with Tom Hutchinson, is it you that has the proxy for Karen, or Karen Wilcox that has the -- oh, okay.

MR. STEVE PEIRCE: Good afternoon and thank you. This is my first presentation to the NOSB and I appreciate the opportunity. My name is Steve Peirce, I’m with Ribus Incorporated. I serve as President.

I come to today’s meeting impressed with what I’ve seen you all do over the last two days.
I also want to bring forward an issue that I think actually slipped through the cracks, and I’m coming forward with a cooperative spirit to resolve this issue that I think slipped through.

Earlier Andrea said, you know, is there any new information during the Sunset as we were looking at new products trying to get on the list. I’m just on the opposite side. I’ve got a certified organic ingredient, actually 100 percent certified and EU certified, that earlier this year -- I’ll take you to page number 1. I understand that the Sunset review is about a two year process. If you’ll draw your eye over to the right hand side where the colors start, in January of this year we introduced a brand new food ingredient, certified organic, made from rice hulls, to replace silicon dioxide, a synthetic that has been and is currently on the national list.

About two months later the preliminary ruling came out; the Federal Register asked for comments. During that comment period, which ended May the 7th, we did submit comments, and the rest of my time, the few minutes I’ve got left, will comment on what occurred between that May the 7th and the 16th of October, when the final ruling
came out.

My purpose today is to make three points with the NOSB. One, make you aware of several unexpected events that occurred in this process. Number two, bring three perceived violations of the Organic Food Production Act to your attention, and number three, provide an opportunity for you to take either an initiative -- or initiate a corrective action or take it yourself.

I’ve got a little bit of information on my bio, company and personally. Situational facts were number one. We did introduce that new product in January. Number two, we did go ahead and submit written comments to the, I guess, NOP, and I’ve used NOP and USDA interchangeably, and I will apologize in advance for that, because I’m assuming I’ve made a couple of mistakes there.

We provided written notification, informing the NOP that a new, commercially available ingredient that functions similar to and is a substitute for a synthetic on the national list, silicon dioxide, does exist.

In response to that we received comments back, written, that we did comply completely with the request in the Federal Register. Next we received a phone call from the USDA and an
attorney from the USDA’s Office of General Counsel. They let us know that that -- those comments were never reviewed by the NOSB and were not brought to your attention, that they were reviewed by, quote, a host of USDA employees, something that I never found in the Act as a standard procedure to follow.

We were also told in writing that the new Sunset review, five years from now, will begin 24 to 30 months prior to the expiration, so be looking for action on silicon dioxide in the year 2010.

These kind of comments concerned us. We had conversations with the USDA and maybe I failed by not sending that same letter to each of you that are on the NOSB. I did not know I needed to. In hindsight I wish I would have. So we took this to the Missouri Department of Agriculture, U.S. Senate, and U.S. House of Representatives. The last page in your package is a letter that was sent on the 1st of this month to the Secretary of Agriculture, asking him to re-review this issue. Reason being we feel that the actions that were taken, and I do not feel that they were intentional. I want to be the first one to state that. Whether it was an oversight, a
misunderstanding, maybe false expectations on our part, but something slipped through the cracks, we want to bring it to your attention, and we are willing to cooperate fully with anything that we need to do.

Basically I wanted the NOSB what has occurred, and I was told that it occurred without your knowledge, and I believe that, and that has been confirmed by one of the Board members yesterday.

I heard Andrea say that innovation was good, annotations create risk, and inconsistency. One of the things that we looked at was 6517, and it talks about the certification, and the Secretary sets up the national list and so forth. And guidelines for prohibitions or exemptions of prohibited substances for organic farming or handling are permitted under this chapter only if -- and if you read farther it goes on to say only if it is because there is the unavailability of a wholly natural substitute product.

Well, this is a situation where there’s not --

MR. STEVE PEIRCE: . . . just a natural
substitute, there’s a certified organic substitute in commercial existence, and what we are proposing -- we did not file a petition because we didn’t necessarily want the product removed. If we follow the letter of the law it ought to be removed, period. We asked for an annotation so that we don’t disrupt the commercial supply, which I know is critical to the industry, and we would simply like the annotation to read that silicon dioxide for use in agricultural products, if the wholly natural substitute is not commercially available.

MS. ANDREA CAROE: I need to stop you --
MR. STEVE PEIRCE: [Interposing] I’ll stop there.

MS. ANDREA CAROE: ... because your time is up.
MR. STEVE PEIRCE: Yes.
MS. ANDREA CAROE: Unfortunately. I will -- of course I don’t know anything about how this situation occurred, and -- but I do know that we have a new method for receiving comments, and that new method may precipitate -- be precipitated out of the fact that there was difficulty making sure that all the comments were received, so --
MR. STEVE PEIRCE: [Interposing] We sent
this one in Federal Express so that we would have
a receipt so --

MS. ANDREA CAROE: [Interposing] I
understand, but I mean, regulations.gov is a new
database that we use, which we’re challenged with
the turnover and using this new system, which you
may have heard earlier in the meeting.

MR. STEVE PEIRCE: Right.

MS. ANDREA CAROE: So I suspect that that
is a mitigating step for these types of errors,
but again --

MR. STEVE PEIRCE: [Interposing] Sure.

MS. ANDREA CAROE: . . . I’m unaware of
the situation. I will let you know that a change
to an annotation can be petitioned, or an addition
of an annotation can be a petition. The removal
of a substance, as we stated before, can be a
petition and there is also a petition that takes
precedence over other petitions --

MR. STEVE PEIRCE: [Interposing] Sure.

MS. ANDREA CAROE: . . . so there --
even though we’re not in the Sunset process with
this, it doesn’t mean that you have to wait five
years before an action to happen, so I would
suggest that you utilize one of these mechanisms
that are available to you.
MR. STEVE PEIRCE: We would be happy to after we, what I would say, fully exploit what we complied with; making comments during the Sunset, and that's the piece that previous fell upon deaf ears, and why I brought it to the attention of the Board today. And I don't know what the ability is to go backwards and change anything.

MS. ANDREA CAROE: It's probably -- my suggestion to you, sir, is to move forward and not try to go back to that recommendation, because that ship has sailed. I mean our recommendation has already gone through on that material --

MR. STEVE PEIRCE: [Interposing] I understand.

MS. ANDREA CAROE: ... and I think it would be easier to initiate the petition to remove or petition to change the annotation at this point, based on the information you provide. And we certainly would like to see that information as I've said, that advances where we're going, that's what the --

MR. STEVE PEIRCE: [Interposing] Sure.

MS. ANDREA CAROE: ... beauty of this regulation.

MR. STEVE PEIRCE: And that's the spirit in which we introduced the product to the
MS. ANDREA CAROE: Thank you so much.

Tracy?

MS. TRACY MIEDEMA: What is this used for?

MR. STEVE PEIRCE: It’s used as an anti-caking agent, like silicon dioxide, a flow agent, we’ve used it with a drying agent in fruits, and powders, and that type of thing, and most recently there was a statement issued in organic egg production where there’s egg washing going on and foaming is an issue, we have done some preliminary tests and we’ve got field trials going on now with producers to use it as an anti-foaming agent in egg washing.

MS. TRACY MIEDEMA: So if you have something that you feel is truly more appealing to the organic consumer, you know, I just wanted to give you a chance to market that, and --

MR. STEVE PEIRCE: [Interposing] Thank you.

MS. TRACY MIEDEMA: Yeah, it seems like the market’s going to sort this out for you within a short period of time.

MR. STEVE PEIRCE: It’s a silicon dioxide or a rice concentrate, and from a label
declaration point of view it’s a strong impetus, even to the point that we’ve got conventional spice producers that are buying the organic product because they don’t want silicon dioxide even on a conventional label.

MS. ANDREA CAROE: Is there any -- Julie.

MS. JULIE S. WEISMAN: I’m looking at the timeline here, and I just want to make sure that I understand what I’m seeing --

MR. STEVE PEIRCE: [Interposing] Sure.

MS. JULIE S. WEISMAN: . . . because I’m pretty sure, I mean, this is an item that was in the big batch, the initial batch of Sunset materials --

MR. STEVE PEIRCE: [Interposing] Okay.

MS. JULIE S. WEISMAN: . . . from what was o the original rule that was published in 2002, and we were reviewing comments on this during 2005 --

MR. STEVE PEIRCE: [Interposing] Yes.

MS. JULIE S. WEISMAN: . . . and voted about two years ago at the Fall meeting. Okay. So now here I see that the commercial introduction of this ingredient happened in January of this year.

MR. STEVE PEIRCE: Of 2007, that is
MS. JULIE S. WEISMAN: Okay. So this was not commercially available when we were deliberating --

MR. STEVE PEIRCE: [Interposing] No, it was not.

MS. JULIE S. WEISMAN: ... the renewal of this on the list.

MR. STEVE PEIRCE: No, it was not.

MS. JULIE S. WEISMAN: So I'm trying then to understand --

MR. STEVE PEIRCE: [Interposing] And this is where I commented --

MS. JULIE S. WEISMAN: [Interposing] Yeah.

MR. STEVE PEIRCE: ... maybe it was an oversight on my part, or a misunderstanding, but when I looked at the Federal Register that was published on March the 6th, it was the proposed rule, and what was on there, and it said, processes are the public, if they've got comments that are substantial, please bring them forward. I felt then, and feel today, that this is substantial because it is new information that if you read the way that the law is written, when a commercially available organic product, blah blah
1. blah. So even though it did not come in, in your timeline, which I wish that it would have been commercially available, it did come in during a comment period, and that is not what anybody seems to want to recognize.

2. MS. ANDREA CAROE: Well, I believe that what you commented on was the proposed rule, which was after our recommendation, when the Federal Register notice goes out, that these materials have been voted on and approved by the Board, and at that point the comments they’re looking for I would guess would be more of process at that point. There is a Federal Register notice sent out -- went out well before that, asking for comments for new information. So --

3. MR. STEVE PEIRCE: [Interposing] Which I don’t the NOP nor anybody else would want to read concepts that someone has of an ingredient.

4. MS. BARBARA C. ROBINSON: Andrea?

5. MS. ANDREA CAROE: Barbara.

6. MS. BARBARA C. ROBINSON: This is a little -- you know, we apologize, but it’s a bit of apples and oranges, because your material, while it may constitute new information, your material itself would have had to go out for a tap. While you may have it certified, there’s no
assurance to the Board itself that it’s -- it’s very nice of you to come forward and say I’ve got something that can replace silicon dioxide, but this Board doesn’t just take your word for it.

MR. STEVE PEIRCE: Nor would I ask them to.

MS. BARBARA C. ROBINSON: No. So it would have to go out for a tap. The proper procedures, I believe, is -- I think -- I hope that it was explained to you, nor is the national list a proprietary list. We don’t --

MR. STEVE PEIRCE: [Interposing] Sure.

MS. BARBARA C. ROBINSON: ... we don’t just put Ribus on the national list.

MR. STEVE PEIRCE: Nor was it requested.

MS. BARBARA C. ROBINSON: I understand that, but this material would have to be sent out for a tap and thoroughly analyzed and then, you know, and determined whether the components of this product satisfy, you know, what you say.

MS. ANDREA CAROE: Barbara, his product is a certified product, not -- it’s certified.

MS. BARBARA C. ROBINSON: Right.

MS. ANDREA CAROE: It’s a certified product.

MALE VOICE: Certified correctly.
MS. BARBARA C. ROBINSON: Yeah, but if he’s going to say it’s a wholly natural ingredient -- and furthermore, silicon dioxide, which properly have to be petitioned to come off the national list.

MS. ANDREA CAROE: That’s right. That’s what -- that’s the key. It has to be petitioned to be removed.

MR. STEVE PEIRCE: You -- and thank you for your comments. This is the first I’ve heard them off of probably five or six conversations with the USDA and NOP.

MS. BARBARA C. ROBINSON: And you may petition at any time for silicon dioxide to come off the national list. You do not need to wait for Sunset to come back around. That may happen at any time.

MR. STEVE PEIRCE: And that I’m aware of.

MS. BARBARA C. ROBINSON: But there’s been no -- I’m sorry, but there’s really been no violation, I don’t believe, that’s occurred here. There’s probably been some misunderstanding of the process, and for that I apologize, but I don’t think there’s been a violation. We don’t just send stuff to the Board, they wouldn’t comment on the proposed rule. They had already done their
due diligence up to that point.

MR. STEVE PEIRCE: So when the request from the Federal Register was for comments --

MS. BARBARA C. ROBINSON: [Interposing] That’s for comments from the public.

MR. STEVE PEIRCE: I consider myself public.

MS. BARBARA C. ROBINSON: Yes, I -- yes, you are. Yes, you are. Yes. But, you know, there wasn’t sufficient information and there wouldn’t be sufficient information about this product to say okay, this is sufficient information for the Board to change its mind on Silicon Dioxide.

MALE VOICE: Actually it wouldn’t have been a case of the Board changing their mind, it would have been us.

MR. HUBERT I. KARREMAN: Well, the vote had already occurred anyway.

MS. BARBARA C. ROBINSON: Yeah, we would have had to overrule the Board, and all they’re doing is renewing an exemption that has already been in existence.

MS. ANDREA CAROE: Gerry, and then Hue.

MR. GERALD A. DAVIS: I just want to repeat in different words what Barbara just said.
I believe what happened with you was your introduction of the product did not come at the best time at all for us to accomplish what you’re hoping to accomplish, as far as incorporating into the Sunset process, and by all means your most aggressive and best way probably is to petition to remove the synthetic silicon dioxide with your supportive information of your new product, new type of material that can replace it, rather than --

MR. STEVE PEIRCE: [Interposing] And I appreciate that.

MR. GERALD A. DAVIS: . . . take any other stance that’s less aggressive. Be direct.

MR. STEVE PEIRCE: Sure.

MR. GERALD A. DAVIS: This is the kind of thing we hope would occur, to replace some of these materials.

MR. STEVE PEIRCE: Thank you.

MS. ANDREA CAROE: Hue, and then Tina.

MR. HUBERT I. KARREMAN: Well yeah, I mean, your comment, if it had come earlier, prior to our vote to renew silicon dioxide, would have made a big difference probably.

MR. STEVE PEIRCE: Sure.

MR. HUBERT I. KARREMAN: So it was just
we had already voted, and then the Federal Register notice came out, and that’s when extra public comment comes in, but our vote had already gone in, so just petition to get silicon dioxide off the list. Do it tomorrow.

MR. STEVE PEIRCE: How long does it take in a situation like this for a --

MR. HUBERT I. KARREMAN: [Interposing] I have no idea.

MR. STEVE PEIRCE: ... petition for something to change?

MS. ANDREA CAROE: Yeah, we have a whole presentation on that that you I guess weren’t here for. Tina?

MS. KRISTINE ELLOR: I’ve heard a couple of times in this meeting that just because it’s on the list doesn’t mean that you’re allowed to use it, if there’s, oh, sorry. That doesn’t apply here, huh?

MS. ANDREA CAROE: 606 is where commercial availability is. There’s no commercial availability or wholly --

MS. KRISTINE ELLOR: But I also appreciate your sentiment in not wanting to yank it and --

MR. STEVE PEIRCE: [Interposing] Sure.
MS. KRISTINE ELLOR: . . . and making other potential -- you know.

MS. ANDREA CAROE: Okay. Hue.

MR. STEVE PEIRCE: It’s a six to eight month product. We want to see if it works.

MS. ANDREA CAROE: Hue, and then we have to move along.

MR. HUBERT I. KARREMAN: Just have there been petitions previously -- historically, to take things off the list when something like this happens, and if so, how long has it taken? Just to get that out.

MS. BARBARA C. ROBINSON: Well, you know, remember your into ruling. First of all you’ll have to vote to -- and tell us to take it off the list. And then of course we’re into the rule making. I’ll have to go down to OGC and beg them for your document.

MR. STEVE PEIRCE: Thank you, all.

MS. ANDREA CAROE: All right. Thank you.

MS. BARBARA C. ROBINSON: But we --

MR. STEVE PEIRCE: [Interposing] Thank you.

MS. ANDREA CAROE: I -- I wish you the best of luck.

MR. STEVE PEIRCE: Thank you very much.

MR. TOM HUTCHESON: Good afternoon, Tom Hutcheson speaking for Karen Wilcox and my last name is H-U-T-C-H-E-S-O-N, same as one of the aquaculture participants, Scottish spelling.

First, regrets from Karen that her plans for the afternoon have taken her away. I’m sure she would have wanted to say what we’re going to say now herself, but thanks very much to Andrea Caroe for her dedicated and energetic leadership of the Board, and of course her excellent work over the past five years.

First just a reminder that OTA’s comments did contain a substantial bit on definitions, and I would urge the Board to look at that. We think it contains a very useful perspective.

Secondly, just to go back over issues of listings on 606 and commercial availability. Based on a discussion this morning I thought it might be good to introduce a little bit of the business perspective on how that works.
Unless there’s a demonstrated demand, manufacturers are unlikely to invest in an organic product. If organic -- and this is for minor ingredients, that is in the five percent of a 95 percent product.

If organic manufacturers are not allowed to use, say, conventional grape seed extract, then there is no incentive to produce the organic version as the conventional isn’t being used and there’s no demonstrated demand. If they are allowed to use the conventional, potential suppliers will assess the market and the market potential, and invest accordingly, as was done in the 1990s with the classic example of cinnamon. The organic preference rule drove the development of organic cinnamon and many other organic spices. The incentive to potential organic suppliers is if they make it, it must be used, and of course we loudly applaud your efforts to tighten protocols for determining commercial availability.

Remember, no one is required to make organic grape seed extract, but if there is a demonstrated potential demand, if conventional grape seed extract is being used, you will see investment according to the demand. That’s all I have to say. Thank you all very much.
MS. ANDREA CAROE: Thank you, Tom. I like that. Gwen, I understand Kristen’s in the room, so you’re going to -- is it -- are you -- where’s Kristen? Is somewhere in the room? You’re Kristen? Come on up. Five minutes.

MS. KRISTEN KNOX: I promise to make it brief because when I made the appointment to speak I didn’t realize I was going to have the chance to speak earlier during the meeting, so I’ll keep my comments very brief. I just would like to urge each and every one of you on the Board, if you have not had a chance to read the letter that I sent on November 9th, and the supporting materials, to please do so before you make your final decision, because I believe that we have addressed concerns, substantially, and I will be available for any further questions of concerns after that.

FEMALE VOICE: Give your name, please.

MS. ANDREA CAROE: Thank you.

FEMALE VOICE: Any questions?

MS. ANDREA CAROE: Any questions for Kristen?

MR. HUBERT I. KARREMAN: I hate to be
dumb, but what was the -- which --

MS. KRISTEN KNOX: It was the sodium bicarbonate.

MR. HUBERT I. KARREMAN: Thank you.

MS. KRISTEN KNOX: Okay.

MS. ANDREA CAROE: That’s okay. We’re all a little bit dumb right now. Okay, thank you so much. Gwendolyn.

MS. GWENDOLYN WIER: Right. Good afternoon, Madam Chair, NOSB members, NOP staff, and ladies and gentlemen of the gallery. I love to say that.

My name is Gwendolyn Wier. I work as a processing program reviewer for Oregon Tilth. We certify 524 processors, I’ve managed and worked on several certified organic farms, and I hold a degree in food science, an emphasis on fermentation science, and a minor in chemistry.

Our comments today are on the definition of materials. First I’d like to thank the Board for taking up the issue of agricultural versus nonagricultural. After Oregon Tilth requested clarification in October 2004 and while many moons have passed, and my headache has turned into a way of life, we are very grateful for your continuing efforts on this very complicated matter, and we
appreciate the consideration you have given to our input.

We very much understand that the documents presented are works in progress, and in that respect appreciate this issue being listed as a discussion item only.

Oregon Tilth supports the Van diagram and the holistic approach it takes. However, we urge you to deal with synthetic, non-synthetic, and egg, non-egg separately, while not letting their connectivity escape final decisions. And we strongly urge you to take up the NOSP documents on synthetic, non-synthetic from the August 15th, 2005 meeting and the NOP document of March 2006, and continue where that discussion left off.

Okay. So from here out I’m talking egg, non-egg only. First off I’ve offered up yet another decision tree where I’ve tried to incorporate and improve all of the decision trees and comments presented today.

With respect to first to box number one on the Joint Committee decision tree, the question asked whether the substance is derived from plant or livestock. This box needs to be expanded to include aquatic life. The details of the terminology I’m not sure of. They need to be
worked out, but seafood is covered in OFPA and standards for aquaculture are clearly being developed.

This is also the box where fungi and other nonplant, nonbacterial lifelike creatures will need to be further addressed. I would also urge you to further address fermentation byproducts because there’s a growing world of edible fermentation byproducts that can and are being organically produced; i.e., alcohol, i.e., arithritol.

Oregon Tilth supports deletion of all or at least part of the definition of non-agricultural, but please keep in mind that the term agricultural product in OFPA and the rule is defined as any agricultural product. My grandpa told me you can’t define a word by using the word being defined to get the definition, so box number one is crucial; it defines the source, and it’s this box that has primarily tied up this discussion for the last three years.

Box number four states that if any other ingredients have been added to the substance and remain in the final product, the substance becomes nonagricultural. I think the question here is appropriate, however, the addition of an
ingredient doesn’t render a substance agricultural or nonagricultural. The addition should simply be evaluated for compliance with either 605 or 606, and I’ve demonstrated that adjustment in the decision tree that I’ve passed around.

Additional processing questions need to be asked, such as have any volatile synthetic solvents or synthetic processing aids been used. The rule may already answer this, but it’s not clear. It depends on how you read it, and certifiers are reading it inconsistently.

Oregon Tilth, in conjunction with PCO -- Pennsylvania Certified Organic, we’ve submitted a policy question to the NOSB that addresses this question. I handed them out, there’s not enough, the copier broke. The document is titled “What Restrictions Apply To Non-organic Ingredients Allowed in Organic Food” and focuses on the prohibition found at 205270c(2). The document proposes resolution to this question via the Q and A section of the NOP website. The answer to the question would appropriately be worked into the decision tree.

And finally Oregon Tilth would like reiterate [unintelligible] comments by saying that Organic is a processed based standard, rather than
a performance based standard. The result of a
given input or product is not the result of what
it is in most cases, but how it’s produced. In
the history of OFPA and in the current NOP
regulations the working thought has been if a
substance is organic, can be organic, then it must
be agricultural. I have no inspected or reviewed
operations for yeast, yeast extracts, glycerin,
fatty acid, sucrose esters, enzymes, flavors,
colors, and probiotic vitamins. These substances
can technically be certified organic based on the
95/5 composition and compliance with other
applicable sections of the rule. It’s entirely
possible to produce a synthetic according to the
OFPA definition, a synthetic organic product, you
just don’t call it synthetic, you call it
processed, and it’s entirely possible to certify
yeast. Why? Because their production relies on
agriculture. They are agricultural products with
an emphasis on product.

MS. ANDREA CAROE: Thank you.

MS. GWENDOLYN WIER: Thank you very much.

MS. ANDREA CAROE: Thank you. Any
questions for Gwendolyn?

MS. KATRINA HEINZE: I wanted to thank
you, Gwendolyn for your comments today, as well as
comments that we’ve received in the past from you. I know you’ve given us a lot of thought, and your efforts are greatly appreciated.

MS. GWENDOLYN WIER: Thank you.

MS. ANDREA CAROE: I think, Gwendolyn, you’re helping us create a forest of decision trees at this point.

MS. GWENDOLYN WIER: It is. I know. There’s limbs. Limbs everywhere.

MS. ANDREA CAROE: Yeah.

MS. GWENDOLYN WIER: Limbs abound.

MS. ANDREA CAROE: Thank you.

MS. GWENDOLYN WIER: Thank you very much.

MR. JEFFREY W. MOYER: Madame Chairperson?

MS. ANDREA CAROE: Yes?

MALE VOICE: Jeff is here.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes, I just wanted to apologize to the Board, to the program, and the gallery for my absence earlier today. I’m happy
to be back and I apologize for that.

MS. ANDREA CAROE: Thank you. Thank you, Jeff. Thank you. All right. Do -- M. J., you’re here. Okay. I got -- all right. Whenever you’re ready to start, Consuela.

MS. CONSUELA ALLEN: Hi, my name is Consuela Allen and I’m the Assistant Team Leader for the Organic and Quality Standards Audit Team at Whole Foods Market. I’d like to comment on the Accreditation Committee’s recommendation on multi site certification systems, a recommendation which my company supports. In particular I’d like to talk about the role of the internal control system, and how the objectivity and consistency of my work as part of that system, gives integrity to the company’s organic certification.

I would also like to describe how our work facilitates continuous improvement of organic compliance throughout the company in all stores throughout the year. Our company consists of ten auditors -- our team consists of ten auditors who inspect each retail store between 10 and 11 times a year, spending between 3 and 4 hours in each store.

Each auditor on my team goes through a basic organic compliance training in the retail
store upon hire, and then they go through and initial three day auditor training. The auditor’s reports are constantly monitored for consistency and quality. All of the audits are surprise audits. No store knows when they will be audited.

Each of our auditors adheres to nationally specified audit criteria and makes sure that all of the members of a retail team understand the issue of organic compliance and their role in keeping our product organic.

This includes quizzing team members on their sanitation methods and looking at past organic sanitation logs to ensure the organic compliance protocols are in fact in place and in practice.

If there is an issue our auditors speak to leadership in the store to clarify what needs to be done to maintain organic compliance. We often conduct on the spot training. I am bilingual and I often do trainings in Spanish, if necessary.

After an audit is conducted, the auditor files a report on an electronic form which is sent to myself, Joe Dickson, the National Organic Programs Coordinator, the store team leader, and the regional leadership. If there are any issues,
they are red flagged and a complete description of 
the area of noncompliance is documented. I look 
for any continuing issues and we make sure that 
the auditor who will be conducting the next audit 
is given a location -- of a given location, has a 
copy of the current audit to reference and monitor 
for repeat noncompliances.

The criteria on the audits are updated 
annually after our inspections by our certifier in 
order to more closely focus on areas of potential 
noncompliance.

As the Assistant Team Leader for the 
audit team I impressed upon both my team and all 
Whole Foods team members that are being certified 
as an organic retailer is an earned privilege and 
that we -- one that we never take for granted. 
Our focus is to report without bias and to direct 
all resources to any organic noncompliance issues 
that are recorded.

The audit team is very much dedicated to 
being fair and tough, while making sure that the 
stores and the team members are aware that organic 
compliance is an asset that needs continuous 
tending and monitoring. My team of auditors is a 
highly professional and dedicated group whose work 
as the eyes and ears of the company makes it
possible for our national office and our organic
certifier to ensure that our organic compliance
plan and the national organic standards are being
upheld in all of our stores.

Thank you for the opportunity to comment.

MS. ANDREA CAROE: Thank you, Consuela.

Is there any comments or questions? Bea.

MS. BEA E. JAMES: Do you know how much
you’re currently spending, approximately, on
certification --

MS. ANDREA CAROE: [Interposing] Oh, I
don’t think that’s an appropriate question.

MS. BEA E. JAMES: No, I can’t -- okay.

MS. ANDREA CAROE: I don’t think that’s
an appropriate question.

MS. BEA E. JAMES: Never mind.

MS. ANDREA CAROE: Any other questions?

Thank you very much.

MS. CONSUELA ALLEN: Thank you.

MS. ANDREA CAROE: Okay. M. J. Marshall
Herman here? Zareb? Okay. Then the next one on
the list is Cheryl Van Dyne. Are you in the room?

MS. CHERYL VAN DYNE: Yes.

MS. ANDREA CAROE: You’re next.

MS. M. J. MARSHALL: Good afternoon. My
name is M. J. Marshall. I’m the Director of Government Relations for the Flavor and Extract Manufacturers Association, and I’m here today to talk to you today about criteria for determining agricultural versus nonagricultural substances for use in organic processed foods.

FEMA has been taking a long, hard look at the organic movement, following its trends, and we’ve been giving a lot of thought to how we can help support the organic market. We -- to coin a certain phrase, realize that we live in an imperfect world, but we’ve been also trying to focus on how we can help improve upon that imperfect world and recognize the organic market’s needs, recognizing that it needs to have the flexibility to grow and develop over time.

So in order to support this developing industry, as I said, we wanted to come up with what we believe will be a very valuable tool, particularly for certifiers, to determine when a product is agricultural versus nonagricultural.

Flavors in general food use. They may be simple or complex, they may be synthetic or nonsynthetic, they may be agricultural or nonagricultural, and they may be derived from animals, plants, herbs, spices, and botanicals.
Flavors are also complex mixtures, derived from a variety of sources, both agricultural and nonagricultural. An important point to note here is that while we continue to believe that flavors should be listed on 205.605, we also recognize that there are some instances where some ingredients used in flavors are more appropriately listed on Section 205.606.

So again, getting back to this whole discussion of ag versus non-ag, we agree that there needs to be a process to simplify the decision for organic uses to help select suitable flavors in a consistent, cross industry fashion, to distinguish agricultural versus nonagricultural flavors.

So FEMA, having reviewed the decision tree that the NOSB put forth, has come up with an alternative approach. So first I’d like to go into a little bit of comparison or NOSB’s proposed decision tree, and then I’ll get to the FEMA proposed decision tree.

In FEMA’s view the NOSB proposed decision tree concludes that some materials considered not suitable for organic use under the NOP criteria, must be synthetic. For instance, spice olea resins obtained by solvent extraction. We agree
that spice olea resins may not be suitable for use in organic foods, but they are not synthetic, they simply are not organic compliant. And we -- it would, you know, also point out that in putting forth and developing the FEMA decision tree, we made certain that we adhered very closely to the NOP rules and regulations and definitions.

So with respect to the NOSB decision tree, we believe that, as I pointed out, there could be some misapplication of the decision tree in other sectors of the trade, because nonorganic foods, for instance -- and this raises a concern to FEMA members and our clients.

So I just put up this NOSB decision tree. I don’t think I really need to go through it. I hope everybody here is familiar with it, so Valerie, if you want to skip to the next couple of slides. There you go.

So a decision tree comparison again. With the FEMA proposed decision tree what we do right up front, and the next slide I believe will show you our decision tree, so I’ll get to that in a second. We would propose to eliminate synthetic materials at the beginning of the decision process, which we think is very important. And we also focus on determination of the agricultural,
nonagricultural status of any given material. So we conclude for nonsynthetic flavors, that some may qualify as agricultural and meet the requirements for organic certification, and others may be suitable for organic use.

MS. ANDREA CAROE: I’m sorry. Your time has expired.

MS. M. J. MARSHALL: Oh, okay.

MS. ANDREA CAROE: Is there questions?

MS. M. J. MARSHALL: Can I just show the next slide.

MS. ANDREA CAROE: Is there questions from the Board? Joe.

MR. JOSEPH SMILLIE: Could you please show the next slide?

MS. M. J. MARSHALL: What’s that?

MR. JOSEPH SMILLIE: Could you please show the next slide?

MS. M. J. MARSHALL: Show the next slide?

MR. JOSEPH SMILLIE: Yes.

MS. M. J. MARSHALL: After this one?

MR. JOSEPH SMILLIE: No. This one.

MS. KATRINA HEINZE: This one.

MS. ANDREA CAROE: He’s giving you an opportunity to explain your slide.

MS. M. J. MARSHALL: Oh, okay. Well,
yeah, if I -- sorry. If I could maybe just use an example of citric acid. I mean, if you follow this decision tree all the way down to number eight, is a material an agricultural product as defined by USDA. The FAS -- Foreign Agricultural Service, U.S. Trade Ag definition, which I put on this slide, right there, what you would determine is that it’s an agricultural product based on this definition, and I think it would be really helpful for the Committee to have a presentation by someone who’s very familiar with the harmonized trade -- harmonized tariff schedule, because in the FAS definition, several of the chapters -- or all of the chapters help make the determination as to when a product is agricultural, versus nonagricultural. So essentially there’s really already a process in place to help you determine that, because that’s what you have to look at when you import a product into the country. And as it says at the bottom here, certain other products under Chapter 33 are considered agricultural products. The most important of this is essential oils. So we would believe that, based on our decision tree, that essential oils are an agricultural product, and they’re also an agricultural product based on the FAS definition.
So --

MS. ANDREA CAROE: [Interposing] So any of the Board members have further questions? Hue?

MR. HUBERT I. KARREMAN: Well, I just -- we have to take that definition into account, I would think, at least in our deliberations if that’s what that USDA is calling agricultural.

MS. ANDREA CAROE: All right.

MR. HUBERT I. KARREMAN: We can’t look the other way and say no, it’s not.

MS. M. J. MARSHALL: Yeah.

MR. HUBERT I. KARREMAN: But anyway.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: I agree, and I think that I would definitely like to look more at this, but I do also want to caution that definitions of agricultural, for the purposes of trade and tariff, are meant to serve a very different purpose than ours, maybe. I’m not -- I just -- as a -- this may be very helpful, and we should also keep in mind that it was meant for a very different purpose.

MS. ANDREA CAROE: Katrina.

MS. KATRINA HEINZE: I have two things. The first is have you submitted this either electronically or in a written document so that
the Committee --

MS. M. J. MARSHALL: [Interposing] No.

MS. KATRINA HEINZE: ... can review it?

MS. M. J. MARSHALL: No, but thank you for asking my question. We will be. We intend to submit follow up comments to the Board and NOP staff because we very much want to work with you to come to some sort of agreement, terms, what have you on determining ag versus non-ag, because it’s very important to us.

MS. KATRINA HEINZE: Okay. Then my second comment was going to be that as has become abundantly clear for many topics this meeting, but certainly our definition materials, these matters are more complex than they always appear. You know, we’ll take a look at these comments, we’ll take a look at all the definitions, we’ll figure how everything wraps together, and we’ll be back at the next meeting. Thank you.

MS. M. J. MARSHALL: Right. Well, absolutely. Well, we concur wholeheartedly that this is very much a complex issue, and so that’s why we hope that the Board would help, you know, rely on FEMA industry expertise on the issue of flavors in particular and how they are -- they can
be determined ag versus non-ag.

MS. ANDREA CAROE: Tracy and then Hue.

MS. TRACY MIEDEMA: Just very quickly, are you considering extracts agricultural?

MS. M. J. MARSHALL: Yeah. Yes. The experts in the background say yes.

MS. ANDREA CAROE: Hue.

MR. HUBERT I. KARREMAN: Just in response to you, Julie, in that this is under agricultural and marketing service, therefore this tariff type thing actually would I think apply, because we’re in commerce here.

MS. JULIE S. WEISMAN: Uh huh.

MS. ANDREA CAROE: Okay. Further questions? Great. Thank you very much, and we would appreciate your presentation, and if we can get it.

MS. M. J. MARSHALL: Definitely. Thank you.

MS. ANDREA CAROE: Thank you.

FEMALE VOICE: All things will be posted.

MS. ANDREA CAROE: All things will be posted, as is appropriate. Okay. Cheryl Van Dyne, and then up next is Rick Green. Rick, are you here?

MR. RICK GREEN: Actually Barb Chinn
should be next, and then I would go after her.

   MS. ANDREA CAROE: Okay. That’s fine.
Barbara Chinn is next. Okay.

   MS. VALERIE FRANCIS: Cheryl Van Dyne, the whole one that you gave me, the Van Dyne --
   MS. ANDREA CAROE: Uh huh. Oh, sorry,
   Cheryl.
   MS. VALERIE FRANCIS: Not the Chinn one first?
   MS. ANDREA CAROE: Excuse me.
   MS. VALERIE FRANCIS: You gave me three original PowerPoints, and so you want me to eliminate all the prior three and only use the one that you gave me? Just clarifying.
   MS. CHERYL VAN DYNE: [unintelligible] that I gave you on [unintelligible].
   MS. CHERYL VAN DYNE: Okay. Now I understand. Cheryl Van Dyne, CP Kelco. My name is spelled C-H-E-R-Y-L V-A-N space, capital D-Y-N-E. CP Kelco thanks the NOSB for the opportunity to present information and answer questions for the Board on the petition material Gellan gum. We have three CP Kelco representatives here to answer the Board’s questions, and the information
presented in the package for the Board can be reviewed at your own pace. We’re going to present an overview of the technical functionality Gellan gum brings to the organic industry.

I don’t think that’s it. Okay. And so there will be three speakers. Included in your packet is a compilation of letters that we present to the Board from industry. Included are letters from the industry that were given to CP Kelco to bring to this meeting and those posted on regulatory -- or regulations.gov, and --

MS. ANDREA CAROE: [Interposing] Could you speak a little bit closer to the microphone.

Sorry.

MS. CHERYL VAN DYNE: Oh, I will.

MS. ANDREA CAROE: Thank you.

And so you can see that we had quite an outpouring from the industry for support of Gellan gum, and we wanted to bring that to you as a package. If you could go through it. And keep going Valerie.

Yeah.

CP Kelco would like for the Board to understand that Gellan gum is a polysaccharide, it is a gum, and it is a -- composed of repeating monosaccharide units and two glucose units, and
one which is a component of sucrose, which is a common sugar. Food grade Gellan gum is tested to meet the purity requirements identified for Gellan in 21 C.F.R. 172.665, the Food Chemicals Codex, and the EU specifications for purity, as well as JECFA, and Gellan gum is manufactured in accordance with FDA’s food GMPs 21 C.F.R., Part 110. And Gellan gum does not contain any heavy metals or their contaminants in excess of the FDA tolerances.

The manufacturing process of Gellan and the use of Gellan result in no significant impact to the environment. Continue please. And there are no reported adverse affects from Gellan to human health or the environment. Gellan has been used in food since the early 1990s. The next one.

So we ask why Gellan gum, and we are going to have Barb Chinn present this -- you know, its functionalities to you, but Gellan presents distinctive qualities to formulators of products across various application segments for products for the organic consumer. Barb Chinn, our food scientist, will present information on Gellan use. And if you could go. Keep going, Valerie.

Valerie? Okay.

MS. BARBARA CHINN: Hi. I’m Barbara
Chinn, C-H-I-N-N, and I’m the Food Applications Manager at CP Kelco, and I’m here because I understand there was some confusion at the last meeting in terms of what Gellan gum did, so I’d like to give you a crash course on the functionality of Gellan gum in foods and beverages. Next slide. Next.

So as Cheryl said, Gellan gum is a stabilizer, it’s a long chain molecule produced by fermentation, and as such it is animal free and sustainable, and as a long chain molecular, when we use it at very low use levels in beverages it will form a network. The Gellan molecules will associate very weakly with each other, and this network we refer to as a fluid gel, and this fluid gel is capable of suspending particulates in beverages, and by particulates I mean things like minerals and fiber. And when we use it at higher use levels it’ll form a true gel that you can actually unmold and cut, and we use that property to do things like enhance heat stability, bake stability, provide texture, and just control water in general.

Now, like all stabilizers, Gellan gum has its own unique fingerprint in terms of properties, and these properties drive the best fit
application. So every gum has its applications where it works very well, and applications where it doesn’t work so well. And what we’ve seen as a growing area of interest is the suspension of particulates in beverages. Next. Thanks.

So when we use a Gellan gum fluid gel, we can suspend all sorts of insoluble particulates, like cocoa, insoluble minerals such as calcium carbonate, and tricalcium phosphate, we can suspend soy protein, fruit pulp, and very -- this picture shows some very novel includes that are seen Asia of basil seeds and some [unintelligible] cocoa particles.

But this is very important to create very uniform, appealing appearing products on the shelf, as well as to ensure the consumer consumes the particulates, and that’s especially important when we’re including nutritional supplements in the beverages. Next slide.

So further evidence to the importance of suspension is in this article, where the researchers looked at a number of calcium fortified beverages, and in all of the rice and soy beverages they saw a lot of sedimentation where oftentimes the calcium -- it was calcium carbonate or tricalcium phosphate was settled to
the bottom of the container, and it was a thick
sludge at the bottom of the container, and even
with vigorous shaking they often could not get it
resuspended. So as such, the consumer may not
ingest that calcium and that’s especially
important when consumers are drinking soy milks
and rice milks as alternative to dairy milks. So
it puts the risk -- it puts the consumer at risk
of insufficient intake. Next slide.

In this table, you can read it at your
leisure, but I’ve compared Gellan gum with
carrageenan and pectin, and across the top listed
a number of functionalities of these products in
beverages. And the reason I chose carrageenan and
pectin to compare with Gellan gum is because both
of them are used in beverages and both of them
will form true gels at higher use levels. And as
you look at the functionality of these ingredients
in these applications you’ll see that none can
substitute for another. There are situations
where carrageenan works, you know, very well,
other situations where Gellan gum works well, and
other situations where pectin works well, so you
cannot substitute one for the other. Next slide.

And this compares those same three gums
in food applications, and again it’s the same
story; one gum does not substitute for another. They each have their own, you know, best fit applications, and sometimes, as in the case of pectin in a standard of identity jam or jelly, it is the only stabilizer you can use. Okay. Next.

So in conclusion I’d like to say that Gellan gum has unique properties which lend themselves to specific food applications, and utilization of Gellan gum, building gels in organic soy, rice, and almond beverages would ensure consumption of key nutritional ingredients, such as the soy proteins, the calcium, and maintain excellent sensory characteristics. And the properties of Gellan gum complement those of other stabilizers, such as pectin, xanthan, and carrageenan. And in summary, the availability of Gellan gum for use in organic foods, by itself, as well as in combination with other stabilizers, will bring new functionalities to the product developers of organic foods and allow those developers to better serve this important market.

Thank you.

MS. ANDREA CAROE: Thank you. And just for clarification, do you have one more speaker --

MS. BARBARA CHINN: [Interposing] Yes.

MS. ANDREA CAROE: . . . from your
organization? Okay. So there will be one more
five minute presentation. Do you have questions -
- does the Board have any questions? Katrina.

MS. KATRINA HEINZE: I have a point of
clarification. Are we able to hear all three
speakers and then lump all our questions in one
group? Is that -- are we able to do that? I just
wanted to make sure. Newbie question. Thanks.

MS. ANDREA CAROE: Jeff.

MR. JEFFREY W. MOYER: I have a question
actually with [unintelligible] here with Kevin.
If you didn’t use Gellan gum in a beverage, could
you not simply put on the label, shake before
consuming?

MS. BARBARA CHINN: Well, as it -- the
one article showed, they could -- they shook very
vigorously, and often times they could not
resuspend that, so the consumer doesn’t know until
they get to the bottom of the container, if they
look, at they have this sludge at the bottom and
in fact they didn’t consume that. So you do get
hard packing with a number of ingredients.

MS. ANDREA CAROE: Steve.

MR. STEVE DEMURI: I might have missed it
in your presentation, but what’s the carbohydrate
source that you’re fermenting?
MS. BARBARA CHINN: Corn syrup.

MR. STEVE DEMURI: Corn syrup?

MS. ANDREA CAROE: Any other questions?

Okay. Thank you very much, and Rick -- no. Yes, Rick Green is the next person. I just want to bring the on deck person up. Marc Cool, are you in the room? You will be next.

MR. RICK GREEN: Okay. Hello again.

I’ll be very brief since I think Barb covered everything. But, you know, one of the things I want to touch on, as we talk about a lot of the technical aspects, and in my own household we actually have -- I have people who can’t have dairy drinks, and so we’re big fans of soy beverages, and we’ve seen them improve over the last ten years or so. And you know, one of the things I’m looking at for the use of Gellan is, you know, we’ve made the point about it being a nonanimal gel, which is, you know, very consistent with sustainability practices. It’s also good for people with dietary restrictions like Kosher, Halal, vegetarian.

I think, you know, one of the main things is that really the organic industry came you know, to us because they saw a need for this, and there’s been a really overwhelming support, and
that’s really the main point that I wanted to make.

I did want to address whoever asked about the shaking issue, because as we found and in my own household, is that you don’t -- you want to get away from things that you have to shake, especially if they’re in cartons. Because while a teenage boy can shake a carton with the intensity of an industrial paint shaker, that it lacked the upper body strength to keep the top completely sealed, and we have ceiling fans in my house, so it’s amazing how much a small amount of soy milk can get distributed over a kitchen. So you know, as a consumer I would prefer to get things that I don’t need to shake, and Barb tells me that I should get more calcium, so that’s really all that I wanted to leave you with. So I wanted to be brief. If there’s no questions.

MS. ANDREA CAROE: Thank you. All right. Jeff?

MR. JEFFREY W. MOYER: Maybe a follow up question to what Barbara just mentioned. She mentioned that you use corn syrup. Could you or do you use organic corn syrup in the production of Gellan gum?

MR. RICK GREEN: I don’t believe we do.
We get corn syrup from such manufacturers as Cargill -- I’m sorry, what’s that, Cheryl?

MS. ANDREA CAROE: I’m sorry, I’m going to need you to go up to the mic --

MR. JEFFREY W. MOYER: [Interposing] Yeah, we can’t hear you.

MS. ANDREA CAROE: . . . and give your name because this is on transcript. Thanks.

MR. RICK GREEN: Again the fermentation nutrients are really processing aids for the bacteria. No matter what you feed the bacteria -- you could use wheat syrup, and we have done that in the past. You can use all sorts of different carbohydrate or protein sources because it’s an extra cellular polysaccharide. So the bacteria will create the same Gellan gum regardless of the, you know, fermentation inputs. So you use what’s, you know, what works best in the process.

MS. ANDREA CAROE: Bea.

MS. BEA E. JAMES: Are you using high fructose corn syrup or just --

MR. RICK GREEN: No, it’s -- I guess the technical term for it is, what, 42 DE? Barb could probably explain that better to you as to what the significance of that is.

MS. ANDREA CAROE: I’m sorry, you’re
going to have to come up to the mic and give us your name. Thank you.

MS. BARBARA CHINN: Barb Chinn. Uh, 42
DE refers to 42 dextrose equivalents. It is a measure of the degree of the starch hydrolysis in the process of making corn syrup from corn starch. 100 percent DE means it’s been fully hydrolyzed to basically its glucose units, so 42 DE gives you a measure of the degree of hydrolysis. It’s along the lines -- Karo corn syrup is about 36 DE, so it’s a little more hydrolyzed than Karo syrup.

MS. ANDREA CAROE: Katrina. Oh, Jeff?

MR. JEFFREY W. MOYER: I still don’t understand why, if we’re going to be using Gellan gum or petition to use Gellan gum in organic products we could not use organic corn syrup, or wheat syrup, or whatever fermentation base you’re using. Why wouldn’t we do that?

MR. RICK GREEN: I’m sorry. Julie, were you going speak out or did --

MS. ANDREA CAROE: [Interposing] I’m -- well, I’m -- okay. Katrina had -- you want to wait?

MS. KATRINA HEINZE: I can wait.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: I’m trying to
answer Jeff’s question. This is a 605, not a 606 item. In other words, this is not an item that anyone is suggesting is going to be made certified organic, it’s a non organic for the five percent, and so the -- there’s no jurisdiction for us to require. I mean, that’s, you know, if we want to open that one up that’s certainly a can of worms that we can look at, but that’s not the way things are right now.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: I’m glad I waited.

That was a nice segue. Thank you. I had a chance earlier today to go back and look at the transcripts from our last meeting to refresh myself on the confusion we had around this material, and a lot of the confusion had to do with whether it was a 605a or a 605b, so we talked about that this morning, that it’s extracted with isopropyl alcohol. The other discussion we had was -- and I haven’t had a chance to look at this, but either the tap or the petition mentions that in the drying process or the extraction process, I don’t really remember which, there’s a change to the acetyl groups, maybe during hydrolysis, I’m not entirely sure. And that factored into our confusion on whether it was a 605b or a 605a. So
I was wondering if you could speak to that. So the basic question is, is there a chemical change from how it exists naturally?

MS. ANDREA CAROE: And just to qualify; a change that would happen without a natural process.

MS. KATRINA HEINZE: Correct.

MR. RICK GREEN: Okay. Do -- can you call that transcript up, because I don’t recall that. I need the context of it.

MS. ANDREA CAROE: Basically what we’re asking you, I mean, it’s not -- it’s irrelevant what the transcript says. It really just prompted our history here, but the question that the Board and specifically the Committee was considering, was whether this at some point became synthetic, was there a chemical change that was one other than would happen in a natural process such as fermentation or oxidation or some --

MR. RICK GREEN: [Interposing] Right. I think I understand. The presence or the percentage presence of acetyl groups in Gellan can be very variable, depending on the organism and even the fermentation. So it’s one of those sort of variable parameters you get because it’s a biological origin where you don’t have a variable
amount of, say, you know, the polysaccharide structure. Does that address the question?

Because I --

MS. KATRINA HEINZE: [Interposing] So how do you -- my follow up question would be how do you adjust the level of acetyl groups? Is that done through a natural process or a chemical process?

MR. RICK GREEN: The processing of Gellan gum, there -- it could be chemical, it could just be the processing, you know, through pasteurization because we are required to kill the bacterial. So hold on. Cheryl’s passing something to me here. Yeah, from the tap review it did say that the extraction -- the extraction and formulation steps don’t alter the identity of the Gellan gum produced by the microbial culture so, you know, as far as it’s food grade status. It remains Gellan gum because the, you know, Gellan gum is the polysaccharide and some of these other things can be variable. So basically it will still meet the FDA definitions, regardless of the variability of the acetyl groups.

MS. ANDREA CAROE: Questions?

MR. RICK GREEN: Yeah, I’m not sure we’ve gotten there yet.
MS. KATRINA HEINZE: Are you going to be here tomorrow, too?

MR. RICK GREEN: Yes, I will and --

MS. KATRINA HEINZE: [Interposing] Okay.

MR. RICK GREEN: . . . if you would like to talk about that offline, because I think we’re not quite there, but, you know, we are short on time for the other speakers.

MS. ANDREA CAROE: You have a question to Bea?

MS. BEA E. JAMES: I just want to thank you for bringing out the troops to try to educate us on this material. It’s been very helpful.

MR. RICK GREEN: Well, thank you too. I realize it is kind of counter intuitive, it’s a very sort of strange, you know, way to make products, but, you know, a large part of it is that, you know, the one thing I wanted to leave you with is that there is a very real, you know, desire and need for this, you know, from, you know, the people that are going to be using it. Their customers are telling them that, so they’re coming to us and telling us that, and then of course, you know, so they asked us to come to you. So thanks again. I realize that the Board, you know, has seen the support from the industry, and
I appreciate you guys bringing that up.

MS. ANDREA CAROE: Any further questions?

All right. We may have them tomorrow, so again --

MR. RICK GREEN: [Interposing] Okay.

We’ll --

MS. ANDREA CAROE: . . . don’t go far.

MR. RICK GREEN: . . . we’ll be here.

MS. ANDREA CAROE: We’ll be here until, like, 9:00, 10 o’clock tomorrow night.

MR. RICK GREEN: Okay. Thank you.

MS. ANDREA CAROE: I hope not. I hope not. I hope not. Geez. It’s a joke. Marc Cool and on deck Steve -- I’m not good with names. F-O-U-R-N-I-E-R. Steve, are you in the room?

MR. STEVE FOURNIER: Yes, ma’am.

MS. ANDREA CAROE: Okay. You’re on deck.

MR. MARC COOL: Good evening, thank you.

My name is Marc Cool. I’m with Seeds of Change. We’re a 100 percent certified organic seed and food company based in Santa Fe, New Mexico. I’d like to address the Board regarding the issue of commercial availability; specifically the seed component of that. Of all the very important, very urgent, and very difficult issues you’re facing, and there are a lot of those, I fully recognize that -- you have a very full slate.
Seed is equally important and urgent, but actually not very difficult. Seed already is in the regulations that growers must use certified organic seed. There has been an NOSB recommendation passed in August ’05 supporting -- to that effect, supporting that and that’s not yet been implemented. I mentioned in March, when I spoke with you last time, that in vegetable production less than one percent of organic vegetable production is grown using organic seed. To me that’s quite scary. After using five years and after the implementation of NOP rule, there’s still that little certified organic seed available, and we talked last time a little bit about the reasons for this supply and demand, et cetera. We can go into details later if you want. The fact is that there is -- if you want to put it this way, kind of an abuse of the system. There’s not a lot of transparency, nor oversights, nor accountability for using organic seed, and there should be.

So I think this is not a very difficult issue. I do want to discuss very briefly why -- you know, I work for a seed company so obviously I want to sell organic seed, but the reasons that we are in this industry, the reason I support this
recommendation are two fold. One is this authenticates the whole organic chain. If you see the organic mark as a brand, then consumers need to have confidence that the chain has integrity and is whole, and starts with organic soil and organic seed. That’s the rule, that’s the way it should be, that’s not the way it is. We have to recognize that. The second reason is very importantly from a seedsman’s perspective, our goal long term is to develop varieties of seed that are specifically adapted to low input, agriculture and organic conditions. These types of varieties will perform better for farmers agronomically, they’ll have better traits for consumers, they’ll be healthier for people, and they will be healthier for the environment. This is a longer term goal for the organic seed industry.

We can’t get there if there’s no organic seed used. We can’t, you know, offer organic seed if there’s no organic seed industry, so these issues are all very interrelated. I heard this afternoon -- I’m a little bit --

[END MZ005025]

[START MZ005026]

MR. MARC COOL: . . . scared that it
seems that you might, this evening, deliberate
over including in your commercial availability
discussion, seed or not. I’m hoping you haven’t
made a decision to exclude seed yet, hoping that
you’re still willing to think about this. I’d
like to sway you to include in the recommendation
tomorrow the seed provision. We’re not asking you
for anything new, this is already something that
you’ve recommended, it’s part of the rule like I
said.

I have heard a lot of comments that even
though this is all the right thing, we all agree
this is the right thing, it would be very
difficult to implement. I kind of disagree with
that. The burden of proof on showing proof of
organic seed being used shouldn’t really rely on
the certifiers. In my opinion that should be a
burden on the growers. Growers should include the
use of the variety of seed they use in their OSP.
Growers know very well what seed they’re using.
The biggest grower I know uses about 100 varieties
of vegetable seed per year. That’s a lot, but
it’s not a huge burden. The growers know the seed
they use very well, they have lists of the seed
they use, they know the performance of the seed,
they know where it came from, they know if it’s
organic or not organic. It’s quite simple for them to make a list, sit down with the certifier at the kitchen table and in all honesty go over the list and say this is organic, this is not organic, and here’s why this is not organic, and here’s the criteria I used to want to use a non-organic variety.

That should be a very simple discussion that the certifier and the grower have. It should be an open, transparent system with oversight and with accountability.

That in my mind is not a hugely difficult endeavor. One thing I’d like the Committee to hear, because I do understand there is some concern with the documentation process, is that myself and my company would be willing to help, either financially or otherwise, as appropriate or relevant, to both certifiers and NOP, if there’s a way that we can help develop a system to document this and develop a website, et cetera, and we would like to reach out to certifiers to discuss this with them and find a way to make this system work. I would hope that the basis of this would be your positive recommendation tomorrow to include seed in your final review. So with that, any questions? I’d be happy to answer.
MS. ANDREA CAROE: I get -- I just want to clarify that we’re not proposing that we ignore seeds, we’re talking about separating it out from the 606 and -- I mean, the ingredient portion of it, and retooling it so it makes more sense, as far as the logistics of how it would work. But we agree with you, we want to promote seed, that’s why we’re going to continue to pursue it.

Now, I have Steve, and then I have Hue, and then I have Jeff.

MR. STEVE DEMURI: Thanks for your presentation, Marc. Are you folks a seed producer, or are you just distributing?

MR. MARC COOL: We are a breeder, a producer, a distributor.

MR. STEVE DEMURI: So you are actually breeding?

MR. MARC COOL: Yes.

MR. STEVE DEMURI: Are you working with companies out there like the Pedoes [phonetic] and the As Grows [phonetic] that produce --

MR. MARC COOL: Pedoe not, because they’re part of Seminis [phonetic], which develop --

[Cross talk]

MR. MARC COOL: But generally yes, we co-
develop with other parties, as well as ourselves.

MR. STEVE DEMURI: Are you finding from those other companies that you work with a desire to develop organic seeds? Or is there a --

MR. MARC COOL: [Interposing] The answer is there’s a huge interest. People see the $16 billion U.S. food -- organic food market as an interesting market. They also see the extremely small vegetable crop production, seed market, and they are worried about that difference. They know there is going to be -- because of regulatory enforcement, there will be a future organic seed industry, but right now it’s not big enough for them to bother about. So for them it’s too high of a risk, too high of a cost. They look for a specialist like ourselves and others to develop the organic seed industry.

MR. STEVE DEMURI: So how would you recommend we get the ball rolling?

MR. MARC COOL: I recommend that -- and I understand Madame Chairman, your point about splitting it up, and I frankly don’t care if you split it up or put it together. I would like you to make a recommendation to NOP tomorrow, not in March, that’s my point, regarding seed.

I would propose that we first put the
recommendation on paper, on the table, such as it has been done already in August ’05, such as it already exists in the rule, and then I would propose that we work together with certifiers and the NOP to find the system to actually enact this. The fact that it’s difficult to track this in some people’s minds doesn’t mean it’s not right. Let’s first say it’s right, and then let’s find a way to track it. I would be willing to help with that.

MS. ANDREA CAROE: Okay. Steve.

MR. MARC COOL: Financially or otherwise.

MS. ANDREA CAROE: Hue and then Jeff.

MR. HUBERT I. KARREMAN: I just want to agree with what you’re saying about how, you know, we have to get back down to the seed, get that organic. I think it’s the same thing in livestock. You know, we have poultts that are -- you can get them at one day old. They’re not organic until then. The origin of livestock essentially, you’ve got to -- we have to stimulate, you know, incentives to complete the whole organic cycle so that organic agriculture is very different than convention from, you know, seed to finish, and you know, we heard yesterday from a guy from Blue River, I think it was, who said he sold 60 percent of his organic seed, he
had a lot left over, and now that’s field crops,
and I have learned in the last day that that’s a
very different market than the vegetable type
demands.

But still we just need to get that
incentive to not let farmers or whoever just find
conventional seed, where if they just check three
sources and they can’t get it. It’s got to be a
lot harder. A lot harder or just not at all so
that you can have your business and other folks
too.

MS. ANDREA CAROE: Thank you. Jeff?
MR. MARC COOL: Can I make a comment on
that and respond to it briefly?

MS. ANDREA CAROE: We really have to keep
rolling. I’ll let you comment at the end. Jeff?
MR. JEFFREY W. MOYER: I don’t mind
[unintelligible].

FEMALE VOICE: Gerry.
MS. ANDREA CAROE: Gerry.

MR. GERALD A. DAVIS: Marc, what was the
name of that seed company you mentioned that does
not cooperate with you on development of varieties
and what other major vegetable seed companies are
also kind of stonewalling the process, that would
not work with you?
MR. MARC COOL: It’s not a matter of them not working with us, it’s vice versa. Without getting to details, there’s various companies in the U.S. that have been purchased by both Monsanto and Sagent in the last number of years. Those are two companies who are involved in [unintelligible] research, which we believe can’t -- is not compatible of course with organic production systems, and we also believe they can’t differentiate in their breeding lines between the GMO lines, conventional lines, and potentially organic lines. So we’ve made the decision to not work with people who actually have active GMO breeding. Luckily in vegetable production it’s not very many. Of the 12 breeding companies in the world, major vegetable breeding companies, only about two, which are U.S. based, are involved in GMOs. The rest are not.

MR. GERALD A. DAVIS: And those two would be?

MS. ANDREA CAROE: You know, Gerry.

Gerry.

MR. GERALD A. DAVIS: Okay. Sorry.

Okay.

MS. ANDREA CAROE: Let’s not go there. Let’s not go there. Any other questions?
MR. JEFFREY W. MOYER: Can I still make my comment?

MS. ANDREA CAROE: Jeff.

MR. JEFFREY W. MOYER: Thank you, Andrea, for allowing me the time. We did hear yesterday about grain crops, and there are differences between grain crops and veg crops, and I am a firm supporter, and have been forever, for using organic seed. However, I’m in contact with lots of growers and lots of farmers on a smaller scale and there’s huge issues with seed quality in vegetable seeds, more so than in grain seeds, and I think we have to be aware of that in terms of germination and true to type.

Personally I’ve bought seed from many different producers, including yourselves, and have found that type according to label is nothing at all what it should be. Germination can be all over the board because of the certification. There are no good certification standards on vegetable crop seeds in the small lot purchasing area, and we have to be aware of that when we -- if we’re going to put any kind of a burden on growers to use this seed, that the burden has to come back onto the seed producers to produce quality product, because I’ve had a lot of
complaints about comments I’ve made in public
meetings about using certified organic seed.

MS. ANDREA CAROE: All right.

MR. MARC COOL: I completely agree.

Certified organic seed must be as high quality or
higher in terms of trueness to type, germination
purity, and disease absence to conventional seed.
That’s a very important part of what we’re doing.
The only way to get there is to have an organic
seed industry which means people using organic
seed.

MS. ANDREA CAROE: Thank you, Marc. All
right. Thank you very much. Any further
comments? Okay. Thank you.

MR. MARC COOL: [Unintelligible].

MS. ANDREA CAROE: Now, before we go any
further, next up is Steve Fournier, but I want to
ask the Board, do we need a break?

FEMALE VOICE: Yes.

MS. ANDREA CAROE: I think I have one,
two, three, four, five -- nine. So we’re going to
take a ten minute break. On deck is Dave Carter.

[Audio interruption]

MS. ANDREA CAROE: Thank you for your
patience. Okay, Steve. Come on and -- whenever
you’re ready to get started.
MR. STEVE FOURNIER: My name is Steve Fournier, S-T-E-V-E, F, as in Frank, O-U-R-N-I-E-R. I’m with Pet Guard Company.

First of all I want to thank this body for all the work that they’ve done and kind of thank you in advance for the work you’re going to do. So it’s a ton of it.

Although not heavily discussed today, my comments are concerning organic pet foods. Companion animals are no longer considered pets; they’re family members. As such, Pet Guard feels organic pet food should be under no less scrutiny than human foods.

While the differences in nutritional needs are a fact, they should not be an impediment to bona fide organic pet foods being in the market. With the combination of organic regulations with AFCO nutritional regulations, and the vast amount of nutritional data that goes with that, I feel that with minor adjustments, organic standards can be applied fairly and beneficially. Being the sole diet supplier for companion animals make them unique and dependent upon their humans for 100 percent of their nutritional adequate needs.

As such, these diets must be fortified
with nutrients that may not be needed in human
diets or that humans can consume at will, as
needed. Taurine is such an ingredient. While
available for supplemental use only, as a
synthetic it is essential to the health of cats,
and to a lesser extent, dogs.

Supplementation is necessary because the
animals cannot physically eat enough food to
supply it with its needs. While it is [clearing
throat] excuse me. While it is preferable to
adhere strictly to human standards for pet foods,
the unique nutritional needs of cats and dogs is
the hurdle we must get over. With that being
said, the closer the guidelines are to each other,
the less temptation there may be for companies to
only look in the short term gain or ride a wave of
popularity instead of the final destination for
organics. That being healthier foods, healthier
people, and a healthier environment. That’s it.

Thank you.

MS. ANDREA CAROE: Thank you. Do we have
any questions for Steve? Julie, any questions
from pet food?

MR. STEVE FOURNIER: Thank you.

MS. ANDREA CAROE: Thank you so much. Up
next, Dave Carter with Neil Simms. Neil, are you
in the room? Neil?

MALE VOICE: He’s long gone.

MS. ANDREA CAROE: He’s long gone?

MALE VOICE: Yeah [unintelligible].

MS. ANDREA CAROE: Okay. Well, that makes -- then I need Nicole. Nicole, I can’t read your writing. Nicole from Vermont.

MALE VOICE: Daney.

MR. DAVE CARTER: Okay. Madame Chair, members of the Board, my name is Dave Carter. I’m involved in bison pet food, consulting, and an alumni of this auspicious group. Today I’m speaking strictly for myself, though.

First of all Andrea I want to congratulate you on completing a successful term and over the weekend we’ll start teaching you the secret handshake for former NOSB chairs.

I do want to limit my comments tonight strictly on Board policy issues and specifically the Board policy manual. In two areas in particular, conflict of interest and activities outside the Board.

I know yesterday morning, when Barbara gave her initial comments, she outlined some
things in terms of those issues, and one of the things where I think she and I could agree on completely is that this Board contains a lot of conflict of interest. In fact, I would go beyond that. I would say that by design the drafters of OFPA put together the NOSB to ripe with conflicts of interest, because when you bring together a people with the wealth of experience and expertise, they naturally bring along a lot of their biases and their personal issues as well.

And so the real test is how we handle that balance, and that’s why the Board policy manual was developed, or one of the reasons it was developed and why it’s so critical. When we put together, or started putting together, the Board policy manual, one of the things that we started to draw on was what are some similarities out there. And if you look, almost every state in the United States has a state statute that governs nonprofit associations. Those are groups that serve a larger constituency, so that’s where we kind of drew on. And if you take a look at almost every one of those statutes, or at least every one that I’m familiar with, it talks about nonprofits are allowed to have conflicts of interest, that is not the issue.
It’s that when there are those conflicts, that they need to be clearly identified and then publicly identified and addressed, and in some cases, people ought to recuse themselves and in other cases not, but it’s up to the Board to make that decision.

And so that’s the model that we tried to develop. The problem is we really don’t have any way within the Board policy manual to enforce that within the Board or to talk about compliance, and I would encourage the policy development Committee to start looking at some of those things within the parameters of what the Board can and cannot do. I always like to say that whatever’s good enough for a local community group that helps raise money for playground equipment is good enough in terms of a procedure for a $17 billion industry.

In terms of, you know, recusing yourself in the quorum, the integrity issue that was raised, I guess I have to disagree with the Deputy Administrator in that I think that the process is served -- it’s enhanced when people will recuse themselves from time to time. You’ve got 15 members on here. If a couple of folks recuse themselves, I think ultimately the decisions -- we
may agree or disagree with those decisions, but
they -- the integrity of those decisions are
enhanced by the fact that people that have
identified conflicts of interest have willingly
recused themselves in certain circumstances.

And then finally the activities outside
the Board, I was surprised yesterday by the
comment that what you do on your own time is your
own business because that really reflects a 180
degree departure in previous directives, at least
to the Board. I know in February 25th and 26th of
2003 we had a Board planning retreat here in
Washington D.C. where we started to talk about
Board policies, and to develop that, and it was
very clear at that time that when you are outside
of the Board, that you need to do everything you
could to make sure that your activities were not
conveyed in any way at all of representing the
Board, or speaking for the Board, or as a member
of the Board.

And so those are some things that I agree
more with the former interpretation as in terms of
the guidance, rather than with the one that was
issued yesterday morning, because I think it is
very important for all of us to be very respective
that while we’re here, we need to recuse ourselves
of some things, while we’re outside we need to make sure that we recuse ourselves of being part of the NOSB.

With that I thank you very much, and thank you all for your patience at this late hour.

MS. ANDREA CAROE: Okay. Thank you Dave. I’d like to say I can talk about nonprofit management with some expertise, and my company, in full disclosure, my company does have members on my Board of directors that do maintain conflict of interest. And we fully expect those members to participate in discussion and development. When it comes to a vote perhaps they recuse themselves, but they are not expected to be quiet. In fact, I would think they’d be doing a disservice to our Board, because that’s why they’re there, is to provide that. I think that’s consistent with what I read in our Board policy manual, and all members can and are expected to participate in those discussions. Our Board policy manual also indicates that before a vote, and I will, before we start voting, just as you did, call for any potential or perceived conflicts of interests, and the Board will make that decision on whether we consider that conflict enough that members should recuse themselves from vote.
We have not had votes on -- in the particular situation that -- there has been no votes.

MR. DAVE CARTER: Okay.

MS. ANDREA CAROE: So I’m a little puzzled by what you’re protesting, because we haven’t gotten there yet. Votes are for tomorrow, and at that time we’ll call for any conflicts of interests, and those will be disclosed, and the Board, in fitting with the policy manual, will decide whether they’re conflicts. I think what -- not to speak for you, Barbara, but what Barbara was saying in regards to on our own time and what we do is our own thing, is that we as private individuals, and I was told this from the very beginning of the -- my term on the Board, is I have a right to do whatever I want on the outside. However, I will not represent myself as representing the Board. Even as members, if it is, you know, you have to be very careful even if it is something that has been discussed at the Board, not to represent yourself as answering for the entire Board. That’s consistent as well, so I’m -- I guess I would like some more detail from you. I think, you know, we’re in agreement on a lot of different -- of the basic premise, Dave,
but I don’t understand a particular situation. I
don’t feel like anything has gone past the point
where there’s been any policies of this Board that
have been broken.

MR. DAVE CARTER: Okay. There’s -- well,
there’s a couple of issues at play here. Number
one is the whole issue of yes, having a voice and
no vote. I mean, at what times you choose to have
a voice and no vote. And I think it’s important,
you know, in terms of not only in materials
issues, I think the procedure is very clearly laid
out that when you go to take formal votes that you
ask for that conflict. I mean, there’s that whole
process, and that’s good, and there were times we
forgot to do that when I was Chair and you went
back and did it after the fact, just to make sure
that it was done.

More and more there’s, you know, as much
as I hate to say this, it’s not likely that the
Board is going to be involved in fewer of the
controversial policy issues and administering. I
mean, we’ve seen the whole thing with grower
groups, with everything else. And I think clearly
on, you know, clearly first -- early on in those
discussions that folks that have conflicts of
interests need to get those out. The case in
point I would use in mind, for example, is you
know, when the issue of a pet food -- that we were
going to start organizing a pet food taskforce,
was to -- even before that taskforce was appointed
or the process was there, announce that I was
involved in the formation of a pet food company
and so that I was going to try to refrain from
being in certain positions, and in fact that’s one
of the reasons that the Handling Committee ended
up dealing with pet food is because I was chair of
the Policy Committee at the time, and even though
the Policy Committee was supposed to deal with all
of these directives, we handed off the other one
just to make sure that, you know, beyond an
appearance of a conflict of interest there.

MS. ANDREA CAROE: Dave, you know, I
guess we’re going to have to agree to disagree,
because I think that you could have lent quite a
bit of expertise to a discussion on pet food if
you were involved to that point.

Now, if you chose to abstain from a vote,
or if the Board felt that you were in conflict for
the vote, that’s a different situation, but
definitely I think you robbed this Board of your
expertise in that situation. So I -- again I
think we should agree to disagree. And this is
from my expertise and my experience outside this
Board on a nonprofit Board that is under that
same -- nonprofit organization that’s under that
same structure that you have suggested.

So with that I think we’ve heard your
comments, Dave, and I -- you know, for the next to
24 hours as Chair of this Board, I feel that we
are fully within it. I stand by all of our
members and what they’ve done, and, you know, I do
not believe that there has been an issue, and we
will continue to try to uphold the policy manual
as interpreted.

MR. DAVE CARTER: Okay.

MS. ANDREA CAROE: Thank you.

MR. DAVE CARTER: Thank you.

MS. ANDREA CAROE: Any other questions
for Dave. Thank you, Dave. Next up is Nicole,
and on deck is -- I’m having trouble with the
handwriting, but Eunice.

FEMALE VOICE: Eunice.

MS. ANDREA CAROE: Eunice. Is that -- I
don’t have your last name at all.

MS. EUNICE CUIRLE: It’s Cuirle, C-U-I-R-L-E.

MS. ANDREA CAROE: Okay. Nicole,
whenever you’re ready.
MS. NICOLE DANLEY: Great. I want to thank the Board for the opportunity to speak today, and I’m going to try to be brief, partly because it’s going to be facilitated by the fact that my brain is much this late in the evening.

My name is Nicole Daney and I’m the Certification Administrator for Vermont Organic Farmers. I’m speaking on behalf of 501. We finally broke the 500 mark, certified producers.

So there are several things I wanted to comment on today.

Starting with I’d like to address the clarification of definition of materials. In general I guess I just feel nervous about changing past NOSB Board decisions. I understand kind of the motivation of this Board was to clear up inconsistencies regarding substances that have been listed as both agricultural and nonagricultural in different parts of the rule.

But I’m wary about changing the definition of agricultural to allow more substances to be considered agricultural and thus qualify for certification.

I’m not totally against it, just wary of it. As stated in the Materials and Handling Committee’s recommendation, the OFPA states that
not all live is agricultural. And my question; who benefits by having more substances meet the criteria for agricultural, so I would like to recommend to the Board that they keep the definition as conservative as possible.

I guess I’m feeling skeptical today because I’m also skeptical of the value of redefining yeast as agricultural, partly because I am concerned -- that was something that was mentioned in the discussion before about cost and supply for livestock producers in Vermont. I’m afraid of the way our dairy farmers are going to look at me when I tell them that their yeast and their feed has to be certified organic.

But I do agree with Rose’s comments earlier today about adding an annotation to the existing allowance of yeast. And I feel that as a certifier I’m already verifying that the yeast itself is not genetically modified, and in some cases that the substrate that it’s grown on is non-GMO. So I don’t think it would be too much different to verify that it was grown on organic substrate, so I think this is possible and it might solve the problem.

As far as standardized certificates, I wanted to commend the Board for addressing this
topic, because I do feel like it’s an issue in our
industry, and I generally agreed with most of the
ideas and statements for the recommendation.

In regards to the standardized terms for
certificates, I wanted to remind the Board that
mixed vegetables has been the accepted description
for many of our small, diverse, vegetable growers,
and so I would like that to be taken into
consideration when the NOP or the Board decides on
standardizing terms.

As far as grower groups, we don’t certify
any grower group, so it’s not our area of
expertise, but we do support the ACA position on
grower groups, and I did want to reiterate that we
do not believe that grower groups should include
retailers or handlers. We support the definition
of grower groups that was posted in the minority
opinion attachment to the recommendation. I won’t
read that for you, because you know what that
says.

But I would like to add, just from the
earlier discussion, that as far as our
organization, initial and renewal inspections for
our farmers and processors look almost identical.
We do check buffers on a yearly basis because we
never know what might be happening on adjacent
So I think historically grower groups were certified because of accessibility and financial obstacles, and I think the Board should consider that reasoning as they come up with the recommendation.

I’m not going to -- I’ll skip my recommendations on the commercial availability requirement because I do support the Certification Committee’s decision when they changed their recommendation to keep seed and planting stock separate, which I think was a good decision.

And then I would just remind the Board that probably planting stock shouldn’t get lost in the language when you’re writing that recommendation.

As far as livestock materials, I wanted to reiterate the need for the NOP to approve the livestock materials that have been recommended by the NOSB, and I do appreciate Barbara’s comments that she’s personally prioritizing the addition of some of these materials to the national list. But I do urge the Board to assist the NOP in finding a reasonable solution for allowing the materials that have been left out of the current proposed rule. For example, the propylene glycol and
calcium proprienate. So dairy farmers we feel really need these critical tools to care for their animals, and in light of these animal welfare discussions that we’ve been having, the importance of proving all of these materials is really paramount.

Okay. So lastly I just -- I also, like always, need to comment on pasture and origin of livestock. I really feel our organization of farmers feel that consumers and producers are really waiting with baited breath to see how these two issues are going to be resolved. We feel that these two issues are the major cornerstone of consumer confidence, and if we disappoint them with either the regulations that we write, or the enforcement of these regulations, their confidence will erode and I feel that the organic label will stagnate, which will affect the livelihood of thousands of farmers and their families, as well as the continued growth of the entire organic industry. So thank you.

MR. JOSEPH SMILLIE: Mixed vegetables. How specific do you feel as a certification organization, you want to get on that certificate?
MS. NICOLE DANELY: I feel on a case by case basis, depending on what the growers are doing. And in certain -- different circumstances, where we have orchard as they’re growing apples, we would clearly write apples in that situation, and in some regards we would even potentially list the three different varieties of apples that they’re growing.

But when I think of our small, diverse vegetable growers, it is included in their application, the list of vegetables that they’re growing, but potentially they might have crop failures, and I almost worry more or it could potentially be a worry that you’ve now got a certificate that lists a specific crop, but they’ve had a crop failure on and, you know, as far as keeping that up to date, I worry about that. And I also feel like during the audit and the inspection, the verification of what they’re growing, that happens there.

MR. JOSEPH SMILLIE: Okay.

MS. ANDREA CAROE: Anybody else? Hue.

I’m sorry.

MR. HUBERT I. KARREMAN: Nicole, just with that docket that hopefully will come out in the next week or two, we’ll just have to see
what’s on that and not, but there certainly have
been some creative ways to deal with some of those
over the counter things that you mentioned. So
hopefully we can get to that, but also just --
nah, maybe, well, regarding, you know, you were
saying you’re kind of fearful of telling your
dairy farmers, you know, they’re going to have to
use organic yeast -- why? Shouldn’t they --
they’re getting the organic premium, shouldn’t
they just be wanting to use it?

MS. NICOLE DANEY: Well --

MR. HUBERT I. KARREMAN: [Interposing] I
mean, they’re organic.

MS. NICOLE DANEY: Yeah.

MR. HUBERT I. KARREMAN: I would think
they would want to use organic yeast if they
could.

MS. NICOLE DANEY: But I’m not
necessarily sure that yeast should be considered
agricultural, and I do feel that some of our
farmers might question that, especially since
they’ve been feeding yeast that was acceptable and
certifiable -- or not certifiable.

MR. HUBERT I. KARREMAN: No, I understand
that, when something gets switched midstream,
dairy farmers go nuts. You know --
MS. NICOLE DANEY: [Interposing] I also just -- I see their faces looking at me, like, yeast? Yeast is agricultural? And I feel like that -- that I have that question too.

MR. HUBERT I. KARREMAN: Yes.

MS. NICOLE DANEY: And as much as I want to push our industry to make sure that, you know, we’re trying to create innovative techniques, I think we can do that potentially with this -- with yeast without having to make it certifiable. You know, by creating the annotation.

MR. HUBERT I. KARREMAN: Yeah, no. I understand that. It’s very complex. But I mean, I’d say if there’s a light at the end of the tunnel for yeast to become organic, you know, I would want to see that happen. I know it’s really complex, but then I would also I guess like to see the dairy farmers say good, we got organic yeast, we can get it now. Finally.

MS. NICOLE DANEY: Right.

MR. HUBERT I. KARREMAN: But I have a feeling that won’t happen, and that worries me, that the dairy farmers, they get their premiums, but just like anybody in society, if you can be cheap about something potentially, you will, and yet they’re getting the organic premium, so they
should wrap their arms around the idea of getting
organic yeast, potentially.

MS. NICOLE DANIEL: Uh huh.

MS. ANDREA CAROE: Any other comments?

MALE VOICE: [Unintelligible].

MS. ANDREA CAROE: Kevin.

MR. KEVIN ENGELBERT: Speaking on behalf
of organic dairy farmers who, if --

MALE VOICE: I thought you might speak
up. That’s fine.

MR. KEVIN ENGELBERT: We don’t all go
nuts when something changes, and if organic yeast
becomes a reality, we will embrace that.

MS. ANDREA CAROE: Any other comments,
questions? Thank you very much. Eunice, you’re
up, and Rich Theuer, you’re on deck.

MS. EUNICE CUIRLE: Okay. My name is
Eunice Cuirle, that’s E-U-N-I-C-E. Last name is
C-U-I-R-L-E and I’m here representing Marinalg, M-
comments brief, considering the time. Marinalg
International is a trade association representing
the worldwide producers of seaweed derived
extracts. First I’d really like to commend the
Handling Committee for taking the time to review
comments that were submitted in response to your
October 2nd report regarding carrageenan and auger — auger. We agree with the recommendation presented this morning that carrageenan and auger be reconsidered for retention on the national list, and thank you for that. Carrageenan and auger each provide unique properties when used in food. In fat reduced products carrageenan provides an indulgent property. It provides versatile gel textures and controls syneresis and whey off. It provides a range of viscosities, and it’s used as a film former. Carrageenan’s properties provide for its use in meat and dairy products, as you’ve seen earlier today. And it’s also applicable in personal care items, such as toothpaste and chewable vitamins.

Auger, on the other hand, is somewhat of a niche product. It’s unique in that it provides a thermal set when exposed to high temperatures, and as such it’s used in the icing on preassembled baked goods; meringues, aspics, some meat products, and sauces. And I’ll end my comments there. I just wanted to give you some additional clarification on these two products.

MS. ANDREA CAROE: Thank you very much. Is there any questions? Thank you very much. Rich, you’re up, and I have Will Fantle down, but
I think you’ve already done -- Mark.

MALE VOICE: [Unintelligible.]

MS. ANDREA CAROE: Okay. You’re on deck.

MR. RICH THEUER: Well, good evening.

It’s very late and you’ve been here a long time, and I hope everybody’s had a little candy like I had to keep from getting too hypoglycemic. My name is Rich Theuer, I’m a private citizen and occasional consultant from Raleigh, North Carolina. My comments represent my own views and probably nobody else’s. As you can see, I -- oh, can I go back? As you can see I happen to be part of the cause of the problem in 1992 and 1994, relating to materials.

And then I got my comeuppance as a tap reviewer, trying to figure out what really was synthetic and what was nonsynthetic. Lesser so the agricultural, but I was very gratified when Dan mentioned this morning about the cellulose, and I remember in the tap review coming to the conclusion, in one out of three, that yes, you could make it organic if you started with cotton. You could make it probably organic if you started with glucose -- organic glucose and had a microbial fermentation, but it certainly was synthetic if you did the pulp isolation, the
Then I’m now with OMRI, trying again to figure out from old cap reviews what do materials do.

What I’d like to do today is review your materials from a rather unique point of view. Can I have the next? First of all I think the definition of agricultural substance, as you have described, should be either deleted or substantially modified, because it’s confusing, problematic, ambiguous, and I think it’s contrary to the sense of the OP -- the Organic Food Production Act. Actually something starts or agricultural, it really doesn’t change, and it can actually become synthetic or start synthetic, but it really doesn’t change. The other thing that I think is required is a working definition of a chemical process. In the synthetic definition there are -- if it’s formed by a chemical process or it’s chemically changed, or -- and then the exemption for something that’s from a naturally recurring biological process.

The work done two years ago on coveilant ionic by Rose Kiernagan [phonetic] and associates, I think did a nice job on point number two. But point number one really could use, if not a
definition, some good examples, right? Cellulose isolation from wood pulp by these horrible chemical methods would be a good example. We need more, but we don’t really know what chemical process means, and as Dan mentioned earlier, the early tap reviews are so inconsistent, so ambiguous sometimes, and you really wonder how did people ever figure that out. And of course after seeing that, the Board would vote you know, like 8 to 5 that it was synthetic. You know, you don’t tell sex that way and sometimes you can’t tell synthetic that way either.

No, the next one is -- they’re points to disagree with and it sounded like, when I was reading the document, that minimal processing of an agricultural product could make it nonagricultural. Further processing could change it enough to make it synthetic, even if there was no chemical change. And maybe I misread it wrong, but -- misread it, but I think I disagree if that’s the meaning. Could I have the next?

When we talk about agricultural product, getting to the point of does any processing change it, and I think in the document you mentioned that lysozyme [phonetic] really should be synthetic, and I would disagree with that because of the
words of the act; a product derived from livestock, marketed for human consumption, is still agricultural. And chicken goes to egg, goes to egg white, goes to lysozyme, and so lysozyme is still agricultural, and I know a processor would never want to fool around with it chemically because then it would lose activity. Can I have the next?

And so the paradigm of agricultural and nonagricultural, nonagricultural to synthetic, I don’t think is right. Agricultural always stays agricultural, synthetic can actually go to nonsynthetic if you isolate. Can I have the next one?

If you take corn starch from GMO, the decision tree of about two, or three, four years ago, says you can remove synthetic part and you wind up with corn starch that you can ferment to citric acid, and that is nonsynthetic.

And then a final question; can there be nonagricultural organic. That to me is the $64 question. I don’t think you can.

MS. ANDREA CAROE: Thank you.

MR. RICH THEUER: It has to be -- can I have one more, please, and then -- synthetic definitions, and just as a point of view, next
one, in processing it doesn’t make really a big
difference. Everything goes thorough the national
list. But for crops it does make a difference,
and I think as I learned after last meeting, can I
have the next and final, and then I’m gone. I
think you’ve got a real problem with streptomycin.
It’s a natural material, it’s on the list of
 synthetics, it’s really nonsynthetic, and someday
someone’s going to use it and there will be no way
of stopping them from using it for anything.

MS. ANDREA CAROE: Thank you, Rich.
MR. HUBERT I. KARREMAN: I’ve got one
question.

MS. ANDREA CAROE: Jeff -- Katrina, and
then Hue, and then Bea.

MS. KATRINA HEINZE: Thank you for some
very well thought out comments. I really
appreciate it, and some good slides that we can
use.

MR. RICH THEUER: Thank you.

MS. ANDREA CAROE: Hue.

MR. HUBERT I. KARREMAN: On your
streptomycin then, what do you think about
penicillin, because I hear that from straight --
or conventional [unintelligible] so they say well,
penicillin’s natural, it’s from the soil.
MR. RICH THEUER: They’re, well, let me tell you what I know, and then what I don’t know.

The two microorganisms to make the oxytetracycline and streptomycin were isolated from the soil. It’s a very simple fermentation, I’ve read the patents, and it’s a -- in fact, for the fire blight they actually spray I think, from what I read, the entire culture, so there’s no isolation. So it’s absolutely nonsynthetic.

In the case of pencillins, many of them are semisynthetic pencillins, and so I would have -- I would, you know, from a point of view, I think you need to look at each and every one to exactly know what is it, what is a direct product of fermentation, and also the aspect of was it a GMO organism that may have been involved.

So streptomycin, it is not a GMO. The organism was isolated in about 1940. The fellow who did it got the Nobel prize in ’52 because they thought it would eliminate TB, but it’s all pre-modern science.

MS. ANDREA CAROE: Okay. Gerry.

MR. GERALD A. DAVIS: So I remember when we reviewed streptomycin for the last Sunset process this question came up, but what was unclear in the tap was whether there was something
in the formulation process of the finished product as used in agriculture that made it synthetic, and this is kind of interesting, new information to bring up, and --

MR. RICH THEUER: [Interposing] I have not gotten that far, except to -- there’s a professor at Wisconsin working on fire blight in pairs in Wisconsin who basically indicated, and from what I’ve read on the internet, that the culture of streptomycoses drisius [phonetic] is very little modification, it’s just blown all over the orchard.

Now, the reason I got into that is after the nanomycin which was, you know, nonsynthetic, you know, looking into this and saying oh, this is even worse in terms of having the resistance factors generated. I’d have to look into that, Gerry.

MR. GERALD A. DAVIS: I’d be interested in your input if we could be in contact. Thanks.

MS. ANDREA CAROE: Dan.

MALE VOICE: Who’s next?

MS. ANDREA CAROE: Bea said she didn’t have him.

MR. DANIEL G. GIACOMINI: On that -- the one slide where you think you may have
misunderstood, I think you may have -- it wasn’t
what we intended to say, but certainly was your
intent. I’ll put it that way. Were you on the
Board when lysozyme was put on the list?

MR. RICH THEUER: I think that was later.

MR. DANIEL G. GIACOMINI: Okay. Well
then I’ll ask it then; why do you think they put it
on 605a?

MR. RICH THEUER: I have no idea. No,
Dan, when I was on the Board ’92 to ’94, and they
asked me to come back in ’95 to chair the sessions
of going through processing materials, and it blew
my mind how some things were said to be synthetic
and some things were said to be nonsynthetic,
knowing -- having done 63 out of the 71 tap
reports. That, you know, I knew those materials
and I don’t understand how it happened. It was by
a vote.

MR. DANIEL G. GIACOMINI: Well, it was
confusing then, and it’s confusing now, and if our
document did nothing more, it’s getting --
hopefully it’s at least getting people maybe to
look a little bit outside the box of things in
different ways and maybe we’ll find an idea that
we can move with.

MS. ANDREA CAROE: I think lysozyme is,
like, within the last three years. I’m pretty sure I voted on it, but at this point I’ve got random access memory, so I can’t remember what the logic was. But I’m pretty sure that it was fairly recent that that was put on the list.

MR. RICH THEUER: And sometimes there’s no rhyme or reason.

MS. ANDREA CAROE: It’s case by case, which is, you know, what we’re trying to solve. So any other Board member questions, comments?

Thank you, Rich. Always thank you.

MR. RICH THEUER: Thank you.

MS. ANDREA CAROE: Your historic perspective is very valuable.

MR. RICH THEUER: If I can be of assistance I’ll -- I’m here.

MS. ANDREA CAROE: We will definitely call on that.

MALE VOICE: We need your card.

MS. ANDREA CAROE: All right. Mark Kastel and that is our final commentator for today, so this is it, folks.

MR. MARK KASTEL: Okay. Good afternoon. Thank goodness. My name is Mark Kastel, I’m representing the Cornucopia Institute, we’re based in Cornucopia, Wisconsin. I also have a proxy
here from Tom Willey of T. D. Willey Farms in Madera, California. Am I saying that right, Dan?
Madera. Okay. Thanks. First I want to preface before I go into my remarks -- substantive remarks, I want to say that what happened during my testimony yesterday I feel was inappropriate, and let’s look forward though, instead of back. But I want to highlight history for some of the newer Board members.

The tradition of the Board chairperson briefing the participants at the beginning of the meeting to act in a respectful manner is a byproduct of an era which predates, incidentally, the Cornucopia Institute’s founding, where there was some vociferous language and behavior on the part of some participants on the Board. Sometimes some staff, and sometimes some participants. But let me say that I would like to see whoever comes in as chairperson discontinue this tradition of briefing the adults in this room as in terms of acting in an appropriate manner, because it leads to potential censorship.

I don’t think there’s anything that I said yesterday that was either disrespectful or factually inaccurate, but if I had, you folks have the right and ability to either scold Mark Kastel
or any other participant here if you think my behavior’s out of line, or if you think that statements made by somebody making a presentation that’s factually inaccurate, you have obviously the right and maybe the responsibility to try to correct the record.

So I really want to discourage whoever comes in from continuing this tradition, and hope that we all remain and continue to respond in a respectful and professional manner.

Folks, it’s time. It’s time for the NOSB to take a look at the exemption, the cap on the exemption for certified organic direct market producers which was set at $5,000 when this process began in the year -- prior to the year 1990. What that number should be I’m not going to recommend today, but I want to read you a brief part of an article that was in the Wall Street Journal this morning on biodynamic agriculture, and it said in part, for those who feel organic farming has sold out to corporations, biodynamic farming has often seen as the last bastion here of shelter.

So first of all that sentiment we don’t like to hear, obviously, as we get more larger players in, and the smaller farmers are the folks
who really consumers can romantically relate to, and I think it’s important for us to have marketers and participants in this industry in all scales.

And so whether that number should 15,000 or some other number, it really eliminates the possibility for a lot of small, part-time seasonal direct marketers to label their products organically, and we should be encouraging the expansion. A lot of them will be the ones to raise to a higher commercial level in the future, and we want to encourage that entry level growth.

Grower groups. My comments are intended in no way to impugn the credibility of an example -- the Whole Foods representative that was just recently speaking, and she’s rightfully proud of their internal procedures and their internal auditing protocol. But I want to emphasize that these are internal auditors.

The Cornucopia Institute, as a public charity, by law in the State of Wisconsin, has to be audited every year by outside auditors, and that’s really the strength and basis of our certification program in the organic industry is that consumers depend on the USDA to accredit outside auditors, outside certifiers, and we at
the Cornucopia Institute, and much of our membership, thinks it’s not in the same class, and shouldn’t be in the same discussion to talk about third world peasant farmers on a very small scale, and talk about multinational retailing corporations in the United States in the same breath.

Next subject, leafy greens. There is an advance notice of proposed rule making with a docket open right now that I hope the Board will consider, if nothing else, as individuals participating in voicing your views on. This is a -- this is bad news for organic producers around the country. This is an effort to take, quote, the voluntary program in California, and turn it into a national program. First of all, let me emphasize that the California program is not really voluntary, that there are a number of large supermarket chains and food distributors that are requiring their suppliers -- their growers to adhere by these standards. At a minimum, the United States Government should delay potential implementation of this on a national basis. There is not a good scientific basis for these protocols. Since the California voluntary -- the Leafy Green Marketing Agreement went into effect,
there’s been at least two recalls from participants in that program that were adhering to those protocols, so this is no guarantee we’re going to solve the problem that manifested itself in spinach last year.

The regulations would discriminate against organic farmers. It would eliminate forms of biodiversity, it would cause farmers to have to, in essence, sterilize the environment and it’s in conflict with our -- some of our mandates in the organic standards.

The problem has been in a prewashed spinach, and bagged leafy greens. The problem has not been in other leafy greens. But the proposal on the table is to expand this for all leafy greens, including this like arugula and chard. At a minimum, if the problem is with these prewashed greens, we should get these other crops off the table.

At a minimum we should think about, and I hope you folks will chime in exempting small direct marketers and organic growers. These are not the people responsible for national epidemics. The one size off rule does not fit. This is a disproportionate burden on small organic growers.

One of the requests is testing at harvest time,
and so let me contrast this.

We have large farms, commercial industrial farms in California that some of them are monocrop producers, some of them are producing one to three crops per year that will be mandated to be tested at harvest. We have members in New York State, in Wisconsin, in California that produce many, many crops. You’ve heard testimony about the challenges of procuring organic seed for vegetables. Many -- dozens of crops, and some of these farmers are going to market every week, and doing a harvest every week. If they have to go to the expense of a testing protocol, this could put some of them out of business, and so I want to lastly read just a couple of quotes from Mr. Willey’s testimony here. He said last week a shipment of ours was held up at the Canadian border because it included two boxes of bunched kale, and we are not signatories in the, quote, Leafy Green Handler Marketing Agreement. Thank you.

What’s objectionable about the Leafy Green Agreement it is -- is it is anti-biological, anti-nature, and biased. It imposes growers -- discriminates against growers using traditional production methods demonstrated to be safe over
Coerced by processors, farmers up and down the Salinas Valley are destroying hedgerows, any farmscape that might attract wildlife, though no significant evidence exists to implicate native species in produce contamination. And I also in closing want to recognize the California Alliance with Family Farmers, CAFF, for their work -- leadership on this issue, and I’ll close here and take any questions, if there are any.

MS. ANDREA CAROE: Are there any questions or comments?

MR. MARK KASTEL: Then I’ll say good night and thank you.

MS. ANDREA CAROE: We are -- that completes our public comment session, and our agenda for the day, so we stand in recess until 8:00 a.m. tomorrow morning, where we will start public comment again.

MS. ANDREA CAROE: We can reconvene.

Good morning. First on the public comment is Kim Dietz with Kelly Shea on deck. We’re all ready, so Kim, whenever you want.

MS. KIM DIETZ: Get to hear my raspy voice first thing in the morning. Ready? Okay.

Good morning. My name is Kim Dietz and I’m here today to give you public comment as an individual industry member, and not of those of my employer.

I served on the NOSB from 2000 to 2005 as Handler Representative, three of which were as Materials Chair. Prior to that I’ve chaired RTA’s MPPL Committees -- Committee, during the drafting of American Organic Standards and much time before that, as well. And I was one of the founding members of ORMI. The reason I bring that up is just for experience with materials, because I think again that is most severe charge, and most of my focus.

Today I continue to volunteer in this industry whenever needed as leading task forces
and other things like that.

First of all I’d like to request a technical correction on a recent recommendation for beta carotene, listing in 606. The CAS number, 1393.631 noted on the annotation is incorrect. That needs to be fixed. That annotation -- or that CAS number actually is for an auto, and I’ll supply the MSDS sheets and background to Bob Puller [phonetic].

Sunset materials and materials in general. As a former Board member I feel for each and every one of you when you go through the painful discussions with materials. Believe me, you’re not alone, we’ve all been there. It takes a while to get going and understand exactly how it all works, but you’ll do it. You’re a competent group and we have faith in you.

Here’s a few words of advice; use the process and the material recommendation guidelines at all times. Don’t waiver from those when reviewing material.

I caution you to refrain from personal opinion or stating that you personally believe a
product should or shouldn’t be allowed for some reason or another. Be consistent, use your national list. If the materials on the national list that’s similar or has a similar process, or is placed in a similar place, use that as guidelines.

Some of the comments yesterday about previous voting on 606 materials, in comparison to the current petition being discussed, was quite alarming as a member of the audience sitting back, and especially as a former Board member. I caution you to be careful with that. You want to be consistent and fair again with the material review process.

If any Board member or Committee feels that information is needed -- more information is needed, you can always defer a vote. I didn’t hear that talked about at all over the last three days, and it’s not something you want to do, but you can defer to request more information, and that’s a fair thing to do instead of voting or rushing something through because you’re not sure of all the information that you need. So you can
You certainly shouldn’t vote if you don’t feel like you have everything that you need.

Crop materials; just a point of clarification. A comment was made yesterday that no public comments were received. I did submit public comment on those. And particularly because I was on the Board when we voted on those, and it was very difficult to get the farmers in to petition those. We pleaded with them for years and years, and we finally got those petitions in, so I’m not surprised you don’t have comments, but they are using those.

Finally the discussion docket on the definition of materials. I think you’ve all heard the comments. It’s a good start, and we’ll get it there. Thanks, Bea. I thank you all for bringing forward this document, and I encourage you to engage the industry leaders, former NOSB members, and any other public people that are interested in this process. I do support a working group on this, and in fact there’s been many of us here over the last few days in the room that have
somewhat semiformally formed a group with or
without you, and I kind of hate to say that, but
as a materials person it’s what I’ve done almost
my whole career, and, you know, we’re going to
follow it closely and if there’s not the proper
mechanism within the NOSB then, you know,
collaboratively we’re going to all work together
and make sure that you get the comments you need
from a concentrated force.

I’ve got some specific examples. The
decision tree I think is very close. The fourth
block that was mentioned yesterday by Gwendolyn,
and I think I’ve talked to you about a few people,
definitely was missing some pretty critical
information on handling basically what has made
everything 100 percent organic, and that’s it, and
you don’t want to go down that road. Oh, okay.
One last thing? Thank you Madame Chair for your
service of five years. I’m sure it’s been a fun,
and painful, and glad you’re ready to get off
road.

MS. ANDREA CAROE: Thank you, Kim. Could
you elaborate for some of our newer Board members
the Sunset -- the reason for Sunset, and our
purpose in Sunset?

MS. KIM DIETZ: The reason for Sunset is -- should be fairly basic. If the material is
still needed in the industry, then it should be
continued to be allowed, so long as there’s no
negative comments on that material.

And a negative comment with be a very
formal comment that comes in, giving you the
reasons why it needs to come off, and really,
industry information as to why it needs to come
off. That’s really -- supporting it such as
there’s an alternative available. We had a
speaker yesterday with an alternative for some
materials. Really the industry needs to make sure
that that -- that whatever’s out there is
something that they can use.

But the Sunset is meant to just reenlist,
and for you to go through and say okay, if there’s
nothing changed, and no new material to replace
it, it should continue to remain. Is that what
you were looking for? Okay.

MS. ANDREA CAROE: Exactly. Any
questions for Kim? Hue.

MR. HUBERT J. KARREMAN: In that same vein, what about if, like, for some reason, you know, there’s public outcry about some material, but it’s just, like, well, we don’t think it should be in organics, you know, just that kind of thought.

MS. KIM DIETZ: It’s not -- yeah, I don’t -- it’s not fair, actually. I mean, I stood back yesterday, and as a manufacturer -- put my work hat on for a minute. As a manufacturer, if I use the material that this other person’s saying I have a replacement for, you need to give the industry time to look at the new material. Certainly we always want to look at new things, and we’ve been leaders of this industry, many of us, but you want to make sure that whatever the replacement in will work for you. There’s a lot of different applications for a lot of different products out there, so you should just be able to say we’ll take it off for no reason. It needs to be -- the industry needs to look at it and have time to see if it really works for their products.
MS. ANDREA CAROE: Barbara.

MS. BARBARA C. ROBINSON: That’s why we — if you go back and you look in the process for Sunset, in the ANPR -- you remember the Advanced Notice of Proposed Rulemaking that we wrote, there’s a whole lengthy description of the process and what has to be put forth in order to basically to remove material from the national list, and we went to great lengths to describe the evidence, basically, that has to be produced by the public in order to delist or not renew the exemption for material. We’re not starting over again with each and every material. Otherwise you never would have gotten through 174 materials on the national list for this first Sunset.

It is simply according to the law, you are just saying -- you are just renewing the exemption. But that ANPR was quite detailed and said, you know, someone must come forth with evidence, and the burden is on the industry to come forth with that evidence that says hey, you know, I’ve got the proof here that says why this material should come off the national list. You
don’t have to come up with the evidence, and you
don’t -- and it is not your charge to say -- to
challenge all previous Board’s decisions about why
this material now fails to meet all the criteria
that put it on the national list the first time.

MS. ANDREA CAROE: Other questions or
comments from the Board? Thank you.

[Cross talk]

MS. ANDREA CAROE: Next up is Kelly Shea,
and on deck is Will Fantle. Will, are you here?

MALE VOICE: Will [unintelligible].

MS. ANDREA CAROE: Well, we’ll pass at
this time. Steven Walker, are you in the room,
Steven? You’re on deck.

MS. KELLY SHEA: Good morning, National
Organic Standards Board and program. I am Kelly
Shea with Horizon Organic and Silk Soymilk. I
guess I also have morning voice like the previous
speaker.

First off we would like to thank Andrea
Caroe for her five years of service to the organic
community. Thank you, Madame Chair. Also want to
note that we appreciate Bea James’ comments
yesterday on Gellan gum. At White Way we do believe it will have excellent unique uses in organic, and will not be duplicative to other materials on the list.

As regards the Sunset materials, carrageenan, agar agar, and cellulose, these three Sunset materials, there have been no calls at all for their removal from the list. There has been no new information about the criteria regarding these materials, nor any available substitutes proposed, and so we appreciate the Committee’s recommendation to relist this item, and we appreciate the Board’s consideration.

We would like to comment on the great news that the program provided on the pasture proposed rule and the livestock materials moving forward. This has been a very, very long time in coming, and I know the 425 farmers that ship to our Horizon Organic label, as well as many other farms out there, will appreciate the efforts of the Board and the program in this area.

I would like to point out one learning from this process we’ve gone through. In order
to, well, I won’t say that. I think I’ll just cut straight to the chase. As we look at the origin of livestock clarification to the regulations, I think based on our learnings we should either consider a technical correction to the regulations because the regulation is not correct in the way it is written provides an uneven playing field, so I think I’d appreciate it if the program and their attorneys considered a technical correction, or at the very least, a proposed rule without an ANPR. I believe with an ANPR we will be years out from this effort as well, and so I would like the program to take that under consideration.

And lastly I would like to remove from my comments yesterday the two odious words taskforce, and substitute the words working group. I didn’t quite realize the stigma attached to the words task and force, and so I appreciate the education that I received from many, many members of the Board and the program, and so once again I would like to reiterate the organic community’s willingness to come alongside the Board in some form of a working group to look at the history of
ag, non-ag, nonsynthetic, synthetic, and try
together to come up with a solution that will work
for the community today, and the community of the
future. Thank you.

MS. ANDREA CAROE: Thank you, Kelly. Any
questions? Comments? Thank you, Kelly. Steven
Walker? You’re up, and then Jackie Von Zuden
[phonetic]. Jackie, are you in the room? Yes?
Good.

MR. STEVEN WALKER: Good morning, I’m
Steven Walker, Certification Manager at Midwest
Organic Services Association in Wisconsin. I’d
like to thank the Certification, Accreditation,
and Compliance Committee for their consideration
of the concerns and benefits of multi site
certification schemes.

This is another challenging issue in the
organic community’s persistent struggle to balance
promotion of the growth of organics with
maintenance of a strong organic standard.

Continuation of grower group
certification is important to the organic
community, however, MOSA does not support the CAC
Committee recommendation. The introduction to that recommendation states it extends the logic of the 2002 NOSB grower group recommendation to accommodate organic industry developments. Although logic can be extended to a new conclusion, it can be a mistake to do so.

This Board has previously had to clarify inappropriate extensions of logic. For example, you clarified that stages of production language and allowing temporary confinement for livestock cannot be extended to include lactation.

Similarly I see that the proposed extension in scope to enable limited certifier inspections of retailer and other handler groups as being based in convenience, rather than necessity. It amounts to a weakening of our organic standard and would again put us at risk for more questioning of the integrity of the organic label.

As I’ve said here before, frankly I’m tired of defending against the -- lost my spot here. Tired of defending against the questions and the suspicions. I do recognize that economic
efficiencies and reducing burdens on certified
operations have their place. In that light I’d
echo Michael Sligh’s comment from Wednesday; that
we seek to do no harm to small farmers.

Overriding that principle, I’d add that
our decisions must first ensure that we do no harm
to consumer’s trust in the organic label. We need
to get back to a focus on the grower’s needs.

I would not portray the 2002 NOSB grower
group recommendation as being in need of fixing
because it’s broken. Rather, it’s in need of some
fine tuning. Others here have pointed out that
the organic system plan based internal control
system model has been long in use and is
functioning fairly well, with ongoing improvements
and with many success stories.

Group certification systems are based on
sound accreditation, auditing, and certification
norms. MOSA supports the CAC’s suggested
revisions to the 2002 NOSB recommendation.

The ACA recommendation and other comments
before you seek to sensibly limit and define the
grower group certification parameters. These
systems were developed based on considerations on how to lower market entry barriers for small holder groups. Certification should not be a technical barrier to market access.

This said, lowering barriers to certification should be based on need, such as limited access to infrastructure and limited financial capability, and must be balanced with risk assessment. Need should not preclude due diligence in addressing organic integrity risks.

In MOSA’s experience, the group certification scheme is not deemed appropriate or necessary for retailer or handler situations. We certify a handful of retail operations. Our certified retailers have expressed that multi site retail certifications have devalued their certification efforts, and have created an unlevel playing field.

We do not certify any retail chains per se, but we have certified several retail operations with multiple stores, using centralized management and a single organic system plan.

It’s our policy to perform annual
inspections of all sites, and these inspections have found instances where compliance issues vary from one location to the next, even though the organic management plan is held in common.

Though there is committed organic management plan supervision, it’s not easily transferred to all store personnel. Risks to organic integrity and organic management variables are very site specific at this level. We’ve seen the need for annual third party inspection in our limited multi site situations, let alone retail chains with hundreds of store locations.

Thanks for seeking a way forward, but also for recognizing that the multi site certification recommendation needs to be pulled back because of the perception that it could lead to organic integrity questions. Perception is as important as practice. You’ve wisely applied the brakes before hitting a slipper slope.

I’m pleased to work in a community where we can fairly effectively design the rules to fit our needs, but let us remember that this is a diverse organic community and needs that must be
addressed include consumer’s higher standards desires, as well as organic operators needs for an efficient, sensible certification process, when balancing these needs it ultimately benefits all to err on the side of a stronger organic standard.

MS. ANDREA CAROE: Thank you so much.

MR. STEVEN WALKER: Thank you.

MS. ANDREA CAROE: Questions? Tracy.

MS. TRACY MIEDEMA: Just in trying to explore the limitations of how an ICS can work, it sounds like you’ve encountered, in multi store operations that are certified organic, you visit every single store and you feel that every store inspection annually is important. Is that -- that’s what I heard you say just now?

MR. STEVEN WALKER: I think it’s an additional control and from the comments that I heard yesterday, it sounds like the ICS system is working very well in some situations, but there’s not a need to then cut back the third party certification --

MS. TRACY MIEDEMA: [Interposing] So my --
MR. STEVEN WALKER: . . . by inspection.

MS. TRACY MIEDEMA: Okay. So my question is -- here's the persistent question I have. You don't certify any multi site operations that are farms, is that right?

MR. STEVEN WALKER: We do. Well --

MS. TRACY MIEDEMA: [Interposing] That have an ICS?

MR. STEVEN WALKER: Not that I -- the gist of your question; we’re not doing coffee growers and things like that, but we do have for instance a poultry operation with a centralized management and multiple farms, all following the same organic system plan, and I like in that organic system plan too in our internal control system. There may not be a separate document saying this is our internal control system, but there is that document, the organic plan, they’re, you know, pretty much one and the same.

MS. TRACY MIEDEMA: Right. And that’s what I’m seeing as, you know, the internal quality system, whether it’s a farm with many locations, a farm where each farm manager is an owner of that
piece of land, I mean, where are the limitations? Why is it not working with these stores? And you’re insisting upon making sure every store gets an annual inspection, which sounds like it’s prudent in this situation. Why might it be okay at a farm but it’s not in the store?

MR. STEVEN WALKER: Well, I’m not saying it’s ideal in a farm situation. It’s need based, and with the farms situation that we are certifying, we are inspectioning all of those individual poultry operations.

MS. TRACY MIEDEMA: Do you have any opinion on --

MR. STEVEN WALKER: [Interposing] That’s the point.

MS. TRACY MIEDEMA: ... group certification -- grower group certification, you know, say 100 member farm, do you believe that every one of those member units should be inspected annually?

MR. STEVEN WALKER: Yes. Should.

MS. TRACY MIEDEMA: So that -- so you feel you’re really sort of -- if there’s a
spectrum, you’re at the absolute end of every --
you would say every member, every time, every
year, always?

MR. STEVEN WALKER: No. I think that the
grower group certification scheme can be
effective. We need some additional definition
parameters; how do we assess risk, those types of
things, but it’s not idea, and I see it as a
compromise situation. A reasonable compromise
that isn’t needed at the retailer level, the
handler level, where there’s sufficient
infrastructure and so forth.

MS. TRACY MIEDEMA: Thank you.

MS. ANDREA CAROE: Any further questions?

Jennifer and then Rigo.

MS. JENNIFER M. HALL: How do you
prioritize -- or how do you level the playing
field? Because I actually find it interesting
that people see less of a need for annual
inspections on the farm, when that’s where the
integrity starts, and at the retail level people
seem to put more of an onus on the end of the
game.
MR. STEVEN WALKER: I guess I’d back off and saying less of a need, but it gets back to that practical, sensible, this balancing act between what do we need to do to promote the growth of the industry while maintaining the integrity in the organic label. And I think that the grower group situation as its been presented, you know, 4 or 5 -- 15 years ago, is a reasonable way of finding that balance, but that kind of approach is not needed in the situations that we are certifying.

MS. ANDREA CAROE: Rigo.

MR. RIGOBERTO I. DELGADO: Yeah, I have a question. If you -- assume we have a farmer who owns 1,000 acres, but those are split into 10 different fields, close to each other, this person is growing the same crop, same procedures, and so forth. Do you go and inspect each of those fields every year?

MR. STEVEN WALKER: Risk based, and we have situations like that as well. A big farm, ten different parcels or something, we will inspect the entire operation more thoroughly.
It’s that initial update and inspection scenario again. Based on the organic plan and our experience in overseeing that operation, we may not inspect, you know, every inch of every field in subsequent years, but we’ll do a more thorough job in that first year. Risk based.

MS. ANDREA CAROE: Other questions?

Thank you.

MR. STEVEN WALKER: Thanks.

MS. ANDREA CAROE: Next is Jackie Van Zuden and Leslie Zuck. You’re up on deck.

MS. JACKIE VON RUDEN: See how that works. It’s Jackie Von Ruden. I am a Certification Specialist from Midwest Organic Services Association of [unintelligible] Wisconsin. I have a statement to read from our director, Bonnie Wideman.

Members of the National Organic Standards Board and National Organic Program, thank you for your work, it is appreciated. On behalf of the 450 organic dairies we certify, we ask that you give attention to the dairy replacements issue.
Our farms are small, the average herd size is around 50, but the commitment to organic farming represented here is large. A commitment to not only organic methods of production, but to sustainable family farming as well.

The certification of industrial organic dairy farms in other parts of the country has an impact on our farmers here in the Midwest. This past spring an influx of milk into Wisconsin from large dairies caused economic hardship for a significant number of our farmers, and some of our organic milk went into the conventional market with farmers receiving lower than conventional pay price.

The current dairy replacement policy, as defined by the NOP chart given to us in October of 2006 allows these large operations to maximize profit and minimize sustainability by selling off organic heifer calves and transitioning conventional heifers to organic production.

A survey of our farmers done this fall show that 98 percent of them would like to see that all organic dairy producers are subject to
the same dairy replacement at state rules. Based on the results of this survey, MOSA joins the Federation of Organic Dairy Farmers in asking the NOP for the following dairy replacement policy. Once an operation has been certified for organic dairy production, all dairy replacement animals, including all young stock, whether subsequent born on or brought in -- onto an operation, shall be under organic management for the last 1/3 of gestation prior to the animal’s birth.

We also look forward to the forthcoming clarification of the pasture requirements. Again on behalf of our farmers who see pasture as an important part of organic livestock production, we would like to see a measurable amount of real pasture be required for all age groups with no exclusions for stage of production. We believe that organic dairy should be located where pasturing is possible.

In closing, I would like to share a comment from one of our organic dairy producers in Indiana, Ipka Veldhaus [phonetic]. He said, I think for the whole organic sector we should look
at what the market of organic -- at what the market the organic consumers want, which can be generally described as honestly produced organic food products, raised with attention and care for the environment and sustainability. The market wants clear rules they can depend on because the food chain is nowadays extremely long. Such that consumers have to trust the rules are sufficient and they are followed.

They cannot check this themselves. If there are unclear rules or questionable practices and interpretations of the rules, this will harm the whole organic movement.

There are roughly 1,600 organic dairy farms in the country. We certify and are representing 28 percent of them. On their behalf we thank you for consideration of these comments.

MS. ANDREA CAROE: Thank you. Hue?

MR. HUBERT J. KARREMAN: Just wondering what’s your feeling about irrigation in organic agriculture.

MS. JACKIE VON RUDEN: My personal feeling, representing MOSA, would be that it would
be fine if it’s a sustainable practice and supports the environment as well, and is not depleting our natural resources.

MS. ANDREA CAROE: Any other questions for Jackie? Thank you so much.

MS. JACKIE VON RUDEN: Thank you.

MS. ANDREA CAROE: Leslie, you’re up. On deck, Grace Marroquin.

MS. LESLIE ZUCK: Good morning. I’m Leslie Zuck, that’s Z-U-C-K, like luck. And I’m here representing Pennsylvania Certified Organic. I’m also the Chair of the Accredited Certifiers Association, but I’m not speaking on their behalf. I might a little bit, but not -- if I do I’ll let you know.

I have a few comments on your standardized certificate recommendation. I’m a little confused by the two separating out the expiration date recommendation, and I understand that you have some -- there’s some merit for doing that, but it puts us in a situation of trying to figure out if I support your standardized certificate recommendation am I supporting a
standardized certificate without an expiration date, and I’m confused by that. I’m not sure if the program has that sorted out. They -- I don’t know, they may need some additional help with figuring that out because I haven’t been able to quite understand what -- how to support the standardized certificate recommendation that doesn’t say there’s an expiration date because I -- as a, you know, certifier, I don’t really want to do that because that I thought was part of the main reason we are going forward with trying to standardize our certificates, from the rationale that was included in that recommendation.

But I do -- we do recommend -- or support removing the paragraph regarding the continuation of certification. We call that the eternal certification clause. But I think we’re going to have to explain that somehow get across in this recommendation that -- or in the regulation, that although the certification is for life, as we like to say, the certificate does expire. The certificate’s the proof of certification, that’s what we’re talking about here, that’s what’s
expiring, so you know, I really appreciate Barbara’s comments on behalf of the certifiers and any burden this might place on the certifier, but if we don’t run out there and get the certification completed by a certain time, you know, their certification is still valid, and they are in good standing, and as a -- you know, the ACA did go on record as supporting this standardized certificate recommendation. And as Joe said, as certifiers we’re already doing this. You know, we constantly are out there, updating certificates and our verification forms. We essentially send those out prior to the expiration date every year, and in the meantime, you know, any time throughout the year that their product, or their fields, or their farm names change, we immediately issue a certificate, and I probably sign three or four of those a week which is great because it makes me feel useful. It’s one of the few responsibilities I have at the organization. But I do appreciate your concern in that regard. On your paragraph B(5) regarding the trade names, I just have one question for you;
what if there is no crop or product? We’re talking about, you know, if we certify a restaurant are we going to put on their bacon and eggs or blue plate special, or, you know, essentially what would a handler certificate look like, because right now ours will just say handler or they’ll say processing plant. So, you know, we’re talking about warehouses, cooperatives, wholesale distributors, retail stores. They’re not going to have a common trade name for some of these particular products, and maybe you’ve figured that out, but I just wanted to question -- had a question about that.

And I have a few comments on commercial availability, your recommended guidance. If the program is worried about placing undue burdens on certifiers, this is the one we would like you to protect us from.

We are okay with evaluating the credibility of the commercial availability documentation submitted by the certified operation. Okay. We are already doing that. That’s your paragraph B(2). We’re doing that,
we’re doing that well. Certifiers have various ways that they go about that, and every year we are seeing significant increases in the use -- thank you, of organic seed and organic ingredients. We are seeing that in our organization. So we must be doing something right, and the certified operations do want to use organic products when they’re available, but my staff really is not in a position, nor does -- you know, we don’t have the time, energy, or expertise to analyze test data, search for ingredients and materials and tell our clients what they should be using and where they should be buying it from. That’s the client’s job.

It is our job to verify compliance with the rule, we do not ensure compliance, and we don’t help clients source ingredients, and, you know, it’s also not our job to help producers of organic materials in the marketing of their products.

I do want to say it’s not database fear. Really it’s not because certifiers absolutely love databases. We use them for everything, we’re good
at it, we’re fine with databases. It’s just the concept. I kind of figured out what that would cost our organization, and you know, it’s about a 2 to 3 percent increase in the workload for each of our reviewers, which is going to be 15 to 20 percent increase in the workload overall, and that’s another half time employee just to kind of collect and distribute that data.

And then one other really quick thing on the wording of your recommendation, just to remind you that because it’s a recommendation, so when you start it out by saying that the ACAs shall do all these six things it kind of sounds like we have to, and if it’s a guidance document I would like to see the language reflect that a little differently. Maybe should, or if they feel like it, or something.

MS. ANDREA CAROE: Or if they feel like it. Thank you, Leslie, for your comments.

MS. LESLIE ZUCK: I bet you have questions. I knew it.

MS. ANDREA CAROE: Joe.

MR. JOSEPH SMILLIE: Well, Jennifer,
chime in also. We’re going to have to work
through this, Leslie, so --

MS. LESLIE ZUCK: [Interposing] We’ll
help.

MR. JOSEPH SMILLIE: . . . let me go
back to -- we’ll start with the standardized
certificate one and then finish up with commercial
availability. Basically we passed a
recommendation on expiration. Right. That’s been
passed, so I don’t have that document right in
front of me, but you need to refer to that
document. It was -- it’s not part of this
document, it’s not mentioned in this document
because it’s a separate recommendation that was
passed at the last meeting on expiration.

And --

FEMALE VOICE: [Unintelligible].

MR. JOSEPH SMILLIE: I’m sorry. Okay.

Yeah. Last fall. Basically the two documents
both go together as guidance, our input to the
NLP. What the NLP does with it is --

MS. LESLIE ZUCK: [Interposing] Okay.

MR. JOSEPH SMILLIE: . . . their
business. We do -- you made a very important
point, you know, internal certification, unless
voluntarily surrendered, revoked, or suspended, is
a right, but the certificate definitely can be --
expire. So we’re agreed on that.

As far as some of the issues that you
brought up with the standardized certificate, I’m
glad that you support it. I think that we all
agree that we need to have --

MS. LESLIE ZUCK: [Interposing] As long
as it has an expiration date.

MR. JOSEPH SMILLIE: That’s already a
recommendation. As far as your number 5, which is
one of the tricky issues that we had to deal with.
You know, Section B(5), at a minimum the common
trade name of each organic crop and/or product
produced by the operation.

Then it’s the second sentence that I
think that we’re banking on. I’ll use your very
complicated example of the restaurant. And as you
know, and I know, and other people are going to
find out; certifying restaurants is -- I won’t say
impossible, but it’s about the most difficult
certification operation that there is, because those people are -- we thought we were crazy, but you get into the restaurant you find out what crazy really means.

But basically what it says here is for extensive lists, additional pages may be used as per 205.404c(2), and then down below we have that allow for the use of additional pages for information, provide the number of additional pages as specified on the certificate.

That’s how I think this document addresses that complicated issue. So rather than put the blue plate special, you know, tortillas, that sort of thing, what we would suggest and what I’ve seen other certifiers do is for distribution lists is that you manage an up to date distribution list and the same for restaurants.

They would have to -- they would provide that additional specification in an additional sheet. It wouldn’t be on the certificate, per se. It would be --

MS. LESLIE ZUCK: [Interposing] So you’re saying -- you’re expecting that the certifier
would have a constantly updated list of all of the blue -- the menu items from the retailer or from the restaurant that would go out with that certificate every time we issue the certificate? It seems a little strange.

MS. ANDREA CAROE: Yes, because I mean, that’s already --

MS. LESLIE ZUCK: [Interposing] I think we need to talk about that.

MS. ANDREA CAROE: Leslie, that’s really already in the rule that you have to have in the organic system plan formulations.

MS. LESLIE ZUCK: It’s in the organic system plan, but it isn’t on the public document that we send out with every request for a certificate.

MS. ANDREA CAROE: Okay.

MS. LESLIE ZUCK: Plus it’s going to change on a weekly basis on the -- at a restaurant.

MR. JOSEPH SMILLIE: Well, it’s a problem. I certainly agree with that. But it’s been a problem with distribution and traders from
the get go. I mean, you’ve got a big distribution
coming that’s bringing ingredients from all over
the world, and palletizing --

MS. LESLIE ZUCK: [Interposing] Right. I
agree.

MR. JOSEPH SMILLIE: . . . and shipping
them out, I mean.

MS. LESLIE ZUCK: I agree.

MR. JOSEPH SMILLIE: I mean, that’s what
we have to do.

MS. LESLIE ZUCK: Oh, yeah. Okay.

MR. JOSEPH SMILLIE: More or less.

MS. LESLIE ZUCK: Well, I think with the
expiration date though, the question is if the
program doesn’t accept or publish your first
recommendation on expiration date, and they do
take the one that you’ve just sent -- you’re
sending out now to them --

MR. JOSEPH SMILLIE: [Interposing] Okay.

MS. LESLIE ZUCK: . . . what does that
mean?

MR. JOSEPH SMILLIE: Well, let me --

MS. LESLIE ZUCK: [Interposing] You get a
standardized certificate without an expiration date or what?

MR. JOSEPH SMILLIE: Yeah, but again some of the purposes of this document are to -- well, let me just go back to the -- it’s in the key purposes. I mean, it’s possible that the NOP, in their wisdom, and hearing your plea of undue burden, will strike some of this guidance. That’s a possibility. But what we really -- some of the basics of this document that are important is that the phrase certified as compliant with the USDA national program gets put on those certificates --

MS. LESLIE ZUCK: [Interposing] Uh huh.

Yep.

MR. JOSEPH SMILLIE: . . . and some other basic things that we think --

MS. LESLIE ZUCK: [Interposing] Yep.

MR. JOSEPH SMILLIE: . . . are really essential get put on. How we deal with, like, the list of the common trade names is complicated, and this is our best shot at at least getting that process started so that we can have --

MS. LESLIE ZUCK: [Interposing] Okay.
MR. JOSEPH SMILLIE: ... certificates that are somewhat accurate, and I think that entire industry agrees with that --

MS. LESLIE ZUCK: [Interposing] Yeah, I --

MR. JOSEPH SMILLIE: ... concept, that we need a better --

MS. LESLIE ZUCK: [Interposing] We haven’t seen accuracy as much of an issue as just a consistency. I mean, certifiers are the ones that are going out there and they’re going through an operation, and trying to look at 200 certificates that all have everything in different places and they call it different names, so we do have an interest in standardizing that.

I would like to see it be a truly standardized certificate and actually be a format so that everything is in the same place, and we are using the same language and, you know, just like when you do your taxes, you know, there’s an instruction sheet on the back that says you know, here’s all the counties, and the code names and everything and, you know, to really truly
standardize it if we’re going to go through the

MS. ANDREA CAROE: Well, Leslie, we went
trouble to do this.

there, and we got a lot of kickback on that, so
this was the happy medium of not being that
prescriptive.

We agreed with you. Your colleagues in
the industry don’t necessarily agree that they
want to do that, so this was the -- this is where
we are.

MS. LESLIE ZUCK: We don’t always get
what we want.

MS. ANDREA CAROE: And Leslie, the other
thing I want to say is if when these
recommendations go through, you know, provided
this one passes the Board and it gets passed
through to the program, if the program were to
release implementation of this and not the
expiration dates, there would be further --

MS. LESLIE ZUCK: [Interposing] Sure.

MS. ANDREA CAROE: . . . comment

MS. LESLIE ZUCK: Oh, you bet. There
will.

MS. ANDREA CAROE: So that would be -- I mean, it’s not like this is, you know, we’re putting it into the black hole, it’s going to get implemented and then, you know, that’s it. There are other opportunities, so I wouldn’t you know, I wouldn’t get too wrapped up on that yet. Okay?

Thank you. Any -- oh, Joe.

MR. JOSEPH SMILLIE: I have to deal --

there was also the commercial availability --

MS. LESLIE ZUCK: [Interposing] Yes.

Yes.

MR. JOSEPH SMILLIE: . . . and the Committee worked last night --

MS. LESLIE ZUCK: [Interposing] Oh, good.

MR. JOSEPH SMILLIE: . . . and this morning, and I think your concerns are absolutely completely reflected in our new iteration.

MS. LESLIE ZUCK: Thank you.

MS. ANDREA CAROE: Thank you. Any further questions? Thank you, Leslie. Grace Marroquin, you’re up. And on deck, Sue Baird.

MS. GRACE MARROQUIN: May name is Grace
Marroquin, President of Marroquin International Organic Commodities Services, Inc. based in Santa Cruz. I’m sorry I have to come back up here to take up your valuable time, but there were some statements made yesterday that I would like to correct, especially since we have a new Board that weren’t here for the past 3-1/2 years while we’ve been attempting to get this through.

So the statements -- there was a statement made by Rosie that addressed the issue of yeast as an agricultural product. She said that if the Board recognized yeast as an agricultural product it would represent a change in the definition of agricultural product. This was incorrect. OFPA sets the definition for agricultural products. We have never proposed a change in OFPA definition. Yeast fits within this definition.

In October 2006 the Handling Material Committee agreed unanimously that yeast was an agricultural product under this definition. However, Rosie was right when she said that the Board should deal with the ag, non-ag
question separately from the synthetic, nonsynthetic question. They are two completely different questions and they do not need to be decided together. We agree with her on that one. Barbara Robinson’s input was helpful yesterday when she said that reclassifying yeast was a distinct question and should be solved separately. We agree with that wholeheartedly. The discussion document is divided into several sections, and the section on yeast does not have anything in common with the rest of the sections. Why an annotation would not be sufficient, Rosie suggested that instead of placing yeast on 606 as an agricultural product it would be better to keep yeast listed as a nonagricultural on 605a and add an annotation. Besides Andrea, you know, we agree with you and Joe Smillie on that, and that’s a good enough reason. Since organic yeast is not available, the goal is to make it clear that organic yeast would be a preferred organic ingredient if commercially available. Keeping yeast on 605 list would not
accomplish this at all. The only way to do this is to place it on the section of 606 with the other agricultural ingredients.

The status of our petition, we need to clear that up as well. Marroquin International filed its first request to reclassify yeast in July of ’04, and in August of ’06 it resubmitted the same request in the form of a 606 petition. We consider this petition still pending. The remark yesterday was that we withdrew it. We absolutely did not do this. We have never withdrawn a petition. I’d have to shoot myself to do that.

Last March, just before the Board meeting, we learned that the Handling Committee had voted 4 to 1 to reject the petition. We felt this action was premature because we understood that the Handling Material Committee were still considering ag, non-ag definition. So we asked that the petition to be temporarily deferred. The Board agreed to this, and if you read the transcripts from March 28th, ’07, pages 28 to 31, it’s pretty clear right there that it was not
being withdrawn.

Eliminating the definition of non-ag substances. The discussion document in section 4.1.1 says that the Joint Committee is considering eliminating this definition from the NOP regulations. During this meeting a number of commentors, including OMRI, Oregon Tilth, and Richard Theuer have called for the eliminating of the definition. We agree with this.

The definition does not mention yeast at all. The definition names a mineral or a bacteria culture as an example of a nonagricultural substance. Yeast are fungi and not bacterial, but when the Handling Committee looked at the yeast petition it cited bacteria as a reason for finding that yeast was not an agricultural product.

To repeat, and if you go back through all the transcripts, you’ll find clear backing on this; that yeast are fungi and not bacteria, and biologists regard this as a profound distinction, because fungi and bacterial have very different cell structures. Yet as long as a definition stands there will be confusion between yeast and
We request that the Board simply focus on the yeast question and take care of it as Barbara Robinson had suggested. It is a distinct question in a discussion document yeast is outside the scope of all the questions raised, and we sincerely hope that this does not fall into a working group or taskforce stage, because otherwise I’m going to have a lot of gray hair by the time this is done.

So now that the EU has recognized organic yeast in food and in feed, we ask that the Board finally approve yeast as an agricultural product. What’s that old quote? Justice delayed is justice denied. I thank you all for considering this.

MS. ANDREA CAROE: Thank you, Grace. Any questions for Grace? I just want to -- one thing, Grace. We never called yeast bacteria, what we said was in our Handling Committee discussions, that just like there are not any standards within the regulations for bacteria, there is none for yeast. We compared it only in the fact that
microorganism type production techniques are not within the standard.

MS. GRACE MARROQUIN: Uh huh.

MS. ANDREA CAROE: So we didn’t call yeast --

MS. GRACE MARROQUIN: [Interposing] It wasn’t in the document. Where it was -- when they were looking at the --

MS. ANDREA CAROE: [Interposing] We didn’t call it yeast. We never called yeast bacteria, I guarantee that.

MS. GRACE MARROQUIN: Good. Good.

MS. ANDREA CAROE: So, I mean, we recognize that they’re distinctly different --

MS. GRACE MARROQUIN: [Interposing] Thank you.

MS. ANDREA CAROE: . . . but there are similarities when you’re talking about the implementation of the regulation. So just wanted to clarify that.

MS. GRACE MARROQUIN: Okay.

MS. ANDREA CAROE: Okay?

MS. GRACE MARROQUIN: Thank you.
MS. ANDREA CAROE: Thank you.

MS. BARBARA C. ROBINSON: [Unintelligible.]

MS. ANDREA CAROE: Barbara.

MS. BARBARA C. ROBINSON: Grace, I -- we need to go back and look. It sounds odd to me that the Board would be rejecting the petition.

MS. ANDREA CAROE: We didn’t reject the petition, the Committee was rejecting the listing of yeast as an agricultural material.

MS. BARBARA C. ROBINSON: Yeah, I’m a little perplexed by that, Grace, so I think we’re going to -- Valerie and Bob, I think we need to go back and do a little digging on that. That sounds out of the normal of the process here. I don’t think the Board rejects petitions.

MS. GRACE MARROQUIN: I --

MS. ANDREA CAROE: [Interposing] We never rejected the petition, Barbara.

MS. BARBARA C. ROBINSON: Yeah. No, I know, but Grace said there was a vote, a pending vote to reject a petition and I --

MS. ANDREA CAROE: No.
MS. GRACE MARROQUIN:  No.

[Cross talk]

MS. ANDREA CAROE:  There was a Committee vote on the material for -- on the petition for listing on 606. the Committee met and voted on it, and --

MS. GRACE MARROQUIN:  [Interposing] In March.

MS. ANDREA CAROE:  . . . it was getting ready to go to the Board. But the vote at the Committee level was not in favor of listing.

MS. BARBARA C. ROBINSON:  Yeah, so then you said what? You asked for --

MS. GRACE MARROQUIN:  [Interposing] They defer making a decision because the ag, non-ag question was clearly all over the place and we had new Board members, and I saw the writing on the wall and I thought, you know, they can’t really make a good decision here.

MS. ANDREA CAROE:  So you asked for it to be deferred.

MS. GRACE MARROQUIN:  To be deferred and tabled and I believe if you go back to the
transcripts, Joe and Andrea both agreed -- I don’t
know Andrea, but I know Joe agreed -- they asked
me if this was what I wanted and I said yes, and --

MS. ANDREA CAROE: [Interposing] Okay.

MS. GRACE MARROQUIN: . . . with the
understanding it was only being tabled until they
can come up with a clearer definition.

MS. ANDREA CAROE: Okay.

MS. GRACE MARROQUIN: Okay. Thank you.

MS. ANDREA CAROE: Thank you. Sue, hold
on until they make sure that they get the mic
situation worked out. While I’m waiting, Mark
Kastel, you’re on -- Mark Kastel on deck. Are you
here, Mark?

MALE VOICE: [Unintelligible].

MS. ANDREA CAROE: Okay. Katherine
DiMatteo, you’re on deck.

MS. SUE BAIRD: Hi. Sue Baird, QAI. QAI
deals with the issues of ag, non-ag, synthetic,
non-synthetic, on a daily, perhaps hourly basis.
It’s just our business, and we really, really urge
you -- and I know that you’re working on it, and
what a thorny, horrible issue, but we’re urging you, as the Joint Committee, to take the hard stance of actually defining agricultural.

We agree with you that nonagricultural is -- needs to be just deleted. It just causes too much confusion in the whole world. We agree that recognizable versus not -- unrecognizable just really is just needs to be deleted because you can’t go there with it.

We were a little disappointed that the decisions were not made to make a definition and let’s get it over with, let’s get a definition for agriculture. We’re asked -- we were a little disappointed with your flow chart.

Specifically let me tell you one spot that we thought was a little thorny, and that’s where you said in the flow chart that -- and I didn’t write this one down. I should never do that. The addition of synthetic additives, or the use of synthetic solvents would necessarily result in a chemical change and create a synthetic material. And the reason we have a problem with that spot in your flow chart is because in the Q
and a section of the NOP you specifically state additionally the remainder of ingredients and are made with organic specified product may include, and in point 2 says nonorganically produced agriculture products, raw processed, that have been produced using synthetic, nonsynthetic, nonagricultural substances without regard, 601.601. So your chart prohibits something that you’ve already said in Q and A is allowed. So look at that particular section there, because -- and it was, like, number two box or something. I had it marked, but then I didn’t bring it with me. We’re just asking you to revisit. Please give us a definition of agricultural. Remove the definition of nonagricultural, and it was interesting because Rich said this last night; define the terms chemical change. Chemical treatment and biological processes for us, because there’s the real crux of what makes an agricultural nonagricultural.

I sent or had Gwen send her flow chart to our specialist, Jessica Walden, and by the way, we thank her for this. She’s the technical
specialist in the QAI world. She went through the chart, we find it much more easy to go through than perhaps your flow chart that we understand you tried to put everything together, may create a little more problems.

There’s some problems tweaking with Gwen and Emily’s, but look at it real closely. We did -- or Jessica did. Found some areas that might be a little inconsistent. We think maybe number two, we’re going to be able to certify citric acid now. [Unintelligible] on 605a, and if it can be we probably will.

Heads up QAI will be certifying citric acid next, if we go through this, but just a little problems. But, you know, let’s get a definition. Thanks.

MS. ANDREA CAROE: Thank you, Sue. Any questions for Sue? Joe.

MR. JOSEPH SMILLIE: I’m sorry, did you actually -- did you submit your version of the flow chart? Was that part of yesterday’s --

MS. SUE BAIRD: [Interposing] No.

FEMALE VOICE: No, she’s
MS. SUE BAIRD: No, this actual section was what I -- it’s just a cut off of the first one. I just sent it around for a little more clarity. The first submission is this thing again, it’s not anything new.

MR. JOSEPH SMILLIE: Okay.

MS. SUE BAIRD: Okay?

MS. ANDREA CAROE: Dan.

MR. DANIEL G. GIACOMINI: I had two questions because I missed your three listings of the terms, but I see they’re listed here at your thing. But you recommend -- and I realize this may be rhetorical, but you recommend the definition of agricultural. Do you have a suggestion?

MS. SUE BAIRD: No.

MR. DANIEL G. GIACOMINI: We’ve been working on it for a long time, so.

MS. SUE BAIRD: I understand that, we all have, and we know it’s thorny, but we would certainly be willing to collaborate with you with all these other great experts out there to come up
with a definition. So don’t leave us out of trying to work with you.

MR. DANIEL G. GIACOMINI: Okay. And we just hope that, you know, that the community is, you know, looking at this as a work in progress, and we’re bringing it to you to, you know, what course corrections, you know, where does it need to be worked on, and we’re hoping it’s viewed in a positive light like that --

MS. SUE BAIRD: [Interposing] Right.

MR. DANIEL G. GIACOMINI: . . . rather than completely being internal and it goes on for another couple of years and --

MS. SUE BAIRD: [Interposing] It just can’t.

[Cross talk]

MR. DANIEL G. GIACOMINI: Then we have -- we’re accused of transparency problems, so we didn’t want that to happen.

MS. SUE BAIRD: We appreciate that. I do have with me kind of a decision tree that QAI goes through to determine ag versus non-ag, and I will certainly give that to you, if you’d like to see
it. Great.

MS. ANDREA CAROE: Thank you. Any --

MS. SUE BAIRD: [Interposing] It’s based on the March and November, and then we did a little tweaking on our own. Okay.

MS. ANDREA CAROE: Is there any other questions for Sue? Thank you, Sue.

MS. SUE BAIRD: Okay.

MS. ANDREA CAROE: Katherine, you’re up.

We’re going to take a little break after Katherine, but Emily Brown Rosen, you’ll be up after the break.

MS. KATHERINE DIMATTEO: Thank you very much. I’m here today as Katherine DiMatteo, D-I-M-A-T-T-E-O. And just for some of you in the room who don’t know who I am, I was the Executive Director of the Organic Trade Association from 1990 to 1996 and some of you may have heard or have heard me spoken of as the lapdog of the capitalist pigs. Before that I actually have been thoroughly engaged in food cooperatives since the early ‘70s and in the cooperative style of economic for my life, I would say.
So that’s just who I am. I’m going to make -- most of my comments are also about group certification as an individual -- this is an individual comment, but if I have some time I have multiple thoughts on things that you have deliberated on during these last few days.

First of all I want to say for anybody on the Board and in the room who feels that group certification is a pass, it is an allowance for a less than rigorous controls or less than rigorous inspections, or something that somebody’s getting that an individual farmer may not be able to get?

I just want to know what we can provide -- we being the greater population that supports group certification, to make you see or help you see that this is not just a collection of people who are coming together to market some common product without any rigor and do it for convenience, as opposed to necessity.

Thank you for that comment before. That this is a very rigorous, very well designed system with a lot of controls in it, and it reflects the system that I believe everyone
who’s been in the movement from earlier than
myself, has been trying to work for; trust. But
verified, and I feel us all going towards the
mistrust, the distrust, as the basis for the
decisions that we’re making, rather than the trust
factor. And I’d like to get and hear and see that
coming out of both the public comments you get and
in your deliberations and your work.
 Not saying that the work hasn’t been
excellent, and it has, and I appreciate every
minute that you have spent on these things.
 But if there’s anybody who has these
feelings that somehow these people are getting a
pass, it’s not true.
 Let me talk about the system itself. The
accreditation. When the accreditor goes to the
certification organization they don’t go through
every single file. They don’t read every file on
every certified operation that that certifier is –
– has certified in the past year. They’ll do spot
checks of the files and they may even do spot
checks of the certified operations.
 Risk sampling, very organized controls.
If they see things that they want to follow up with, they will do that. It’ll be in the record. That’s when they’ll do inspections or come in unannounced on things.

Same for the certifiers. The certification organization isn’t going to go -- when they send an inspector to a facility --

[END MZ005028]

[START MZ005029]

MS. KATHERINE DIMATTEO: They’re not going to talk to every employee. They’re not going to go there during the early shift and the late shift or the middle shift of the day. The same thing on the farm, and many people have said that they do go to every inch of every field of every farm that they certify. But I would guess that that’s not true in most circumstances, but again that’s the system we have and we are taking that same system with this idea of group certification and making it work through rigorous control, oversight systems that follow the same practices that we have throughout our national organic program and throughout the world in most
of the certification programs and organic systems
that are out there. And just one comment,
Barbara, we already do have self-certification.
It’s a $5,000 exemption. Those people are self-
certified, and I buy food every week in a food
coop that I know the farmers are selling those
products as organic. They say they’re less than
$5,000, but if I calculate how much I spend on
their products, I know that’s not true. One last
thing, I want to thank our chair who has done a
magnificent job. All of the chairs of all of the
committees have. I want to thank you, and in line
with other gifts I know you’ve gotten, I happen to
just have this with me. [Unintelligible]

FEMALE VOICE: Thank you very much,
Katherine. Questions for Katherine? Jeff?

MR. JEFFREY W. MOYER: Yeah, not so much
a question as a comment on your terminology using
the word “trust.” I think that when decisions
were based on philosophy as they were many years
ago and in some cases still are, then I think
trust is a very meaningful word. However, when
the decisions are based or centered more on a
profit motive, then I think trust needs third-party verification.

MS. KATHERINE DIMATTEO: That’s a long, philosophical discussion I’d love to have with you because I think the word “profit” is probably—we each can define that in our own way just like agricultural/non-agricultural and synthetic and non-synthetic. So, it’s all to each of us individually. We all have profit motivation.

MR. JEFFREY W. MOYER: Of course.

MS. KATHERINE DIMATTEO: Even if that means that the profit is just making it to the end of the day with enough to eat. So, that is, you know, we’re into this corporate big bad corporation thing, and somehow imposing personal feelings about the fact that some people can afford to do things and other people can’t. I say build a system, make it work. The people who qualify for the system participate in the system.

FEMALE VOICE: Bea?

MS. BEA E. JAMES: Thank you for your comments and also for coming to these meetings. I appreciate the years of experience that you bring
when you address us. I just wanted to ask you
based on your comment along the same lines as what
Jeff mentioned on trust, do you believe—do you
believe that rules, laws, regulations, are made
for trustworthy people or to protect trustworthy
people against people who are not so trustworthy?

MS. KATHERINE DIMATTEO: Hum,

interesting. You know, I have to say I wasn’t
around when the community, the industry went to
Senator Lahey’s [phonetic] office and the
Congressman’s office from Oregon to say we want a
law. You know, we want this to happen. I have to
say I wasn’t involved in the organic movement at
the time so I don’t, I don’t know. From the
history, people were feeling that it was the force
of a regulation that would allow people to be
protected from those people who could not meet the
standard or would not follow the system, and it
also would set up that consistent requirement that
everybody or every operation be certified and
participate in this third-party objective
oversight and have internal control systems and
organic system plans for their operations. So, I
think that was the motivation was at least from what I understand it that there would be a way, you know, to show people what you needed to do and then to weed out the people who couldn’t meet the system and the requirements. I don’t know if that answers your question quite.

FEMALE VOICE: Any other questions for Katherine? Thank you again, Katherine.

MS. KATHERINE DIMATTEO: Thank you all.

FEMALE VOICE: All right, it is about ten after. If we could just take a ten-minute break, that would be great.

[break]

MS. ANDREA CAROE: After Emily is Steffen Scheide. Are you here, Steffen?

MS. STEFFEN SCHEIDE: I’m here.

MS. ANDREA CAROE: Okay, Emily, you’ve got a proxy so you’ll be ten minutes?

MS. EMILY BROWN ROSEN: You could give me the [unintelligible].

MS. ANDREA CAROE: And two fives, we’ll give you two fives. Did you get that? Five, two fives—she wants five minutes.
MS. EMILY BROWN ROSEN: Oh, and I need Valerie to put up my [unintelligible].

[background conversation]

MS. EMILY BROWN ROSEN: Okay, I have my technical expert. Dr. Caraman [phonetic] is going to help me out on the slides. So, whenever you’re ready let me know.

MS. ANDREA CAROE: All right, so at your leisure you can start your presentation. We’re going to do five-minute presentations. Right?

MS. EMILY BROWN ROSEN: Yes.

MS. ANDREA CAROE: Okay.

MS. EMILY BROWN ROSEN: Everyone ready?

Okay, go. My name’s Emily Brown-Rosen [phonetic]. I work for Pennsylvania Certified Organic, and I promised the other day to solve all your problems. There’s my light bulb brilliant ideas. It doesn’t solve all the problems, but it just puts the framework together a little better, and it helps us, you know, helps me and you identify what needs more work. Next slide. Okay, the tools are in hand. We have all this old work that I know you’ve got through some of it, but it was hard to
figure out how to put it all together because there is so much work that’s been done on this. So, you know, these are the key documents to work with. There as an original AGNON [phonetic] Ag draft in May 2005. There was another one I forgot to put up here the September/October one of 2006. The August 2005 Synthetic/Non-Synthetic draft and then NOP came back with really—comments on it that were very constructive and a really good flow chart. So, those are very good. Now we have the 2007 Oregon Tilf [phonetic] proposed decision tree, which is another really helpful piece of the puzzle. Next slide, please. It’s okay.

Okay, so this is the main change I would make in your decision tree now. Your first block right now of the—you know, I understand the idea of trying to have one tree that does all, but there are certain breakout points where you have to separate it because right now the right now the first question is is the substance or product derived from plant or livestock and marketed in the U.S. for human or livestock consumption? And so if you say no to that, then it’s not an
agricultural product. However, if you put soybean meal as your first question for fertilizer and you’re not—and the answer to that question would be is it marketed for human or livestock consumption, the answer would be no. You would get it’s not an agricultural substance so there’s something a little bit wrong here. We have to take—that’s what got people upset because you didn’t deal with the crop products. It kind of starts out with processing rather than thinking about growing the plants first. So, this is the first question. Does it come from plants, livestock—well, I added a few other things here while we’re getting the universe bigger, fungi, aquaculture, marketed for human consumption, or livestock feed, or pet food? Then if it’s yes, we start with the ag/non-ag chart, and if it’s no, we skip a page and go to the synthetic/non-synthetic because those are the only relevant questions on those products. Next slide. I’m going to take a few examples through this process if we have—I’ll probably only get through one, but if you want to do more just ask me a question. Okay, cellulose
in livestock feed—okay, go back up. Could you go back up to the first question? Okay, is it derived from plants, livestock, [unintelligible]
okay, so the cellulose we use in the commercial world is mainly derived from trees, from wood.
So, yes, it’s from plants so we would say yes and go to the ag/non-ag chart. Could you go down to this? Okay, so you probably can’t all read this, but number one is it from plant, animal or aquaculture? Yes, go to question three. Question three has the substance been processed to the extent that its chemical structure has changed? Yes. Cellulose that comes from trees is like a very complex polysaccharide compound. Trees, wood, is about 50% cellulose. It has hemicellulose. It has lignins. The tap review explains, you know, and I happen to have done that tap review so this is the one I picked because it’s, you know, there’s cellulose in trees, but it has to go through a radical process to end up as a cellulose that we use. So, it is chemically changed. So, question four, is the change the result of a naturally occurring biological process? No, it
involves KOH. It involves bleach. It involves a whole lot of chemicals and sulfur. No, so then it’s non-agricultural. Okay, so next we go to the synthetic/non-synthetic chart. So, do you want to—could you escape from there and the other one is loaded there. And you will see the synthetic/non-synthetic chart. I couldn’t—here we go. Okay, so this as from last spring from NOP actually. So, the substance not on the list—we’re talking about cellulose. Is it from a natural source? Yes, so we go down to the next one, which is does extraction of the substance from its source—that sentence doesn’t make sense here, but is—well, does extraction by chemical or physical methods occur? In this case we would say, yes, they use acids, bases, a number of chemical steps there. So, it goes—do you want to scroll up a little bit here? It goes into this extraction box, and they ask these particular questions about extraction. Has the substance been transformed into a different substance via chemical change except for [beep] naturally growing processes? Has it been altered to a chemical form? See, this
might need some tweaking. When you run through here, you might find some things that need tweaking because you also might say it’s not extracted it’s actually further synthesized. You know, you could be adding chemicals and making something new. There could be another whole chain in here.

MS. ANDREA CAROE: Emily? Your time is up, Emily.

MS. EMILY BROWN ROSEN: Okay.

MS. ANDREA CAROE: Board members, questions or comments?

MS. BEA E. JAMES: I have one question.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Valerie, is that—Valerie has a copy of this, right?

MS. EMILY BROWN ROSEN: Yes.

MS. BEA E. JAMES: So, she could send that to the rest of the—

MS. EMILY BROWN ROSEN: [Interposing] Yes, yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Some day it
would be nice maybe with the materials committee
to have all of these charts people are advocating
with your chart like all side by side by side
because it really gets kind of confusing when we
have new chart that’s very detailed to remember,
oh, what was the difference in that last chart and
your chart and all that. So, maybe something to
keep in mind.

MS. ANDREA CAROE: It’s the decision tree
forest.

MR. HUBERT J. KARREMAN: Yeah.

MS. ANDREA CAROE: Yes.

FEMALE VOICE: It’s good homework for the
joint committee.

MR. HUBERT J. KARREMAN: Again, we
followed some of the same methodologies. We ran a
number of products during our joint committee
meetings through our charts, and we get to, oh,
man, this really works. Then we get another one,
oops, it doesn’t work.

MS. EMILY BROWN ROSEN: It takes a lot of
tweaking, yeah.

MR. HUBERT J. KARREMAN: So, is a lot of
tweaking going to go on, and again the practice of running materials through them until they’re all seemingly get fair and consistent treatment is the exercise.

MS. ANDREA CAROE: Other questions?

Kevin?

KEVIN: Emily, on your chart just in the short time we’ve seen it I’ve seen chemical process, chemical change, and chemical structure. How can we get this simplified down to determine when a line is crossed, and is there any way to simplify these terms so we can come down to an easier decision-making process here?

MS. EMILY BROWN ROSEN: There’s a really good definition of all of those steps in the synthetic/non-synthetic document, the text of the document, from August of 2005. And I would urge you to go back and look at those definitions because that’s when you get—when you have to—also, it’s very important to know, I realize, you have to have very good information about how the substance is manufactured so then you can say, oh look, they’re adding, you know, propylene oxide or
this, that, and the other thing. And what’s it doing to the product? And you can say, ah, yes, that meets the definition of chemical change. You know, an atom is added or subtracted to the molecule. It’s very specific. Sometimes it’s hard obviously, but I think if we have it all spelled out and we refer to those definitions, we’ll be okay.

MS. ANDREA CAROE: Other questions? Okay, so we’re going to give you—

MS. EMILY BROWN ROSEN: [Interposing]

The second five minutes.

MS. ANDREA CAROE: —five more minutes for your proxy, and your proxy is for?

MS. EMILY BROWN ROSEN: Melanie Saffer [phonetic] for Pennsylvania Certified Organic.

Uhm, one just closing point I’ll make on this is that the cellulose, I did make one change on Gwendolyn’s chart, which was, you know, if it’s ranked as synthetic, I mean, or it could be derived from agriculture but then it has synthetic processing [unintelligible] or some reason that would knock it out of being agricultural, then the
last box on her chart I would say go to the other chart, you know. Go to it’s non-agricultural. Now review it for synthetic/non-synthetic. You may want to list it as synthetic. So, it ties the charts together, but we will do—I’m, you know, Kim already asked to help her work on this with a test, I mean a test working group. So, we’ll come back in the spring with some more fleshed out ideas, and I’m glad that the committee worked on this. Now, I understand what they did, and I think we can put it all together. So, I think it’s going someplace. Okay, also—one quick comment before I get into my main topic here is glucono-delta-lactone [phonetic]. We did comment.

MS. ANDREA CAROE: Emily, is this part of your second presentation?

MS. EMILY BROWN ROSEN: Second presentation. Oh, you didn’t start yet?

MS. ANDREA CAROE: Okay, thank you.

MS. EMILY BROWN ROSEN: Oh, good. Okay.

Glucono-delta-lactone [phonetic] is an [unintelligible] used for making silken tofu, and I don’t think there were a lot of comments added
to the comment period about that, but as I recall the tap review there were no—you know, it was beneficial material. It made a whole different style of tofu, and that was a particular reason for it in case you were wondering. So, and we don’t see any objection for that. We put that in our comments as being to renew that.

Completely new topic is, and it’s related to the fact I was very happy to see that Barbara announced the new policy about transparency, putting all the decision documents up, even accreditation and non-compliance. It’s going to be tough for all of us, but I think the reward will be, you know, the internet age, instant communication, we all know what’s going on, we can all do a better job. So, that’s really wonderful. Along those lines, I recently found out about a compliance decision that happened I believe a whole year ago in November regarding fortification of food, and I didn’t know about it until like two weeks ago. So, we were doing completely different things, I believe, as certifiers on this issue. And it involves, you know, the rules say that
nutrient vitamins and minerals according to 21 CFR 104.20 the guidelines therein can be used in organic food. And I’ve always interpreted this and I think most of the certifiers have always interpreted this to mean that vitamins and minerals are allowed in organic food provided they’re used in accordance with these guidelines, which are kind of an interesting piece of work from FDA. I understand they come from like 1996, and they’ve always been difficult to evaluate because they were in these guidelines not as a regulation. They basically say you can use a whole long list of vitamins and minerals. Here is procedures you should use, you know, for determining their need, and there are certain things we’re never supposed to do. So, we’ve been trying to follow that, but now the interpretation that was given in this compliance involved a product fortified with an additional nutrient that was not a vitamin or mineral. And the understanding that compliance had was that any nutrient, not just vitamins or minerals, that are somehow referenced in this guidance document are
allowed in organic food without further needing to be on the national list. This guidance does deal with vitamins and minerals, and then there is this little clause “F” in here that says any other nutrient that’s anywhere in 21CFR for use as a nutrient in food can be used. So, basically it’s a huge monster loophole that you could allow, you know, claim it’s a nutrient, claim it’s a novel food, it has some kind of—prove it has some kind of nutrient value, and it doesn’t have to be on the list. It’s puzzling me why some of these products are on the market place as organic. I thought maybe they were being considered agricultural ingredients not commercially available. Then it turns out after 606 rules they’re still out there. So, this is the reason. So, I think you might want to re take up this subject, this understanding of what that listing is supposed to mean. And if we really need to do a petition to get this straightened out, I guess industry can work on that. But I wouldn’t think we need to do that. I don’t think that’s really in the best interest here. But, I mean, if we
have to we will. So, I just wanted to bring that
to your attention. Thank you.

   MS. ANDREA CAROE: Thank you. I remember
dealing with that regulation, and I remember full
fortification where you had to add the entire list
and replacement for a typical food product where
you could fortify to it or you lost anything
during fortification. I don’t remember the
blanket exemption in 104.20. I don’t remember.

   MS. EMILY BROWN ROSEN: Do you want me to
read part “F” here?

   MS. ANDREA CAROE: Andrea, Barbara?

   MS. BARBARA C. ROBINSON: It’s based on a
board recommendation that was made, and if you
read the annotation in the national list, first of
all, that says vitamins and nutrients, and I
believe it says including accessory nutrients,
Emily.

   MS. EMILY BROWN ROSEN: No, it doesn’t.

No.

   MS. BARBARA C. ROBINSON: Well, the board
recommendation does, and if you read the board
recommendation, it specifically listed those
accessory nutrients on which that compliance decision was based.

MS. EMILY BROWN ROSEN: I understand there was an old decision, yes.

MS. BARBARA C. ROBINSON: And so that’s what the decision was based on. It referenced that specific accessory nutrient, and the board’s recommendation at the time, I don’t have it in front of me, but the board’s recommendation when they made it, and this goes way back. I think it precedes the program implementation was written because they said they did not want to preclude I forget even how they said it, but they didn’t want to get in the way of new nutrients or—

MS. EMILY BROWN ROSEN: [Interposing] Novel nutrients, yeah.

MS. BARBARA C. ROBINSON: Novel, right. That would come on the market and things like that.

MS. EMILY BROWN ROSEN: Right.

MS. BARBARA C. ROBINSON: That would be added to foods and so they didn’t want to get in the way of that. They knew that there would be
these things, and, yes, if you do go into 104.2 in FDA’s regulations, there is that section that says, you know, vitamins and minerals and then any other nutrients that can be added to foods. And I don’t—you know, I don’t think that’s—I don’t know that you want to just characterize it as some glaring loophole in the regs, but you have to be—it has to be shown. And also the board’s recommendation, I believe, says when recommended by an independent authority. I believe there was that discussion, and there as quite a discussion in the transcripts if you go back when the board was deliberating on this that these things had to be recommended by an independent authority in order to be recognized by FDA.

MS. ANDREA CAROE: I think that’s in 104.20.

FEMALE VOICE: Can I respond?

MS. ANDREA CAROE: I think 104.20 says that they have to be—

MS. EMILY BROWN ROSEN: [Interposing] I could give a little history there on that. The board—there was this old addendum, I think it’s
addendum 25 of 1995, it’s like two paragraphs, and it happened at that same 95 meeting where they had a vote on vitamins and minerals. And actually Rich—I guess he’s not still here, had written a lot of—he was a tap reviewer on the vitamins and minerals. So, there was additional discussion and an addendum item that clarified that, and we’d also like to not preclude accessory nutrients. And, you know, it was very kind of sketchy. I wasn’t there. Maybe Brian remembers what happened, but the actual vote on the tap reviews on that meeting was for vitamins and minerals, and the actual recommendation, or the annotation was when required by law or recommended by professional association. So, when we got to the proposed rule, I think it was the second proposed rule in April 2000, it was written as, you know, nutrient vitamins and minerals, as they appear—you know, in reference to this FDA guideline 104. And I remember Keith telling us at the time, you know, required by law, that’s one thing. Well, they figured the FDA guidance was the closest thing we had to required by law, but recommended by
professional association there was—how would they
know—who is the right association? I mean it was
too vague. You know, we didn’t want to just put
something like that in the regulations. So we’re—
now it became linked to, you know, vitamins and
minerals and then this FDA guidance. So, it’s
kind of an unhappy marriage I think in some
senses, but I—you know, I, you know, I know there
was the addendum. But I don’t know how such
discussion there was about that addendum. I mean
it’s a very old piece of work, and I know the vote
was really specifically for vitamins and minerals.
There was no vote for accessory nutrients as far
as I know.

MS. ANDREA CAROE: Well, I think you
shined a light on an area that definitely needs to
be on the work plan for a little bit of guidance.
So, Hue?

MR. HUBERT J. KARREMAN: Just one
question. Is this only for foods or also feeds?

MS. EMILY BROWN ROSEN: No, it’s only
referenced for foods. Feeds is just as FDA
approved for livestock. So, it’s okay over there.
FEMALE VOICE: Hence, my admonishment to you yesterday about making sure whatever you do is accurate for the historical record because people use this stuff down the road. You dig out old board recommendations and say, hey, this must be what they meant, and we use them. So, make sure whatever you mean, you really do write it down because somebody long after me is going to come around and use it. Trust me.

MS. ANDREA CAROE: Okay, so...

FEMALE VOICE: That’s the only record there is.

MS. ANDREA CAROE: So, we have a work item number, work item for handling, and we’ll remember the hysterical perspective on this.

MALE VOICE: Hysterical?

MS. ANDREA CAROE: Hysterical. Thank you, Emily. Steffen Scheide, you’re up next, and Patty Bursten Deutsch, are you in the room, Patty?

You’re next.

MR. STEFFEN SCHEIDE: Oh, good morning. I’m Steffen Scheide. The name is spelled Steffen, last name Scheide. I’m affiliated with Summit
Hill Flavors, manufacturer of organic certified savory flavors. I’d like to take the opportunity this morning to comment on your discussion of ag versus non-agricultural. This is clearly an important issue to the entire organic community.

The latest discussion document has a decision tree and a universe of material chart attached. Regarding the proposed decision tree we believe there is need for further clarification. For example, when you look at box four, if you were to use salt as a preservative of an agricultural product, this product would become non-agricultural, and I clearly don’t think that is what is intended. When you look at the universe of material chart, it is a wonderful effort I think conceptually to take a look at the whole matter. However, it is hurt by the absence of a decision tree, and we are also concerned about the possible elimination of so-called non-agricultural materials.

I’d like to state that there have been significant changes affecting the flavor industry. USDA FSAS has assumed jurisdiction over meat and
poultry flavor products this year. This regulatory change means that these ingredients are now just meat and poultry products, and as such they are agricultural. However, without a listing of flavors as non-agricultural and 20605A in general, more complex organic certified flavors would not have been possible. I understand that these issues are not easy, and I understand a lot of work has been put into these matters. However, in order to move forward because I think all of us feel that there is a little bit of uncertainty all around, we’d like to suggest the following. Perhaps one you could stay within the current regulations and the definitions thereof. Secondly, you could actually focus on the need of certifiers who have actually been very active in this matter, and finally I think it would be very good for the entire industry if you could issue one decision tree and then invite public comment toward that decision tree itself.

In closing, I would like to thank Andrea for her stewardship, and I wish you all the best in the future. I’d like to thank all of you on
your hard work and efforts on this matter. Thank you.

MS. ANDREA CAROE: Thank you so much. Are there any comments or questions? Thank you so much. Up next Patty Bursten Deutsch. On deck is Lynn Coody.

MS. PATTY BURSTEN DEUTSCH: Okay, I have to take my glasses off so I’m just going to assume that you’re all smiling at at me. Hi, I’m Patty Bursten Deutsch. I’m an independent organic inspector with ten years’ experience. I’m a senior partner of Organic Concepts, a consulting, developing and training organization serving a broad range of clients. My husband and I are owners and operators of a certified organic dairy operation in Wisconsin. Thank you all very much for your time and effort, and I really appreciate the opportunity to speak to you. I want to briefly comment on the CAC recommendation to changes to 205.404B, the issue of standardized certificates. It’s not an exaggeration to say that over the past 10 years of inspecting I have looked at thousands of certificates from many of
the 95 accredited certifiers. As a whole, in their current iteration many certificates are such that it is impossible while on site to verify any or all of the following items, specific products that are certified, certification status of items listed such as if they are 100% organic, organic or made with organic and whether or not any of the specified or unspecified products are actually certified to the national organic program. Without this additional information, an inspector’s ability to fully and thoroughly verify NOP compliance of organic inputs is significantly hampered.

While I support the recommendation from the CAC in its entirety, I feel that it may not actually go far enough, and I just want to acknowledge that I know how unpopular what I’m saying is. I believe that additional information to be added or which could be added would be the annual date of the update inspection, the brand names and/or labels of all inspected and certified products. Finally, I want to add that there are some certifiers, as you know, that currently use
an addendum or other type of associated document
to list this information, and the board might
consider leaving the certificates as they
currently are while requiring, actually mandating
that such an addendum be updated at the time of
the annual renewal or at any time that the organic
system plan is updated with relevant changes.

Thank you. Okay, now I can put my glasses back
on.

   MS. ANDREA CAROE: Thank you, Patty.

Questions for Patty?

   MS. PATTY BURSTEN DEUTSCH: Thank you.

   MS. ANDREA CAROE: Thank you. Next up,
Lynn Coody, and then on deck Will Fantell, are you
here? Mark Castell, are you here? Okay, on deck
is Barbara Robinson.

   MS. LYNN COODY: Hi, everyone, I’m Lynn
Coody. It’s spelled Lynn Coody. I—my business is
Organic Ag Systems Consulting from Eugene, Oregon,
and I’ve been working with certification and
accreditation systems since the mid-eighties. I’m
now assisting certifiers with complying with
accreditation requirements of the NOP and other
accreditation programs, and in this capacity I have helped certifiers document, design and implement systems for grower group certification. I worked on the task force with the National Organic Coalition to create their Grower Group Comments, and I support those comments. Today I came to the microphone to try to answer questions that Kevin was asking yesterday. And he didn’t get them really addressed for various reasons, so I thought his questions were great and we were just going to get to the meat of the issue. But then we got sidetracked. So, his questions basically focused on how grower group certifications actually play out in practice and I wanted to give a little bit of information more about this. Some of the other speakers have done this a little bit more this morning, especially Katherine, so I appreciate that. But Kevin’s major question was how—what happens—how many non-conformances are still acceptable within a grower group and allowing it to go forward. But in practice the way it really works is that there can be non-conformances within a grower group system
just as there can be a non-conformance in a single operation. What really matters is is the ICS, the Internal Control System, aware of them? Is it catching them? Is it actually acting to make those individual growers either conform or no longer be part of the grower group? So, it may be the case that an individual grower within the grower group has a minor violation. In this case, the ICS should catch it. It should require corrective action. It should monitor the corrective action, and if the grower can come into compliance, they’re still in. If the individual grower has a major non-conformance, the ICS should catch that and should eliminate that grower from the grower group for—usually it’s for three years. If it’s a major non-conformance, they have to transition back in, that kind of a thing, just the same way that an individual grower, individual certification will work. So, the thing that causes a decertification of an ICS, of a grower group, is malfunction of the ICS itself, not necessarily individual problems with individual growers. These would be things such as the ICS is
not performing rigorous, annual inspections of every operation in their grower group. That’s where the annual inspection comes in not from the certifier but from the ICS. Another problem would be that the ICS is not identifying problems with the grower operations. They’re just not seeing them. Another problem might be they’re not requiring appropriate corrective actions. Another problem might be they’re not correctly monitoring the implementation of the corrective actions. In other words, they notice them, but they’re not going forward and making sure that they’re all corrected just like a certifier would have to do. Another thing is they’re required to educate their growers about the standards. They’re required to maintain their own quality system, their own ICS quality system, including documentation and complete records not only of the ICS but of each individual grower in the ICS. They have to have records of the inspections and their corrective actions. So, if they’re not doing that, the ICS would be failing. And another thing would be that they’re not complying with any conditions imposed
on the ICS itself by the certification body. So, maybe QAI or Oregon Tilth, or OCIA has told the ICS you’re not doing a good job here. Maybe you’re having conflict of interest or you’re having some problem. You must correct it. If they haven’t done that, the ICS would be failing. The grower group would be not certified any more. So, it’s not a matter of just a few problems with a few growers inside as long as the ICS is correcting it. That’s what the certifier checks. The certifier actually is checking the ICS, and three tools—just in closing there are three major tools to do this. They audit the records of the ICS. So, they go in their office. They look at the ICS’s records. They look at the inspections records. They repeat the actual inspections of a certain amount of the growers, they actually go and repeat it and compare the records, and the third thing is they often do witness inspections. In other words, they’re following behind an ICS inspector and watching what they do and again comparing right on the spot what’s going on with what the ICS is doing. Thank you. That was a
lot.

MS. ANDREA CAROE: Thank you, Lynn. That does put it in perspective very well. I guess, you know, as I’m listening to you it’s like, you know, we probably should have drawn some analogies, but it would be like going to a farm inspection and talking to employees, random employees. If one employee doesn’t know what they’re doing, it doesn’t mean the farm is bad. It means there’s a system problem that that farmer doesn’t understand.

MS. LYNN COODY: Right, which you would correct maybe by training or things like that.

MS. ANDREA CAROE: Right.

MS. LYNN COODY: It’s not a hopeless situation in other words.

MS. ANDREA CAROE: Right. Dan?

MR. DANIEL G. GIACOMINI: How would you address where I think the argument would be made that the requirement is for a third-party annual inspection? You have very much an internal annual inspection.

MS. LYNN COODY: Right, I would address
that by saying a third-party annual inspection is done of the ICS, which is the certified party by the certifier.

MS. ANDREA CAROE: Katrina?

MS. LYNN COODY: The certifier comes in and inspects the ICS, the grower group.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Thank you. Your comments were particularly helpful for me as I think through this. I do have a question.

MS. LYNN COODY: Okay.

MS. KATRINA HEINZE: I just want to make sure I understand what I heard. So, if you went in and did inspections of this small sub sample of all the farmers—

MS. LYNN COODY: [Interposing] Yes.

MS. KATRINA HEINZE: --would you differentiate between a non-compliance that you as the certifier found that the ICS had not identified versus a non-compliance that you found that the ICS had identified?

MS. LYNN COODY: Yes, I would because the one that the ICS found, I would be saying did the
ICS deal with it appropriately. I wouldn’t be so worried about that if they were dealing with it appropriately and they had characterized it appropriately as a minor violation. If though the ICS did not find the problem, that’s when I start to get worried, and I start to say as the certifier, gosh, now the risk has gone up. I think I’ll do a few more inspections so I can double check them, exactly right. That’s a really good question, perfect question. Thanks.

MS. KATRINA HEINZE: Thank you.

MS. ANDREA CAROE: Well, but also if you were to identify that the ICS identified a major non-compliance—

MS. LYNN COODY: [Interposing] And didn’t take action.

MS. ANDREA CAROE: Well, even if they did take action, I mean that’s a different thing.

MS. LYNN COODY: Well, they can identify a major non-conformance as long as they tell the grower we’re not buying from you any more and you’re out of our grower group.

MS. ANDREA CAROE: Right, right.
MS. LYNN COODY: That’s find if they’re identified it’s okay.

MS. ANDREA CAROE: Appropriate action, an appropriate action.

MS. LYNN COODY: That’s right.

MS. ANDREA CAROE: Bea?

MR. STEVE DEMURI: Thank you, Lynn. Do you think that same model that you just described for farmer grower groups is a model that would be appropriate for producers, handlers and retailers?

MS. LYNN COODY: Well, thank you for asking that question. As I said at the beginning, I did work on the NOCK [phonetic] group that created their comments for presentation here, and our group did not support that extension of the concept of grower groups to retailers and handlers. The reason that I personally don’t support it, and one of the points that I made to our group, is to me retailers and handlers, it’s basically like a food chain. All of the things that go wrong on the bottom, get concentrated in the food chain because many of the—say like a retailer or a distributor or somebody, they’re
taking in products from hundreds if not thousands of certified parties. So, to me having the chance to annually review the records of that part is really important for a certifier. Now, I know, at least—my husband works for a retail chain, and they have stores all over Oregon. Although they buy a lot in bulk, their practice is also to buy local so each store is soliciting things from the farmers say right around Eugene, Oregon, so they can have local markets, and I think this is really a common practice. I’m not an expert in retailing, but that’s a reason why a certifier would want to be able to have access to that record even though they may have systems for handling the products from the coming in and everything else, their procurement can be radically different. Since retailers and handlers, one of the most important things is no commingling and also keeping things from being contaminated, those things I believe need to be checked on an annual basis from the certifier.

That’s my personal opinion.

MS. ANDREA CAROE: So, let me—based on
your belief of the importance of what the
retailers are doing, I take it you’re an advocate
for mandatory certification for retailers?

MS. LYNN COODY: I would like to see
that, but that’s not part of what the NOP is
doing. Way back when we were writing OFFFA
[phonetic] I was an advocate for mandatory
certification of retailers.

MS. ANDREA CAROE: Okay, so since we
don’t have mandatory, a voluntary certification
that allowed for an ICS would be better than what
we have, which is none.

MS. LYNN COODY: I don’t think so because
I think it provides consumers with a false sense
of assurance compared to—

MS. ANDREA CAROE: [Interposing] But the
assurance they have right now is none.

MS. LYNN COODY: Because then they can’t
make an organic claim that they’re a certified
operation so I think it’s fair.

MS. ANDREA CAROE: I guess I don’t
understand, Lynn, because if they don’t make any
claim, they don’t get certified and they’re not
making a certification claim for their retail
operation, you’re still making the organic claim
of the product. So, I don’t understand exactly.

MS. LYNN COODY: Well, because they’re
required under the rule to make sure that there’s
no commingling and no contamination, under the
rule as it is.

MS. ANDREA CAROE: Right, without
verification.

MS. LYNN COODY: Yeah, without
verification, but that—

MS. ANDREA CAROE: [Interposing] That’s
my point.

MS. LYNN COODY: I guess it would be
great if it were all even, but it’s not even under
the system that we have. Personally, I prefer a
system, when we’re going to implement a system, I
like it to be as rigorous as we can. That’s all,
and when I’m thinking about this, I’m not just
thinking about retailers. I’m thinking about
other handlers who also are required to be
certified.

MS. ANDREA CAROE: Like the distributors?
MS. LYNN COODY: Well, like processors.

MS. ANDREA CAROE: Okay, all right. Hue, and then [unintelligible] and then Kevin?

MS. ANDREA CAROE: Actually, I’ll reverse it because I know Kevin has had his hand up a while.

MR. KEVIN ENGELBERT: That’s okay.

MR. HUBERT J. KARREMAN: All right, I don’t know if you can answer this or not, but I hear about the non-compliances and how do you check for them, you know, with the ICS and annual inspection. And maybe you can’t answer this.

MS. LYNN COODY: Give it a shot.

MR. HUBERT J. KARREMAN: Okay, in livestock, what do you call a minor versus a major non-compliance, in livestock certification of a group of farms somewhere let’s say?

MS. LYNN COODY: Well, I mean certifiers have to deal with this every day, right, so usually minor violations are things that are correctable without having a-making the product itself be impacted so it’s usually things like record keeping, that’s minor, things like that.
whereas certainly use of a prohibited material is clearly major. But there’s all kinds of things in between, and certifiers on a daily basis, it doesn’t matter grower groups or not, they have to make a decision about what’s major and minor. A while ago there was a paper that the NOSB put out that what is major and minor for each of the different categories, and that’s one of the things certifiers use for guidance, both for grower groups and for individual certified operations.

MS. ANDREA CAROE: Okay, I have Rigo, Kevin and then Tracy.

MR. RIGOBERTO I. DELGADO: Thank you for your comments.

MS. LYNN COODY: Sure.

MR. RIGOBERTO I. DELGADO: I’m also trying to understand the whole complexity. About ICS, who composes those groups, and I’m thinking of grower groups? How is that group composed, the ICS, and how are they paid? Are they composed of the same farmers that form the group, and if so how can you guarantee objectivity in the whole process?
MS. LYNN COODY: Right, okay, well that’s a good question. The farmers usually come together because they’re in a certain geographical area and they have a desire to market usually to the U.S., right, because we’re NOP. So, they’re in a certain area, and they actually—the ICS are usually people who are able, who are usually can speak English, who have some kind of agronomic background, who can help the growers with training, identification of disease, things like that, and also have a propensity for administration. It’s almost like running a small certification agency. If you have 100 growers, you have 100 inspections to do each year. You have to assign inspectors. So, usually that’s the type of people. They usually either get someone from within their group or in many cases or in many cases hire someone from the outside. In traditional grower groups from a long time ago, frankly, it was usually in many cases it was people from the U.S. or Europe who had moved someplace in the southern hemisphere and were helping them, helping these folks ship stuff out.
But now more than likely it’s indigenous people who are just, you know, well educated enough to do this.

As far as conflict of interest, I agree that can be a problem especially under the terms of NOP. And I think that is where—what we need to work on in this recommendation. I think that is a legitimate concern, and there needs to be a certain distancing of—it certainly shouldn’t be farmers inspecting each other. But I think if you could have—we could set up a system for having folks who are appropriately distanced. I mean that’s where I think we need to do the work. That’s what we need to think about certainly much more intensely than worrying about how it’s going to be applied in the retail situation in my own opinion. That’s where we need to put our brains.

Hue, you’re next. I mean I’m sorry, Kevin’s next, and then Tracy. I’m sorry.

MR. KEVIN ENGELBERT: Thank you, Lynn and Katherine for bringing this subject back up and addressing some of the concerns I have. I have two questions. One Hue touched on is I’m still
not clear about—and it’s probably subjective, depends on the operations, where you go from a minor to a major compliance in these grower groups and two what—if one of the spokes or two of the spokes have been found to have major compliances and are out of the grower group, what’s the procedures for making sure they remain out for I’m assuming five years?

MS. LYNN COODY: Well, I’ll answer the second one first because I remember that better. What happens is the grower group each year as part of their farm plan basically is asked to submit a list of growers, and so you can see—they have a list of growers that are in and growers that have been removed within that year. That’s what the certifier checks, to see how is in and who is out. Then when you go to do your inspection, you make sure that each of the growers who is in is getting inspected and monitored and everything else. As far as keeping the people out, certainly of that individual grower group you can see whether they’ve crept back in unless there’s some bad actor like we have even here in the U.S. where
people sometimes change their farm name, get different land, all kinds of different things. There are all kinds of sneaky ways to get back in, and I’m sure that happens in grower groups just the way it happens here with other farmers. But that’s the mechanism. There’s a specific listing of the operations, the amount of acres they have, a farm map and all that kind of stuff so you can see exactly where they are and which fields they’re controlling.

MS. ANDREA CAROE: Kevin, I just want to speak to you on this just a little bit. I really think you need to consider this like one operation with employees, separate employees. If you go to an operation as an inspector and they have 20 employees and you talk to 4 employees and 2 of them have not been properly trained, you’re not getting rid of those two employees. You’re talking to them about the integrity of their system for outreaching to their employees. That’s where the violations are. That’s why the ICS is what gets the violations, not the independent entities. It’s—they are an indicator of how well
the ICS is working, and so all of the violations
are going to happen on that end. And as far as
major and minor non-compliance it’s like any other
certification that certifiers apply. They
actually are going to determine whether this is
something that can be quickly mitigated or
something that can’t be quickly mitigated and has
an immediate effect on the integrity of the
organic product being produced. So that’s all out
there right now, but really don’t look at these
groups as 12 entities. They’re not. They’re one,
and each one is applying that operation. They’re
all part of it like employees within a company.
Okay? I think—I hear us keep on going to the
detail, and I’m just trying to put it in words to
get it across because I think we’re losing
something in the translation here. Would you
agree, Lynn, that’s the way you would explain it?

MS. LYNN COODY: Yes, did she answer the
question that you addressed to me okay for you?

MS. ANDREA CAROE: Tracy, you had a
question? Anybody else?

MS. TRACY MIEDEMA: I do. I have a
question for you, Lynn, and then I also want to respond to something you asked about Rigo. I really appreciate National Organic Coalition Comments that were submitted November 12th, and I have spent quite a bit of time with them. You know, one of the places that your group agreed with this recommendation, and this goes back to the 2002 criteria is that cooperatives of growers that meet the definition of person are eligible for certification as a group. And I just want to remind everyone that when we’re talking about these groups, there’s a big laundry list of what it takes to be able to join the club, you know, basically.

MS. LYNN COODY: Yes, right.

MS. TRACY MIEDEMA: We’re talking about uniformity being managed as a legal entity under one central administration, limited to people who sell all through one group. There’s not a bunch of individual certificates. You know, we have the quality control system, ad nauseam, so the idea that just two people who want to get together and not have to get inspected every year can just join
up and skirt inspection is an absolute fallacy and
is just not having really studied what this is all
about yet. So, when I read the National Organic
Coalition comments I found a lot of common ground
actually.

MS. LYNN COODY: Absolutely, yeah.

MS. TRACY MIEDEMA: But there was kind of
a key difference of opinion, and that’s how far to
extend this throughout the supply chain.

MS. LYNN COODY: Right.

MS. TRACY MIEDEMA: In your opinion, not
the question of should it be applied to retailers,
but can? And do you think that there are such
things as effective internal control systems that
do work in other parts? Can they work?

MS. LYNN COODY: I’ll tell you as far as
belief in internal control systems, you’re talking
to a person who believes very strongly in that
because I see it work from accreditation down.
So, you know, I do believe that it can work, but I
don’t believe that it’s in the best interest of
the organic industry to go in that direction.
That’s my opinion. I think internal control
groups can work well for everything from how the NOP organizes itself as an accreditor all the way down to the way I manage my family to make sure everybody goes to school on time. That’s a minor internal control group, but I’ll tell you that one runs like clockwork.

MS. ANDREA CAROE: Joe?

MS. TRACY MIEDEMA: I’ll be super quick. I just need to reply to Rigo’s question about conflict of interest within these places and just site that, you know, at our 5,000-acre farm we have a quality assurance department, and this group operates independently. I mean we’re all paid by the same boss. But just because I want to ship something that quality assurance department puts the hammer down because the integrity of the organization is at stake if your quality assurance department is not operating as a stand-alone, independent policing agency. And that’s what these ICSs are. That entire group has an enormous amount of exposure if it is not operating independently without conflict of interest, and any smart ICS would not want that exposure.
MS. LYNN COODY: Yeah, and just one point that I wanted to make that Tracy didn’t quite mention is just remember that in these ICSs like Tracy presented it as spokes of a wheel yesterday. Imagine if only one spoke is out and all the other 20 spokes get decertified? There’s a lot of interest to make sure that everybody is doing things well because that’s something that individually certified organizations don’t have to deal with is their neighbors and making sure that everyone else is doing things well. Okay, Joe?

MR. JOSEPH SMILLIE: Tracy hit on it. I just want to stress it. Again, it’s when the recommendation came out, it extended the opportunity of other groups other than growers to meet the criteria, and as Tracy pointed out, it’s a very strict criteria.

MS. LYNN COODY: Right.

MR. JOSEPH SMILLIE: I just want to speak practically about that. From my point of view and in my experience there’s very few handlers will fit that criteria. It just so happens, and I don’t know if it’s an accident of history or
design, the only group that I really see being able to meet that criteria are retailers. We didn’t design the program, our recommendation to include growers and retailers. We designed the criteria by which someone could apply group certification, and from a practical point of view, looking at it practically, processors just aren’t going to meet it. They’re not going to hit that criteria. They’re just not going to make it. They have that opportunity, but it’s very, very, very doubtful that processors and even distributors and other handlers can meet it. Retailers because of the unique situation of the ICS and the central control and the single OSP being identical among the participants or the sub-units, it just so happens that it’s possible because of the way that practicalities work that retailers can hit that. So, again, this wasn’t like a political recommendation. This was a regulatory recommendation, and what we did is put down the criteria for the first step, the first phase of this. What Lynn has really gone forward to was what we always considered to be phase II,
which was getting down to the quality manual.

MS. LYNN COODY: That’s right. We love quality manuals.

MR. JOSEPH SMILLIE: The risk—it’s—let me tell you, folks, it’s a big manual. It’s a very serious manual. Luckily, because of the work of [unintelligible] and many, many other organizations that manual exists and that can be adapted as we move hopefully quickly. Again, we didn’t have that much time to do the work, but we can take those manuals, whether they’re ISO manuals or others, and we can adapt those so that we can have the quality manual, which gets down to the detail of the risk/benefit analysis and all of the other inspector qualifications, ICS conflict of interest, all of those details. We don’t have to, as Tracy said yesterday, reinvent the wheel. A lot of it’s there. We just have to make a decision as to how we’re going to move forward on this, and then start to bring in those quality manual issues.

MS. ANDREA CAROE: Okay, Joe. Bea, and then we’ve got to wrap this up, guys.
MS. BEA E. JAMES: You know, I mean I sit on this board as the retailer representative, and that I think it’s important to remember that if you’re a retailer and you’re marketing certification that you are in the prime light of being a keeper to communicate to the consumer that that USDA seal really does mean what the consumer expects it to mean, and I know from my own experience that without having somebody who is extremely knowledgeable like a certifier come to each location and make sure that the checkpoints are in place, that you risk— you risk miscommunicating what a USDA organic seal means, and I’ve seen it happen. So, I believe that it’s important to keep the certification at the retail level just as stringent as anybody else, and I heard during Aquaculture a lot of people comment and say it shouldn’t be easy.

[END MZ005029]

[START 106939-2A]

MS. BEA E. JAMES: It should be something that is earned and it should be something that is quantified by somebody who really understands what
it means when you say no commingling. You got a
USDA, huge USDA seal right when a consumer walks
in the store and they get mixed messages because
not ever store is being inspected. So that's my
only comment.

MS. ANDREA CAROE: All right. With that
we're going to—we got to wrap up. We got to wrap
up, Jeff, I'm sorry. This is it. I'm sorry. I
got to stop it. This is going to be further
discussed. It's not an action item for this
meeting. I—you just happen to be on the other
side of the cutoff, but... Thank you, Lynn.

MS. LYNN COODY: Thank you so much
everyone.

MS. ANDREA CAROE: All right. Last
commenter, Barbara C. Robinson.

[Background noise.]

MS. BARBARA C. ROBINSON: Do I have to
say my name again?

[off-mic]

MS. BARBARA C. ROBINSON: Excuse me?

[Laughter.]

MS. BARBARA C. ROBINSON: I am the proxy,
Andrea.

[Background noise.]

MS. BARBARA C. ROBINSON: I'm moving another agenda item up a little ahead of schedule because I realize that I should have done this a little earlier, but... Andrea, I just wanted to say—well, I guess I should do this. Barbara Robinson, Deputy Administrator.

I wanted to say thank you from the National Organic Program and from the Agricultural Marketing Service for all your many years of service on this Board, and most especially for the last year in your capacity as the chair of the Board. And aren't you glad you haven't been chair longer. And I am sure, my dear, my friend, Chair, and all the other names that we have gone by over the past five years, that there have been many days and many meetings where the end of the meeting, what you have really felt like saying was the following at the end of the day when I said, "So, how goes it?"

"I'm depressed. I get wet. My face broke out. I'm nauseous. I'm constipated. My
1 feet is swelled. My [unintelligible]. My sinuses
2 are clogged. I've got heartburn. I'm cranky and
3 I have gas."
4  
5 [Laughter.]
6 However, with all due respect, Andrea, I
7 would like to present to you a certificate of
8 appreciation for your five years of dedicated
9 service on the board.
10  
11 [Applause.]
12 MS. ANDREA CAROE: I only have one
13 response.
14  
15 [Laughter.]
16 [Music.]
17  
18 [Background noise.]
19 MS. ANDREA CAROE: Thank you so much,
20 Barbara. I think we need to take a 15-minute
21 break so we can be prepared for votes next. I
22 know Bea wants to get settled so that she can
23 record them and I need to get settled as well. So
24 15 minutes, folks.
25  
26 [Break.]
27 MS. ANDREA CAROE: Okay, let's reconvene.
28 First up for the voting portion of this
meeting, Rigo Delgado and the policy committee.

MR. RIGOBERTO I. DELGADO: Thank you, Madame Chair. Our first item is the one related to updates to the policy and procedures manual. We believe that these revisions will allow us to function better as board members and it's part of the ongoing update of policy and procedures manual. So at this point I would like to move for the approval of the following updates to our policy and procedures manual.

The first one found on Page 5. The change is found on Page 6 of Section 2, which includes an introductory paragraph to the section, an addition of the mission of the Board. Two edits to the mission statement and an updated number.

We'd also like to include the change to the typo found in Page 33, and changes in sections, in the Section 8. On Page 45, the change of location for the committee recommendation form, updates to the committee recommendation form, found in the same Page 45; and on Page 54, the addition on the section of
clarification of deferral.

Finally, the two definitions found in Appendix D, Page 62.

MS. ANDREA CAROE: Okay. So what we should do as we're presenting these vote items, let's present them and then make your motion a little bit more concise, if we could. And then—

MR. RIGOBERTO I. DELGADO: [Interposing] Very well.

MS. ANDREA CAROE: Just so that we can record it, what the exact motion was.

MR. RIGOBERTO I. DELGADO: And I also would like to clarify that I'm making the motion for the whole list of changes here as one, and if there is any objections, obviously we can split those. But at the moment, the motion is to approve the updated changes listed to the policy and procedures manual.

MS. ANDREA CAROE: Is there a second?

FEMALE VOICE: Second.

MS. ANDREA CAROE: Is there discussion?

FEMALE VOICE: I have one piece of discussion. On the form on Page 45, that's a
program form not a board form. So were the changes made by the program or did policy committee make changes?

MR. RIGOBERTO I. DELGADO: Page 45—give me a minute.

FEMALE VOICE: We made those changes and then you're adopting them into your manual.

MR. RIGOBERTO I. DELGADO: That's right.

FEMALE VOICE: That's what I wanted to verify, that it wasn't changes we initiated.

Thank you.

MR. RIGOBERTO I. DELGADO: That's correct. Thank you for that.

MS. ANDREA CAROE: Any further discussion? Jennifer.

MS. JENNIFER M. HALL: Very minor, but the first change is, it's a typo, actually. It's not Section 2, it's Section 1, Page 6. So just for clarity in the minute.

MR. RIGOBERTO I. DELGADO: That's right. So the first change will be Page 5 and it's the introduction section.

MS. ANDREA CAROE: Any further
discussion? Hearing none I will start with Tina on the vote. Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.
MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: And the chair votes yes. The vote is zero noes, fifteen yes, and it passes.

Next item, Rigo.

MR. RIGOBERTO I. DELGADO: Thank you, Madame Chair. The next item is—considers updates to the new member guide. Essentially includes two changes that were discussed yesterday and this formed part of the ongoing process of maintaining this as a working document that will benefit new members, as you recall. Well, at this point, without further ado, I would like to motion that we accept—update the new member guide with the following changes: addition to the section called, "What are rules in the process of rule making," and two, the inclusion of the section called, "Tracking changes in word documents."
MR. HUBERT J. KARREMAN: Second.

MS. ANDREA CAROE: Okay. So, Rigo has made the motion and Hue Karreman has seconded it. Is there any discussion on the new member guide changes? Hearing none we will go to vote starting with Jerry.

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.
MS. ANDREA CAROE: Jennifer?
MS. JENNIFER M. HALL: Yes.
MS. ANDREA CAROE: Jeff?
MR. JEFFREY W. MOYER: Yes.
MS. ANDREA CAROE: Kevin?
MR. KEVIN ENGELBERT: Yes.
MS. ANDREA CAROE: Hue?
MR. HUBERT J. KARREMAN: Yes.
MS. ANDREA CAROE: Tina?
MS. KRISTINE ELLOR: Yes.
MS. ANDREA CAROE: And the chair votes yes. The motion passes, zero no votes, fifteen yes. Thank you. Rigo, is that the end of...?
MR. RIGOBERTO I. DELGADO: That concludes our section, Madame Chair. Thank you.
FEMALE VOICE: [Unintelligible] has a question.
FEMALE VOICE: Andrea, when they're doing a first or a second or a motion or whatever, they need to specify what for, for the court reporter.
MS. ANDREA CAROE: Okay.
FEMALE VOICE: Who seconded. Who made the second.
[Crosstalk.]

MS. ANDREA CAROE: Okay. I think I restated it.

MALE VOICE: I got it this time, yeah.

MS. ANDREA CAROE: Okay. All right.

Thank you.

MALE VOICE: Don't let them go by too quickly, though.

MS. ANDREA CAROE: Okay. I will definitely restate it so we have it on the record.

FEMALE VOICE: Do we need to restate something now?

MALE VOICE: No.

[Crosstalk.]

MS. ANDREA CAROE: Okay. So the joint policy items are up next. Rigo, Gerald or Hue, I don't know who's taking the lead on the votes for this.

MALE VOICE: Madame Chair, if I am allowed, I am taking the lead.

MS. ANDREA CAROE: Thank you.

MALE VOICE: And the first item is the document called "Guidance for Certification of
Operations Participating in Crop Production Research.” It's a reminder that the joint committees feel that agriculture research is a critical component in the growth and expansion of organic agriculture and we realize that crop research has—faces specific challenges, specifically when it deals with prohibited practices in materials and procedures. And we believe that this document will provide the necessary clarification and guidance that is required. So on that note, I would like to move to accept the Guidance for Certification of Operations Participating in Crop Production Research.

MS. JENNIFER M. HALL: Second.

MS. ANDREA CAROE: Okay. Second from Jennifer Hall. Any discussion? Hearing none—

MS. LYNN COODY: [Interposing] Weren't there some proposed wording changes? Did those get dealt with?

MR. RIGOBERTO I. DELGADO: Thank you very much, Lynn. Yes, the proposed changes—and I apologize for that—as follows, the first one is
found on Page 2 of the document. And it's Section 8.82. We replaced the sentence that reads, "per regulation, all land treated with prohibited materials will be considered." That was replaced, "will be considered to be" was replaced by "must undergo." So the sentence now reads, "Per regulation, all land treated with prohibited materials must undergo transition,"—and we included the word "prior"—"to certified organic status subject to procedures following 205.202." [Unintelligible.]

MR. RIGOBERTO I. DELGADO: The next change is found on—prior—

MS. ANDREA CAROE: Oh. Got you.

MR. RIGOBERTO I. DELGADO: Right?

[Crosstalk.]

MR. RIGOBERTO I. DELGADO: The next change is next page, answered question four. The last sentence, "land exposed to" and we added the word "prohibited materials." So it—at this point, Madame Chair, I think it's proper for me to—in this point of clarification, obviously, it should—I withdraw my motion and then resubmit it.
MS. ANDREA CAROE: You can amend your motion and it can be—as long as the second accepts that.

MR. RIGOBERTO I. DELGADO: Well, at this point I would like to amend the motion to include the changes that we just discussed.

MALE VOICE: Second.

[Crosstalk.]

MS. ANDREA CAROE: The first second, which was Jennifer, do you accept those—

JENNIFER: Yes.

MS. ANDREA CAROE: —amendment. Thank you. Further discussion on this item? Further questions? Okay. At this point I will call for a disclosure of any potential conflicts of interest with this document. Hearing none we'll go to vote starting with Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?
MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: And the chair votes yes. So that's zero no votes, fifteen yes, and
the motion passes. Moving on.

MR. RIGOBERTO I. DELGADO: Thank you, Madame Chair. The next item is the Guidance on **Temporary Variance for Research**. Again, the members of the joint committee believe that the framework that we are providing with this guidance gives the consistency and clarity that is required at the time for allowing such temporary variances with the purpose of research.

So on that note I would like to move that we recommend the approval of Guidance on Temporary Variance for Research.

MR. JEFFREY W. MOYER: Second.

MS. ANDREA CAROE: So it was moved by Rigo and seconded by Jeff. Is there any discussion on this item? Bea.

MS. BEA E. JAMES: I noticed that in your committee votes there was somebody who voted no and I was wondering if they might be able to just talk a little bit about why.

MR. RIGOBERTO I. DELGADO: If I recall the history, we had a series of questions included in the original document that were withdrawn
afterwards and the member that opposed some of those questions was not present at the second voting and I felt at that time that it was proper to keep his no vote in the record. If I'm not clear on that, we submitted a question—a document to the committee first and included a series of clarification questions. There was confusion at the time and that's where the no vote came and I believe that was changed afterwards and we came out with that no vote. In other words, it's a typo. That's the clarification.

MS. ANDREA CAROE: Is it absent then or a yes vote?

MR. RIGOBERTO I. DELGADO: It should be an absent.

MS. ANDREA CAROE: Any other questions? Comments? Hearing none we'll go to vote.

Starting with Tracy?

MALE VOICE: Hold on. Well, I guess—this particular document could affect or help me with research in the future, for the good of—

FEMALE VOICE: I'm sorry.

MALE VOICE: —organic livestock. Not
that I would gain hardly a penny from that, but I just thought I'd let you know that this would, as it says in the document, advance research through variances at the secretary level, I guess. So anyway, I just thought I'd let the Board know that I may be engaging in research that may, may, take advantage of this document.

MS. ANDREA CAROE: And thank you, thank you both.

MALE VOICE: I would have to say the same thing. Obviously—

MS. ANDREA CAROE: [interposing] All three of you.

MALE VOICE: [unintelligible] research.

MS. ANDREA CAROE: I failed to ask for potential conflicts. Is there anybody else that would like to disclose any potential conflicts?

FEMALE VOICE: I would request that my colleagues not set the bar that low for conflict of interest.

MALE VOICE: Just disclosing.

MS. ANDREA CAROE: Does anybody on the Board feel that this is—that what was disclosed is
a conflict of interest for voting? Nor do I. So the vote will proceed and I ask the members to please vote. Starting with Tracy.

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?
MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Jerry?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: And Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Chair votes yes. So that's no no votes, 15 in favor, the motion passes. Okay. Moving on to Handling Sunset materials. Thank you for the joint policy crops, livestock committee. I think I got everybody there. There's nearly a whole board boat there.

Okay. The first recommendation that we're going to vote for is a grouping of 605a materials which includes agar agar, carrageenan, calcium sulfate—where is our—wait, I have it up. No, no, no, it's on the recommendation. And animal enzymes. Okay. Agar agar, animal enzymes, calcium sulfate, carrageenan. These are for 605a. There is an additional 605a item which will be voted separately that was—[Crosstalk.]
MS. ANDREA CAROE: Sorry. Is there any discussion?

FEMALE VOICE: We haven't even had a motion.

FEMALE VOICE: Oh, okay. I'm sorry. Alright. Get in the groove here. Okay. Hold on one second. Let's just tee up the motion and then let's make the motion and then get a second.

FEMALE VOICE: Do—the recommendation of the handling committee was for the relisting of these four substances on 605a. Do I have a motion?

MALE VOICE: You can make it.

FEMALE VOICE: You can make it.

MS. JULIE S. WEISMAN: I move that these four materials be relisted on 605a. Do I have a second?

MR. JOSEPH SMILLIE: Second.

MS. ANDREA CAROE: So Julie Wiseman moves with Joe Smiley seconding. Any discussion on these items? Bea James.

MS. BEA E. JAMES: I have a question on the point of order. I just, I want to make sure
that everybody understands that we're voting on the handling Sunset materials as a group and that if there's any particular discussion on each one of the individual items, then we can pull those out and discuss it. Is that correct?

FEMALE VOICE: (A), I think that's correct and if anyone has an objection to them being voted as a group, we can vote on them separately.

MALE VOICE: Or pull out any one individually if somebody has a problem on that. That's why we—

FEMALE VOICE: [Interposing]

[Unintelligible.]

MALE VOICE: Yeah, the ones out separately already.

MS. ANDREA CAROE: Katrina.

MS. KATRINA HEINZE: Similar to what I expressed at the March meeting, I work for a large consumer products company.

[Crosstalk.]

MS. KATRINA HEINZE: I'm only going to do it once so we don't have to do it for every
handling and crop material. There is a
possibility that we, either now or in the future,
use one or all of these materials. I just wanted
everybody to know.

MS. ANDREA CAROE: Thank you for that.

Bea?

MS. BEA E. JAMES: I don't know if it's
appropriate for me to ask this question regarding
a Sunset item, but I am curious anyway. I'll take
whatever response I get.

Why agar agar, which is derived from
seaweed, is on 205605, nonsynthetic—nonsynthetic.
I don't understand that.

MS. ANDREA CAROE: I'll just take a—this
is Sunset. We're not reviewing this material so
Sunset is not the time for replacing, removing
annotations, changing in it. It's about the
continuation of regulations so you're voting to
continue it where it is. If you disagree with
where it is and you want to vote against it,
that's your decision but we are—we can only at
this time vote for maintaining it where it is.

MS. BEA E. JAMES: So if I had an issue
with agar agar, then we would vote on that one separately?

MS. ANDREA CAROE: If you—you could ask them—the person that made the motion to accept an amendment to delete that item for a further motion.

FEMALE VOICE: No, Andrea.

MS. ANDREA CAROE: Yes?

FEMALE VOICE: No.

MS. ANDREA CAROE: No?

FEMALE VOICE: If you—you can have an issue with it but, you know, you should have gone through this in the ANPRB. But the—as a Sunset material, the question before you is not to debate where it should be on the national list. It's simply to renew its exemption again. It's not to reconsider, you know, the worth of agar agar or whether the previous Board got it right when they put in on the—where they put it on the national list.

MS. BEA E. JAMES: So if I think it should be on the national list but it's the wrong place then—if I think it's in the wrong place,
then I would vote yes and then address that at another time?

FEMALE VOICE: Correct.

MS. BEA E. JAMES: Okay.

MS. ANDREA CAROE: Any further discussion on these items for Sunset? Hearing none, the vote is to relist. The recommendation is to relist so your yes vote is to relist these materials. I will call at this time for anybody that feels that they have a potential conflict that they need to disclose. Steve.

MR. STEVE DEMURI: Since Katrina started it, I also work for a large consumer product company. We do not use any of these—

MALE VOICE: —so I'll say that once.

MS. ANDREA CAROE: Does anybody on the Board feel that these conflicts are such that the member should not vote? Hearing none, I ask the members to vote. We will start the vote with Katrina.

MS. KATRINA HEINZE: Yes.
MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?
MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: I got the initials [unintelligible]. And the chair votes yes. So zero against, fifteen in favor, the motion passes.

Moving on.

MS. JULIE S. WEISMAN: Yes. We have a second recommendation now, which is for the relisting of a glucono-delta-lactone, also on Section 605a of the national list. I would like to move at this time that glucono-delta-lactone be relisted.

MR. STEVE DEMURI: Second.

FEMALE VOICE: Thank you.

MS. ANDREA CAROE: Okay. So the motion is by Julie Weisman, second by Steve DeMuri.

Okay. I'm trying to—any discussion on this item?

MALE VOICE: Just to—asking the committee for a clarification. This was pulled off because of a different amount of public comment or significant difference in public comment?

FEMALE VOICE: I wanted to explain to my
fellow members, I was the no vote on this material. Prior to this meeting we had received very little public comment as to its continued use in the industry and so I wanted—I was concerned that I didn't fully understand how it was used. I am now satisfied by the comments we have received. So I just wanted to clarify for the Board that it is widely used and, you know, the products for which it is appropriate.

MS. ANDREA CAROE: Further discussion?

Any potential conflicts of interest that you would like to disclose? Hearing none, we will move to vote starting with Joe.

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?
MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: And the chair votes yes. Zero against, fifteen in favor, the vote—the motion passes. Moving on.

MS. JULIE S. WEISMAN: Okay. We have a third Sunset recommendation, and that is for the relisting of cellulose on Section 205605b of the
national list. That would be synthetics allowed in handling.

MS. ANDREA CAROE: Is there a second?

MS. KRISTINE ELLOR: Second.

MS. ANDREA CAROE: Okay. So I have a motion by Julie Weisman and a second by Tina Ellor, Kristine Ellor, whichever you like to be called. Any discussion on this item? Okay. Any potential conflicts of interest, any cellulose people here? No cellulose people. Hearing none, we'll move to vote starting with Bea James.

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie Weisman?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?
MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: And the chair votes yes. That's zero against, fifteen in favor. The motion passes. Moving on.

MS. JULIE S. WEISMAN: Okay. We're now moving into petitioned materials and we have two up for vote this morning. The first one is grape seed extract, which was—it's material that we—was not able, for time reasons, to be included in the
March meeting and so we are addressing it in this meeting. This is being petitioned for 606. That is an agricultural product, a non-organically produced agricultural product for 606. The handling committee—where's the vote?

[Crosstalk.]

MS. JULIE S. WEISMAN: Okay. All right. Yeah, this—okay. Thank you. The handling committee vote for this was three, four—were three in favor, no opposed, two members were absent that day.

FEMALE VOICE: Make the motion.

MS. JULIE S. WEISMAN: I move—the recommendation is for grape seed extract to be added to section 606 of the national list.

MS. ANDREA CAROE: Is there a second?

MR. STEVE DEMURI: I'll second.

MS. ANDREA CAROE: Motion was made by Julie Weisman, seconded by Steve DeMuri. Any discussion on grape seed extract? No discussion? Okay. Any potential conflicts of interest with grape seed extract? Okay. We will go to vote starting with Julie.
MS. JULIE S. WEISMAN: I vote yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: No.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: No.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: No.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: No.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: No.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: No.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: No.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tina—yeah, Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: One of the "T"s.

Katrina?
MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: No.

MS. ANDREA CAROE: And the chair votes yes. Eight no, seven in favor. The motion fails.

Moving along.

MS. JULIE S. WEISMAN: Okay. We have a second item, petitioned item, up for vote this morning. It was—it's Gellan Gum, which was voted at the spring meeting but we—a motion was made and we voted yesterday to reconsider this item. We've heard quite—well, I shouldn't [unintelligible]. We've heard a lot of public comment in the past few days on Gellan Gum. We had an opportunity here, a lot of expert information was offered during this meeting and so we now—we now have a recommendation and I move—the motion is for Gellan Gum to be added to Section 605a of the national list. That is a nonagricultural, nonsynthetic—did I say something [unintelligible]? Okay. Nonagricultural, nonsynthetic material.
MS. ANDREA CAROE: Is there a second?

MR. JOSEPH SMILLIE: Yes, seconded.

MS. ANDREA CAROE: Motion is made by Julie Weisman, seconded by Joe Smillie. Is there discussion on this item? Katrina.

MS. KRISTINE ELLOR: Maybe a point of clarification. My understanding is that our recommendation is for listing on 605b.

MS. JULIE S. WEISMAN: No. That's incorrect. I want to make sure that it is absolutely clear, the petition was made—the petitioner asked for a listing on 605b but it is—after all of our deliberations and all of the explanations we've heard in the last three days, this is absolutely material being recommended for inclusion on 605a.

MS. KRISTINE ELLOR: I'm looking at the screen, that's why I'm confused.

MS. JULIE S. WEISMAN: Okay.

MALE VOICE: Madame Chair—

MS. ANDREA CAROE: [Interposing] I'll have to—that's something I'll have to update for the record. Dan?
MR. DANIEL G. GIACOMINI: This was also a reconsider of the previous vote. So if we had—it needs to be the same as the vote at the March meeting. If we want to change from that, that motion would then need to be amended.

FEMALE VOICE: Fair enough. So we have actually a motion for 605b and we can amend it at that time—at this time if somebody wants to offer an amendment.

MALE VOICE: Madame Chair?

MS. ANDREA CAROE: Dan.

MR. DANIEL G. GIACOMINI: I move to amend the motion to 605a.

MS. ANDREA CAROE: Is it accepted by the principal motion? Julie, do you accept that?

MS. JULIE S. WEISMAN: Absolutely.

MS. ANDREA CAROE: Joe, do you accept that as a second?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Okay. So now we have a motion on the table for listing of Gellan Gum on 605a. Discussion?

MALE VOICE: Just a technicality.
Actually, since I was not here in March, I did not vote on this, does that come into play here? Is it the same people voting or it's present here and now?

MS. ANDREA CAROE: No. You're on the Board. Any other discussion on this? This is a reconsideration and we really want to make sure that we're discussing this. Katrina?

MS. KATRINA HEINZE: I am under the belief that it still belongs on 605b. Gellan Gum is processed in a way very similar to Xanthan [phonetic] Gum, which is on the national list under 605b. Both are fermentation products that are separated by isopropyl alcohol. So I just wanted to get that out for folks' discussion as we vote on whether it's listed on 605a or 605b.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: In the procedure of—the person making the motion and the second both accepting it, at this time your only option then would be to make another amendment or vote it down.

MS. KATRINA HEINZE: Vote the material—
MS. ANDREA CAROE: [Interposing] Katrina.

MS. KATRINA HEINZE: —or make a second amendment. Are those my choices?

MALE VOICE: Vote no or second amendment.

MS. KATRINA HEINZE: I move that Gellan Gum—I'm not sure exactly what to move. Let's see. I move that Gellan Gum, the recommendation be changed to list it on 605b.

MS. ANDREA CAROE: Is there a second for it?

MALE VOICE: Second.

MS. ANDREA CAROE: Okay. Oh, wait a second. I'm sorry. I shouldn't have done it that way. If it's a friendly amendment it is accepted by you, Julie, as the principal motion. Do you accept the amendment?

MS. JULIE S. WEISMAN: I don't.

MS. ANDREA CAROE: Okay. It's an unfriendly amendment, I guess. So is there a second to that? Am I doing this right, Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Okay. So is there a second to Katrina's unfriendly amendment?
MR. GERALD A. DAVIS: Second.

MS. ANDREA CAROE: Gerald. Okay. So now—where are we? Do we have to vote on the amendment?

MALE VOICE: Yes.

MS. ANDREA CAROE: Okay. We have to vote now and we'll do this by voice vote to amend—we are voting to amend the motion to change the placement of Gellan Gum to 605b instead of 605a. Is there discussion on this? Tracy, and then Jeff.

MS. TRACY MIEDEMA: Yes, a point of discussion and clarification from yesterday. My understanding is that the most germane issue is that we're voting whether to add something to the national list and that ultimately the program will decide whether it resides under A or B?

MS. ANDREA CAROE: That's true. Jeff?

MR. JEFFREY W. MOYER: My question was just to Julie to see if she could explain why she wanted it on A because I already got Katrina's explanation on why she wanted it on B.

MS. JULIE S. WEISMAN: Yeah. The fact
that there is a synthetic processing aid does not make this a synthetic product. It's a processing aid, it's not an ingredient. Okay. And I also think that the fact the although we do look at the—although it is certainly our charge to respect the decisions of previous Boards, the definitions of material has not been consistent over the years and I don't think the fact that Xanthan gum, having a similar process—and I haven't looked, compared those two—but I don't think the fact that that resides on a different part of the list should set the precedent for where this one—we should go on our own.

MR. JEFFREY W. MOYER: But the petitioner originally asked to be put on B; is that correct?

MS. JULIE S. WEISMAN: Yes. And petitioners often don't, I mean they have their own understanding and some of it is some—the level of their understanding varies, as does ours, about where things belong at different times.

MS. ANDREA CAROE: Just a clarification. We're not beholden to what they're asking for placement. Just to get it—just the material. So
Joe, you had a point?

MR. JOSEPH SMILLIE: Point of order,

Madame Chair, I would request that we vote on this amendment in the same manner as the other votes rather than up or down, or request that we—

MS. ANDREA CAROE: [Interposing] A poll vote?

MR. JOSEPH SMILLIE: A poll vote. Yes, ma'am.

MS. ANDREA CAROE: Okay. Hue. I'm sorry.

MR. HUBERT J. KARREMAN: Okay. I'm a little confused but regarding the A and the B, they have different definitions and I know in Sunset we're not trying to—we're not trying to declare if it's in the right category or not. We're just voting on it. But this is a petition material; correct? I mean this is like first time on the list. So we need to know clearly—at least I do—what I'm going to be voting on here, if it's going to be under A or B.

Sorry. I know we're trying to get to that but it makes a difference in the vote. I
don't—because—not because, but—or will the NOP
still place it where it needs to go. But
regardless of that, we need to know how to vote,
like what it's coming into as far as our purview.

MS. ANDREA CAROE: Bob?

BOB POOLER: Bob Pooler, USDA National Organic Program. Traditionally the Board has
initially voted on whether material is synthetic
or nonsynthetic and than after that vote decide—
you know, that vote decides where, what section
material may go in if it's approved.

MS. ANDREA CAROE: Thank you for that,
Bob. I'd like—I know we've got more questions,
but I'd like Kim Dietz, if you can come up and
just help sort this out.

KIM DIETZ: Kim Dietz, and I don't
represent the NOP so, you know, I'm just going on
history and what we've done in the past. So I'll
just have to give you my guidance from that and
Bob is correct. Typically when you vote on a
material you do vote synthetic, nonsynthetic.
We've done that to help clarify so you know what
section of the list to go on.
At the same time, you're making your best judgment with the information that you have and if you recommend that it goes on A and it really should go on B, then you would hope that gets clarified through public comment when you post the Federal register notice and you have to make the best judgment that you can.

So that being said, also if you have a similar product that's in the wrong place, there are mechanisms to move that, to petition to move it or if there's a clarification of the national list, you can move things because you know there are things in the wrong places. So hopefully that answers your question.

MS. ANDREA CAROE: Bea has a question.

MS. BEA E. JAMES: No, I don't.

[Crosstalk.]

MS. ANDREA CAROE: Bea has a question and then Gerald. Do you have any?

[Crosstalk.]

FEMALE VOICE: If you vote to put this on the national list, this is the beginning of rulemaking. Then we will get public comment and,
you know, there will ultimately be—you know,
there'll be a lot of feedback and it may
ultimately turn out that when the program writes
the final rule it will say well, hey, even though
we just, you know, the Board said it should go, we
say it should go on a 605, ultimately it has been
determined through the public comment and, you
know, whatever, that while the Board said it
should go on 605b or a, that the program has
determined that it really should go on A or B.
But, you know, this can get sorted out.

So I just—I guess what I'm trying to say
is don't—this isn't like do or die, really, I mean
I know—you do it the best that you can given the
information that you have. I just don't want to
see you have dueling sword battles over this and
say oh my god, if it's, you know, if we can't
determine whether it's A or B, well, we're just
not going to—we'll reject the whole thing out of—
because that's what I—where I sort of sense you're
about to go. If we can't make up our minds here,
we'll just vote it off. Don't do that. Take your
best—do the best you can with the information that
you have and we'll get this sorted out through a process.

MS. ANDREA CAROE: Okay. Bea?

MALE VOICE: No, go ahead. I was going to say something else.

[Crosstalk.]

MS. BEA E. JAMES: Okay. I think because of all of the confusion, for some reason this material has got a jinx on it or something, I don't know, but I would like to ask that the people from CP Kelco come up and just very briefly explain why you petitioned for it to be on B, which is synthetic, instead of A, which is nonsynthetic.

[Crosstalk.]

FEMALE VOICE: Hold on, hold on. Gerald?

[Crosstalk.]

MR. GERALD A. DAVIS: I wanted to point out what Kelco said yesterday was that—and the influencing factor that caused me to second Katrina's motion was the 500 parts, 450 to 500 parts per million of isopropyl alcohol that remains in the Gellan Gum. That's within their
allowed—amounts are allowed and everything, but
that is what remains and that's why in our
discussions over the last few years over what is
synthetic versus nonsynthetic is how much
extraction is left in the finished product and
whether—

MS. ANDREA CAROE: [Interposing] Okay.
MR. GERALD A. DAVIS: —that influences
whether it's synthetic or not.
FEMALE VOICE: Let me just qualify. This
motion is not to add isopropyl alcohol to our
list. It's to add Gellan Gum.
MR. GERALD A. DAVIS: I understand.
FEMALE VOICE: No—but Gellan Gum
[unintelligible] material.
MR. GERALD A. DAVIS: I know.
[Crosstalk.]  
MR. GERALD A. DAVIS: Which is nothing
wrong with that it's just—
MS. ANDREA CAROE: [Interposing] All
right. Let's get the gentleman from CP Kelco to
address this very quickly.
FEMALE VOICE: Can I make one more
comment? Your handling committee has made a
recommendation. Your handling committee has
determined, to the best of their knowledge,
whether it's synthetic or nonsynthetic. Your
handling committee are the experts on the Board on
a material. So that's one thing.

The amount of alcohol, the amount of the—
whatever the extraction, is considered a
processing, an aid under the CFRs. Doesn't that
deam something synthetic, it's an allowed
processing and remember the consistency of what
your doing and remember your definitions and
again, just do the best you can.

MS. ANDREA CAROE: Okay. I'm going to
rein this in. I do want to hear from the
gentleman from CP Kelco and why—addressing Bea
James' question, why you initially asked for 605b
listing.

RICK GREEN: Okay. Again, I'm Rick Green
from CP Kelco and we basically just put it in the
same place, 605b, because Xanthan was there
because it was the—very similar material. So we
were just going on what the previous, you know,
decision was made and, you know, we don't have
any—if we had thought 605a was a better choice we
could have petitioned for that. That was really
the only reason, is that we looked for the most
similar material and it seemed to make sense that
it would go there. So if that material was
initially, you know, mislisted, you know, we have
no objection to, you know, having it on either
list. That's, you know, the basic reason was
because it seemed to make sense to us at the time.

MS. ANDREA CAROE: Okay. I'll ask for
more questions, but I just want to remind this
Board that diminimus [phonetic] processing aids,
just like Kim Dietz has just indicated, are not
what we consider and they are allowed through
other federal regulation. It's inconsistent with
other Board deliberations for us to take those
insignificant amounts and disqualify useful
materials for organic production. I think that's
kind of over and above.

Go ahead, Katrina.

MS. KATRINA HEINZE: I do want to remind
the Board that in addition to the isopropyl
alcohol or maybe separately from that is a better phrasing, that there is some discussion that the functionality of this ingredient can be slightly modified to the changes of the acetyl groups and that similar to Xanthan Gum—or is very similar to Xanthan Gum. So my belief that it's on 605b has more—is related to that.

MS. ANDREA CAROE: Would the gentleman from CP Kelco like to address the acetyl group manipulation?

RICK GREEN: I think as we pointed out yesterday, you know, in the TAP [phonetic] review they addressed that same—it doesn't really change the food identity. It wouldn't change the cas number. It's basically Gellan Gum. So, you know, it's still the same food material and I'm not sure what more detail you'd like on that.

MS. KATRINA HEINZE: It's just my point that it goes through some chemical change during that, as indicated in the TAP. Very minor. It's just some change in the acetyls.

MS. ANDREA CAROE: Tina.

MS. KRISTINE ELLOR: Yeah, I have to say
that when we originally looked at Gellan Gum I considered it to be synthetic based on that it was—there were changes in the acetyl groups. So, you know, were there changes to food identity? Is that still a chemical change? That would be my question, I guess.

RICK GREEN: I guess that would be better for a chemist to decide because chemical changes can be part of the actual, you know, the bacterial fermentation itself. So if the bacteria makes the change, you know, if there's inherent variability in the Gellan itself, is that a chemical change in processing? It's—as to whether it goes on 605a or 605b, it's really not an issue for us or for the end users.

MS. ANDREA CAROE: Tina.

MS. KRISTINE ELLOR: My question would be are the acetyl changes taking place as part of the downstream processing after the fermentation? And that would make that clear.

RICK GREEN: Well, they could take place either after fermentation or during fermentation because the amount of acetyl that's made by the
bacteria is variable. So if you have a batch
where it's got low acetyl or high acetyl, then you
don't have any further changes. You could, you
know, manipulate it further if you needed to do
that as well.

MS. KRISTINE ELLOR: Do you manipulate it
further? Do you manipulate the acetyl groups as
part of your downstream processing?

RICK GREEN: You can reduce the acetyl
groups, yes.

MS. KRISTINE ELLOR: Do you?

RICK GREEN: As to whether we do, I would
say yes. And it's really a matter of batch
variability because if you need low ethol
[unintelligible] because someone has an
application and your bacteria is producing higher
[Unintelligible.] [Phonetic.] then you can
chemically change it. But you don't necessarily
need to. And because these are biological batch
processes, it will vary. But so yes, it can be
chemically modified and if necessary we could do
that. So if that would make it a synthetic as
opposed to a nonsynthetic...
MS. ANDREA CAROE: Okay. Hue.

MR. HUBERT J. KARREMAN: Well, I think from what you're just saying, that the original change is due to the biological processing fermentation, to me then says that's a natural process because it's biological and that's your—and then occasionally you have to change it because of biological variability, but now I understand what you're saying, Katrina. But if it's due to the fermentation and that's a biological process, that to me is the basis for it to be still natural.

MS. ANDREA CAROE: Any other discussion? At this time, just to clean this up I would make the recommendation that we withdraw the present motion that's on the table and that perhaps somebody move that we deem this synthetic or nonsynthetic, however you want to word it, and vote on that portion first.

MS. KATRINA HEINZE: I withdraw my motion.

MS. ANDREA CAROE: Katrina, it's not your motion, actually. The motion on the floor—
[Crosstalk.]

MS. ANDREA CAROE: Okay. You're withdrawing your motion. Okay. Then I need also, Julie, for you to withdraw your motion.

MS. JULIE S. WEISMAN: Okay. I will withdraw my motion.

MS. ANDREA CAROE: Okay. So we have no motions on the floor at this time. All right. Anybody want to make one?

[Laughter.]

MS. ANDREA CAROE: Julie? Oh, Joe?

MR. JOSEPH SMILLIE: I'd like to move that Gellan Gum be considered as a nonsynthetic and placed on 605a.

MS. ANDREA CAROE: No. We don't want to get in the mess. Let's just deem in synthetic or nonsynthetic at this time.

MR. JOSEPH SMILLIE: I'll withdraw that. I would like to move, Madame Chair, that Gellan Gum be regarded as nonsynthetic.

MALE VOICE: Second. Okay.

MS. ANDREA CAROE: I didn't catch that. Who second?
FEMALE VOICE: Bea.

MS. ANDREA CAROE: Bea. Okay. All right. Now, we can have more discussion on this. So—

MALE VOICE: [Interposing] Madame Chairman, question to the program. Mark, would this be a decisive vote?

MARK: This should just go one way or the other.

[Crosstalk.]

FEMALE VOICE: So what do you want him to have, a majority?

MALE VOICE: Just a simple majority.

MS. ANDREA CAROE: A simple majority will do. We're not adding anything to the list at this point. We're just—

FEMALE VOICE: You're just making up your mind.

[Crosstalk.]

MS. ANDREA CAROE: I'll refrain from comment on that. Okay, so the discussion is whether—well, the discussion is on the motion that Gellan Gum is nonsynthetic. Any discussion?
Tina.

MS. KRISTINE ELLOR: I'd actually love to hear from [unintelligible] on this, if we could indulge me.

MS. ANDREA CAROE: We invite Brian Baker to the podium to give his words of wisdom.

FEMALE VOICE: State your name and affiliation.

BRIAN BAKER: Thank you. Brian Baker, research director, Organic Materials Review Institute and also former TAP reviewer, and NOSB wannabe.

I would point out to the Board that this is an important decision, whether it's synthetic or nonsynthetic and it has—there's an implicit source restriction in 605. If something is on 605a, that means that it has to be from a nonsynthetic or natural source. There are a number of items that are on 605a that can be from a synthetic or nonsynthetic source. For example, calcium chloride can be extracted from brine. It can also be produced by the [unintelligible] process. If someone were to ask to have a product
with, for example, calcium chloride, then—to be 
used in organic processing, for processing a 
produce labeled as organic, that would need to be 
documented to be a nonsynthetic source.

Similarly with Xanthan Gum, there was a 
discussion about the various different sources of 
Xanthan Gums. Many are nonsynthetic. Some are 
chemically modified by means similar to what was 
discussed. So if you decide that only the 
nonsynthetic sources of Gellan Gum are permitted, 
and it's on 605a, there is an implicit source 
restriction there that will need to be verified by 
the certifiers and by their agents. If on the 
other hand it is on 605b, it is less restrictive 
and the source is less important and these 
chemically modified Gellan Gums would then be 
permitted.

MS. ANDREA CAROE: Thank you, Brian. Any 
further discussion on the nonsynthetic nature of 
Gellan Gum? Hearing none, we will vote on this 
motion. I will restate, the motion is to consider 
Gellan Gum nonsynthetic. The motion was made by 
Joe Smillie and seconded by Bea James. And we are
starting with Dan.

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENCELBERT: Yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: I'm going to say no.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: No.

MS. ANDREA CAROE: Joe?
MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: And the chair votes yes. So that is two against and thirteen in favor. Gellan Gum is now nonsynthetic.

Now, next up?

MS. JULIE S. WEISMAN: I move that Gellan Gum be added to Section 605a of the national list.

MS. ANDREA CAROE: Is there a second?

MS. JULIE S. WEISMAN: Be added, excuse me.

MR. STEVE DEMURI: Second.

MS. ANDREA CAROE: Steve. Motion is made by Julie Weisman and seconded by Steve Demuri.

Further discussion on adding Gellan Gum to 605a?

Katrina.

MS. KATRINA HEINZE: All that being said, the last [unintelligible] that we spent, this material has lots of good uses for organic products and I would ask the Board to consider
that many similar gums exist on the list and are widely used.

MS. ANDREA CAROE: I would say that that is not a criteria for 605a. It is a criteria for 605b.

MS. KATRINA HEINZE: Thank you.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: I would just like to make a very quick point, but to get it on the record that the discussion that we've been having over this whole period on this item makes—the problems we had with it at the last meeting was far more than just a little bit of nonlinear issues and being late in the day and some people leaving. It's a complicated issue with a lot of possibilities. It's good we're reconsidering it but I just want to go back that for people that were critical of that decision, they look at the process that even at this point in time this is still taking.

MS. ANDREA CAROE: Well, we all feel vindicated now. Any further discussion on Gellan Gum for addition to 605a? Going, going. Okay.
Time to vote. We will start with Rigo.

MR. RIGOBERTO I. DELGADO: Yes.

FEMALE VOICE: I'm sorry. I'm having trouble.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?
MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: And the chair votes yes. Hallelujah, we're done.

FEMALE VOICE: Let's move from Gellan Gum.

MS. ANDREA CAROE: The vote was zero against, fifteen in favor. The motion passes and I suggest that we consider taking a break for lunch. It's now 11:40 if I'm converting from California. Right?

MALE VOICE: Madame Chair, I'd like to move we break for lunch.

MALE VOICE: Second.

MS. ANDREA CAROE: Do you have a conflict of interest?

MALE VOICE: Yes.

MS. ANDREA CAROE: All right. We will
stand in recess for one hour, coming back at
12:45, no later.

MALE VOICE: Was there a second? Did I
get a second?

[Background noise.]

[END 106939-2B]

[START MZ005031]

MS. ANDREA CAROE: All right, we’ll
reconvene, and Gerald, you’re up with crops
materials for a vote.

MR. GERALD A. DAVIS: Thank you, Madame
Chairman. Yes, the first material that is on the
floor is the new petition, potassium silicate.
The first thing to point out is on the screen
versus the posted recommendation we have struck
out the plant or soil amendment item, which all
three of these categories were voted on separately
by our committee. The plan and soil amendment one
has been deleted per request of the petitioner so
it’s not on the table for vote. The remaining two
would be for plant disease control and as
insecticide. The crops committee based on public
comment we received in the discussions within the
board yesterday met on this subject last night and
one other material to discuss whether we wanted to
change our votes, reconsider, based on the
testimony. So, we did meet, and we did—there was
a motion and a second to revote on this based on
the new information we were provided and the—five
months ago when we initially considered this,
several of the crops committee members mentioned
that the strongest reason for them voting against
listing it was they couldn’t perceive there would
be that much interest in the material and that
much usefulness of it. So, that’s some of the
comments that were discussed within our committee
last night. People were saying, you know, we have
a lot more information now. We see a reason to
revote. So, the vote was taken, and it was five
yes, zero no, and one absent for listing potassium
silicate for the as insecticide category, and we
voted separately again also five zero, one absent,
to list it as plant disease control. So we will—
and that’s designated at the bottom of the form on
the screen and what transpired last night. So, I
wanted to point that out, and the remaining
question we talked about yesterday concerns the
annotation, and we didn’t decide on that last
night either way but decided to leave it open
whether there would be a motion from anyone. We
might entertain a notion to delete the annotation
just for consistency’s sake in cleaning up the
recommendation. With that I’d like to—

MS. ANDREA CAROE: [Interposing] Okay,
so exactly what is the motion? Or are you—have
you made a motion?

MR. GERALD A. DAVIS: I guess I could. I
will make the motion that we strike the
annotation.

MS. ANDREA CAROE: Okay.

MR. GERALD A. DAVIS: Which is no
industrial byproducts allowed in the manufacture.

MS. ANDREA CAROE: Let me just—I need to
clarify things. What did your committee vote on?
Was it with the annotation?

MR. GERALD A. DAVIS: We voted on it with
the annotation as is.

MS. ANDREA CAROE: Okay, then we will
discuss that and maybe amend your motion at this
point, but are you making a motion to allow this material for those two uses or do you prefer that we vote separately for each of these? I mean it seems like it was pretty consistent. Do you want to—I need a motion on the floor from the committee. The committee didn’t vote that the annotation be deleted. So, bring the motion from the committee.

MR. GERALD A. DAVIS: As is.

MS. ANDREA CAROE: And then when we discuss it, we can—

MR. GERALD A. DAVIS: [Interposing] That’s the time to bring in the question about the annotation?

MS. ANDREA CAROE: Yeah, yeah, we can discuss it on the floor.

MR. GERALD A. DAVIS: Being that we have deleted one of the categories, I would like to move that we vote on them individually. So, I would move that we—to vote on the use of potassium silicate beginning with as an insecticide to add it to the national list?

MS. ANDREA CAROE: Is there a second?
MR. JEFFREY W. MOYER: I’ll second that.

MS. ANDREA CAROE: So, the motion has been made by Gerald Davis and seconded by Jeff Moyer to add potassium silicate to 601 as a, 601E, as an insecticide.

MR. GERALD A. DAVIS: Correct.

MS. BEA E. JAMES: With the annotation.

MS. ANDREA CAROE: With the annotation that is—

MR. GERALD A. DAVIS: [Interposing] At this point, yeah.

MS. ANDREA CAROE: Can you read the annotation because my eyes aren’t—

MR. GERALD A. DAVIS: [Interposing] The annotation reads no industrial byproducts allowed in the manufacture.

MS. ANDREA CAROE: Okay, so we have a motion. We have a second. Is there discussion on this topic? Steve?

MR. STEVE DEMURI: Is it aqueous potassium silicate or just potassium silicate?

MR. GERALD A. DAVIS: As petitioned it’s aqueous potassium silicate.
MS. ANDREA CAROE: Okay, then is the motion for aqueous potassium silicate?

MR. GERALD A. DAVIS: It will need to be because that is what the petition states?

MS. ANDREA CAROE: What is the recommendation from the committee?

MR. GERALD A. DAVIS: The recommendation says aqueous potassium silicate at the top.

MS. ANDREA CAROE: Further discussion.

Now, you still have an annotation on attached, so?

MR. GERALD A. DAVIS: Correct.

MS. ANDREA CAROE: Further discussion?

MR. JEFFREY W. MOYER: There was discussion among the committee members whether or not it should be there, and there was a not a consensus. We voted on the material the way it is. There was discussion about it afterwards, and there was a split decision—part of the committee wishes to keep it on. Part of it wishes to remove it, and so that’s why it’s a point of contention and discussion here.

MS. ANDREA CAROE: Tina?

FEMALE VOICE: I believe Jerry has new
information you gathered last night about the
manufacturer of this that might affect the
annotation if I remember correctly?

MR. GERALD A. DAVIS: Well, partly in the
testimony yesterday they talked about what’s the
likelihood of slag materials, calcium Silicate,
being used to make aqueous potassium silicate, and
it’s really not possible. That’s the testimony
that I wanted to highlight so they according to
the petitioner in their comments yesterday and
they reiterated that in further conversations,
just a repeat of it, that they don’t know of any
way that aqueous potassium silicate could be made
out of calcium silicate slag.

MS. ANDREA CAROE: So, my question to you
is why even have the annotation? It’s an extra
barrier of verification.

MR. GERALD A. DAVIS: Exactly.

MS. ANDREA CAROE: But you still have it.
Nobody has made a motion to remove it so we’re
voting on it with an annotation.

MR. GERALD A. DAVIS: I understand that.

MS. ANDREA CAROE: Tina?
MS. KRISTINE ELLOR: Can I make a motion that we remove the annotation? Would this be appropriate?

MR. HUBERT J. KARREMAN: Second.

MS. ANDREA CAROE: And that is second.

Yes. So, Tina Ellor has moved to remove the annotation from the recommendation, and actually before I get to you, Hue, Gerald, do you accept this as a friendly amendment. And does your second?

MR. JEFFREY W. MOYER: I do not.

MS. ANDREA CAROE: Okay, then it’s an unfriendly amendment. Is there a second for it?

MR. HUBERT J. KARREMAN: Hue.

MS. ANDREA CAROE: Hue. I know I’m just trying to put this in. Okay, did I do that right, Dan?

MALE VOICE: Yeah. I’ll tell you.

MS. ANDREA CAROE: You know, this is not my expertise. Okay, so what we have on the table is a motion to remove the annotation from the recommendation, and so is there discussion on that?
MALE VOICE: One extra bit of information. I checked with Brian Baker just now about annotations on this material, and he points out that some of the other materials, like copper sulfate or copper do not have that sort of restriction so we wouldn’t exactly be being consistent by adding an annotation on this particular form of disease control or insecticide.

MS. ANDREA CAROE: Further discussion?

Okay, let’s vote on removing the annotation from the recommendation starting with Jennifer:

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: No.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: No.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?
MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Abstain.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: No.

MS. ANDREA CAROE: And the chair votes yes. Three against, eleven in favor and one abstention, so the motion passes. Now we have a recommendation on the table with out the annotation for the listing of aqueous potassium silicate for the use as an insecticide.

MR. GERALD A. DAVIS: Correct.

MS. ANDREA CAROE: Is there any
MR. DANIEL G. GIACOMINI: I move to amend the motion by striking the word “aqueous” and adding, I don’t have it in front of me the cast number for potassium silicate.

MS. ANDREA CAROE: Gerald, do you accept that as a friendly amendment?

MR. GERALD A. DAVIS: Considering the other possibilities of what are out there that could be used, no, I would not accept that.

MS. ANDREA CAROE: Is there a second for the unfriendly amendment? The motion dies due to lack of a second. So, we still have the motion on the table for the addition of aqueous potassium silicate for the use as an insecticide. Further discussion? Hearing none we will proceed to vote stating with Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes

MS. ANDREA CAROE: Tina?
MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Dan?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: And Jennifer?

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: And the chair votes yes. Motion passes zero against, fifteen in favor. No abstentions or absentees. All right, so—
MR. GERALD A. DAVIS: The next motion I would like to bring would be to add aqueous potassium silicate to the national list as plant disease control, section 205.601i.

MR. JEFFREY W. MOYER: I’ll second that motion.

MS. ANDREA CAROE: Okay, so as I understand this exists with the annotation coming out of committee. So, I have a—so, okay, the motion made by Gerald Davis, seconded by Jeff Moyer is to add aqueous potassium silicate for use as plant disease control and with the annotation—I can’t read it. What’s the annotation?

MR. GERALD A. DAVIS: No industrial byproducts allowed in manufacture.

MS. ANDREA CAROE: No industrial byproducts, okay, so discussion on that motion?

Tina?

MS. KRISTINE ELLOR: Once again I’d like to motion that we remove the annotation.

MS. ANDREA CAROE: Is it accepted by the motioner?

MR. GERALD A. DAVIS: Yes.
MR. JEFFREY W. MOYER: No.

MALE VOICE: Seconded.

MS. ANDREA CAROE: Hold on. Jeff, no?

MALE VOICE: Sorry.

MS. ANDREA CAROE: Okay, unfriendly amendment, are we accepting it as an unfriendly amendment?

MALE VOICE: No.

MS. ANDREA CAROE: Friendly amendment no.

You said no as a second, so do we have a second as an unfriendly amendment?

MALE VOICE: Again, unfriendly.

MS. ANDREA CAROE: Yes, very unfriendly.

So, discussion on the removal of the annotation for this material recommendation—any discussion?

Hearing non, let’s vote on the removal of the annotation in the recommendation for aqueous potassium silicate for the use as—

MR. GERALD A. DAVIS: [Interposing] Plant disease control.

MS. ANDREA CAROE: Plant disease control, thank you.

[Unintelligible]
MS. ANDREA CAROE: Starts with Kevin?

MR. KEVIN ENGELBERT: Would you clarify again, what are we voting on?

MS. ANDREA CAROE: Oh, my gosh, I knew you were going to say that. We are voting to remove the annotation in the recommendation for the addition.

MR. KEVIN ENGELBERT: No.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald.

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?
MS. BEA E. JAMES: Abstain.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: No.

MS. ANDREA CAROE: Jennifer:

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: And Jeff?

MR. JEFFREY W. MOYER: No.

MS. ANDREA CAROE: Oh, and I vote yes.

Thank you for that. Okay, I think we’re exactly the same as we were before, three, eleven, zero, three against, eleven for, and one abstention, so sorry. You’re right. So, that motion passes.

Now we have the original motion on the table for the addition of aqueous potassium silicate for addition to 205.601E as a—

MALE VOICE: [Interposing] It’s “I”.

Section “I”.

MS. ANDREA CAROE: Okay, as plant disease control. Any discussion on that motion.
FEMALE VOICE: Without the annotation?

MS. ANDREA CAROE: Without the annotation. Any discussion? All right, so the vote will start with Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.
MS. ANDREA CAROE: Rigo?
MR. RIGOBERTO I. DELGADO: Yes.
MS. ANDREA CAROE: Jennifer?
MS. JENNIFER M. HALL: Yes.
MS. ANDREA CAROE: Jeff?
MR. JEFFREY W. MOYER: Yes.
MS. ANDREA CAROE: Kevin?
MR. KEVIN ENGELBERT: Yes.
MS. ANDREA CAROE: And the chair votes yes. So, that will pass zero noes, fifteen in favor. All right. Uh, I forgot to call for conflict of interest. Does anybody have any interest that they would like to disclose as a potential conflict? Then that stands. Moving along.

MR. GERALD A. DAVIS: Moving along, the next material is sodium carbonate, peroxyhydrate, also known as—named as percarbonate to shorten it a little bit. This is the second material that the crops committee considered last evening in our meeting due to additional public comment, and discussion within the board. And for this one I’d like to turn it over to Jeff Moyer, Vice chair to
lead the discussion on this, describe what we did.

MR. JEFFREY W. MOYER: Thanks, Gerry.

Before we put a motion on the floor, Madame Chairperson, we wanted to make a couple of comments about this particular material and the process we went through as we evaluated this and then again re-evaluated it. I’d say that this crop committee if it has any prejudices at all it is prejudiced against putting synthetic materials on the national list. Given the tap review that we had to work with and the nature of the questions on the committee recommendation form that we submitted to the board, we came to the logical conclusion that this material was a synthetic material and therefore when we answered these questions, it did not pass the criteria by which to put it on the—to add it to the list. I will also say that, you know, there are materials that are already on the national list that if they were to come in front of this committee today to go through the same process, we may come to the similar conclusions. I know that was discussed yesterday that some of the materials that are
currently on the list are less safe or less easy
to handle than this particular material. That’s
not to say that this material doesn’t work for its
intended purpose because probably it clearly does
although I have no personal experience with it and
that the material isn’t safer or easy to handle.
The other issue that the committee discussed was
oftentimes this particular material is being
petitioned to use as an algicide. Oftentimes,
algae is a symptom of a much larger issue, and the
committee was certainly in favor of treating, not
treating symptoms but looking at major root causes
for particular problems. Often over-nitrification
of water causes algae bloom, and there are reasons
that you may be able to get away from not using
this material or any other for that matter. I
think the fact that our initial recommendation was
not to approve this material and now when we make
our new recommendation it will be adjusted and we
voted last night to go ahead and recommend
approval of this material should not in any way be
viewed as anything other than this process at work
in the way it was designed to work. In that as
new information comes to light through the open forum of these types of meetings, the transparency of that I think is quite appropriate. And for us to re-evaluate our decision based on that information and the discussions that we’ve had here at this board our new recommendation for this material is to go ahead and list. And I’m going to make the motion that we list sodium carbonate per oxyhydrate on 205601A as an algicide.

MS. ANDREA CAROE: Is there a second?

MS. KRISTINE ELLOR: Second.

MS. ANDREA CAROE: Thank you. That motion has been made by Jeff Moyer, seconded by Tina Ellor, or Kristine Ellor. Tina? Tina, she wants Tina, okay. All right, discussion on this motion? Steve?

MR. STEVE DEMURI: I have a question for the committee. Could this replace one of the other substances on the list that is less safe?

MR. JEFFREY W. MOYER: Sharing personally, part of my decision making on changing my vote was based on the new information coming from the petitioner that they had received
EPA approval for the use of this in rice production which in that case it would replace copper sulfate, which is far less of a good choice than this material. So, I was—this heavily weighed in my decision to change.

MALE VOICE: Steve, yeah, it could replace it. It doesn’t necessarily replace it. That would be up to the user. It does not automatically take something off the list that is already there. Somebody would have to petition to take that material off of the list based on the fact that this new material is available.

MR. STEVE DEMURI: That was my point. Somebody could petition to take something off.

MALE VOICE: That’s correct. That’s my understanding, yes.

MR. GERALD A. DAVIS: At the point of our deliberations earlier this spring in committee, originally on this material they did not have EPA approval for use in rice, and we checked on that and had no clue that it would be forthcoming during this process that they would get it.

MS. ANDREA CAROE: Just a—I want to make
sure that we all get recognized so that the
recorder is getting the names down. Bea, I
believe you had a question.

MS. BEA E. JAMES: Jeff, I just want to
make sure I understand this. Your original
recommendation you voted against adding it to the
national list, correct?

MR. JEFFREY W. MOYER: That is correct.

MS. BEA E. JAMES: Okay, and now you are
wanting to vote to add it to the list?

MR. JEFFREY W. MOYER: That is correct.

Our recommendation currently would be to go ahead
and add it to 205601A.

MS. BEA E. JAMES: Even though the form
says under six are there adverse biological and
chemical interactions in the agro ecosystems, yes;
is there potential detrimental chemical
interactions, yes; is the substance harmful to the
environment, yes?

MR. JEFFREY W. MOYER: That’s absolutely
correct, and that’s why I wanted to preface my
recommendation by stating that personally, and I
speak for some others on the committee that our
prejudice is really to not put materials that fall in this category on the national list, but—and that’s why our initial recommendation was to not recommend this material to be added to the list. However, given the new information that we heard throughout this meeting and the fact that this material could replace a much more harmful and detrimental material and actually be safer to handle and use, our recommendation is that even though it does fail the criteria, and so we did not go back and change our classification of this material. It still fails in all of the categories. We still recommend currently that it be added to 205601A. That’s correct.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: The replacement that you’re talking about—was that for fire blight? IS this the material?

MR. JEFFREY W. MOYER: No, this material is only for an algicide.

MR. GERALD A. DAVIS: Gerald Davis.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Just to try to
answer your question a little more, the
environmental hazard of this material that we
assessed from the tap is strictly a raise in pH
and alkalinity of a farm pond. That’s the
environmental impact. So, it is an impact, and we
said, yes, it does affect the environment. But in
relation to copper sulfate, for example, it’s far
less. So that’s why the apparent contradiction.

MS. ANDREA CAROE: Hold on one second,
Bea, I’ll get to you. I would caution the members
of the committees when you’re filling out these
forms, I know I was dramatically yesterday when I said
walking across the lawn is an environmental
impact, you know, you really have to be very
careful when you’re filling out these forms, if
you are filling out that there is an environmental
impact but you’ve discounted it as not being
significant enough to change your decision, to
clearly indicate that in the box that is provided.
We’ve done that before, and sometimes it’s not
significant enough to keep this product from use
in organic production. And indeed you want to
know that you haven’t ignored it. But, you know,
your rationale should clearly be on the forms as
historic record of this discussion. Barbara
Robinson, then Bea James.

MS. BARBARA C. ROBINSON: Yeah, I really
want to aboard the committee for, Jeff, for what
you did. I, you know, I understand and the board
should be prejudiced against synthetics. That is
the nature of—that is your charge by law. You are
supposed to be prejudiced against putting
synthetics on the national list. I hope you are.
That being the case, I would hope that what you do
is what Andrea has just sort of suggested is that
what you do is with the form that is preserved for
the record that even if you want to check the box,
yes, there is an adverse impact that over where we
have given you space for comments that you say
noted, but not of a significant amount to fail the
substance, or to fail the criteria.

MALE VOICE: [off mic]

MS. BARBARA C. ROBINSON: Right, because
we’re going to have to—when we go to rule-making,
this is all part of the record. This could be,
and we will have to explain to the public how did
you come to the conclusion that you did. You know, we have to explain to the public the board recommended to the Secretary to add this to the national list, but your record says it flunks. You know, it’s not enough for me to say, well, the board is inherently prejudiced against synthetics because that is—by definition you should be prejudiced against synthetics. So, if you could just please, you know, it’s all right to check the box that there’s an adverse impact, but if you could simply please in the comment section note that the adverse impact is not of a sufficient nature to have rejected by your vote.

MS. ANDREA CAROE: Okay, I have Bea, Hue, Gerald and then Valerie.

MS. BEA E. JAMES: I would also like to echo that if you are making a decision based on another material that you think is similar but has worse effects, that somehow is documented in here too because for me when I look at this if I were to vote strictly based on how you filled out this form, I would vote against it.

MS. ANDREA CAROE: Hue?
MR. HUBERT J. KARREMAN: I would just echo Bea and Barbara and also do you think that someone will petition copper sulfate to come off if this comes on besides the company that’s maybe making this? I mean do you really think that there will be people wanting copper sulfate coming off the crops list for this use?

MS. ANDREA CAROE: I really don’t know that anybody can answer because we don’t know the availability or the effectiveness. I mean there’s a whole list of factors involved with that.

Gerald?

MR. GERALD A. DAVIS: I wanted to respond to Barbara’s comments similar to the ones you made yesterday, and the committee did discuss that last night with Valerie. Our intention was to include the transcript of this discussion as part of the document. And I wanted to ask if that is sufficient or would it be more appropriate to change the—to fill in the comment section on the form itself.

MS. ANDREA CAROE: The actual recommendation is the first page of this document.
The rest of it is like as Barbara said for back-up, the rationale that led to this. So, we can move forward, and the back-up information, the following pages, can go back to committee and get filled out in more detail. I don’t think that there’s any break in protocol because without all of that, the actual recommendation is to list this material. All the rest is background. So, you know, I would suggest, you know, we take back the form and fill it out no the form because that’s the way the program is used to it. Just for the consistency of the documents they have, this is the document they need.

MR. GERALD A. DAVIS: Okay.

FEMALE VOICE: We can work with you on that. There’s time for that.

MS. ANDREA CAROE: Valerie?

MS. VALERIE FRAUCES: The committee last night seemed really prejudiced against revising the form that they had written on the date they had—they didn’t really want to revise it because they felt strongly that it stood as it was at the time. And they wanted to put an interim document
in between the final NOSB recommendation with an
explanation of their additional logic and
reasoning with the transcript cut into it. So, it
was a complete record of their original discussion
and decision and subsequent.

MS. ANDREA CAROE: I still think that the
recommendation because the vote coming out of your
committee was to list. That rationale needs to be
summarized in those papers, what the rationale was
coming out of committee. You had a positive vote
for this material, so that needs to be in there,
and if it includes dialog and testimony received
during the first part of this meeting, go ahead
and put that [Interposing] here. But again, that
form should be filled out Gerald?

MR. GERALD A. DAVIS: Message received.

MS. ANDREA CAROE: Tina? I didn’t mean
to beat you up.

MS. KRISTINE ELLOR: Yeah, and I
personally don’t have any problem, you know, once
put that way that we’re not going to actually
change our criteria but further elucidate how we
came to that decision. That’s fine with me.
MS. ANDREA CAROE: I would suggest if you need examples, I can show you about, I don’t know, 40 different petitions that we’ve done where we’ve—because nothing is black or white. It’s a whole bunch of grey. So, you need to clarify it. This vote is to list. We’re okay with this vote. Like I said, the recommendation is to list. The first page is fine. The other pages are going to go back and get filled out. The program won’t be able to move forward until they have that for clearance. That will just be backup, follow up work for the committee. Right now we still have the motion on the floor to list sodium carbonate peroxyhydrate to 601A. The motion has been made by Jeff and seconded by Tina, and we’re still in discussion on this material. It’s been a good discussion. Hearing none, let’s vote. We will start with Tina. Tina?

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?
MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: No.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: You missed Jennifer.

MS. ANDREA CAROE: Oh, I’m sorry.

Jennifer, it was the wrong J. Jeff?

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?
MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: And the chair votes yes. So that is one opposed, fourteen in favor, zero abstentions or absents, and that motion passes. Oh, I’m so sorry. Was there anybody that had a potential conflict of interest with that material? Okay, none. Thank you.

[off mic]

MS. ANDREA CAROE: Okay, do you have another material, Gerald?

MR. GERALD A. DAVIS: Yes, we do. The last new petition material is sodium ferric hydroxy EDTA [phonetic]. It’s misspelled on the recommendation form, Valerie. [off mic] Pardon me?

MS. ANDREA CAROE: I said that can be a technical correction.

MR. GERALD A. DAVIS: Right, okay. As mentioned yesterday, we—the committee voted six to
nothing to not list this material. It failed all
three categories substantially, not much grey area
in our opinion on this material. And due to the
EDTA molecule itself, it has lots of information
on it in the negative based on a lot of usage that
there is worldwide. I’d like to move that we vote
whether or not to list this material.

MS. ANDREA CAROE: Okay, I’m going to
help you with this one a little bit.

MR. GERALD A. DAVIS: I know.

MS. ANDREA CAROE: Just because
historically what we have—well, through the
evolution of board votes we have determined it’s
easiest always to frame a material list
recommendation as an addition. So, the motion
would be to add.

MR. GERALD A. DAVIS: To add sodium
ferric hydroxy EDTA to the national list on
205601H as a slug and snail bait.

MR. JEFFREY W. MOYER: I second that.

MS. ANDREA CAROE: There’s a second. So,
the motion has been made by Gerald Davis.
Seconded by Jeff Moyer to list sodium ferric
hydroxy EDTA on 205601H as a slug and snail bait.

MALE VOICE: [off mic]

MS. ANDREA CAROE: I believe it. Okay, so any discussion on this item? Hue?

MR. HUBERT J. KARREMAN: I’m just wondering. Wasn’t it just two years ago ferric chloride put on the list for that exact same reason, slug/snail bait?

MR. GERALD A. DAVIS: Ferric phosphate was approved by this board to be added to the list. It is still. It has not gone to rule making that I know of.

MR. HUBERT J. KARREMAN: Didn’t we vote on ferric chloride as well somewhere?

MR. GERALD A. DAVIS: It was ferric phosphate.

MR. HUBERT J. KARREMAN: Was it?

MS. ANDREA CAROE: We’ve been informed by one of our experts in the audience that is actually on the list now the ferric.

MR. GERALD A. DAVIS: I had never heard it go through the registered process and all that.

MS. ANDREA CAROE: Katrina, your fellow
board member is pointing that out to you. Tina?

MS. KRISTINE ELLOR: What we found when we looked at this, and we actually didn’t have a tap for the sodium ferric hydroxy EDTA. We had the tap for the other material is that they are pretty different. You know, we looked into it, you know, fairly intensively, and the information that came out about this particular compound caused us to reject it.

MS. ANDREA CAROE: Any further discussion? Hearing none we will proceed to vote starting with Gerald? Oh, wait, wait, wait before we vote is there anybody that would like to disclose a potential conflict of interest with sodium ferric hydroxy EDTA? Okay, now we can vote starting with Gerald. Gerald?

MR. GERALD A. DAVIS: No.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: No.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: No.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: No.
MS. ANDREA CAROE:  Joe?
MR. JOSEPH SMILLIE:  No.

MS. ANDREA CAROE:  Bea?
MS. BEA E. JAMES:  No.

MS. ANDREA CAROE:  Julie?
MS. JULIE S. WEISMAN:  No.

MS. ANDREA CAROE:  Dan?
MR. DANIEL G. GIACOMINI:  No.

MS. ANDREA CAROE:  Rigo?
MR. RIGOBERTO I. DELGADO:  No.

MS. ANDREA CAROE:  Jennifer?
MS. JENNIFER M. HALL:  No.

MS. ANDREA CAROE:  Jeff?
MR. JEFFREY W. MOYER:  No.

MS. ANDREA CAROE:  Kevin?
MR. KEVIN ENGELBERT:  No.

MS. ANDREA CAROE:  Hue?
MR. HUBERT J. KARREMAN:  No.

MS. ANDREA CAROE:  Tina?
MS. KRISTINE ELLOR:  No.

MS. ANDREA CAROE:  And the chair votes no. The motion fails fifteen against zero in favor, no absent or abstentions. All right,
sunset materials?

MR. GERALD A. DAVIS: Calcium chloride, I have it in order in my book so the committee recommendation was voted on five yes, zero no, one absent, to maintain the listing of calcium chloride on the national list as a prohibited natural under section 205602C with the annotation brine process is natural and prohibited for use except as a foliar spray to treat a physiological disorder associated with calcium uptake. I’d like to move that we call this to a vote.

MS. ANDREA CAROE: Are you moving to retain this material?

MR. GERALD A. DAVIS: TO retain.

MS. ANDREA CAROE: Is there a second?

MS. KRISTINE ELLOR: Second.

MS. ANDREA CAROE: Tina. Motion has been made by Gerald Davis and seconded by Tina Ellor to retain calcium chloride on 205602C. Is there any discussion on calcium chloride? We’ve lost some members. I’d like them to come back for the vote. Tracy?

MS. TRACY MIEDEMA: Just a point of
clarification, I think in the motion we should have the annotation.

MS. ANDREA CAROE: That’s very clear.

Okay, so Gerald do you want to restate the motion?

MR. GERALD A. DAVIS: The motion is to retain calcium chloride brine process as natural and prohibited for use except as a foliar spray to treat a physiological disorder associated with calcium uptake, to retain that item and annotation on the national list.

MS. ANDREA CAROE: That is the annotation, okay. Okay, I think that’s clear.

Any further discussion on calcium chloride?

MR. GERALD A. DAVIS: I did want to highlight, Gerald Davis, one comment that was part of the aquaculture comments about a closed system aquaculture production that this material, calcium chloride, would be very important to their production system if it weren’t so severely annotated like it is. As it’s annotated at this point, they can’t use it, and it’s—the speaker said that’s not really fair and it’s just something that wasn’t really considered when this
annotation was put on this years ago.

MS. ANDREA CAROE: I’ll get to you in a second, Hue; you’re on next. There will be other materials, I suspect, when aquaculture production comes into the rule that will have to be looked at, and at that time it could be an annotation change. But we haven’t even started entering the rule-making process for an aquaculture standard at this point so there’s plenty of time before they would actually need it. So, and also you probably want some technical information about how it’s going to interact in that system as well. I think that’s good to have that in the forefront of your mind, but I don’t think that it needs to be part of your decision at this moment.

MR. GERALD A. DAVIS: Just background information.

MS. ANDREA CAROE: I agree, wonderful.

Hue?

MR. HUBERT J. KARREMAN: Yeah, I’d agree, and I think that might even come under a livestock production or health thing and therefore don’t worry about it.
MS. ANDREA CAROE: Any further discussion on calcium chloride? Okay, hearing none, where did I end up? Oh, with Steve. Wait, wait, wait, conflict of interest? Anybody have a conflict? Steve, do you have a potential conflict?

MR. STEVE DEMURI: No, I’m just getting ready to vote.

MS. ANDREA CAROE: All right, hearing no conflicts, we’ll go first with Steve. Steve.

The motion is to retain.

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.
MS. ANDREA CAROE:  Rigo?

MR. RIGOBERTO I. DELGADO:  Yes.

MS. ANDREA CAROE:  Jennifer?

MS. JENNIFER M. HALL:  Yes.

MS. ANDREA CAROE:  Jeff?

MR. JEFFREY W. MOYER:  Yes.

MS. ANDREA CAROE:  Kevin?

MR. KEVIN ENGELBERT:  Yes.

MS. ANDREA CAROE:  Hue?

MR. HUBERT J. KARREMAN:  Yes.

MS. ANDREA CAROE:  Tina?

MS. KRISTINE ELLOR:  Yes.

MS. ANDREA CAROE:  Gerald?

MR. GERALD A. DAVIS:  Yes.

MS. ANDREA CAROE:  And the chair votes yes so that passes zero against, fifteen in favor, no absent, and no abstentions.  Next?

MR. GERALD A. DAVIS:  The next materials is copper sulfate for use in rice production as an algicide.  Let me read off the exact thing.  Okay, copper sulfate for use as an algicide in aquatic rice systems limited to one application per field during any 24-month period.  Application rates are
limited to those, which do not increase baseline soil test values for copper over a timeframe agreed upon by the producer and accredited certifying agent. That is section 205.601A3. It is also listed in 205.601E3, copper sulfate for tadpole shrimp control in aquatic rice systems with the same identical wording after that as I just read. Section E is as insecticide.

MS. ANDREA CAROE: Have you made a motion?

MR. GERALD A. DAVIS: I’d like to move that we vote to retain this material on the national list.

MS. ANDREA CAROE: Is there a second?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Motion has been made by Gerald Davis and seconded by Tracy Miedema.

Discussion, Hue?

MR. HUBERT J. KARREMAN: Okay, so now I just voted for the carboxy/hydroxy, you know, that other one, right? Anyway, we all know what I’m talking about.

MALE VOICE: Cash in your scientific
1 credentials.
2 MR. GERALD A. DAVIS: Sodium percarbonate is far easier to say.
3 MR. HUBERT J. KARREMAN: I don’t use it.
4 So, now if I want to let this one go because of the previous discussion, I’d like to but then I’m worried about how long it will take for the process to get the new one on in case this is sunseted. So, I’m just curious about the program.
5 MS. ANDREA CAROE: Let me respond. This is sunset process, and if you read the procedures of the sunset process that are in the policy manual, unless you have compelling evidence to take it off—you do?
6 MALE VOICE: [off mic]
7 MS. ANDREA CAROE: You don’t have your mic on. I can’t hear you.
8 MR. HUBERT J. KARREMAN: We just had this discussion about this other product about how the product we voted on is less harmful/toxic to the environment than copper sulfate. It was just stated.
9 MS. ANDREA CAROE: We have absolutely no
information unfortunately that tells us for sure that this has the same efficacy in all situations and is a true 100% replacement.

MR. HUBERT J. KARREMAN: You didn’t mention that in the last discussion when we were voting on that other material about the efficacy and everything. You were just talking about the—

MS. ANDREA CAROE: [Interposing] As a replacement, as a replacement, Hue. In order for it to be a replacement, it’s got to be able to replace its function in all situations, and we don’t know that for sure. It may in some situations be the case, and it may in all cases, but we have not received that kind of information. Jennifer, Jeff, Gerry, Barbara?

MS. JENNIFER M. HALL: The efficacy was the point I was going to bring up, and I think we did talk about that yesterday in our communication about sunset and what it requires.

MR. HUBERT J. KARREMAN: My comment to Hue was that my understanding of the process would be that if someone has that information, they should come forward and petition the board to
remove that, but they would have to petition to
remove it. We can’t do it through the sunset
process. It would have to be petitioned to be
removed.

MS. ANDREA CAROE: Gerry?

MR. GERALD A. DAVIS: One thing to
remember even though they’re discouraging you from
following your line of reasoning, but beyond the
process of getting the other material on the list,
you also have the problem of federal EPA approval
of sodium percarbonate for rice production is only
the first step because California only has its own
EPA and it usually takes one to two years
following a federal EPA approval to get California
approval.

MR. HUBERT J. KARREMAN: But they grow
rice in Minnesota and Louisiana, don’t they. I
mean it’s not only California.

MR. JEFFREY W. MOYER: The information I
have is that the type of rice production that
requires the copper sulfate in this country is
pretty much only practiced in California.

MS. ANDREA CAROE: Barbara and then Joe?
MS. BARBARA C. ROBINSON: Jeff is right, but try to remember here you just voted on a material that hasn’t even gone through rule making. So, that’s going to take a long time to get through where as now you switching gears and you’re just voting on a sunset material. If you don’t like this material, someone has to petition to take it off, and they’ve got to bring forth a lot of evidence to justify to you why there is no longer good reason for it to be on the national list. Don’t put yourself in that position of being, you know, the judge and jury just because you listened to somebody come forward with a new material and now you want to say, good, well we’ll put the new material on and now we should take off the old material. These are two separate events that are occurring here, and we’re no where near getting sodium ferric hydroxy on the national list. You just voted to recommend it to be placed on the national list. It’s not there.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: In this process of sunset, that information could have been
brought now, but in fact it wasn’t. Isn’t that correct? I mean outside of the rule making of the other thing if this had new information of a problem, for whatever reason.

MS. BARBARA C. ROBINSON: It was not available. The registration hadn’t occurred.

MR. GERALD A. DAVIS: Correct, right, right.

MS. BARBARA C. ROBINSON: As Gerald said, you know, that would have happened way back in the ANPR process anyway.

MR. GERALD A. DAVIS: Right.

MS. ANDREA CAROE: And just to make a point here for transparency this has never posted for a petition to remove. You know, you haven’t even asked for evidence to support that it should be removed or not other than sunset, which is we still need the material and there’s no new information. Okay, so just basically you’ve gotten a little bit of information from public testimony, but there hasn’t been a notice put out that this is the action this board is considering, right?
MS. VALERIE FRANCES: Let me just—you know, this may sound like we’re kind of beating you up but, you know, this is really complicated. No other board has gone through sunset yet. So, this is understandably complex what you’re doing because you’re reviewing new materials at the same time that you’re doing a sunset exercise. This is really confusing to do. So, I certainly would not want you to feel like this is—you know, why do they think we don’t get it because on this side of the table I’m sort of sitting here thinking, you know, which one are we on? Are we on the new stuff or are we on the sunset? It is difficult to do, and I think you’re doing amazingly well by the way. So...

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Just as a comment, sunset probably wasn’t the best term to use for this process. To me in contracting another application, sunset means it goes away unless somebody wants it to remain.

MS. VALERIE FRANCES: That’s exactly what this process is, Steve. Unless you do something
about it, it does go away.

MR. HUBERT J. KARREMAN: But we’re also being told that we have to have really compelling evidence for it to go away, and yet from what Steve is just saying about sunset, it kind of should just go away. But now we’re being forced to say, oh, we got to have this, that and the other thing to make it go away. No, it should just be going away unless we want it on there for compelling reasons.

MS. VALERIE FRANCES: That was what the ANPR process was about, and you are well beyond that is my point. You made the recommendation.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Also, let’s please not confuse sunset and petition process. What you need very compelling evidence for is a petition to remove something more than a petition to add it. And because of that, that—because this gets fast tracked, what we’re looking for is evidence that it is still in use, that there is still a need for it.

MS. ANDREA CAROE: Hue?
MR. HUBERT J. KARREMAN: Maybe I didn’t hear it right, but I thought it also for sunset that if we hear that there’s evidence of some other product that might be out there to replace it, we need to take that into account. Okay, that’s not the case at all with sunset?

MS. ANDREA CAROE: No, that is not the case. We should have done sunset first on voting and then the new stuff. That’s maybe what’s confusing me a little.

MS. ANDREA CAROE: Regardless, that doesn’t come into effect. You don’t consider—that would be something you would consider during a petition process. This process is—is the material still needed? If you had public comment that said we don’t use that anymore. We’ve got this other better material, then you would be able to consider it, but I mean it is very difficult and I know that this board is so diligent about their efforts that, you know, it’s hard to just stop where the sunset process stops, starts, whatever. All right, is there further, is further discussion on copper sulfate? The motion, which
was made by Gerald Davis and seconded by Tracy Miedema is to continue the listing of copper sulfate 205601A3 and 205601, there was another listing, E3. Any further discussion? Hearing none, is there any conflicts or potential conflicts of interest with copper sulfate. Hearing none we will go to vote starting with Tracy.

MS. TRACY MIEDEMA: Yes

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Abstain.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: No.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.
MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: No.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: No.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: And the chair votes yes. Three no’s, eleven yeses, and one abstention. The motion passes. Moving along to ozone gas.

MR. GERALD A. DAVIS: Ozone gas, this is to retain the use of ozone gas under section 205601A as algicide, disinfectant and sanitizers including irrigation system cleaners. I would like to move that we retain this material on the national list?

MS. ANDREA CAROE: Is there a second?
MS. KRISTINE ELLOR: Second.

MS. ANDREA CAROE: The motion has been made by Gerald Davis and seconded by Tina Ellor to retain Ozone Gas on 205601A of the national list. Any discussion? No discussion. Hearing none, we will go straight to vote with Katrina? Oh, wait, wait, wait, anybody want to disclose a potential conflict of interest with Ozone Gas? Hearing none, now we’ll go to vote starting with Katrina.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.
Ms. Andrea Caroe: Jeff?

Mr. Jeffrey W. Moyer: Yes.

Ms. Andrea Caroe: Kevin?

Mr. Kevin Engelbert: Yes.

Ms. Andrea Caroe: Hue?

Mr. Hubert J. Karreman: Yes.

Ms. Andrea Caroe: Tina?

Ms. Kristine Ellor: Yes.

Ms. Andrea Caroe: Gerald?

Mr. Gerald A. Davis: Yes.

Ms. Andrea Caroe: Steve?

Mr. Steve Demuri: Yes.

Ms. Andrea Caroe: Tracy?

Ms. Tracy Miedema: Yes.

Ms. Andrea Caroe: And the chair votes yes, and that passes zero against, fifteen in favor, no abstentions and no absentees. Moving on.

Mr. Gerald A. Davis: The next material is the group of materials designated as peracetic acid. Where is my peracetic acid? There it is—sorry about that. This material is peracetic acid for use as an algicide disinfectant sanitizer.
including irrigation system cleaners, and in section A of 205601 and section I as plant disease control. I move that we retain this material on the national list.

MS. ANDREA CAROE: Is there a second?

MR. KEVIN ENGELBERT: I’ll second.

MS. ANDREA CAROE: Motion has been made by Gerald Davis and seconded by Kevin Engelbert to retain peracetic acid on the national list 205601A and I. Any discussion? Any potential conflicts of interest that should be disclosed—I did it all by myself? Hearing none, we’ll move to vote starting with Joe.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.
MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: And the chair votes yes. Motion passes zero against, fifteen in favor, no absent, no abstentions, move on.

MR. GERALD A. DAVIS: Now, we have a group of materials designated as EPA list 3 inerts
used in passive pheromone dispensers only and referred to in 7CFR Section 205601M2II. Category of use as synthetic, is section M as synthetic inert ingredients as classified by the Environmental Protection Agency, EPA, for use with non-synthetic substances synthetic substances listed in this section and used as an active pesticide ingredient in—

 Accordance with any limitation on the use of such substances. I move that we retain this designation of materials as listed on the national list.

 MS. ANDREA CAROE: Is there a second?

 MR. JEFFREY W. MOYER: I’m sorry, I’ll second that.

 MS. ANDREA CAROE: Okay, the motion has been made by Gerald Davis and seconded by Jeff Moyer to retain EPA list 3 inerts on the national list 205601M2ii. Any discussions on this motion? Dan?

 MR. DANIEL G. GIACOMINI: I would just
like at this point on the record to sort of repeat what the program said yesterday was that even with all the stuff that’s going on with EPA on this issue this still does make sense.

MS. ANDREA CAROE: Any further discussion on making sense? Any further discussion?

MALE VOICE: Cents or sense?

MS. ANDREA CAROE: Well, that’s the conflict of interest. Does anybody make cents from this? Julie?

MS. JULIE S. WEISMAN: I would like to ask a question so that it’s in the record though—not that any of us would be on the board the next time it comes around for sunset, but before that happens these things have to be petitioned whatever the four or five inerts that are actually being used, eventually they will have to be petitioned separately in order for them to continue in use. And it’s never too soon to figure out who in industry needs to be prompted to do that.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: I had a question if
it would be appropriate for the crops committee to
take it to task to notify these manufacturers of
the pheromone dispensers to make sure they
understand what we’re trying to telegraph to them
that you guys need to get petitions in because
your material will go away in five years if you
don’t.

MS. ANDREA CAROE: I mean certainly we
outreach with community, but I think you don’t
want to be part of the petitioning process if you
want to vote on these materials.

MR. GERALD A. DAVIS: I guess what I
should have said is just make sure they get this
information, this action that we took today in
hand so that they know about it just to follow up
to make sure that they have seen it.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: I’d like to ask the
NOP if that would maybe come across as
solicitation for retaining.

MS. BARBARA C. ROBINSON: Well, wouldn’t
we—I guess I’m going to ask my own colleagues
here, wouldn’t we somehow be letting the public
know this through the course of our normal rule-making? Wouldn’t we be notifying the public through the sunset process that—and haven’t we already done this on the web site through the guidance, made the public aware of the fact that EPA is redesignating all of the inerts and so—and I have no problem with us certainly letting the public know that inerts are going to have to be petitioned individually in the future. But, you know, let me just ask you.

MALE VOICE: [off mic] For now it stays on, but at some point, we want to [unintelligible] things with the EPA, and we’ll be coming back to the board.

MS. ANDREA CAROE: Let the program confer on this topic.

MS. BARBARA C. ROBINSON: Okay, Rick is telling me that when we get feedback from EPA within five years, of course, we’ll be coming back to the board and asking you for — telling you how we need to get back in synch with EPA based on their new procedures. So, it will eventually all work itself out, and it will be a lot of work.
There’s no doubt about it, but I have no doubt that this is going to—and I’m sure that EPA itself is still letting people know about this.

RICK: [off mic] And for now we’ve still got the old list up.

MS. BARBARA C. ROBINSON: And for now we do, we still have the old list up and it is still valid.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Just for clarification though, would it be appropriate actually for the board to contact—I mean to me it seems like it might come off as a form of solicitation to try to retain something on the national list and that if somebody wanted to know, I guess what I’m trying to confirm with you is that they should be able to find out that information off of the web site and not through the actual NOSB.

MS. BARBARA C. ROBINSON: Right, right.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Bea, would you feel less uncomfortable if the contact were made by an industry organization that those
manufacturers belonged to rather than specific manufacturers who might have something to gain?

MS. BEA E. JAMES: OMRI is also letting people know about this too.

MS. ANDREA CAROE: This is a very interesting topic, and as much as I’d like to talk about it, I don’t know if we want to stay here too long or if we’re ready to move on. Are you okay with that, Gerry, or do you need to—

MR. GERALD A. DAVIS: [Interposing] I would love to move on.

MS. ANDREA CAROE: This is like a future action. This is about next time sunset or sometime between here and next sunset.

MR. GERALD A. DAVIS: Let’s move on.

FEMALE VOICE: You definitely won’t be here.

MS. ANDREA CAROE: I won’t. any further discussion on these EPA list 3? Does anybody have a potential conflict of interest with EPA list 3 inert with pheromone mating disruption, whatever, none, okay. We will go to a vote starting with Bea James.
MS. BEA E. JAMES: Abstain.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Abstain.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.
MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: And the chair votes yes. Motion passes zero against, thirteen in favor and two abstentions. No absentees. Thank you to the crops committee for your hard work.

Next committee on the block CACC.

MR. JOSEPH SMILLIE: Yes, Madame Chair, the certification, accreditation and compliance committee would—is going to be placing two recommendations in front of the board. The first recommendation will be on standardized certifications, which we’ll have up on the screen shortly. Basically, this was put on the CACC work plan, and we got a certain way along. Then with the help of public comments we were able to deliver a recommendation at this meeting after deferring the recommendation last October. And we feel that the public response especially from the certification sector has been very positive, and we are moving forward with our recommendation.
The principle author will walk the board through this recommendation, and after that we’ll be making a motion for acceptance.

MS. JENNIFER M. HALL: Thank you, Madame Chair. I’d like to present our recommendation on standardized certificates. Receiving public comment we also did make one modification and voted as a committee on that. So, I’d like to talk through that first if you don’t mind. And that is under 205.404d the very end of that sentence where it says or should the certification be allowed to expire—we would like to strike that. It is inconsistent language with the rest of the document and was a holdover from the expiration recommendation. So, with that modification, I would like to move that we approve the standardized certificate recommendation.

MS. ANDREA CAROE: Is there a second.

MR. JOSEPH SMILLIE: Second.

MS. ANDREA CAROE: The motion has been made by Jennifer Hall and seconded by Joe Smillie. Just for clarification, the recommendation already includes the modification that has been voted on
by the committee coming to the board.

MR. JOSEPH SMILLIE: That’s correct. It was a 6-0-0 vote.

MS. ANDREA CAROE: Okay, any discussion on the standardized certificate recommendation? Jeff?

MR. JEFFREY W. MOYER: Yeah, I just have a question for the committee. Under 205.404b5 we discussed and heard testimony today about the fact that might be burdensome. Can you respond to that in any way?

MS. ANDREA CAROE: Joe or Jennifer?

MR. JEFFREY W. MOYER: Either one is fine with me.

MR. JOSEPH SMILLIE: Yeah, I’d like to respond. It’s problematic, and why we decided the common trade name is because number one it is a common trade name, and one of the presenters the other day said, you know, we’ve got a lot of farmers with small vegetables. We call it mixed vegetables. We feel that’s acceptable. It’s gives certification agents enough flexibility to decide what’s on the report. We couldn’t go, you
know, we couldn’t get too vague, and we couldn’t get too specific. And I think I polled you actually for opinion on that too. We went around, and we could not get any good agreement on order, phylum, variety and all that, and we just felt that common trade name would be the most appropriate term to use, which gives certifiers enough flexibility in that.

MS. JENNIFER M. HALL: I would add on the restaurant end, which seems to have its own difficulty that I would suggest that it might be sufficient to attach copies of prior menus knowing that there is seasonality. That provides an audit trail if they can then produce the invoice or bill that they got for items that they’re specifically highlighting as organic. That would be sufficient as a paper trail.

MS. ANDREA CAROE: Further discussion? No further discussion? Okay, I’m not calling for conflicts on this one. It’s a recommendation. So, hearing no further discussion [crosstalk] conflicts to a recommendation? All right, are there any potential conflicts of interest on the
standardized certificate?

MR. JOSEPH SMILLIE: Just for the purpose of the record, I already declared at the beginning of the meeting that I work for a company that is very much involved in the granting of certificates, which are now becoming standardized. I do not feel like it’s a conflict of interest. However, I would like to ask the board to make that judgment.

MS. ANDREA CAROE: Do any of the members feel that there is a conflict of interest for Joe? And I agree. So, we ask that the member vote with the rest of the committee. Any further conflicts to disclose? Okay, then we will start the vote with?

FEMALE VOICE: Julie.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?
MS. JENNIFER M. HALL: Yes.
MS. ANDREA CAROE: Jeff?
MR. JEFFREY W. MOYER: Yes.
MS. ANDREA CAROE: Kevin?
MR. KEVIN ENGELBERT: Yes.
MS. ANDREA CAROE: Hue?
MR. HUBERT J. KARREMAN: Yes.
MS. ANDREA CAROE: Tina?
MS. KRISTINE ELLOR: Yes.
MS. ANDREA CAROE: Gerald?
MR. GERALD A. DAVIS: Yes.
MS. ANDREA CAROE: Steve?
MR. STEVE DEMURI: Yes.
MS. ANDREA CAROE: Tracy?
MS. TRACY MIEDEMA: Yes.
MS. ANDREA CAROE: Katrina?
MS. KATRINA HEINZE: Yes.
MS. ANDREA CAROE: Joe?
MR. JOSEPH SMILLIE: Yes.
MS. ANDREA CAROE: Bea?
MS. BEA E. JAMES: Yes.
MS. ANDREA CAROE: And the chair votes yes. Motion passes zero against, fifteen in
favor, no absent or no abstentions. Moving on.

MR. JOSEPH SMILLIE: Madame Chair, the second item is commercial availability. Now, I know we’re a little ahead of schedule, and I will now get us caught up because we have decided—the committee met last night and decided that [crosstalk]. Everybody’s tired, that’s okay. Basically, we decided that this was an important enough item that we wanted to move forward. We received significant public comment that was number one directed toward—the most important issue it seemed the public comment very strongly felt that trying to put seeds together with 606 items, the only two things that are available in the commercial availability realm, just wasn’t perfect and wouldn’t work as a combined document. So, rather than table the entire document or defer the entire document, whichever is the correct term, Dan, we’ve decided to go back and do a rewrite of the recommendation. Basically, in that rewrite, which the principal author is going to walk you through and then we’ll make a motion for acceptance of that rewrite, we’ve gone through and
removed all reference to seed commercial
availability from that document. Again, as we
talked about yesterday, it’s just going to be more
appropriate for a specific seed document to come
forward under a joint committee between the crops
committee and the CACC committee to issue a joint
document. We did heed the warning and the plea
from the seed industry that really it’s in the
regulation already. They do not feel it’s being
enforced. We urged the program to enforce the
current regulation, and we will be coming out with
a more specific guidance document in the spring.
But for the time being, the recommendation that
you’re going to be considering today is only going
to be concerning 606. The second alteration is we
heard well the public comment from the
certification sector that a certain section of the
document was not only burdensome but possibly
misplaced in that their role was not as we had
originally in the original document sort of
proscribed. So, we’ve gone through and made
significant alterations to that section, and I’ll
let Bea walk us all through the document. Now,
you know, you will be seeing this document for the first time, but I recommend that you follow along with the document that you were issued in the book. I know it’s very hard to read the screen, but mostly it’s a question of deletion, and when we get to sections that are additions, we’ll go through that slowly.

MS. BEA E. JAMES: Thank you, Joe. Let me just get my mic up here. Valerie, I’m wondering if we can get that to 135. I think it will still stay—the whole thing will be on the screen. Most of us are at that age where our eyesight is—I’ll speak for myself anyway. Okay. Higher.

MALE VOICE: One more bump.

MS. BEA E. JAMES: 150, there you go.

Okay. So, just to, you know, Joe gave a pretty excellent summary of the changes that were made to this document, and it’s more of an editing than anything else. So, I’m just going to take you through some of those changes. The first change is obviously is the dates. This is now going to be a document that was created as of, you know, 2
a.m. last night. So, the first strike out is the
last part of the first paragraph that really has
to do with seed, and a lot of things that we
removed from this document do pertain specifically
to seed. And for a lot of the people in the
audience who are anxious to see something happen
with seed, it’s not that we’re removing these
comments from the recommendation and not planning
on doing something else with them. We will use a
lot of the comments that are in here to work in
conjunction with crops and livestock and
certification committee to come up with a separate
recommendation specifically on seed.

The next change—scroll all the way down,
Valerie, please to regulatory citations and
background. We removed 205, 204 seeds and
planting stock practice standards since this
recommendation is now separating out comments that
have to do with seed.

MR. JOSEPH SMILLIE: Bottom of page two.

MALE VOICE: thank you.

MS. BEA E. JAMES: okay, and then we go
to the discussion, and in then discussion the
first change is we didn’t want to totally remove
the fact that we acknowledge that the situation
with commercial availability of organic seed needs
to be addressed. So, we left in information
regarding that, but we’re just acknowledging it in
this document, and we’re highlighting on the last
sentence that I’ll just read the sentence.
Therefore the NOSB recommends evaluation of the
above-listed documents in order to improve the
ability to enforce 205/204 as well as
collaboration between the certification
accreditation crops and livestock committees to
review the above documents on seed and determine
the process for enforcement of commercial
availability of organic seed with a goal to
present a recommendation at the spring 2008 NOSB
meeting.

Then the last sentence is struck. The
final sentence that gives kind of a precedent to
the recommendation to come—the last part of that
sentence that has to do with seed is struck. Then
we go to the actual recommendation, and this was—

MR. JOSEPH SMILLIE: [Interposing] Top
of page four.

MS. BEA E. JAMES: Okay, we didn’t really receive any comments regarding A in the recommendation, so we left the recommendation for training from the NOP and we added in that it should include a review of NOP’s current and any new courses of action for determining commercial availability as well as review procedures for proactive steps that the applicant or certified operator takes to generate. And then the last part of that sentence is struck because it has to do with seed. Section B of the recommendation, the ACA’s role, this is where we get into quite a few changes. So, in B1, the first part of that change is really to—that we took out the reference to seed and that we changed some of the wording a little bit so that documented claims should be accompanied by supporting evidence demonstrating the organic forms of the ingredient or material. And then moving on after the end of that sentence to that we heard from the public that they really didn’t want any kind of a proscriptive direction on how to do that, so we opened that up a little
bit and said examples of such evidence include but are not limited to test data, market reports, third party research, reports on local growing season and letters from suppliers.

We left in the note that acknowledges that the global market is the universe of supply for agricultural ingredients, but we removed all of the reference specifically to seed. Any questions in B1? Okay, going to B2, not a lot of changes here, mostly taking out comments that refer to seed and that we heard in public comment that the proscriptive recommendation to ask for multiple detailed results wasn’t favored by a lot of the certifiers, and so we changed multiple to various and instead of saying should changed it to could. So, it’s documentation could include various detailed results commensurate with known supply of the applicants effort to contact credible sources of ingredients or materials. And then the rest of that is the same except the removal of seed. Any questions on B2?

Okay, moving to B3, so okay, so this is where we heard most of the opposition from public
comment, and that’s the whole idea of ACA’s notifying certification applicants or certified operators with proper lead time, sources of information. A lot of the public comment that we heard yesterday felt that was in some way consulting, which certifiers are not supposed to do. So, we changed that wording so that it is the ACA will maintain and keep accessible sources of information, which lists available, organic ingredients or materials if the certifying agent finds that such sources exist. And we left it at that and we struck the topic of the expectation and lead time. And if you want to explain why we struck.

MR. JOSEPH SMILLIE: Just repeat [off mic]

[crosstalk]

MR. JOSEPH SMILLIE: What I would like to do is accept, you know, my amendments or word changes at this point.

MS. ANDREA CAROE: Unfortunately, what’s being presented is committee-voted on recommendations.
MR. JOSEPH SMILLIE: You’re absolutely right.

[off mic]

MS. BEA E. JAMES: We didn’t have a full agreement on that.

MS. ANDREA CAROE: We can just—I mean we have a voted-on document, Jennifer, and I know there was a lot of changes that were made. So, maybe that’s something we can discuss after the motion is made at the board level. Certainly those things can be done.

MS. BEA E. JAMES: That’s okay. Did you ask that I repeat three?

MS. ANDREA CAROE: I’d just like you to repeat three in its totality.

MS. BEA E. JAMES: Okay, so B3 is ACA’s will maintain and keep accessible sources of information, which list available organic ingredients or materials if the certifying agent finds that such sources exist. That’s it. Everything else is out of there.

Okay, B4 so here we also heard quite a bit of comment as far as keeping an up to date
listing so we made some changes to this point so that it wasn’t so prescriptive. So, I’m just going to go through and read this piece mill paragraph here. ACA’s will keep an up-to-date listing of certified organic 205.606 ingredients. This list will be maintained and submitted to the NOP annually by the ACA for the NOP to collate into a master list of materials and ingredients that are available in organic form. It is recommended that the database of all materials and ingredients will be maintained by the NOP or other NOP-appointed organizations. So, the main opposition that we heard around this was that the certifiers didn’t feel that it was their job to actually maintain this list, and there’s also several concerns around the NOP’s ability to actually keep a database if they do this work. But we didn’t strike the entire thing because we really feel that this is the way to go, and we also changed it so that it is more in the positive instead of keeping a list of all of the granted non-organic items that we’re asking for certified organic 205.606 ingredients.
MR. JOSEPH SMILLIE: My understanding is this was not a change to the current requirements under the NOP—that is a publicly-accessible list of certified products. My understanding is that certification agencies report that currently so it’s nothing new.

MS. BEA E. JAMES: Okay, the last—one of the last ones here, B5, we did receive public comment asking us to pretty much strike five in its entirety, but as a committee we felt it was important to maintain the whole idea of proactive steps that the applicant should be required to do. So, we softened the language a little bit. The main change is that we’re asking that the NOSB would like to recommend that the NOP consider requiring a plan to include detailed documentation of proactive steps that the applicant or certified operator is taking to generate the organic form of commercially unavailable organic ingredients or materials striking seed. So, the language prior to that was very prescriptive, and so now we’re really leaving it up to the NOP to make that final decision, and we’re giving them the recommendation
that we would like to see this happen. Six stays
the same, and the only other thing that changed is
our vote. We passed this document around with
these changes. Everybody voted. We had six yes,
zero no, and I moved and Joe seconded.

MR. JOSEPH SMILLIE: We have that in
writing.

MS. ANDREA CAROE: So, is there a motion?

MS. BEA E. JAMES: Yes, I would like to
move that we accept the edited recommendation that
is now dated for November 30, 2007, for further
guidance on the establishment of commercial
availability criteria.

MS. JULIE S. WEISMAN: Second.

MR. JOSEPH SMILLIE: Second.

MS. ANDREA CAROE: Julie beat you. So, we
have a motion made by Bea James for the further
guidance on the establishment of commercial
availability criteria document dated November 30,
2007, and that was seconded by Julie Weisman.

Discussion? And I’ll start off—just a couple of
reminders. This is a guidance document not rule
change language, and I will also reiterate what we
said yesterday that the urgency in this matter is that this is the protection of the use of 606 materials. This is what restricts the use of 606 materials, a consistent application of commercial availability. So, we felt that with a robust list of materials on 606 it was necessary to have that level of scrutiny on those materials. Hue?

MR. HUBERT J. KARREMAN: I think the content is fine. It’s just the technicality is if it’s a guidance document can you use the word “will” instead of “shall?” That’s all I’m asking. That was my only question.

MS. ANDREA CAROE: You certainly can use the word “will,” but you can’t be—it’s not binding. Right, I mean this is about clarifying the intent of what is due diligence on a commercial availability effort.

MR. HUBERT J. KARREMAN: The only reason I ask is when we were trying to pass some guidance on other things earlier with livestock, I think we were cut back on the word “shall” to “should.” I just want to make sure it’s right going in. Otherwise, it’s fine. I like it.
MS. ANDREA CAROE: Well, those changes could be made at another rendition of this if it was necessary, or we can make the changes here if you have specific ones that you’re interested in. Since we’re in discussion now, we can look at amending this document. Jennifer?

MS. JENNIFER M. HALL: Yes, I would like to go to the original page four. I guess it’s under the recommendation letter B, number 3, the first sentence. Is that it? Two changes, the end of the first line where it says “or” I’d like that to be an “and,” ingredients and materials. Number three. [off mic] No, you were right. [off mic]

MALE VOICE: Item three, yeah, the first line.

MS. JENNIFER M. HALL: At the end of that very first line on number three, “or” should be “and.” And I would like to strike everything after materials.

MS. ANDREA CAROE: This is—Valerie, you should be putting this in track.

MS. JENNIFER M. HALL: Yeah.

MS. ANDREA CAROE: Are you making a
motion for an amendment to this document?

MS. JENNIFER M. HALL: I would like to
move that the document be amended.

MS. ANDREA CAROE: And is that being
accepted as a friendly amendment by the motioner?

They’re in conference.

[crosstalk]

MS. BEA E. JAMES: I accept the change to
say organic ingredients and materials, but I
reject the strike of the last part of that
sentence.

MS. ANDREA CAROE: Okay, there’s a
motion. You have to accept or reject.

MS. BEA E. JAMES: Reject.

MS. ANDREA CAROE: You reject it. Is
there a second as an unfriendly amendment?

MR. HUBERT J. KARREMAN: Yes, second.

MS. ANDREA CAROE: Okay, so there is a
motion on the table for an unfriendly amendment
that will alter B3. Is there any discussion
around that amendment? Joe?

MR. JOSEPH SMILLIE: Yeah, I think the
reason why the “if” the certifying agents find
that such source exists, it may or may not, and this binds the ACA’s that we’ll maintain the access of all available materials. If it’s not there for whatever reason, you know, they still have to comply, and I’d like to let them—I’d like there to be a way that is not so—I’d like to make it more flexible. That’s all it is.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Jennifer, can you explain why you want to remove that last part of the sentence?

MS. JENNIFER M. HALL: Yes, I actually think that it clears it up. It’s just maintaining a list of sources. For me, that last phrase actually makes it more incumbent upon them that they’re looking for something specific, not a general guide of where to find information.

MS. ANDREA CAROE: Hue, did you have something?

MR. KEVIN ENGELBERT: It’s just is the second part of that sentence redundant? It is? Okay, well that rearrangement in my mind.

MS. ANDREA CAROE: Further discussion?
Rigo?

MR. RIGOBERTO I. DELGADO: There is a comment here asking if the last part of that sentence is redundant, and my opinion is that it’s not because if you take it away you’re actually forcing the ACA to have those sources of information. And the way I’m interpreting what the committee wants is to give more flexibility as to whether those sources should be there or not—just a point of clarification.

MS. ANDREA CAROE: Further discussion?

Kevin?

MR. KEVIN ENGELBERT: I think it’s just semantics. To me if they don’t exist, they can’t keep a record of it. That’s why it seems redundant to me, Rigo.

MS. ANDREA CAROE: Further discussion?

Bea?

MS. BEA E. JAMES: Well, I guess I think it’s better to be slightly over redundant since we oftentimes end up in conversations over words like and, of, the, it, and we spend days trying to talk about that. So, for me it clarifies it more,
which is one of the things that I have found is important to do when writing recommendations.

MS. ANDREA CAROE: Before we go on, just you know I know at this time of the meeting we usually get loud in the audience, but we’re really trying to concentrate on these little details. And I ask if you have conversations to take them outside. Is there further comments, questions, or discussions on this amendment? Bea?

MS. BEA E. JAMES: I also want to remind my fellow board members that yesterday when we went through this document that the NOP expressed that they were in support of trying to get a document to them on commercial availability. This is not—I mean it will go to the NOP and from there the final, final will come from them. So, just…

MS. ANDREA CAROE: Further comments?

Further discussion? None. Okay, so the motion that we are voting on right now is the motion to amend the recommendation. The motion was made by Jennifer and seconded by Hue, and that is to amend item B3 by removing the word “or” and replacing it with “and” and then removing “if the certifying
agent finds that such sources exist.

MR. JOSEPH SMILLIE: Point of order.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: I’m not sure how this is handled under Robert’s rules of order, but we did accept as a friendly amendment the change from “or” to “and.”

MS. ANDREA CAROE: You can’t accept part of a motion. The motion included both of them. So, again is there any further discussion on the amendment. Hearing none, let’s vote on the amendment. That’s to change the recommendation starting with Dan.

MR. DANIEL G. GIACOMINI: No.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: No.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: No.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?
MR. HUBERT J. KARREMAN: Yes.

MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: No.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: No.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: No.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: No.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: No.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: No.

MS. ANDREA CAROE: And I vote no, but I’m irrelevant. Okay, one, two, three, four, five, six, seven, eight, nine, ten — ten against, five in favor. No abstentions. No absentees. The motion fails. So, the original document is back on. So can we remove the track changes? Okay, the
motion on the floor is to accept the recommendation. The motion was made by Bea James, seconded by Julie Weisman. Discussion on the recommendation? Katrina?

MS. KATRINA HEINZE: I’d like to make a friendly amendment that the “or” is stricken and replaced by “and.”

MALE VOICE: Second.

MS. ANDREA CAROE: Is the amendment accepted by the motioner as friendly?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: And by the seconder?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Okay, so it is a friendly amendment, we don’t need a second. Okay, discussion on the removal of the word “or” and the addition of the word “and,” adding “and.” Any discussion on that? Bea?

MS. BEA E. JAMES: We have throughout this document ingredients or materials on several of the sentences, and so I’m just wondering if this is truly the only place that the board would like to see this change? Sorry, but, you know,
for consistency’s sake.

    MS. ANDREA CAROE: Dan?

    MR. DANIEL G. GIACOMINI: I don’t want to be too picky here, but if you’re combining early, early grade math and some language logic when you— if you look at what you’re talking as two circles being two sets of things with one being ingredients and the other being materials and you have an overlap in those two circles and those two sets, use of the word “and” is the area over the overlap, the area where both of them are at the same time. The use of the word “or” is the entire area of the two sets. I think what we’re looking at here in that sense and what the intent of that sentence is — is for the entire area of the two sets being the “or” and not simply the overlap area being “and.”

    MS. ANDREA CAROE: Barbara?

    MS. BARBARA C. ROBINSON: In other words, as we say down in OGC where I went to beg for your livestock document—

    MALE VOICE: [Interposing] Thank you, thank you.
MALE VOICE: And grovel she did.

MS. BARBARA C. ROBINSON: --the word “or” implies “and.” So, if you use the word “or” you get them both anyway. [crosstalk] So, if you leave it as “or” you get “and.”

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Thank you, Dan, for reminding me how much I love Venn diagrams. I would like to remove my friendly amendment. Is that the right language?

MS. ANDREA CAROE: You have withdrawn it. You don’t even have to accept it. She’s withdrawn it. It’s done. It’s over with. So, we are back to the original motion that we started with like 25 minutes ago.

MS. TRACY MIEDEMA: Madame Chair, I would like to call for the question.

MS. ANDREA CAROE: The question has been called. All right, the votes will start with Rigo.

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: Jennifer?

MS. JENNIFER M. HALL: Yes.
MS. ANDREA CAROE:  Jeff?
MR. JEFFREY W. MOYER:  Yes.

MS. ANDREA CAROE:  Kevin?
MR. KEVIN ENGELBERT:  Yes.

MS. ANDREA CAROE:  Hue?
MR. HUBERT J. KARREMAN:  Yes.

MS. ANDREA CAROE:  Tina?
MS. KRISTINE ELLOR:  Yes.

MS. ANDREA CAROE:  Gerald?
MR. GERALD A. DAVIS:  Yes.

MS. ANDREA CAROE:  Steve?
MR. STEVE DEMURI:  Yes.

MS. ANDREA CAROE:  Tracy?
MS. TRACY MIEDEMA:  Yes.

MS. ANDREA CAROE:  Katrina?
MS. KATRINA HEINZE:  Yes.

MS. ANDREA CAROE:  Joe?
MR. JOSEPH SMILLIE:  Yes.

MS. ANDREA CAROE:  Bea?
MS. BEA E. JAMES:  Yes.

MS. ANDREA CAROE:  Julie?
MS. JULIE S. WEISMAN:  Yes.

MS. ANDREA CAROE:  Dan?
MR. DANIEL G. GIACOMINI: Yes.
MS. ANDREA CAROE: And I vote yes, and
the motion passes zero again, fifteen in favor,
zero absent and zero abstentions. Good job.
MR. JOSEPH SMILLIE: Thank you, Madame
Chair. Thank you, board.
MS. ANDREA CAROE: All right, the last
vote item for—Hue?
[off mic]
MR. HUBERT J. KARREMAN: Might as well
finish up the voting. This won’t take too long I
hope. Okay, the livestock committee would like to
recommend that the board accepts the agriculture
working group’s interim final report on bivalves
and mollusks, that we receive their report as we
did their early report at State College. We’re
receiving it. We’re going to keep working it.
Nothing is set in stone. It’s just so we can
officially work with it as the livestock committee
and keep on working with AWG as well. So, that
was a long motion wasn’t it? I’d like to move
that we accept the AWG’s interim report on bivalve
mollusks.
MR. JEFFREY W. MOYER: I second that motion.

MS. ANDREA CAROE: Second, okay. So, the motion has been made to accept the Aquaculture Working Group interim final report on bivalve and mollusk on the [unintelligible].

FEMALE VOICE: We know what you mean.

MS. ANDREA CAROE: Yeah, but I’ve got to say it. The motion has been made by Hue Karreman to accept the interim final report on bivalve and mollusk of the Aquaculture Working Group, and that has been seconded by Jeff Moyer. Is there discussion on the motion? Joe?

MR. JOSEPH SMILLIE: Just how you’re proceeding on the committee—how does that get attached to what we currently have? Are you going to look at that and recommend at the Spring meeting or in the future that it be added to our current recommendation?

MS. ANDREA CAROE: Do you want me to answer?

MR. HUBERT J. KARREMAN: If Madame Chair would answer that since she knows the history of
the whole document.

MS. ANDREA CAROE: What happened the last time we received the report. Then the report is discussed in committee for a recommendation to be generated. So, this is just receiving the report. Then the livestock committee will take it and there will be a second recommendation for further rule making for standards for mollusks and bivalves. So, it’s an additional standard, an additional—

MR. HUBERT J. KARREMAN: [Interposing] It will be kind of part of the new agricultural standard that’s being created now by the NOP. As we sit here they’re working on it. I know that. [laughter]

MR. JOSEPH SMILLIE: You’ve got shares in the bridge too, right?

MR. HUBERT J. KARREMAN: no, but you know, what was passed in March is technically at the NOP level now, and we’re just kind of adding on to that after we work as a committee and vote on the bivalve mollusks hopefully in the spring as well.
MR. JOSEPH SMILLIE: And in the same way the net pens & fish meal issue will also be discussed, recommended, and added to it so that once the NOP has the full package of Aquaculture reports, then they’ll proceed or do you feel they’re proceeding?

MR. HUBERT J. KARREMAN: Oh, I have high hopes that they will proceed with what we’ve already sent them already.

MR. JOSEPH SMILLIE: Okay, good enough.

MR. HUBERT J. KARREMAN: I have hope, maybe not high hope. We sent, we voted on something in March. We—it is at the NOP level now to create Aquaculture regulations, standards for agriculture, and now the feed and net pen issue that we had our symposium on we will be sending further recommendations on. Then when we are done with the bivalve mollusks we will send more recommendations all within Aquaculture.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: May I address the NOP in asking are they going to proceed to look at this in piecemeal fashion or is their expectation
to get the second of two parts of what will be a
three-part recommendation and move forward on the
total package?

MS. BARBARA C. ROBINSON: We’re poor.
You know, the coffers are empty. I’ll be honest
with you. We have not begun to do any rule-making
on what you’ve sent us so far. So, I can’t answer
your question, Joe, because we haven’t begun to do
any work. We’ve been working on livestock. So,
you know, if we get a budget and we can get some
more people.

MR. JOSEPH SMILLIE: That’s good.

MS. ANDREA CAROE: Any further discussion
on accepting this mollusk and bivalve report.
Hearing none I will call for the last vote of the
day starting with Jennifer?

MS. JENNIFER M. HALL: Yes.

MS. ANDREA CAROE: Jeff?

MR. JEFFREY W. MOYER: Yes.

MS. ANDREA CAROE: Kevin?

MR. KEVIN ENGELBERT: Yes.

MS. ANDREA CAROE: Hue?

MR. HUBERT J. KARREMAN: Yes.
MS. ANDREA CAROE: Tina?

MS. KRISTINE ELLOR: Yes.

MS. ANDREA CAROE: Gerald?

MR. GERALD A. DAVIS: Yes.

MS. ANDREA CAROE: Steve?

MR. STEVE DEMURI: Yes.

MS. ANDREA CAROE: Tracy?

MS. TRACY MIEDEMA: Yes.

MS. ANDREA CAROE: Katrina?

MS. KATRINA HEINZE: Yes.

MS. ANDREA CAROE: Joe?

MR. JOSEPH SMILLIE: Yes.

MS. ANDREA CAROE: Bea?

MS. BEA E. JAMES: Yes.

MS. ANDREA CAROE: Julie?

MS. JULIE S. WEISMAN: Yes.

MS. ANDREA CAROE: Dan?

MR. DANIEL G. GIACOMINI: Yes.

MS. ANDREA CAROE: Rigo?

MR. RIGOBERTO I. DELGADO: Yes.

MS. ANDREA CAROE: And the chair votes yes. The motion passes zero against, fifteen in favor, no absent and no abstentions. And at this
point we can take a little break. It is now what

ten of three.

MALE VOICE: One hour ahead.

[break]

[crosstalk]

MS. ANDREA CAROE: It’s time. Last call.

It’s the last chance.

[crosstalk]

ELECTION OF NEW OFFICERS

MS. ANDREA CAROE: All right, let’s get
back into session. At this time we are prepared
to do election of our officers.

FEMALE VOICE: What about recognition of

[unintelligible]?

MS. ANDREA CAROE: It’s already done.

So, let’s start with the secretary position, and I
open it up to the board for nominations for
secretary. Bea?

MS. BEA E. JAMES: I nominate Katrina
Heinze.

MR. JOSEPH SMILLIE: Second.

MS. ANDREA CAROE: And there’s a second.

Is there any other nominations for secretary?
Hearing none, we will do voice vote for the position of secretary. All those in favor of Katrina Heinze as secretary say aye.

MIXED VOICES: Aye.

MS. ANDREA CAROE: All those opposed same sign. Abstentions? Congratulations, Katrina.

Congratulations, I’m sure you’re going to do a fabulous job. Your organizational skills will go far in the position of secretary, and I’m so—I bet Bea is just like in tears because she is not going to be doing that work any more. Katrina?

MS. KATRINA HEINZE: I have quite impressive shoes to follow, and I’m honored by everyone’s confidence and railroading.

MS. ANDREA CAROE: Okay, I now open up the floor for nominations for vice chair. Hue?

MR. HUBERT J. KARREMAN: I’d like to nominate Jeff Moyer for vice chair.

MS. KRISTINE ELLOR: I’d like to second.

MS. ANDREA CAROE: Who seconded that? Tina, okay. Hue, Tina—any other nominations for vice chair? Joe?

MR. JOSEPH SMILLIE: I’d like to nominate
Julie Weisman.

MS. ANDREA CAROE: Is there a second?

MR. STEVE DEMURI: I’ll second.

MS. ANDREA CAROE: Any further nominations for the position of vice chair? Tracy?

MS. TRACY MIEDEMA: I’d like to nominate Dan Giacomini.

MALE VOICE: Second.

MS. ANDREA CAROE: Okay, any further nominations for vice chair? I close the nominations, and we will pass around—there’s—

FEMALE VOICE: [Interposing] Everybody has got little post-its. Can you repeat the—

MS. ANDREA CAROE: [Interposing] The three nominees are Jeff Moyer, Julie Weisman, and Dan Giacomini.

[crosstalk]

MALE VOICE: Do they go to the new secretary?

MS. ANDREA CAROE: No, they go to me.

[crosstalk]

MS. ANDREA CAROE: Congratulate the new
vice chair, Jeff Moyer.  [applause]  Moving along to the nominations for chair.

MR. KEVIN ENGELBERT:  I’d like to nominate Rigoberto.

MS. ANDREA CAROE:  Rigoberto.

MR. KEVIN ENGELBERT:  Rigoberto Delgado, the user-friendly name, Rigo Delgado.

MS. ANDREA CAROE:  Is there a second?

MR. HUBERT J. KARREMAN:  I’d like to second for Rigoberto Delgado.

MS. ANDREA CAROE:  Any other nominations for the position of chair?

MS. TRACY MIEDEMA:  I’d like to nominate Jerry Davis.

MR. DANIEL G. GIACOMINI:  Second.

MS. ANDREA CAROE:  We have a nomination for Gerald Davis.  Any other nominations for the position of chair?  Okay, I close the nominations, and I ask everybody to vote.  We have two candidates, Rigoberto Delgado and Gerald Davis.

[end MZ005032]

[start MZ005033]

MS. ANDREA CAROE:  My congratulations and
condolences to your new chair, Rigoberto Delgado.

[applause]

MR. RIGOBERTO I. DELGADO: Well, Madame Chair, thank you very much, or I should say no thanks. But I do want to appreciate your support, colleagues and friends and yours, Madame Chair.

If my memory doesn’t fail, which is not often, I think you are the first woman chair person.

MS. ANDREA CAROE: No.

MR. RIGOBERTO I. DELGADO: Oh, well there you go it fails again, but nonetheless, I would like to personally recognize you and appreciate all of your help. You have not only been a good friend but a good mentor, and I am the first one to recognize that. Your shoes are extremely big, and it’s going to be very difficult to fill them in a good sense.

MALE VOICE: You’ll look funny walking around in high heels.

MR. RIGOBERTO I. DELGADO: Very, very funny I’m sure, but what I would like to emphasize the big lesson that we got from you was having an environment of exchange of ideas, aggressive
sometimes but overall constructive, and I look forward to continuing with that legacy working with my friends and fellow members of the board and also with the NOP and members of the public. I think that the common ground here is love for the industry, respect for the public and the brand, and I appreciate your support. Thank you.

[applause]

COMMITTEE WORKPLANS

MS. ANDREA CAROE: All right, the next item on our agenda, and we are way ahead of schedule, which I feel no guilt over the last three days but the committee work plans. So, we can do them verbally now, but then I ask the committee chairs to send them to Rigo when you return to your place of business. So, starting with in no particular order, crops.

MR. GERALD A. DAVIS: Of course, on our work plan will always be new petitions as they arise. We expect some. Some were turned back for further information and work from the program. So, we expect at least those back plus some more maybe. On our work plan has been the idea of a
report on the state of hydroponics or organic
hydroponics if there is such a thing and if we
should get involved as a board in making
standards. I expect to have a progress report at
the next meeting. Also, the collaboration with
the CAC on the organic seed recommendation that
was mentioned here at this meeting. And also
since we have a renowned mushroom expert on the
crops committee now, we want to open up the
previous mushroom recommendation and standard and
see if there are any improvements or work that can
be done on that.

MS. ANDREA CAROE: Does that conclude
your work plan?

MR. GERALD A. DAVIS: That concludes my
work plan.

MS. ANDREA CAROE: Thank you so much.

MR. JOSEPH SMILLIE: We will spend a lot
of effort working on the multi-site certifying
operations with multiple production units, sites
and facilities issues that’s obviously a huge
issue in the community. We will, as we have before, seek community input and we will work diligently to hopefully come up with a recommendation for the March meeting. I think that’s appropriate.

MS. ANDREA CAROE: Okay.

MR. JOSEPH SMILLIE: And again we will be working with the crop committee on seed availability and bringing what we just deleted as starter material for that. There may be more issues that arise, but that’s currently the work plan.

MS. ANDREA CAROE: Thank you. Moving along—handling committee.

MS. JULIE S. WEISMAN: Every meeting I am able to cross one or two items off this list, and somehow at the end of every meeting there are more items on it than when the meeting started. That being said, I have on my list continued work on the definition of materials, which we will continue to work jointly with the materials committee and we look forward to absorbing the work of the industry working group that appears to
be coalescing on this issue. For materials for sunset review we have one little orphan that we must deal with at the next meeting, which is tartaric acid. I believe that’s all the materials that we still have lingering for sunset. Review of petitioned materials, we have three recent petitions. We have—okay, we have four materials on for 605. One is calcium from seaweed. One glucosamine hydroxide. We have Propionic acid still open, but that was sent back for a tap. I don’t know what that means given what we’ve heard, and then I also have yeast on this list as to we need to clarify the status of the petition. There was a lack of clarity at this meeting as to what—and we need to hammer that down. On 606 one other petition that I think is also still lingering, there was a petition deferred at the spring meeting for the movement of nominated low methoxypectin [phonetic], and we deferred it because at the time we were giving priority to 606 items ahead of the Harvey court deadline and pectin having a place already on the list we didn’t think that it was going to drop out—that
the industry would lose access to it so we do have
to return to that as well. For 606, we have 15
items. I would like to read them into the record
just because I think it’s better if we have one
more place where people will go and know that this
is what we’re looking at. The 15 that are
currently reviewed by NOP and are now at the
handling committee are Chinese thistle daisy,
black paper, camu camu [phonetic] extract powder,
caramel color—we’re going to have to call that
something else, chickory [phonetic] root extract,
Codonopsis [phonetic] root extract, ginger root
extract, jojoba fruit extract, marsala cooking
wine—let’s go for that, peony root extract,
polygala root extract, poria fungus extract,
Rehmannia root extract, sherry cooking wine, and
tangerine peel extract. That is it for 606 items.
We have on our work plan, and I really hope we can
wrap this up in the spring is the review of the
pet food standards. We will consult with the pet
food task force and the livestock committee as
needed. We also have here the issue of flavor
guidance, and I want to keep that on our work
plan. We have food contact substances, and a new
item that got added to our list today is
fortification of food. And that’s it for
handling. That’s quite enough.

MS. ANDREA CAROE: Thank you, Julie. I
think you should have fun with that. Materials?

MR. DANIEL G. GIACOMINI: Thank you,
Madame Chairman. The materials committee’s work
plan at this point in time course, the first item
will always being following and tracking of all
petitions and sunset items with one special note
being along with handling a—working with handling
and the program to clarify the status of the
petition on yeast. The second item is to continue
in the process of the definition or classification
of materials. We have the list of people
interested in helping us through a working group,
and one significant 2A if you would like on that
item being specifically to hopefully maybe have a,
possibly have a recommendation on a non-AG
definition. Item number three, we will continue—
the materials committee will continue to
collaborate with the NOP regarding a process to
have access to information only contained in the CBI petitions regarding commercial availability to be able to place items on the national list with consideration of maintaining confidentiality of the information within the guidelines of the OGC.

MS. ANDREA CAROE: Thank you, Dan. Rigo, policy committee?

MR. RIGOBERTO I. DELGADO: We have three items, Madame Chair, the first one is to complete a database of recommendations. The NOSB will continue working closely with NOP and Valerie to do so. We have several updates to the new member guide. Remember, it’s a living document. One of the updates includes the creation of a link to the final recommendation list as was suggested by public comment, and also as suggested by board members we would like to include a list of common technical sources used by committees to review and acquire information for the review process. And updates to the policy manual we have pending another review of the flow of the document to make sure that it makes sense from a structural point of view. And I believe that concludes the list of
pendings.

MS. ANDREA CAROE: Last but not least livestock and don’t tell me dockets.

MR. HUBERT J. KARREMAN: No, actually I need to thank Barbara again for that docket publically.

MS. BARBARA C. ROBINSON: Because I went down to OGC and begged for your docket.

MS. ANDREA CAROE: I really think you need to get her a pair of knee pads because she’s spending a lot of time on—

MR. HUBERT J. KARREMAN: [Interposing] Well, it’s great. Things are getting done.

Anyway, that was nice to hear at the beginning of the meeting, and we also heard from the agriculture symposium so of course we will be working on that. As far as the two issues, net pens and fish meal, fish oil, also compost for ponds and aquatic edible plants, and that’s going to be in our work plan all kind of under I guess agriculture and also the bivalve mollusks. So, aquaculture is going to keep us going, but that will give us our priority. We do have actually
two materials that we need to look at, fenbendazole [phonetic] which is a parasiticide as was said in public comment, and we hope to have a recommendation for the spring for that. And potentially a second material if they send in a petition for methionine because I’m sure we’re going to be hearing about that, okay, but nothing officially has been done yet. And we really can’t act on it unless the poultry people submit a petition. Right?

Okay, now with the poultry in play, also we would like to look at the outdoor access of poultry in poultry houses and what not because I think we need to do that. And last but not least, of course, and that outdoor access kind of ties in to what Kathleen Merrigan [phonetic] and Margaret Wittenberg [phonetic] brought up, our animal health and welfare, or I should say animal health and care issues. I think I liked that term, whoever said that, animal care. It’s a politically, you know, whatever-neutral. So, we’re going to look into that as well. So we have four things, aquaculture, the fenbendazole
[phonetic], the poultry, and the animal health and care. That should keep us going for the next few years. That’s it.

MS. ANDREA CAROE: Thank you, and with that—what? Joe?

MR. JOSEPH SMILLIE: And bees? What’s the situation with that? Is that livestock?

MR. HUBERT J. KARREMAN: I believe it would fall under livestock, but I think Nancy Ostiguy [phonetic] was holding that torch and I haven’t heard anything from her lately.

MR. JOSEPH SMILLIE: She’s not on the board anymore you know.

MR. HUBERT J. KARREMAN: I know that, and I’m not trying to duck that, but honestly that issue that’s the first I’ve heard that issue in a full year, Joe. Seriously.

MR. JOSEPH SMILLIE: Oh.

MR. HUBERT J. KARREMAN: And I don’t think that was on the work plan. If it has been, I apologize, but I don’t think it has been. Would you like it to be?

MR. JOSEPH SMILLIE: Yes, I would.
MR. HUBERT J. KARREMAN: Can do. That will be number five.

MR. JOSEPH SMILLIE: I’d like you to consider it because I think that, you know, we’re seeing a lot of interest in it and a lot of frustration and again bees have been in the news a lot lately. I think [crosstalk], not that Bea.

MR. HUBERT J. KARREMAN: Not the Queen Bea, the regular bees. Okay, I’ll put that on there, no problem.

MS. ANDREA CAROE: Any additions or comments on the work plans? Once again, please send them to your chair so that can be put together as the entire board’s work plan. So, now other business, is there any other business? Bea?

OTHER BUSINESS

MS. BEA E. JAMES: Well, I would like to just officially thank Andrea for her dedicated and hard work as a very hard-working member of the board as well as an excellent chair, and I want to acknowledge that as chair Andrea really helped bridge and bring together all of the people that are on the board and keep the peace amongst all of
the differing opinions. And that is actually quite a huge accomplishment because as you know we all are very opinionated and have our own ways of communicating. So, I want to acknowledge on behalf of the rest of the board and thank Andrea for her time. And she will be dearly missed.

[applause]

MS. ANDREA CAROE: You’re very welcome.

Is there any other other business? Valerie?

MS. VALERIE FRANCES: I just want to raise a small issue, and I’m sorry to do it. It’s a work plan issue, and I know it’s going to come up if we don’t at least talk about it right now, which is the pasteurized almonds.

MS. ANDREA CAROE: I don’t know exactly that is, you know, that has been brought up before.

MS. VALERIE FRANCES: I just want to make sure it gets discussed a little bit.

MS. ANDREA CAROE: I just want to say that again going back to what I said in the very beginning, I guess Tuesday or Wednesday morning is this board is in maintenance and interpretation of
this regulation I’m not quite sure how this board
has an action in that other than to watch.
Barbara?

MS. BARBARA ROBINSON: I spoke with Bea
about this, but I have already said that I would
like to go back and speak with Lloyd Day first
since there has been a meeting about this. I
haven’t had any juice in my blackberry for the
past couple of days so I haven’t been able to talk
to him about it. But, you know, let me pursue
this a little bit first before I talk to the board
about it. And then I will get back with you about
it. I understand that some board members have
concerns because some members of the organic
community have a concern about this. But let me
follow up because there have been some meetings.
It is a program area in AMS, but there’s another
deputy administrator. Before I go treading on
another colleague’s of mine, before I go treading
on his turf, I’d like to do a little homework and,
you know, then I’ll come back and talk with you.
But let’s, you know, there’s ways to do it. Let
me—I have to do a little homework on this issue
first.

MS. ANDREA CAROE: Thank you. Any other business.

[off mic]

MS. ANDREA CAROE: We have not set a date for the spring meeting, and I assume what we’ll do as we’ve done in the last couple where the program will float dates to the board. So, I mean I know that in the past when I first started on this board, we used to pick the dates at the end of the meeting. But I believe that it’s worked out better that the dates were floated and we did that by e-mail when we all had our calendars in front of us. Other further other business? Okay, closing remarks? I just wrote down a couple of notes. I wanted to talk to the board about what I’ve learned in five years. And it’s very interesting. This is—no, this is going to be quick. The first thing that I learned and I watched it with you members this meeting as you were doing your work, bringing your work to the table, the first thing I learned was humility on the first time I attempted to draft a
recommendation and it was torn apart by my committee and then put together where I think there of the words were my original words after it was done, and then torn apart in public comment, and then put back together again, and the second thing that I learned after that is it ain’t personal. It just ain’t personal. Don’t take it that way. It works out. Nobody is—it’s about the product and not about you and your work. And people appreciate what you’re doing. The third thing I learned is how little I actually know. I come in to an issue puffed up thinking this is a no-brainer, I can whip this out, I know exactly what the issues are, and I never did know a tenth of what was at stake. I learned that through the process, so do your best but know that you don’t know everything, and you’ll learn it through the process. The next thing I learned was stamina to get through and finish a meeting at, you know, 8:00 at night. You know, I learned how to pace myself and I learned how to get through it. You know, you guys got a crash course this meeting, and I appreciate you sticking with me. The next
thing I learned was patience, and I forgot that pretty quickly. So, for a split period of time I had patience, but that’s really hard to keep. And a couple more things. I learned what passion is, listening to the folks that aren’t thinking about these issues as theoretical or regulatory concerns but thinking about them as their livelihood and about their mission to further organic for all kinds of different reasons. So, I learned that by listening to testimony, and that is a wonderful thing that I take away from this position on the board. And lastly, I have experienced great gratitude, which is the pay for this job. It’s well worth it. It’s well worth it, and I thank you all for your support. And I’ll be around. [applause] And with that I entertain a motion to adjourn.

MS. BEA E. JAMES: Motion to adjourn.

MS. ANDREA CAROE: Is there a second?

MR. JEFFREY W. MOYER: I’ll second that motion.

MS. ANDREA CAROE: All those in favor say aye.
1      MIXED VOICES: Aye.
2      MS. ANDREA CAROE: All those same sign.
3 This meeting, this fall meeting of the NOSB is
4      adjourned.
5      [crosstalk]

CHAIRMAN DELGADO: So, we do have quorum and I'm calling the -- the meeting will come to order.

And on behalf of my colleagues, and as Chair of this Board, I want to welcome all of you to this, the 36th meeting of the National Organic Standards Board.

At this moment, Board members, I'm assuming you had time to review the agenda, and I want to call for any changes or comments on your part.

(No response.)

Hearing none, I will call for a motion to approve the agenda as is printed.

MEMBER HALL: I move to accept the agenda as printed.

VICE-CHAIR MOYER: I second that motion.

CHAIRMAN DELGADO: It is moved and seconded to approve the agenda for today as
printed. And we will take a vote viva voce.

Those in favor say aye.

(Chorus of ayes.)

Those against?

(No response.)

Okay, we have an agenda. Thank you very much.

By way of a welcome, I just want to say how proud I am of all the Board members. For the past four months, we have worked extremely hard. We have some changes in deadlines. And I want to appreciate that work.

I know we all were extremely focused on our work plans. We were able to resolve our differences of views in a extremely constructive manner. And I think we were able to work and participate with the program and the public in a most productive of ways. In short, I think this Board is a working unit to be proud of.

You might not know this, Board
members, but we clocked over 100 conference calls in the last four months. Each one of those calls was for sure at least two hours. We had several participants, in some cases up to 10 or more participants in those calls. There were heated debate going on.

And it doesn't take a lot of knowledge to make the math and realize that we accumulated very close to a thousand hours. I know you hate me to say this, and I consider myself the MBA, in-house MBA, but if you put numbers to those hours, pretty soon they add up to several thousands, if not millions, of dollars.

But the important thing is that all this is volunteer work, and that is highly appreciated. I know that's time away from your work, added pressure to your agendas, and most importantly, it is time away from your families. So thank you very much for that.

Right, a quick announcement on my part: our Board member, Mrs. Bea James, won't
be able to join us for personal reasons, so she sends her apologies.

And I would also like to introduce our newest member of the Board, Mr. Barry Flamm. We are very happy to have him. He has been with us for several months now, but that hasn't kept him from being an active member. He is actually forms part of the -- he is the Chair of the Policy and Development Committee, and I appreciate your effort, courage, and dedication, Barry.

Right, on that note, we can proceed on to introductions, unless there are other announcements.

MEMBER HEINZE: Catherine has asked that we remind the public, if you haven't signed in in the registration book, to please do so, so we know who has attended. Thank you.

CHAIRMAN DELGADO: Any other announcements?

(No response.)
Okay, let's proceed with introductions, and we will start on the window side of the aisle with Dr. Hugh Karreman, please.

MEMBER KARREMAN: Good morning. Thank you, Rigo.

My name is Hubert Karreman. I'm -- I sit in the Environmentalist/Resource Conservation seat on the Board. In daily life, I am a dairy veterinarian, working with organic dairy farms in Lancaster County, Pennsylvania, and I've been doing that for the last 12 or 13 years and --

MEMBER ENGELBERT: Thank you, Hugh and Rigo.

I'm Kevin Engelbert. I'm a farmer representative on the Board. I operate a 120-count dairy farm in upstate New York. We've been organic for about 30 years.

I want to thank my sons, as I always do at these meetings, for carrying the load for me while I am away from the farm,
especially during this crucial month of the year for us.

I sit on the Livestock Committee, the Crops Committee, and the Materials Committee. I am very, very honored to be in this role. Thank you.

MEMBER HALL: Hi, I'm Jennifer Hall. I live in Spokane, Washington, and I sit on the Board as a consumer representative on both the Livestock and the Certification Committees.

In my regular life, I direct an effort right now to open a consumer co-op in Spokane, Washington.

MEMBER DeMURI: Hi, everybody. My name is Steve DeMuri. I hold one of the handler positions on the Board.

For fun, I work for Campbell's Soup Company, and there I direct organic manufacturing for our company.

I have been on the Board now for about a year and a half, and it has been an
honor to be on this Board.

MEMBER WEISMAN: My name is Julie Weisman. I'm the other handler on the Board. I'm currently the Chair of the Handling Committee, and this is my -- it's the beginning of my fourth year. Time flies when you're having fun.

In my regular life, I am an owner of Elan and Flavorganics, which involves me in flavor ingredients, both organic and conventional. I am also the mother of two girls who I would -- I hope to get to a meeting before the end of my term.

MEMBER GIACOMINI: My name is Daniel Giacomini. I sit in one of the consumer seats.

I'm from the Bay Area in California, and my daily -- the rest of my daily work is now taken up with issues of the Board. I am also an animal nutritionist and dairy consultant.

And I sit on the Board -- this is
my third year on the Board. I'm Chairman of
the Materials Committee and on the Livestock
Committee.

MEMBER HEINZE: Good morning. I'm
Katrina Heinze. I am in a scientist slot on
the Board with formal training in chemistry.
I also have the honor of being the Secretary
for the Board.

I'm a long-time active organic
consumer and mother of two children. So this
certainly fits some personal passions.

Like everybody else, my day job, I
work for General Mills in our Regulatory
Affairs Group and have most of my experience
in food safety and manufacturing.

CHAIRMAN DELGADO: Before we
continue, I would just ask you, when you
finish talking, please turn off your
microphones. That will avoid the echo that we
are listening to. Okay?

VICE-CHAIR MOYER: My name is Jeff
Moyer. I hold a farmer position on the Board.
My day job is the Farm Director for the Rodeo Institute, a 333-acre research and education facility in Pennsylvania.

I am on the Livestock Committee. I'm the Vice-Chair of the Crops Committee. I'm on the Materials Committee, and I'm the Vice-Chair of the Board.

Thank you.

MEMBER DAVIS: I am Gerald Davis. I am a producer representative on the Board and the Chair of the Crops Committee, and I'm on the Handling Committee.

I work for Grimmway Farms in California. Long-time, 15-year organic farm advisor and agronomist.

MEMBER ELLOR: I'm Tina Ellor. I'm filling one of the environmentalist slots on the Board. I've had the honor this year of working with the Crops Committee and the Livestock Committee, and I can't tell you how much I've learned and how nice it is to see so many familiar faces out there.
MEMBER MIEDEMA: Good morning. I'm Tracy Miedema. I live in Oregon and work for a sustainable and organic farm there and manage the Consumer Products Division, and I sit in the consumer -- one of the three consumer and public interest seats.

My committee work is Handling Committee and Certification, Accreditation, and Compliance.

MEMBER SMILLIE: My name is Joe Smillie. I hold the certifier seat on the NOSB. I'm Chair of the Certification, Accreditation, and Compliance Committee and a heavily-worked member of the overworked Handling Committee.

(Laughter.)

I have been a certifier officially since about 1998. I'm the Senior Vice President of Quality Assurance International.

Before that, I was an organic inspector for a number of organizations. I was a consultant specializing in industrial compositing and
orchard management. And before that, I was an organic farmer.

I have been on the Board for three years and, you know, like everyone else, the reason -- one of the reasons I took the CACC job was because that was the Committee that didn't have much work, and I thought, well, I've got a pretty heavy work schedule, so I'll try that one. But that was a mistake because all of a sudden we got a load of work.

So I just want to testify what everybody else has said, that serving on the NOSB is a real commitment and it takes a lot of time. A lot of the people on this Board spend a lot of time doing reviews and many of the other tasks we have. It's an amazing Board to work for.

We have definitely differences of opinion all the time, but we work really well together as a group, and I'm especially proud of that fact.

MEMBER FLAMM: As Rigo announced,
I'm the newcomer on the Board.

I live in Polson, Montana on the beautiful Flathead Lake. I always have to do a little advertising for Montana.

I have spent my life, vocation and avocation in conservation, particularly in natural resources and environmental work.

On the Board, as Rigo mentioned, I am currently Chair of the Policy and Development Committee. I also serve with Joe on the CAC Committee and also the Crops Committee.

I, my -- briefly, my background, as I mentioned, is in conservation and natural resources, environmental work. Currently, I am primarily an international consultant on conservation in different parts of the world.

And I just recently sold my organic cherry and apple orchard.

And I'm extremely pleased to be part of the NOSB and have worked with a great group of people. I'm real happy to be here.
and hear your comments and meet you individually.

CHAIRMAN DELGADO: Well, thank you very much.

I do want to make an announcement. Board members and members of the public, if we do hear a cell phone go off, we'll take your name down and you will have to buy drinks for all the members of the Board. So please take this time to turn those off.

I would like also to continue -- thank you very much for -- with members of the program, if you were kind enough to introduce yourselves and tell us something about your background. Then if we can start with Dr. Robinson?

MS. ROBINSON: Oh, I'm sorry, what do you want?

CHAIRMAN DELGADO: Introductions, please.

MS. ROBINSON: I'm sorry.

Barbara Robinson, Deputy
Administrator for Transportation and Marketing Programs and presently the Acting Director for the National Organic Program.

Do you want me to introduce the whole staff, or do you want --

On my right is Richard Mathews. To his right is Katherine Benham, then Toni Strother. On my left is Mark Bradley. Next to Mark is Bob Pooler, and next to Bob is Shannon Nally -- at your service.

CHAIRMAN DELGADO: And lastly, we have our Executive Director, Ms. Valerie Francis. Could you tell us something about your background and the most funniest thing that has happened in the last three hours?

(Laughter.)

MS. FRANCIS: Long-time organic person, nutritionist by training, worked on farming, marketing, retail, wholesale, research, a lot of different activities, certification even more recently.

And glad to be here. This will be
my third year in this role, and it has just
been a blast. I love working at the Board.

And the funniest thing that has
happened in the last three hours is we've had
a heck of a time with our projector. And so
we are trying to get that worked out, but it
has just not wanted to cooperate. So we have
a back-up plan for later. I don't know how
funny that is.

CHAIRMAN DELGADO: Thank you, Valerie.

Okay it's part of the tradition
here on the Board is for the Chair to read the
Board's mission, and that is what I am going
to do at this point. It reads as follows, and
it is found in the Policy Manual:

The mission is to provide effective
and constructive advice, clarification, and
guidance to the Secretary of Agriculture
concerning the National Organic Program and
the consensus of the organic community. All
right?
And let's move on, then, to the Secretary's report. Dr. Heinze, if you would be so kind?

MEMBER HEINZE: Okay. It has been a while since anybody has called me "doctor". It's a little bit shocking.

Okay we have two matters to take care of as part of the Secretary's report. One is the meeting transcripts from our November meeting, and the other is our meeting minutes. So we'll take those in order.

So I have -- I believe the transcripts are in order and there's no discussion unless anyone on the Board has discussion on the transcripts.

(No response.)

Okay, hearing none, I move that we accept the November 2007 meeting transcripts.

CHAIRMAN DELGADO: Any second?

MEMBER ELLOR: Second.

CHAIRMAN DELGADO: It is moved and seconded to accept the November 2007 meeting
transcripts.

Discussion?

(No response.)

All right, ready for the question?

The question is on the motion to accept the November 2007 meeting transcripts, and we'll take a viva voce vote.

All those in favor please say aye.

(Chorus of ayes.)

All those against?

(No response.)

Okay, the motion is approved here.

Any abstentions?

(No response.)

Thank you for the correction.

None. So, thank you.

We'll continue on.

MEMBER HEINZE: Okay, the second matter is the November 2007 meeting minutes. Typically, that is a combination of the Secretary's minutes as well as the vote summary. Due to the transition in Secretary
and a technical error, the Executive Committee has not voted on the vote summary. So we'll have to handle those at our next meeting. So this is just the minutes from our November 2007 meeting.

Any questions or discussion on those?

(No response.)

Okay. I move that we accept the November 2007 meeting minutes.

VICE-CHAIR MOYER: I'll second that.

CHAIRMAN DELGADO: It is moved and seconded to accept the November 2007 meeting minutes.

Any questions? Discussion?

(No response.)

Hearing none, we are ready for the question. The question is on the motion to accept the November 2007 meeting minutes, and we'll again take a viva voce vote.

All those in favor please say aye.
(Chorus of ayes.)

All those opposed say no.

(No response.)

Any abstentions?

(No response.)

Okay, the motion is approved.

MEMBER HEINZE: That ends the Secretary's report.

CHAIRMAN DELGADO: Thank you very much.

Well, it is 11:29, and it is now the turn for the National Program to provide us with their report. And I'll ask Dr. Robinson to do so at this point.

MS. ROBINSON: Good morning.

First of all, I would like to welcome Dr. Flamm to the Board.

Barry, we certainly do appreciate you accepting this appointment. And we have for you a plaque and your letter of appointment, signed by Secretary Edward Schafer. So I want to present that to you now.
with appreciation for accepting the call to serve the Nation and the United States Department of Agriculture as a member of the National Organic Standards Board.

(Applause.)

Okay. Well, we've had some good things happen to us this year. One was we got a lot of extra money. And with this program, every little bit helps.

The FY08 budget increase was almost a 100 percent increase in our budget, which for the size of this budget is -- I guess you could say that's not saying much, but for us we jumped up and down for joy. We're up to $2.6 million in program funding.

And last fall, when I talked with you -- with the Board and with the industry -- I told you that we were going to make some changes if we got some new money, and so we have. At that time I talked with you about trying to increase transparency in this program. So we think that we are on the road
to doing that.

    I also told you that we would probably, you know, scrape our knees a little bit when we did it. But we have done some -- made some changes, and I am pretty pleased with those.

    Because of the additional funding that we have received, we are now to the point we have been able to actually create some structure in this program. Whereas, before we always had kind of the situation that I like to call, you know, seven or eight people, just, you know, get up there and do some work, now we have been able to create three branches in the program for the first time.

    We have a Standards Review and Development Branch. We have a Accreditation, Auditing, and Training Branch, and we have a Compliance and Enforcement Branch.

    Rick Matthews heads up the Standards Review and Development Branch. Mark Bradley heads up the Accreditation, Auditing,
and Training Branch, and at the moment we don't have anyone heading up the Compliance and Enforcement Branch.

But for the moment, and until we fully get staffed up, we are trying to staff up to 15 or 16 people this year, and we hope that we will be able to do that. For the moment, if you are in either the Accreditation, Auditing and Training Branch or the Compliance and Enforcement Branch, my expectation is that you wear both hats.

We also have changed our website, which I am sure -- in fact, I know -- that many of you have noticed. We now look like the USDA home page. If you've ever been on that site, we now look like that.

We have been waiting a long time to be able to do that. So we're very happy that we now look like the USDA home page, and we had to come into compliance with that directive.

But when we did that, it enabled us
to take advantage of some things and begin to
create what I talked to you about last fall,
which was to start to build more transparency
and create this glass house for the NOP to
begin to publish everything that we can
publish for this program and put it on the
website.

So we are beginning to publish all
the information that we can relative to our
certifying agents. We started something
called NOP Access, where we are trying to put
up questions and answers that we receive from
outside parties.

We know that you are reading it
because you let us know where we don't do it
right. I'm not going to apologize for the
website or for the fact that you point out our
mistakes because that lets me know you are
reading. So I'm very happy for that.

Like I said before, Access is new.
The website is new. Like anything new, it's
not perfect. We'll get there.
We are engaged in equivalence discussions with Canada. We have had two technical meetings with them. We are coming up on a third discussion with them. We are very optimistic and we remain so. It is a priority for us because it is a priority for you. So it is high on our list of things to accomplish.

Yesterday I met with officials from Japan, after they were meeting with representatives from the U.S. Trade Representative's Office. We presented them with a letter of recognition. So they are now one step closer to requesting equivalency discussions with us as well.

We understand that they have removed restrictions on potassium bicarbonate and lignin sulfonate. They still have problems with fumic acid. That will be a problem if they request equivalency discussions with us.

We understand that the EU has also
backed away from their concerns about potassium bicarbonate as well, which is good.

As for regs, the materials dockets are moving through clearance, as they need to be, and we will get them done. The sunset dockets, everything will move through and get there on time.

The pasture rule is still working its way through clearance, and we remain optimistic that we will have something for the industry.

That's all that we have for the NOP update, unless you have questions.

CHAIRMAN DELGADO: Are there any questions? Kevin?

MEMBER ENGELBERT: Two questions, Barbara: Do you have any idea what the pasture rule is going to look like? Will it resemble the NOSB recommendations at all?

Two, where does the origin of livestock stand?

MS. ROBINSON: We're writing the
origin of livestock rule right now, Kevin. We haven't put it through clearance yet, but we are writing it.

Yes, I do know what the pasture rule will look like because we wrote it, not to be flippant or anything, but I do know what it will look like.

What was the other part of your question? Will it look anything like the NOSB recommendation? Yes, it will meet everyone's needs. Yes.

CHAIRMAN DELGADO: Any other questions for Dr. Robinson?

Kevin, was that clear? Satisfied?

(Laughter.)

Never mind. Well, we'll move on.

Mr. Smillie?

MEMBER SMILLIE: Any timeline on the head of the third branch of the NOP, for hiring that person?

MS. ROBINSON: I'm hoping this summer.
CHAIRMAN DELGADO: Any other questions? This is your chance.

MS. ROBINSON: Oh, it's not your only chance. I'm here for the whole meeting.

CHAIRMAN DELGADO: Absolutely. Yes, I must recognize that, and thank you for participating with us every month on the conference calls. You have been extremely supportive, and I want to recognize that.

Very well. Thank you very much for your report.

MS. ROBINSON: You're welcome.

CHAIRMAN DELGADO: And it is 20 before the hour. That concludes our first section of the meeting. The next part is very interesting. It is lunch. So we'll take a recess and come back at quarter to 1:00.

We have a total of 47 public commenters. We'll start with Mr. Ed Maltby. We need to be here promptly. So I'll ask you to be here at quarter before the hour.

Yes? Is the room going to be
locked? Can we leave our valuables here? It will be locked and you can leave your valuables.

Yes?

MS. FRANCIS: Rigo, I'm not sure we can really start before we say we're going to start when it comes to accepting comment, to be sure that a commenter does not miss their opportunity.

CHAIRMAN DELGADO: I stand corrected. You're absolutely right. So we'll start at the listed time, which is one o'clock local time.

Any other clarifications? Questions?

(No response.)

Okay, we are in recess.

(Whereupon, the foregoing matter went off the record for lunch at 11:38 a.m. and went back on the record at 1:05 p.m.)
CHAIRMAN DELGADO: Okay, we're ready to start.

We are now into the second part of our program for today, which is public comment.

Before starting, however, I would like to read the policy for public comment that is stated in our Policy and Procedures Manual. It has seven points and I will read all of them, starting with No. 1.

"All persons wishing to comment at NOSB meetings during public comment periods must sign up in advance." And that has happened.

"A person will be called upon to speak in the order they sign up. Unless otherwise indicated by the Chair, each person will be given five minutes to speak.

"Persons approaching the Board should give their names and affiliations for
the record." And I will be reminding all speakers of that.

I'll just skip to the next one.

"No person will be allowed to speak during the public comment period for more than 10 minutes."

And the most crucial I think is the following: "Individuals providing public comment will refrain from personal attacks and from remarks that otherwise impunge on the character of any individual on the Board or the members, on the program, or the public."

So I'll be asking that of the public, and I'll be very careful with that.

All right, on that note, we have some other groundrules on the part of our Secretary.

MEMBER HEINZE: Part of my duties as Secretary are to assist those speaking with their time management. So I have my timer. Five minutes. When you have one minute left, a big yellow sign. When you have used up your
time, stop sign. So, hopefully, everyone will be able to see those.

CHAIRMAN DELGADO: Thank you very much.

There is one clarification there on the part of our Director.

MS. FRANCIS: I didn't hear if you actually said this; I was talking to someone up here, but I just need to make sure that, if you have written comments that you want passed out, that when you come up here, check in with me before your comment time, and bring me the comments, I will pass them out.

I guess you'll bring the first person up, and then there will be someone on deck each time?

CHAIRMAN DELGADO: Yes.

MS. FRANCIS: And you also need to state your name and your affiliation for the record at the beginning of your talk for purposes of the transcript. That would help us a lot.
CHAIRMAN DELGADO: Good. Thank you.

All right, any other comments, announcements?

(No response.)

Let's move on to our first speaker, Ed Maltby, representing NODFA.

After will be Charlotte Vallaeys as a proxy for Mark Costell.

MR. MALTBY: My name is Ed Maltby. I'm the Executive Director of the Northeast Organic Dairy Farmers' Alliance and Administrator for the Federation of Organic Dairy Farmers, which is a national umbrella organization for dairy farmers across the country.

What I am going to, I should say, read -- but nothing I'm going to say today is in any way new, and that is the problem. We have an access to pasture rule that isn't due to come out for quite some time. We have an industry that is split. We have an organic
consumer which is questioning the integrity of the organic seal in a very public way, so much so that once the integrity of the seal is diminished, then the consumer, the farmer, the marketer, the industry as a whole will lose the credibility necessary to justify the increased profitability for every sector of the industry.

Now in looking at the access to pasture rules -- and I was on a conference call last week with organic dairy farmers across the country, and they had a few suggestions as to how I might present myself today, 100 percent of which I ignored because your caveat in starting was to be polite and not insulting.

One of the suggestions was I should bring some stale milk and put it around the room, so that you wouldn't forget the crisis that organic dairy farmers are in.

To get back to the necessary regulations, and this is nothing new, 120
days, 30 percent dry matter has been out there now for two years, three years, four years. So we're not suggesting anything different from what the NOSB recommended many years ago. We're not looking for anything new. We're looking for something to be published.

To that extent then, we continue our lobbying at the USDA. Last month myself, a representative from the National Organic Coalition, and Horizon Organic met with the Under Secretary for Agriculture and expressed our deep concern with what was happening and the delay. We need something out. We need something that recognizes exactly what the NOSB put out there, not in part, but 100 percent, so that will retain the confidence of farmers who have been struck not just with one crisis, but with three or four different crises.

You all know the price of diesel, $4.80 or $4.90 a gallon. You know the price of health insurance. You know that farmers are
suffering. You know that farmers are going out of business and going back to conventional, and now is the time to act.

We need to have clear direction to the certifiers: This is how you measure access to pasture. Many certifiers are doing that now, but we don't have a level playing field across the country.

That should be a relatively straightforward thing to do. It is welcomed by both small farmers, not small farmers but farmers who have small herds. Most of the farmers with small herds are rather large, but -- one minute left. But it is welcomed by small and large farmers across the country in arid areas where land is irrigated, California, in the Midwest, in the Northeast.

Anytime any of you need any substantiation of that, go to the NODFA website, and it's a bit easier to navigate than the USDA NOP website, which is, of course, coming along very nicely, and thank
But before she shows me the yellow stop sign, which when I'm driving I disobey routinely, origin of livestock, last third of gestation, we need it; we need it now. We have to stop farmers who are going to enter the industry doing so under false pretenses.

We have to have enough information so organic dairy farmers can plan for the future, can invest in livestock, can invest in the land base they need to farm sustainably for the future.

Thank you very much.

CHAIRMAN DELGADO: Mr. Maltby, please --

VICE-CHAIR MOYER: Ed, can you return to the podium? Thank you.

CHAIRMAN DELGADO: We have a question here from Dr. Karreman.

Go ahead, please.

MEMBER KARREMAN: Ed, regarding the farmers in economic crisis, one of the things
that I read about definitely on some of the LISTSERVs, one in particular, is that because of the large certified organic dairy farms, the small certified organic dairy farms are getting -- you know, they don't have the economies of scale and whatnot, and if there weren't that many, it would be a lot better.

So how many, roughly, how many of those large organic dairy farms do you think there are that are actually -- do you have any numbers somewhere that show that the large organic dairy farms are actually, you know, truly affecting directly the small farms?

That is one of the reasons for the pasture rule, of course, is that all the cows will be out, and apparently the larger farms might not be able to make that. Therefore, there will be smaller farms left.

So I guess I'm just asking, do you have any clue about how many of those large farms that you feel or your group feels that might not be in compliance with the current
rule that are affecting things right now?

MR. MALTBY: I think the problem is that they probably are somewhat in compliance with the current rule. The current rule is not specific enough.

If you look at the reasons why you need an access to pasture rule that defines quantifiably just how much grass or forage crops that need to be grazed is what consumers expect. That is what is on every carton of milk.

So you need the cows out there in their hobbie-fours. They need to be out there grazing.

If you look at the number of large dairies coming online, then we are talking perhaps eight to ten 5,000-plus cow dairies which are going to come online unless some regulation comes out that clearly defines what they need to do and what land base they need to have.

Now if you look at 5,000-cow herds

NEAL R. GROSS

www.nealrgross.com
and multiply that by 10, that's 50,000. The
most conservative estimates, we've got under
200,000 organic dairy cows in the country. So
the math is quite simple.

When there was a surplus a year ago, people were talking about a wall of milk.
Well, unless we get definition on exactly how many acres you need to sustain a large dairy
herd, then we will have a wall of milk coming from the West and the Midwest that is going to
drive small family farmers out of business.

CHAIRMAN DELGADO: Mr. Engelbert?
MEMBER ENGELBERT: Yes. Ed, I think I may resemble one of your remarks.

(Laughter.)

MR. MALTBY: It wasn't directed at you, Kevin.
MEMBER ENGELBERT: I have a number that I heard of family farms in the Northeast
who have gone out of business. But do food farmers in NODFA have an official number? Do
you know how many farms have gone out of
business in the last year?

MR. MALTBY: We don't exactly
because it is very difficult to calculate. We
know that at least 25 organic dairy farmers
have stopped shipping organic milk. Some have
gone back to conventional. Some have gone out
of business.

What we do know is that one
supplier of organic feed in the Northeast said
his receivables went from 500,000 back in
September of '07 to 1.5 million. So you are
seeing farmers who are in debt. You are
seeing farmers who have used their savings.
You've got farmers whose line of credit has
run out, and expect something catastrophic to
happen this fall, which is not going to do the
integrity of the seal any good.

MEMBER KARREMAN: I guess I have
one follow-up question, if I may. My
question, more specifically, is perhaps, do
you have any numbers about the amount of
consumers that have backed off buying organic
dairy products because of this perception out there with the large farms skirting the rules, or whatever, you know, like you all say?

MR. MALTBY: Right, and we don't have those figures yet, but if you look at anecdotal accounts in newspapers, you see that people are backing off from apparently paying extra for organic milk.

Our study shows that the retail price of organic milk in the marketplace is, in fact, slightly less than it was two years ago. So it is not price.

So if you take that information, then it is questioning the integrity of the seal, and whether they should pay extra for that, and what does it do to benefit their environment, their children's environment, and in my case my grandchildren. I don't look that old, but I had kids when I was young.

(Laughter.)

MEMBER KARREMAN: Thanks.

CHAIRMAN DELGADO: Any other
questions?

(No response.)

Thank you very much.

MR. MALTBY: Thank you.

CHAIRMAN DELGADO: Up next is Charlotte Vallaeys. After her is Mitch Johnson.

MS. VALLAEYS: Hi. My name is Charlotte Vallaeys. I'm a Farm and Food Policy Analyst at the Cornucopia Institute, and I have a proxy statement for Mark Castell, who is the Co-Director of the Institute.

Mark would like me to share with the Board our concern for the lack of enforcement of the organic regulations for these large dairy farms and the apparent favoritism toward certain corporations at the compliance level.

He has asked me to read the following sections from a press release issued by the Cornucopia Institute earlier this month:
"The Cornucopia Institute has filed a formal legal complaint with the USDA claiming that one of Dean's Horizon suppliers, a dairy in Snelling, California, was skirting the law by confining the majority of their cows to a filthy feedlot rather than allowing them fresh grass and access to pasture, as the federal organic regulations require.

"Cornucopia has also asked the Inspector General at the USDA to investigate appearances of favoritism at the agency that has benefitted Dean Foods.

"Cornucopia charges that past enforcement of the Organic Foods Production Act, the law governing organic food labeling and production, has been unequally applied toward major corporate agribusiness by the USDA.

"We are asking the USDA, once again, to investigate serious alleged improprieties at dairies that produce Horizon organic milk.
"Besides the legal issues that Cornucopia raised, they suggest Dean Foods has seriously injured the value of its Horizon label and the reputation of organic milk. In the eyes of consumers, factory farms with questions about humane animal husbandry and records of endemic pollution do not meet the ethical litmus test.

"Cornucopia's most recent complaint is the third filed with the USDA alleging Dean Foods has broken the federal law that governs organic production. Prior complaints also charged Dean with confining cattle on their two corporate-owned dairies, managing as many as 8,000 head of cattle each.

"Although the USDA, based on Cornucopia research, sanctioned or decertified two independent factory farms supplying Horizon, the federal agency dismissed both legal complaints against Dean Foods itself.

"According to documents obtained under the Freedom of Information Act by
Cornucopia, the USDA never investigated or even visited Dean's largest corporate-owned industrial dairy in the desert-like conditions of central Idaho.

"It appears that Dean Foods has more political clout in Washington than the two independent factory farm operators that were found to have been abusing the trust of organic consumers.

"According to FOIA documents, Dean Foods hired lawyers at Covington and Burling, one of the Capital's most powerful and influential legal and lobbying groups, to plead their case.

"The USDA closed complaints we filed in 2005 and 2006 without ever having visited the Horizon dairy in Idaho and warned Dean Foods in advance before inspecting their Maryland farm.

"In a letter to USDA Inspector General Phyllis K. Fong, Cornucopia asked her to investigate why the agency arbitrarily
chose to adjudicate some of the formal legal complaints filed by Cornucopia, but looked the other way when it came to the largest corporate dairy processor and marketer in the country for almost identical alleged offenses.

"Cornucopia's letter stated conditions on the 8,000-head factory farm operated by Dean in Idaho were very similar to the factory farms that the USDA has already sanctioned. The only discernible difference appears to be how much money Dean Foods has spent on lobbyists and campaign contributions in Washington."

We would like to stress that the current rules are enforceable, as evidenced by the enforcement actions against Aurora and VanDrake. So we ask the Board to be on record to support strong and even-handed enforcement against all marketplace players no matter how large and powerful.

Furthermore, we urge the enactment of the new regulatory language controlling
pasture and the origin of livestock. These must be no less strict than the standards are today, only easier to understand and enforce.

Thank you.

CHAIRMAN DELGADO: All right, thank you.

Any questions from the Board?

Dr. Karreman?

MEMBER KARREMAN: Just a simple -- not a simple point, but it's conventional and organic. Regarding animal welfare and how animals are kept, I've got to say that on some of the larger farms, animal welfare is better than on some of the small farms I see. I'm just saying that. You can't just take a broad brush and say large farms, 1,000-2,000 head, conventional or organic, have bad animal welfare.

I'm in the industry. I just want to correct you on that.

CHAIRMAN DELGADO: Okay. Ms. Miedema?
MEMBER MIEDEMA: I just wanted to
add to my colleagues on the Board and to our
Chair, I do take exception to this pulpit
being used as a forum for unfounded
allegations, and we're going to have a really
long three days if this is the type of
information that flows to us.

CHAIRMAN DELGADO: Okay. Well, I
do have to remind the member of the Board that
this is public comment, and we are obligated
to listen to those comments. Whether we agree
with those or not, or whether we think those
comments are appropriate for our mandate, it's
another story.

MEMBER MIEDEMA: I question whether
enforcement is under the purview of this
Board.

CHAIRMAN DELGADO: Absolutely.

Okay, any other comments?

(No response.)

Thank you very much.

Up next we have Mitch Johnson,
please, and after Mr. Johnson is Patty Lovera.

MR. NEWCOMB: Actually, I'm Harold Newcomb, and I'm a cattle tech services veterinarian for Intervet/Schering-Plough, the petitioner to add Fenbenzadole to the National Organic Standards as a parasiticide --

MEMBER HEINZE: Could you spell your name, please?

MR. NEWCOMB: Ma'am?

MEMBER HEINZE: Could you spell your name, please?

MR. NEWCOMB: N-E-W-C-O-M-B.

MEMBER HEINZE: Thank you.

MR. NEWCOMB: Anyway, we wish to add Fenbenzadole to the National Organic Standards as a parasiticide to be used as an emergency treatment in dairy and breeder stock.

We appreciate by unanimous vote the NOSB Livestock Committee recommended Fenbenzadole to the National List in accordance with Section 205.238 of the
National Organic Standards.

We also want to acknowledge the National Organic Program's decision to allow the petition to be advanced under the 1999 TAP review of Fenbenzadole, Ivermectin, and Albendazole.

Parasite control today stands as perhaps the major factor limiting development of certified organic livestock production. Fenbenzadole addresses this need in a manner much more compatible with the principles of organic agriculture than can be offered by Ivermectin or Moxidectin.

Certainly management practices are the foundation for parasite control in organic livestock production, but the same section that requires organic producers to maintain preventative livestock health practices also requires producers to use appropriate medication to restore an animal to health when methods acceptable to organic production fail.

In addition, animals on pasture
naturally have more exposure to parasites than those in confined situations. Current biological and natural parasite controls are not always effective to control emergency outbreaks of internal parasites.

While Diatomaceous Earth is effective in controlling external parasites, there is no scientific evidence regarding the efficacy of this product on internal parasites.

Controlling internal parasites should never be the main motivation for adding Diatomaceous Earth to the feed.

Organic livestock producers approached Intervet a couple of years ago to request that we petition Fenbenzadole as marketed under the commercial name of Safeguard for approval as an allowed parasiticide under Section 205.603 because Fenbenzadole offers three major advantages.

No. 1, Fenbenzadole is not a macrolide antibiotic. Fenbenzadole is part of
a class of compounds called Fenbenzadoles. By contrast, Ivermectin and Moxidectin are both macrolide antibiotics. As such, they are inherently inconsistent with organic management practices. In fact, the Secretary of Agriculture in 2006 initially refused to accept the NOSB's recommendation to add Moxidectin to the National List for that reason.

Secondly, Fenbenzadole is benign to dung beetles, earthworms, and other beneficial microorganisms. Dung beetles recycle nutrients in pastures and control horn flies and face flies. A single manure pat can generate 60 to 80 adult horn flies if protected from insect predators such as dung beetles. Fly populations have been shown to decrease significantly in areas with dung beetle activity.

Ivermectins have a broad range of activity in nematodes and arthropods as well. By contrast, Fenbenzadole only targets
nematodes. Studies cited in our petition document the benign impact of Fenbenzadole on the dung beetle, earthworms, and other beneficial microorganisms.

Third, parasite resistencies grow into the Avermectins or Ivermectin. The repeated use of the same drug class contributes to the development of resistance by parasites. Parasite resistance to Ivermectin compounds is well-documented. In contrast, little resistance to Fenbenzadole has been shown during the past 20 years.

In summary, Fenbenzadole represents a viable resource that will allow organic producers to have access to an appropriate medication that will not violate the principles of organic production. We strongly urge that NOSB adopt the recommendation of the Livestock Committee and recommend the addition of Fenbenzadole to 205.603 of the National Organic Standards.

CHAIRMAN DELGADO: Any questions
from the Board?

(No response.)

Okay, I hear none.

Thank you very much.

So Ms. Lovera, and after that is Harriet Behar.

MS. LOVERA: Hi. My name is Patty Lovera, and I'm the Assistant Director of Food and Water Watch, which is a consumer organization based in Washington, D.C. I'm here today to speak about the aquaculture recommendation.

I just want to start off by saying that we represent consumers, and our members especially communicate with us that they have very high expectations of the organic standard in general, and the credibility of that standard is what I am here to talk about, and aquaculture is no exception.

So Food and Water Watch has longstanding concerns about aquaculture in general, especially done in the open oceans.
So the issue of open net pens and wild fish used in meal or oil are two practices we are very concerned about. We think they have such high environmental impacts that it makes them incompatible with the principles of organic production.

So, therefore, with the recommendation you all are considering at this meeting, we were pleased to see Section 252(b) that says there will be no use of wild fish meal or oil in feed, but we have concerns about a couple of the other sections in the recommendation.

The first concern we have is with Section 252(a), which allows the use of fish meal and oil from carcasses, viscera, trimmings from processing of foreign certified organic farmed aquatic animals to be used in fish feed for domestic organic production.

We have concerns about this on a couple of levels. One is as a process question, whether it is really good precedent
just to declare a foreign process basically equivalent to a U.S. process that doesn't yet have a standard. So we are very concerned about the order of events there if we don't have a U.S. standard yet, but we're allowing foreign organic products to come in and be used in organic production here.

Then we have very specific concerns about some foreign standards for organic that allow things like antibiotics and parasiticides to be used that we feel don't match up with the livestock standards we have here.

The other section we are concerned about is 252(1), and we're a little bit confused about this one because it specifies where you can't get fish meal and oil from. You can't come from fisheries that are overfished or at risk, which doesn't seem compatible with Section (b) that says you can't use it. So we are a little bit confused about why that is in there. We think that
that is unnecessary if Section (b) says you're
not to use wild fish meal or oil.

The final point on aquaculture I
need to make is we are very concerned about
any proposal to allow a transitional or a
made-with-organic ingredients label for
aquacultured fish. We don't feel like that is
an acceptable interim solution while we are
still having this debate. We need to figure
out what the standards are going to be, come
up with a good standard, and we don't think
that an alternative label or an interim label
is an adequate solution to the current debate
that we are having.

So I think, rather than repeat the
comment I made six months ago, I will just say
that we are very concerned about kind of the
sense we get from this recommendation and from
some previous debates, that there is this
pressure to have a standard for carnivorous
fish. We don't think that that is the way it
is supposed to work with organic if organic is
going to remain credible with consumers. We don't want to see the standard stretched to meet current practice. The industry practice has to come meet the standard, and the standard has to remain very high for organic to be credible with consumers.

Finally, I will just say, to save some time, we are a member of the National Organic Coalition, and you are going to hear comments from them later that we fully support about grower groups and the need to maintain that issue for growers, and also for the issue of materials and the national lists. We think that this is a huge issue of credibility for organic consumers to trust the standard, and we think there's a lot of process issues that have to be cleared up with the way materials are being added to that list before we add a lot more.

Finally, I just have to also point out that the issue of pasture and figuring out
that pasture rule is another huge credibility issue with consumers.

Thanks.

CHAIRMAN DELGADO: Okay, thank you. Questions? Yes, Ms. Hall?

MEMBER HALL: On the fish meal and oil, in the interest of trying to reduce the burden on wild stocks, and also try to preserve a natural diet for piscivorous species, where would you suggest they get their diet?

MS. LOVERA: We think that it isn't going to be an automatic that carnivorous fish immediately can be organic. So I know there's some companies exploring raising fish organically, herbivorous fish organically, to then turn them into feed for carnivorous fish. If that takes longer, that is the sequence of events. We just don't see wild fish being an acceptable bridge to that because of the environmental impact that it has.

CHAIRMAN DELGADO: Yes?
MEMBER SMILLIE: Patty, since you're the first aquaculture person, I thought I would take the opportunity to forget about the details for a second and try to figure out where your group, what you want out of this. Because I had participated in the beginning on the aquaculture debate, and to me the recommendations that the Livestock Committee has come up with have really gone through a lot of the details and they've gotten down to like what they consider the barest minimum, and a possible future organic aquaculture industry may or may not even be able to grow or survive or even start with what currently is being recommended.

The end game for your group, surely you want to support an organic aquaculture industry because most of your complaints, which are valid and legitimate, are against conventional aquaculture. Don't you feel that we have to find a middle ground, a compromise position, so that we can start an organic
aquaculture industry that can be replaced, hopefully, by consumers voting at the marketplace with an organic aquaculture industry?

But if we kill, if we don't allow this organic aquaculture industry to start, then there won't be really a real competitor to the conventional aquaculture industry that seems to be at the core of most of your issues.

So I just wanted to ask you philosophically, has your group thought about the strategic end game in this? Do they want to support an organic aquaculture industry to compete in the marketplace with the conventional industry that causes all of these problems that you have noted?

MS. LOVERA: I think that the definition of organic is what we are talking about, and if it is only able to be done for certain fish, then it is only able to be done for certain fish. I don't think we want to
sacrifice the credibility of the organic standard for all foods to deal with the issue of aquaculture, and that is a concern that we have.

So we don't think that this is the only way to deal with the negative impacts of conventional aquaculture. We're doing plenty of other stuff to try to deal with that as well. There are fixes that need to be made there, and it is not only going to be duked out in the market with organic versus conventional.

I mean we have to stop the environmental impacts of conventional production and we have to have organic production when it is appropriate and when it meets the criteria of what people expect of organic.

MEMBER SMILLIE: Right.

MS. LOVERA: I mean I don't think we have any reason to bend that in some kind of short-term battle.
MEMBER SMILLIE: One of the problems we face is that it is such a different thing to deal with. In the conversations with the Aquaculture Working Group and many, many others, we have realized that some of our organic rules, which we hold steadfastly to, don't seem to fit, and we need to spend more time in trying to figure out what organic and aquaculture mean. Because if you just take livestock rules or the current feed rules we have, sometimes they just don't fit with the aquaculture realities. We are working off a terrestrial basis.

I mean you will hear more at this meeting about hydroponics, how it can't possibly be organic, and aquaculture is a very hydroponic operation in many ways.

So what we are looking at in aquaculture is trying to figure out how organic integrity fits with aquaculture. If we hold a strict terrestrial definition, it will be problematic, but I understand your
point. It was a good answer. You answered my question.

MS. LOVERA: Yes, but we just have the concern that in the short term I sympathize; I don't envy you guys the job you have to do, but there are bigger credibility issues at risk to solve this one problem of aquaculture. I don't think that that is worth it for organic as a whole. I mean we have to put that integrity first.

MEMBER SMILLIE: Like the foreign fish example?

MS. LOVERA: It makes us very nervous, yes.

MEMBER SMILLIE: Okay.

CHAIRMAN DELGADO: Jennifer?

MEMBER HALL: I would share that I have equal concern about the integrity of the label and aquaculture as a whole. However, I do think, like Joe suggested, that there does need to be some point at which we can start, and that if it is all noes, then the
legitimate concerns you bring up about conventional aquaculture, consumers do respond to that. I do worry that then that just hyperinflates the demand on wild stocks which are already in great jeopardy.

CHAIRMAN DELGADO: Hugh?

MEMBER KARREMAN: If the Livestock Committee were to amend its position on the foreign organic fish such that they cannot have had parasiticides or antibiotics, would that be helpful?

MS. LOVERA: Compared to some people in this room, I'm a newcomer to organic, but my understanding is that to declare a foreign standard equivalent, you have to have a U.S. standard. So I'm a little bit confused about the order of events of allowing that in.

MEMBER KARREMAN: Yes, I'm not trying to get to that point right now. I'm just saying that if there were foreign fish coming in, let's just say, and they were
certified not to have had antibiotics or parasiticides, would that allay some of your -- there's one point that you mentioned on that?

MS. LOVERA: Yes, I mean that would be a start, and we would have to then go look at, are they using that and some of the other concerns that we have that just aren't on the table for this agenda.

CHAIRMAN DELGADO: Any other questions?

(No response.)

Thank you very much.

MS. LOVERA: Thanks.

CHAIRMAN DELGADO: Ms. Harriet Behar, and on deck we have George Lockwood.

MS. BEHAR: Hello, everyone. I'm Harriet Behar, a certified organic grower, an organic inspector, and an educator with the Midwest Organic Sustainable Education Service. I have a few comments on a few different things.
Commercial availability of seed recommendation, the proposal as written puts a tremendous burden on producers, seed suppliers, and certifiers. For agronomic crops, the vast majority of the organic corn, beans, small grains, and legume seeds are now certified organic. However, the availability of organic vegetable seeds is limited.

The marketplace would be better served by having the seed breeders survey the needs of organic farmers and produce seeds to meet those needs. This would get more to the heart of the issue than producing voluminous lists from each certifier.

On aquaculture, the proposal allowing foreign-certified wild-caught fish meal to be used as feed for NOP organic fish puts our domestic producers at a disadvantage, stating that a lower standard certification from a foreign entity is allowed while requiring a higher standard from any domestic producers.
The proposal to test the wild-caught fish for contaminants also takes us down the slippery slope of having the organic label be based in a testing regime and not in a production system.

The NOSB and the NOP should not be pushed by the marketplace to come up with something to meet the marketplace demand for a cleaner fish. The final standard should be consistent with all other NOP standards; otherwise, we risk the lowering of consumer perception for all categories of organic labeling.

Grower groups: Calling this a multi-site certification process goes beyond the original issue brought before the NOP and does not take into account fundamental differences between farmers and retailers/handlers. Farmers are part of a community where there is peer pressure to remain true to production standards set by that community. Farmers manage their land
from year to year, and it remains within the family as well as for generations.

Handlers are hourly or salaried employees who may lose their jobs if they do not perform their work satisfactorily, but would not lose their homes and livelihoods if they do not follow their organic protocols.

The retail environment is notorious for employee turnover, losing the consistency needed from year to year to continuously improve the organic management system.

This proposal to improve internal control systems should be returned to only include farmer producers with any discussion of multi-site certification for retailers or handlers to be part of a completely different document which would address the significant differences between the two types of operations.

TAP reviews: At this time, TAPs are not needed for items on 205.606. It appears that the decisions on these 606 items
are being made solely on the petitioner's statements without any further impartial analysis done in the marketplace. There is no review of the environmental or health effects of the conventional farming or processing practices to produce these items on 606, which is clearly required by OFPA.

After Harvey, there was a tight deadline to have items on 606, and for expediency TAP reviews were not done. However, this should not become the status quo. With the increased funding of the NOP, these TAPs should be instituted.

The presence of okra on 606 and petitioner's justification is one example. I also noted that there was no TAP done on the cheese wax to be reviewed during this session. Again, the NOSB is relying only on those who support the petition to support them with their information, which inherently will be one-sided and not impartial.

Q&As on the NOP website: It is
impossible for the NOP staff to have deep knowledge on every subject, resulting in errors on the website.

One example is whether honeybees can be certified organic. Comparing honeybees to poultry shows a great lack of knowledge in the biology of honeybees.

There is a good NOSB recommendation on apiculture which addresses not only the origin of honeybees, but also the beeswax within the hive which will need to be transitioned. Many entomologists suspect the high concentration of toxic substances used in beehives is a cause of colony collapse disorder, and ignoring the honeycomb issue as well as lack of understanding of bee biology makes this an unworkable answer.

Q&As should be verified as correct by running them by a knowledgeable person, such as Nancy Ostiguy or a member of the NOSB Apiculture Task Force for this specific question.
Methionine, I would hope that some dollars could be found to fund the research on a methionine replacement. Relying only on the marketplace to do this is resulting in a continual extension of the sunset of this clearly prohibited substance. All synthetic amino acids are prohibited in the OFPA.

Lastly, I ask the NOSB to request from the NOP to hire employees with strong technical backgrounds, especially in the materials area, from the increased funding which all of us worked very hard to get in the 2008 farm bill.

Thank you.

It is a big handful. You have a lot of things on your docket that we have to comment on.

CHAIRMAN DELGADO: Thank you.

Questions from the Board? We'll start with the Vice-Chair.

MS. BEHAR: Hi, Jeff.

VICE-CHAIR MOYER: Hi, Harriet.
You did a good job reading very fast.

(Laughter.)

MS. BEHAR: And you have it in front of you.

VICE-CHAIR MOYER: We do. Thank you.

On your comments on commercial seed availability, you said the proposal as written would be a tremendous burden. Can you explain more about that, how tremendous that burden is?

MS. BEHAR: Well, you are asking certifiers to keep lists of all the items that they are approving as not commercially-available. At this point, that's done at the inspection level. It's not always present in a database of the certifiers.

I personally am a certified organic grower. I probably have purchased 30 percent of my organic vegetables or my seeds as organic for my vegetable operation, but 70
percent not organic because I couldn't find it. That is probably about 250 kinds of seeds.

So imagine if a certifier has a hundred vegetable growers. Do the math. They are going to have to maintain these lists. We are asking the seed suppliers to respond back to every vegetable grower that they don't have these 300 vegetable seeds. It is just a tremendous paperwork burden.

VICE-CHAIR MOYER: But as a grower, do you not already make a list of the seeds that you have or that you purchase?

MS. BEHAR: Yes, but I don't have it electronic. They would have to enter it in some kind of database. There would be these voluminous lists done by the certifiers, basically, to service a marketplace demand, where I think the seed people, they should be surveying their marketplace to see what producers want. It may not only be by variety.
The vegetable producers may want certain characteristics; there isn't even a variety available right now. So the marketplace would actually get more information that they need from a survey rather than just finding out that they can't get tyee spinach organic, because they are not finding out from the producer why do they want tyee.

CHAIRMAN DELGADO: Mr. Davis?

MEMBER DAVIS: Harriet, I just wanted to point out that your assertion that certifiers would have to collect and make a list and compile all this, that is not correct. That is not what the recommendation suggests.

So the recommendation purely is that certifiers act as the channel for the growers' list just to collect them, not compile them into a further list. So I just need to point that out.

MS. BEHAR: But the inspector is
usually seeing that on site. It is not always
going back to the certifier because, again, of
the large amounts. You know, there is a kind
of long list there.

And in the areas where we haven't
had a problem, I know in the Midwest -- I am
not sure about the East Coast, but I would say
65 to 70 percent of all the corn, soybeans,
small grains are organic seeds at this point.
Really our lack is in the vegetable area.

CHAIRMAN DELGADO: Any other
questions?

(No response.)
Okay, thank you very much.
Mr. Lockwood, and after that is
George Leonard.

MR. LOCKWOOD: Thank you, Mr.
Chairman. It is, indeed, a great pleasure to
be here today. I'm appreciative of this
opportunity.

I would also like to say that,
since we began this journey with the National
Organic Standards Board in 2005, we greatly appreciate the attention, the interest, the patience, and the diligence that you have provided, and particularly your Livestock Committee. It has been a pleasure working with them over the last several years and a multitude of a conference calls.

You mentioned the number of calls that you have had. I think the Livestock Committee must have the record of the majority of them.

We have carefully considered the proposal after working with the Livestock Committee, what they have proposed, and we are very concerned that perhaps it is not the most workable solution.

I would point out that, since 2006, the Board has been involved in many different meetings and discussions, including a symposium. Our 12-member professional group has participated in all of these. We have carefully considered what the proposal is, and
we, frankly, believe that it is just too risky at this time to place all of aquaculture in what is being proposed.

In what we had proposed back in our interim final report in the year 2007, which was basically adopted with some exceptions, we were of one mind. There was no minority report, and we still are of one mind, that we are unanimous in what we are recommending.

To make our recommendations short, sir, what we simply would like to suggest is what we originally suggested, what we originally proposed to be adopted. We think that there is merit to what the Livestock Committee is proposing here, and perhaps it could be included as Item Q that fish meal and oil from carcasses, viscera, and trimmings from the processing of foreign certified organic farmed aquatic animals will be considered organic for the use in fish feed only.

And the risks are simply this has
never been done before. The equivalency part of the law gives us great concern that the Secretary is going to have to determine a foreign certifier to be equivalent to what we have in the United States. The only way we can possibly see this working is if a grower is to grow to, say, a Natureland standard and to your standards simultaneously, so that that fish could possibly be used as a source of feed.

A second big concern we have is in oil. Right now there are no ways of producing the equivalent of fish oil. That may come, but it is far from certain at this particular stage.

So that is our recommendations, sir. We are just concerned whether or not the equivalency requirement really can be met in an expedient way.

I would also say that at one time the Livestock Committee was considering a phaseout of fish meal and oil. We support
that. If that is what the Board wants to do, we think that is a workable condition.

But when it comes back to what we really recommend, we all feel what we originally proposed was, indeed, the best way to make a viable aquaculture industry organic or to make organic aquaculture viable.

Thank you, sir.

CHAIRMAN DELGADO: Thank you.

Any questions? Yes?

VICE-CHAIR MOYER: Thank you for your comments, George.

A question: If I go down to the supermarket today and buy organic fish, where and how is that produced?

MR. LOCKWOOD: Well, Natureland and the Soil Association are certifying fish that come into the United States under very different standards. As one of the previous speakers pointed out, they allow antibiotics and other prohibited things that we don't allow here.
VICE-CHAIR MOYER: I understand that. So what our position was is that we're trying in some way to accommodate your needs and also the needs of the previous speaker. So when we have an aquaculture working group, an industry, that's not 100 percent happy, and we have an environmental group that's not 100 percent happy, I think we are working on the right track here as a Board, because it is a fine line for us to try to walk.

What we are also trying to do is make it possible to remove that organic fish from the marketplace and substitute it with a U.S. standard that I think is going to be quite a bit higher than what you are seeing there. They would not be able to sell that fish today in the marketplace if this standard that we have proposed would be in place. In fact, they would only be able to use the trimmings of that fish to feed these fish at a very low percentage, 12 percent fish meal and 12 percent fish oil. So that is our goal.
MR. LOCKWOOD: Well, first of all, Jeff, we're not unhappy. We are very, very pleased with the progress that has been made.

VICE-CHAIR MOYER: Good.

MR. LOCKWOOD: We just want to make sure that what is finally adopted here is workable, and we have serious questions, as the 12 of us who are professionals in this field, seven PhDs, we are just very concerned that it may be very difficult to implement.

VICE-CHAIR MOYER: Okay.

MR. LOCKWOOD: That is our concern.

CHAIRMAN DELGADO: Yes, Dan?

MEMBER GIACOMINI: George, regarding the foreign fish meal and fish oil, if that were to go through, meet muster, meet legal challenges, whatever else, would that create a disadvantage to the U.S. aquaculture, fish farmers, as far as getting access to that or do you think that would all just be staying in country and shipping out the fish at the end?
MR. LOCKWOOD: Dan, I have heard a number of people, U.S. growers, who are very concerned about what you just mentioned, that this is discriminatory against the U.S. farmer.

My feeling is that if a U.S. grower wants to get Natureland to certify their crops, that they could probably grow to these standards. I think that is unprecedented. I have never heard of it being done. Maybe you all who are in the business know how that is being done. But, yes, it is a concern.

CHAIRMAN DELGADO: Yes, Kevin?

MEMBER ENGELBERT: Yes, George, briefly, I just want for the record to know that we have done the best we could with what our parameters were. We were told that wild-caught fish oil and fish meal simply will not be allowed when the OPIA writes the rule. When it says organic, it's got to be organic.

Hugh brought up the suggestion, well, there are foreign-certified operators...
selling fish in the United States. If we added onto that recommendation that no prohibited substances be allowed, would that be something that you think would be workable?

As Jeff said, we've got to have some way to get these -- and that you have said, too -- we have got to have some way to get these oils into the system to start the process. Maybe it won't start all at once, but we've got to do something. If we are going to have an organic aquaculture, we've got to bring them in some way.

MR. LOCKWOOD: Kevin, let me say I know how frustrating it has been for all of you, and we share the frustrations and we, again, have great appreciation for all that you have done in that area.

Our biggest concern, again, is workability and equivalency. This has never been done.

What you are saying is, if you were to proscribe antibiotics, and so forth, would
this be equivalent? I don't know. It really boils down to the equivalency concern.

MEMBER ENGELBERT: Equivalency wasn't our main objective. We were simply looking for a source of these fish meals and fish oils that would still qualify as at least some type of organic. Because there are fish processors, from what we understand, being certified by foreign entities. That would provide a source for these oils.

We are not saying that their standards are equivalent, but we are looking for something that would qualify as organic, even though it is not USDA. But once our standards are in place, then everyone would have to meet those.

MR. LOCKWOOD: Well, again, the law requires that the foreign standards be equivalent, whatever that means. It is my understanding that has never been tested in terms of putting it into rules and implementing it. That is one of our major
concerns.

CHAIRMAN DELGADO: Okay, we have Dan, followed by Jennifer.

MEMBER GIACOMINI: I just feel I want to respond to what Kevin just said. We did receive in our discussions, we felt we were receiving pushback from the program when we were discussing the step-down possibilities.

But I think we need to recognize that the discussions that go into rulemaking, for instance, using pasture as an example, the discussions that went into the original rulemaking of pasture is far different than what has gone into the discussions of the pasture document that they are working on right now.

I think whatever we send to the program will be reviewed within the entire scope of the law and the regulation. If Congress felt that it was okay to put into the law, into OFPA, that the Secretary would be
able to consider wild-caught fish to be certified or labeled as organic, knowing that they also had in there the restriction on the feed side of the issue, I think it is prudent of us to put forth the best document we can. If we want to try to see this industry go, we put forth the document that we think might do it and let those kinds of issues be resolved by the NOP. I think we are putting the cart before the horse.

CHAIRMAN DELGADO: Jennifer?

MEMBER HALL: I just want to respond to your comment that, in relation to equivalency, that this has never been done before. I would suggest that this whole recommendation as it relates to aquaculture has never been done before.

So I think we really took the time to sit with that and give ourselves the opportunity to think creatively, given it is a whole new realm. In so doing, the suggestion of using foreign-certified seemed like a good
certain step-up, knowing that those same suppliers, once we have a rule in place for aquaculture, they will be stepping up their own production to meet that regulation, so that they can have access to not the fish feed market, but the human feed market. So it would be a pretty short-lived window that perhaps a lower margin might be the source of feed for the bulk of the species, that over a pretty short window it would be not out of the realm to think that most of the supply would meet our standard anyway.

MR. LOCKWOOD: Our biggest concern, Jennifer, as I said, has more to do with oil than with meal. Farmed tilapia may well be the first source of fish meal. Unfortunately, farmed tilapia is not a high oil fish, and salmon and shrimp require larger, substantial amounts of oil in order to be healthy.

Let me also comment, Kevin. I appreciate that perhaps you have been told that wild marine resources are not going to be
allowed. We've considered that, and simply, as your professional group has sat back and said what we proposed originally is workable and it's still, we think, the only way we can see a viable organic aquaculture industry develop.

We have tried, you all have tried a number of different approaches, and we have, too. We are most appreciative of that.

When we sat back, all of us said what we originally proposed we thought was pretty good and that we have seen nothing that would be workable that is better at this time.

CHAIRMAN DELGADO: Any questions? Kevin?

MEMBER ENGELBERT: Just one real quick. To Dan's point, we have to make sure we make the distinction between feed that's being produced for human consumption and feed that's being produced for livestock. It all comes back to, well, if you can feed it to humans, why can't you feed it to livestock?
And you can. As authors of OFPA, we are still concerned about human consumption in that respect, just like we are right now with this fish oil and fish meal.

CHAIRMAN DELGADO: Any other comments? Questions? Joe?

MEMBER SMILLIE: I would just like to thank George and his working group for spending the time with us. I know it was very frustrating for you at many times. Our group certainly appreciated working with you. It was a very valuable collaboration, and hopefully, we will get somewhere with it.

MR. LOCKWOOD: Well, as Jennifer just said, we're all plowing new ground here or charting uncharted waters.

CHAIRMAN DELGADO: Okay, Kevin, please.

MEMBER ENGELBERT: Thanks for that. I meant to do that with my comments. I forgot. But right, we thank you a great deal, George, in all your patience with us and
working with us and explaining things, the whole nine yards. You've been great.

MR. LOCKWOOD: Well, you're welcome, and it has been our privilege, too.

CHAIRMAN DELGADO: Okay, any other questions?

MR. LOCKWOOD: We'll also be here tomorrow.

CHAIRMAN DELGADO: Great. Thank you, George.

Next is George Leonard, followed by Becky Goldburg.

MR. LEONARD: Good afternoon.

My name is George Leonard. I'm with the Ocean Conservancy.

First, I want to thank the NOSB, the Livestock Committee, and George Lockwood and the Aquaculture Working Group for these challenging issues on aquaculture. As you all know, this is hard stuff. This is the intersection of sustainability and organic principles. If it was easy, I think we would
have been done long ago. But I think we are making good progress.

We have submitted some comments to you in writing, myself and Cory Pete from the Monterey Bay Aquarium in California.

We were also participants in the Symposium you put on in the fall, where we tried to present some performance metrics on the issue of fish meal or fish feed and this issue of net pen aquaculture and the intersection of organic principles.

In preparing some comments this afternoon, I took a look at the comments that had been submitted. In many of those comments, particularly on the industry side, there's a lot of discussion of this issue of practicality; that is, can we do this? What are the implications in terms of industry development?

I think what this really boils down to is two issues that are at play. One is the practicality aspect, but the other is this
fundamental principle of organic and what organic means and being true to the label. These are sort of in some cases fundamentally at conflict.

I guess I would suggest that our comments kind of come at this from, if you need to make a decision going forward about which of those is going to persevere, I think we ought to probably start with principle and then bring practicality in secondarily.

I think the reason for that is the potential long-term damage to the brand itself if we focus too much on practicality, maybe something that it is difficult to recover from.

So given that, with the concept of starting first with principles, I would suggest that the work that the Livestock Committee has done is good progress. The exclusion of wild-caught fish meal and fish oil we think is a good thing. It is a very strong stance against this concept that wild-
caught fish can be declared organic. It is a strong stance for conservation. It is a strong stance that 100 percent of the ingredients in organic farm fish themselves have to be organic.

So all of that I think is good progress. It is a strong stance. We are in support of that.

The flip side, of course, is this issue of the use of foreign-certified products. That, obviously, causes some trouble. I think it causes trouble on a couple of fronts.

One is there's a real potential to confuse consumers if the standards on the feed inputs are different than the standards on the product coming out of that system.

In addition, I think there are some concerns about the standards of foreign certification, including the use of antibiotics, parasiticides, and those are the primary drivers. There are some other issues
as well.

So we remain concerned about that, and that is the reason we have been generally supportive of trying to come up with a U.S. standard that sets the bar for the rest of the world.

So, in a sense, I think that the desire on the practicality side to get a source of meal and oil for the industry to start off perhaps puts too much emphasis on the practicality issue and too far sacrifices the principal concept.

Now perhaps a way to move forward on this would be to focus more on sources, domestic sources of U.S.-certified oil and meal from byproducts of farm fish. I realize this potentially gets us into a bit of a circular argument, but that gets us away from the foreign certification issue.

I suppose secondarily you could work to a situation in which you allow the foreign-certified products with a phaseout
much as the Aquaculture Working Group was suggesting for wild-caught feed, as a potential to move away from that in the long run.

Either way, I think we recognize the fact that many producers are concerned that there simply won't be sources for certified meal and oil to get the industry up and running. I think that is a legitimate issue, but is one in which we need to stick by standards first.

I think, finally, we would just take exception in the minority opinion on this issue of farm fish generally eat wild fish, and as a consequence, we ought to use that as sort of a reason to continue to use wild fish meal and farmed fish -- I'm sorry -- wild meal and oil in organic fish.

We have put together a table for you from some basic literature on the wild diets of many of the common farmed fish. You will see that there's a whole diversity of
food products in the wild, including things like zooplank and phytoplank and algae, microinvertebrates, macroinvertebrates, and of course a number of small fish as well.

So I don't think we should use the idea that wild fish eat regular old wild fish as an excuse to continue the use of wild-caught fish meal and fish oil.

So thank you for your time. I appreciate it today.

CHAIRMAN DELGADO: Thank you.

Any questions? Joe?

MEMBER SMILLIE: I hear all of your comments and I tend to agree with a lot of it.

I just wanted to do -- the equivalency thing is problematic.

MR. LEONARD: Yes.

MEMBER SMILLIE: We recognize that. I'm not sure how it is going to work.

But, again, equivalency doesn't mean identical. There's certain rules about judging equivalency that may be useful if the
National Organic Program wishes to follow them.

The second thing is just grouping all foreign certification standards together. They're not all the same. There's some that are much better than others.

Having reviewed, for example, soil associations, and Naturelands in particular, there's not indiscriminate use of parasiticides. Yes, they are allowed under certain conditions which we wouldn't allow, agreed, but those -- I didn't want to paint them as free use of that.

If you look carefully at those standards, they are very limited, limited use once in a while in certain stages of early growth and all that.

So it is absolutely correct there are prohibited substances under our rule and couldn't be allowed, agreed, but they are extremely limited. Those organizations have in the past said that, if there are additional
requirements needed to meet the U.S. market, a gap study can be done, and every prohibited substance can be pointed out in those standards. They would sign onto an additional requirements declaration that in this case for this load none of these prohibited substances were used, because they aren't used indiscriminately even on those standards.

It's a minor point, but it is something that we could possibly work through with additional requirements on prohibited substances.

MR. LEONARD: Well, I think that's right. Can I just respond to that?

I didn't mean to imply that it is indiscriminate use of parasiticides and antibiotics. I certainly didn't mean to imply that.

The other thing I think it is important to recognize in the context of this issue with aquaculture is aquaculture is not just one species. There's a broad diversity
of things that might be farmed organically, including seaweeds, obviously the bivalve issue, and then a range of fish.

So in many cases this issue itself is boiling down to a couple of species. Most dominantly, farmed salmon is the one that would be most likely influenced. So although there may be some restrictions in terms of the ability of farmed salmon to be declared organic under U.S. regulations, certainly a broad diversity of other species would be just fine.

CHAIRMAN DELGADO: Any other questions? Hugh?

MEMBER KARREMAN: Where do you think the marine fish oil should come from to start the industry?

MR. LEONARD: I know that's the hard nut to crack here.

I appreciate the issue that certainly species like tilapia may not be not be able to provide all the oils we need. I'm
intrigued by the concept, and I don't know how this would fit under the rubric, but a series of many marine algae are producing oils that apparently are quite good in terms of nutritional qualifications. Whether those could be produced or farmed in a way that would be declared organic, I haven't looked into that enough, but I think there's some opportunities there that probably haven't been explored in detail yet.

MEMBER KARREMAN: You know, when we were thinking about this at the Symposium in November, there was a fellow from South Carolina who was talking about some kind of insect production. Maybe you remember that --

MR. LEONARD: Yes, right.

MEMBER KARREMAN: -- and how that could work.

We're just trying to look at various inputs, not to lay it all in one basket, so to speak, to get the marine fish oil, but from various inputs. So maybe
algae -- do you have information on that you could send?

MR. LEONARD: Yes. I mean I can get you some of that. I think certainly the insect idea is a good one. Annelid worms is apparently a good source and is becoming commercially available.

I like the idea of a diversity of diet, feed ingredients. Certainly that is consistent with wild diets for sure.

CHAIRMAN DELGADO: Any other questions?

(No response.)

Okay, thank you very much.

MR. LEONARD: Thank you.

CHAIRMAN DELGADO: Next is Becky Goldburg, followed by Sebastian Belle.

MS. GOLDBURG: Thank you very much.

I am Becky Goldburg. I am a former member of the NOSB and also a member of the Aquaculture Working Group. I would like to talk about two related issues today with
The issue that is receiving the most attention, fish meal and oil and feed. George Lockwood presented comments from the Aquaculture Working Group just now, asking that the NOSB go back to the AWG's earlier recommendation concerning fish meal and oil.

I want to make clear that at issue is not the major goal that we all share, and that is going to organic sources only of meal and oil, which means byproducts from farm fish and potentially other sources of protein and lipids for fish diets, looking to alternatives like George Leonard just talked about with marine algae, worms, insects, and so on. We're all there.

What is at issue is how we get to having a viable industry. There's no perfect solution here. People put forward in good faith a lot of alternatives. We happen to
feel that a transition is probably more workable than going to a system that depends heavily on foreign-certified byproducts from organic aquaculture, which is problematic, for reasons others have described today.

I also want to comment briefly on a couple of Livestock Committee's other feed recommendations. One is an issue that Patty Lovera pointed out. The way the current recommendation from the Livestock Committee is written, there is a Section (l) concerning fish meal and fish oil from wild fish in a recommendation that is otherwise about not using wild fish and feed, and it is just really confusing. That section doesn't belong there. It's about the status of fisheries. I think it was just a mistake it was included, and I urge you to eliminate it.

My other comment, a little bit more substantive, concerns Section (m), which talks about contaminants in fish meal and fish oil. This is not a section that we in the
Aquaculture Working Group got to in our discussions of the Livestock Committee recommendations. So I am offering my own perspective here.

One is that this section requires monitoring of contaminants in fish meal and oil, and says essentially that all pollutants must be removed if there are above regulatory levels in commercially-available meal and oil.

Well, it is really unclear to me what this recommendation means because there are, in general, no regulatory levels for these contaminants in feeds. FDA doesn't have set tolerances or action levels for these contaminants in feed, and even ACCO lacks standards for many of them, especially Lipophilic compounds, which are the ones we worry about most in meal and oil, things like dioxins.

So I am quite concerned that this recommendation, while really well-intentioned, is not particularly workable. I think that
using the original language recommended by the
AWG, which essentially says that the
contaminant levels in meal and oil have to be
comparable to the lowest in the marketplace,
probably makes the most sense at this point.
It is not a totally satisfactory
recommendation either, but it reflects the
reality of current U.S. regulations.

Finally, on the feed topic, I would
like to note that while we on the AWG favor a
transition over using foreign-certified
materials, one element of the Livestock
Committee recommendation that I personally
like is the step-down process for a
transition, where you set some intermediate
levels of meal and oil that are allowed in
feed, because that ensures that people are on
the road to getting where we want them to go.

With that said, I would like to
turn to the topic of compost and say how
strongly I support the Crops Committee
recommendation. It is essential to my mind
for truly organic systems for producing shrimp
and some finfish species like tilapia and
carp, which are naturally scavengers and
grazers in nature.

Basically, what the Crops Committee
recommendation says is that manure from
terrestrial animals may be used to fertilize
aquatic plants intended to feed organic fish
in aquaculture ponds, provided that the manure
is composted in compliance with 205.203, the
standard composting recommendations.

Conventional aquaculture producers
often fertilize their ponds now to produce
blooms of algae and other microbes and the
zoplank that feed on them all, and these
organisms provide a significant part of the
feed for the shrimp or other fish being raised
in the pond, essentially building a pasture, if you will, in your pond.

Without a provision allowing the
use of compost in aquaculture ponds, organic
aquaculture producers, who cannot, of course,
use synthetic fertilizer, will not be readily able to create such, quote/unquote --

CHAIRMAN DELGADO: Becky?

MS. GOLDBURG: Yes?

CHAIRMAN DELGADO: I'm afraid your time is up. Can you just sum up?

MS. GOLDBURG: -- okay, I'll complete in two seconds -- on "pasture-based pond systems". Rather, their systems will be more like feedlots. I think that is really undesirable and it would be great if you supported the Crops Committee recommendation.

Thanks.

CHAIRMAN DELGADO: Thank you.

Any questions for Becky? Hugh?

MEMBER KARREMAN: Just as far as I think you mentioned the residues, or whatever, in the fish meal/fish oil possibly, in OFPA 2107(a)(6), that is where we based that on. I am sure you are aware of that section there.

MS. GOLDBURG: Yes, I'm well aware of that section, but then you have to go and
see what the underlying EPA or FDA structures are. In this case, they are not there.

CHAIRMAN DELGADO: Gerry?

MEMBER DAVIS: Becky, on the compost as the guidelines that are in the rule now with the CN ratios and stuff that are there, would a compost like that be adequate for aquaculture pasture, as you call it?

MS. GOLDBURG: You know, I think that's an open question. I have discussed it with a couple of people, and the answer is not entirely clear, but my sense is we've got to start somewhere. By at least allowing the use of compost in ponds, I think --

MEMBER DAVIS: And there's not a lot of nitrogen there.

MS. GOLDBURG: Yes.

MEMBER DAVIS: But I don't know anything about aquaculture to speak of, either.

MS. GOLDBURG: Yes, it is a really good question and one I've thought about and
asked questions about. The literature is very scarce. There's a small amount of literature, but not a whole lot.

MEMBER DAVIS: If you ever hear anything, if you come across any information that would be helpful to the Committee.

MS. GOLDBURG: Yes.

CHAIRMAN DELGADO: Right, the Vice-Chair, followed by Jennifer.

VICE-CHAIR MOYER: Becky, I would value your opinion on this question: If fish are declared livestock, and livestock need a 100 percent organic feed, how can you justify your step-down version over seven years, where they would for seven years not be fed 100 percent organic feed? How do you do that?

MS. GOLDBURG: That's a really good question. I think it probably is confusing for consumers, and it is one of those things where you justify it, that it is for purely practical purposes, to initiate an industry. We are making real progress toward where we
want to go, and this is the way forward.

VICE-CHAIR MOYER: But it is clearly against the rule, and the rule says, once something is declared livestock, it must be fed -- it doesn't say it should be or could be -- it says it must be fed 100 percent certified organic feed.

MS. GOLDBURG: Yes. Well, what had been discussed with Valorie and among the Committee was potentially creating a transitional label for the farmed product, so that it was clear that products weren't fully meeting the rule.

I realize that is not a perfect solution, either; none of these are. I'm really open to other ideas. No one has come up with quite the right answer, but at least from the perspective of creating an industry, the transition seems to offer the most promise.

CHAIRMAN DELGADO: Thank you.

Jennifer?
MEMBER HALL: On the contaminant levels, where do you access the information about the lowest level in the current marketplace?

MS. GOLDBURG: There is actually a lot of testing right now of feed going on because Europe, the EU actually does have regulatory levels. So you would have to ask feed suppliers about the levels, which are almost certainly being looked at in order to sell feed in Europe.

CHAIRMAN DELGADO: Any other questions? No?

(No response.)

Okay, thank you, Becky.

MS. GOLDBURG: Thanks.

CHAIRMAN DELGADO: Next is Sebastian Belle. No Sebastian?

Well, after that is Tom Hutcheson, proxy for Neil Sims from Kona Blue.

We have some changes. We've got the monopoly here, so trust us.
(Laughter.)

That clarified, Tom, please.

MR. HUTCHESON: Thank you, yes, proxy for Neil Sims of Kona Blue.

Dear Board members:

I would like to offer the following comments on behalf of Kona Blue Water Farms, LLC.:

Kona Blue is the first integrated open ocean fish farm and marine fish hatchery in the U.S. We're growing sashimi-grade Kona Kampachi in waters over 200-feet deep using innovative hatchery techniques and advanced ocean engineering. We are committed to environmentally-sound aquaculture, and we believe that open ocean fish farming can and should be organic.

Monterey Bay Aquarium's Seafood Watch Program recently ranked U.S. yellowtail as a good alternative. This demonstrates that open ocean aquaculture of marine fish can be undertaken in a sustainable manner. We simply
have to ensure that it is done right.

The development of an achievable organic label for marine finfish will provide such assurances and will, thereby, provide real benefits to marine ecosystems and real benefits to consumer health.

The organic label will also provide a widely-recognized imprimatur of quality that will encourage more conscientious farming techniques to be adopted as the industry grows, but we need to create a regulatory climate that will allow an organic offshore industry to grow.

The nutritional needs of marine fish and the low levels of critical fish oil in most other aquacultured species decree that an alternative source of organic fish meal and fish oil needs to be identified to allow development of an organic marine fish culture industry.

We have reviewed the Livestock Committee's recommendation for allowing fish
meal and fish oil from processing byproducts of foreign-certified organic aquaculture and the Aquaculture Working Group's recommendation for a stepwise decrease in the allowable levels of fish meal and fish oil from processing byproducts from sustainable edible seafood processing.

Both hold merit, yet each of these alternative sources may yet present challenges. Therefore, in the interest of providing the best chances for growth of an organic marine fish culture industry, we would recommend that both the Livestock Committee's and the Aquaculture Working Group's recommendations be accepted together.

We see the best benefits to be gained for consumers and for the ocean by accepting both recommendations; i.e., both the Aquaculture Working Group's recommendation for a limited introductory and diminishing period of using edible wild seafood trimmings at about 12 percent and concurrently the
Livestock Committee's recommendation for allowing fish meal and fish oil from processing byproducts of foreign-certified organic aquaculture.

We recognize that the proposals before us may not be perfect, but we place our faith in the guiding principle of continuous improvement, the same principle that is a foundation of the terrestrial organic industry.

Please remember NIH studies, Mozaferian and Rem, 2006, have shown that modest increases in seafood consumption could result in a 17 percent reduction in overall mortality and a 35 percent reduction in mortality from heart disease. These are lives that could -- that must -- be saved.

Organic standards for marine finfish can encourage better marine fish farming practices and improve national health and the health of our oceans. To do this, however, the organic standards must be
achievable and the products must be available.

We commend the NOSB, the Livestock Committee, and the Aquaculture Working Group for their continuing hard work toward establishing regulations for organic aquaculture, and thank you for your consideration.

Sincerely, with aloha, Neil Sims.

CHAIRMAN DELGADO: Well, thank you. Any questions for Mr. Hutcheson? Yes, Dan?

MEMBER GIACOMINI: Just for clarification there, I think in the step-down that he is talking about, and I understand you're reading his statement, but he talking about the Livestock Committee's step-down rather than the Aquaculture Working Group 12 percent set amount.

MR. HUTCHESON: I take your comment. Thank you.

(Laughter.)

CHAIRMAN DELGADO: Any other
questions?

(No response.)

Thank you, sir.

Next is Barbara Blackstone from National Fisheries Institute, followed by Mr. Jim Riddle, Organic Outreach Coordinator for the State of Minnesota.

MS. BLACKSTONE: Good afternoon. I'm Dr. Barbara Blackstone, Director of Scientific Affairs for the National Fisheries Institute in McLean, Virginia.

NFI is the Nation's leading advocacy organization for the seafood industry. Its member companies represent every element of the industry, from fishing vessels at sea to the national seafood restaurant chains. NFI and its members support and promote public policy based on scientific research.

NFI greatly appreciates the opportunity to speak to the NOSB on behalf of the seafood industry.
As we all know, aquatic foods are the final major category of food not yet approved for U.S. organic certification. Though only 1 to 2 percent of food produced in the U.S. is produced by organic methods, 20 percent of the consumers queried in focus group research sponsored by the New Jersey Department of Agriculture said they were committed to purchasing organic seafood while 52 percent said they would buy it occasionally, and 72 percent, significantly, said they would buy organic seafood if available.

Mark then that the industry must have an organic seafood rule to serve consumers who are asking for it, and many of them are asking for it.

Salmon is No. 3 of the top 10 seafoods enjoyed by American consumers, and therefore, should be available for organic labeling.

Supplements of fish meal and fish
oil to feed pisciverous finfish such as salmon is a good agricultural practice that will expand the availability of organic salmon at a reasonable price.

NFI is very concerned because the feed industry has no alternative to fish meal and fish oil for finfish, though it seeks such.

Results in alternative feed research to date are not encouraging, and nothing is on the distant horizon. Sunset clauses will not make feed alternatives happen and will in time prohibit use of fish meal and fish oil to feed salmon and other pisciverous finfish, thus eliminating organically-labeled salmon from the consumer's menu.

USDA will most likely have to extend the sunset clause and provide immediate research dollars for alternative feeds to be a reality within seven years. In the meantime, NFI supports the recommendation of the Aquaculture Working Group that fish meal from
wild fish as a feed additive or supplement may not exceed 12 percent by weight of feed, and fish oil from wild fish used as a feed ingredient may not exceed 12 percent by weight of feed as averages over the production cycle of the fish.

Two notes of concern in the Aquaculture Working Group's recommendation found in appendix A:

One, as just stated, the Aquaculture Working Group's prediction of seven years of research may not be sufficient to find fish meal and oil alternatives.

And, two, exclusion of the use of genetically-modified organisms, GMOs, as a feed ingredient or as an aquatic livestock enhancer represents today's Pollyanna myopic view of aquaculture.

Without the assistance provided by GMOs directly to aquatic animals and to the feeds they consume, seafood may not be a sustaining industry tomorrow.
Our opinion is one shared by the Biotechnology Industry Organization, a worldwide association of over 1100 biotechnology companies, academic institutions, and state technology centers.

In conclusion, NFI urges completion of the current work on organic standards for farm-raised seafood, so that work can begin on standards for those seafoods currently excluded, wild-caught and mollusk.

Further, with our concerns about appendix A just stated, NFI is generally pleased with the recommendation of the Aquaculture Working Group. The organic label for seafood can happen when we remind ourselves that the label is a venue for practices that use and steward natural resources, not rigid conservation practices.

Organic labeling is not about addressing activist issues, but is about defining USDA best practices in production of safe, healthy seafood for the consumer.
Thank you for the opportunity to speak to the Board.

CHAIRMAN DELGADO: Thank you.

Questions? Joe?

MEMBER SMILLIE: Well, it is not really a question. The U.S. organic regulation which you're supporting excludes GMO methods from organics.

MS. BLACKSTONE: Yes.

MEMBER SMILLIE: And speaking as Pollyanna, as I recall the movie, she had the rest of the village smiling pretty well by the end of that movie. Now it may be Disney World, but we oftentimes want to remake the world in our image, which excludes GMOs.

Therefore, I think that any proposal or thing that we hear that talks about confirming the regulations has to take that into account.

MS. BLACKSTONE: I think you can smile for a few years and then we are going to get to a point where there just isn't anything
available that doesn't have a GMO in it.

MEMBER SMILLIE: Well, we are going to do our very best.

MS. BLACKSTONE: Okay.

CHAIRMAN DELGADO: Any other questions?

(No response.)

Thank you very much.

MS. BLACKSTONE: Okay.

CHAIRMAN DELGADO: Next is Mr. Riddle, and I take this opportunity to explain that Mr. Ram Balasubramanian has rescheduled his presentation for another day. So we will take care of him.

Mr. Riddle, followed by Tom Hutcheson again.

And you, I understand, are doing a proxy?

MR. RIDDLE: Right, from Alex Stone, Oregon State University. Ten minutes, please.

Thank you.
Well, thank you for the opportunity to speak. My name is Jim Riddle, Organic Outreach Coordinator with the University of Minnesota, former NOSB member. It is good to see all of you once again.

I am also on the leadership team for eOrganic, which is a multi-state project funded by USDA, CSREES, that is bringing the best scientific information on organic agriculture to the internet through land grant universities and cooperative extension.

I have handed out a brochure about eOrganic, just in summary, a web community where farmers, researchers, and educators can exchange objective research and experience-based information about organic agriculture.

We have a lunch planned for this fall. This is part of a larger e-extension initiative where universities across the country are working together to consolidate information. It is not limited to people working in land grant universities. It is
open for anyone with organic agriculture experience to contribute and become a part of the community of practice.

So I encourage you to check it out. We are working in cooperation with the Sustainable Ag Research and Education, or SARE, ATRA, the National Ag Library, New Farm, OFRF, and other organic information providers.

So we are trying not to duplicate, but to rather maximize the use of resources and make the best information especially available to farmers and extension agents that is research-based information.

We will be having our own frequently asked questions that will be rule-compliant and searchable and follow a chronological order of the organic regulations. It will be built in as part of this website.

I would like to thank you all for the hard work you do in preparing for this meeting. I see some of you still are
suffering from conference call ear and elbow.

I know the feeling well. It is certainly a challenge, the work you do.

We've got a lot to celebrate right now with all of the very strong organic language that is in the recently-passed farm bill. I want to celebrate that and acknowledge the efforts of so many people in this room to make that a reality.

But we also have some cause for concern with these recent polls showing for the first time ever an erosion in consumer confidence in the integrity of organic. There's various reasons for that, but I think it is something that we need to take seriously and do what we can to address that.

In addition to promoting the eOrganic project, I am here today speaking on my own behalf. Even though I live in Minnesota, I am here to defend organic okra.

I strongly disagree with the Handling Committee's recommendation that okra
be added to 205.606. When I look through the
decision sheets, I find the strongest
justification being the petitioner presented
voluminous information and references that
organic okra in commercial quantities was not
available, especially near or transportable to
an IQF facility. Maybe the petitioner should
move the IQF facility nearer to organic okra
fields or possibly transition land near an IQF
facility to grow organic okra, or label the
products that contain non-organic okra as made
with other organic ingredients.

There's a lot of options here, but
there's no entitlement to the use of non-
organic ingredients.

The recommendation appears to rely
solely on the information provided by the
petitioner, and I am concerned that that
petitioner is a client of the person who made
the motion to add okra to the list.

The petition and the recommendation
contain no market analysis and no information
from organic okra growers, and it exemplifies some of the things that have gone wrong with this rush to add materials to the list and the review process, and this particular recommendation should be rejected.

The items that go on 606 need to be rare exceptions. They must be well justified with neutral objective analysis and TAP reviews, not just relying on information from the petitioner.

On a positive note, I support the Livestock Committee's recommendation to add Fenbendazole to the National List. However, it is time to remove Ivermectin, which is not compatible with organic principles and organic production.

I support the allowance of DL-Methionine for two more years only. I think the research can be concluded and alternatives commercialized in that time.

I support the Crop Committee's recommendation to add cheese wax with the
annotations and to reject Dextrin and Tetracycline.

I urge the NOSB to table the Livestock Committee's draft on aquatic plants. I think it is a good starting point, but it doesn't have any background information. It has not been subject to discussion and shouldn't be brought forward to a vote until there's been more thorough discussion of this draft recommendation.

There's a discussion document on hydroponics. Really, the two are so similar that they should be considered together, not separately. It all needs to be done in the context of what the law allows. So looking back at OFPA and requirements for the use of soil and land-based production.

I support the Crops Committee's additions to the existing recommendation on organic seeds. I think there are some problems with that language, but as any guidance gets implemented on this, the NOP
needs to work very closely with accredited certifiers to make sure that standardized protocols are implemented that really work without being an unfunded mandate or overly burdensome.

I do urge that the existing organic seed requirements be better addressed during accreditation audits. There already are requirements.

One thing I like about the Committee's draft on organic seeds is that it followed a good model by building on an existing Board recommendation and amended that recommendation. Well, that is not the case with the discussion document posted by the CACC on multi-site certification.

Instead of building on the existing 202 NOSB Grower Group recommendation, which was recognized by the NOP for guidance, which is a highly unusual thing, and that should have been the starting point -- instead, the CAC chose to expand a previous discussion
document which was never adopted by the Board.

So you are building on a discussion on a discussion of something that has never been adopted instead of resolving the issue of grower group certification when you've got a solid recommendation to be amending and working from.

This draft on multi-site certification, it appears to justify one agency's sample inspection program for retail chains by extending grower group protocols to cover retailers and other types of handling operations.

The draft from the Committee, the discussion document makes no mention of OFPA 2107(a), which states, "A program established under this title shall provide for annual onsite inspection by a certifying agent of each farm and handling operation that is certified under this title."

And OFPA defines handling operation to mean any operation or portion of an
operation that receives or otherwise acquires agricultural products and processes packages or stores such products.

Farm is not defined in the OFPA or the rule. This gives USDA more flexibility in how that term "farm" is applied to a grower group operation.

The Board should direct the Committee, CACC, to discontinue work on the discussion draft, take some of the advice that will be offered here by the National Organic Coalition, the Organic Trade Association that is focused on grower groups, respond to the concerns that were identified by the NOP in the appeals decision and revise the 2002 Board recommendation to strengthen language on inspector qualifications, conflict of interest, and risk assessment protocols.

In addition, the NOP should consider establishing a separate accreditation category for certifiers who conduct grower group certification.
I would just like to let you know that the University of Minnesota will be converting our 70-cow dairy herd to organic, have committed to that.

Also, next week there will be a signing ceremony for a new MOU on organic agriculture with three state, four federal, and three universities in Minnesota, all to service the organic sector.

Thank you. Viva la okra.

(Laughter.)

CHAIRMAN DELGADO: Any questions for Jim? Kevin, please.

MEMBER ENGELBERT: Jim, I know you have your hand on the pulse of everything organic.

MR. RIDDLE: I wouldn't say that.

(Laughter.)

MEMBER ENGELBERT: In your opinion, what's the best way to introduce fish oil and fish meal into the --

(Laughter.)
MR. RIDDLE: Oh, thank you. Yes, right, I love to fish. You're dangling that hook in front of me.

Well, I think starting with the herbivorous fish that can be fed an organic diet, you know, let's start there. That can be done. Everyone agrees that can be done.

Let's have standards for that and let's build from there. That's what I would say.

It may take going to Congress. I mean, otherwise, this predicament of 100 percent organic feed is always going to be a problem.

I mean the other is -- and there has been some consideration about this phasing-out allowance, temporary with a built-in phaseout for the non-organic fish meal and fish oil as feed supplements, which non-synthetic supplements are allowed under the rule, but that it still is a phaseout to allow the industry to adapt.
But I think focus on the low-hanging fruit, which are the herbivorous fish, is really the place to start. Let's have some standards, but don't jump into this, the Board equivalent with some provisions that go beyond a foreign certifier's norm -- I just think that's really problematic.

I don't know if you've gotten feedback from the NOP on that proposal. I think it is a good idea just to talk about, but I don't know that it would fly.

CHAIRMAN DELGADO: Kevin, if we can stick to the comments by the speaker, and before you proceed, let me give the opportunity to Joe. You wanted to talk? Or Dan? And then if you need to expand further, you will have the opportunity.

MEMBER GIACOMINI: Thanks, Jim.

You recommended relisting of Methionine, and let's remember this is not -- for poultry.

MR. RIDDLE: Yes.
MEMBER GIACOMINI: And let's remember this is not continuation as in sunset. This is considered a new petition.

But you would have probably been here three years ago when it came up the second time --

MR. RIDDLE: Right.

MEMBER GIACOMINI: -- this being now the third time.

Are you aware, either then or now, of any significant real data, not hypothetical, not what happens if there's no Methionine in the diet, but real data showing in practical diets impact on health, immunity, feathers, cannibalization, whatever, in real data, with a practical diet of no Methionine, with no added Methionine in it, that we can really hang our hat on?

Because what they gave us in the petition is performance data. I'm not aware of anywhere else where it would just throw bones to an industry like we have done with
Methionine for the ability to maintain more conventional growth.

Can you give us -- do you know where that data is? Are you aware of it? Do you remember it? Or is somebody going to come up with it to help us out on that?

MR. RIDDLE: Yes, well, I could come up with data showing that Methionine is an essential nutrient for poultry. I would have to do a lot of research to try to come up with the rest of the answer, and I'm not aware of that either.

But I am aware of very promising research on high Methionine corn varieties, for instance, or other feed ingredients that I think are very promising, but we need a lot more research flocks, feeding that, to establish some of that data of how well they perform.

But they do need to have outdoor access. It needs to be real, and they are going to gain Methionine if they do have
access to earthworms, insects, and fresh green grass and seeds in their diet. A diversified diet provides a lot of different sources of Methionine.

CHAIRMAN DELGADO: Any other questions? Joe?

MEMBER SMILLIE: Well, I'll jump into the gumbo with you, Jim.

MR. RIDDLE: Hey!

(Laughter.)

MEMBER SMILLIE: 606 is a whole new process caused by the Harvey lawsuit. It wasn't anticipated when we were setting up TAP reviews and for quite a while.

The NOSB was forced to get into the 606 listing, and I just want to point out that the procedures that we're following for 606 are different than the other procedures. I don't know if it is significantly different or not, and I don't want to steal Julie's thunder because I know tomorrow she is going to talk in general about 606 quite a bit. It is
problematic. It is a little complicated.

But one of the things the NOSB is charged with is examining the fragility of supply and doing sort of a risk analysis, to jump over to a different topic, of the situation. Our job is not to determine commercial availability. That is the certification agent's job, because, again, it is a two-step process.

You can't use an agricultural ingredient unless it is on 606, and even if it is on, that doesn't mean you have license to use it. You must prove it is not available.

So it is a two-step process, not that that limits your argument. I mean your argument still stands. Once it gets on 606, then there is more of a chance.

But our job on the NOSB is to look at the risk of the supply side and the fragility, and that is what we did in that case.

The other thing is that when you
say it needs no market analysis and no information from organic growers, in filling out those documents we have been talking among ourselves that we are going to give more information to the public at large about what went into that decisionmaking. I agree with that, and we are just going to have to do that.

The volume of materials we had to deal with really limits your ability to go into extremely great depth, but that research was done, market analysis and information from organic growers, freezing facilities, and certification organizations. They were polled, and we can go into the details perhaps later or off-session, if you want to.

That having been said, I think tomorrow and during the thing when that comes up, we can get into great detail on the gumbo controversy. Because as soon as that passed, I said, "We are going to catch it on this one, guys, guaranteed," because it doesn't look
MR. RIDDLE: Yes.

But when you look at it really carefully and you look at the petition and what we went through, you will see why our Committee justified it and we will see what the Board thinks of that down the road.

MR. RIDDLE: Okay, but the larger process issue, the things that go on 606 still have to meet all criteria, and you need to be addressing -- there's not a pass given to 606 that it only has to address market fragility --

MEMBER SMILLIE: Right.

MR. RIDDLE: -- but it has to be reviewed for the environmental, human health impacts, and all of that. I don't see that happening for 606 items because there aren't TAPs. There's not objective neutral research
being conducted for the Board.

    MEMBER SMILLIE: Yes. Will you handle that tomorrow?

    MR. RIDDLE: Yes.

    MEMBER SMILLIE: That's a very good question, and we've spent a chunk of time this morning actually going through that, and I will let Julie handle that tomorrow in her response.

    MR. RIDDLE: Okay.

    CHAIRMAN DELGADO: Very well, we will make that clarification tomorrow.

    Do we have any more questions?

    Dan?

    MEMBER GIACOMINI: Going back into that vast mind of yours, we have tartaric acid on both (a) and (b) 605 up for sunset. Any remembrance of how that exactly came to play and any comment or any knowledge of usage or anything?

    MR. RIDDLE: I'm sorry, I would have to do some review to refresh my mind.
Sorry.

And I understand my comments about Ivermectin coming off, that that may take a petition to trigger that, but I do think it is time, and anything we can do to get it off when the other goes on would be a very good step forward.

CHAIRMAN DELGADO: Jim, before you leave, I believe Barbara has a comment, question. No? Okay.

Kevin, you wanted to conclude with your statement.

MEMBER ENGELBERT: No, that's all right. I'll pick Jim's brain privately.

CHAIRMAN DELGADO: Fantastic.

Thank you very much.

MR. RIDDLE: All right, thanks.

CHAIRMAN DELGADO: Thank you, Jim.

Next is Tom Hutcheson, followed by Jody Biergiel.

MR. HUTCHESON: Good afternoon. My name is Tom Hutcheson, and I am the Regulatory
and Policy Manager of the Organic Trade Association.

Thank you very much for all your work, and thank you for the opportunity to present these comments.

First, I would like to commend to you the work of the Materials Working Group, with which I served and which is posted as a discussion document regarding the definition of the term "agricultural" and related issues.

This group dove deep into the issues and has developed a document that can serve well as a foundation for discussing the myriad of issues involved.

I believe you received OTA's comments on the certification of multi-site operations, and they should be in your meeting book. These and some replies to the questions that you asked at the end of the current document, discussion document, will be discussed at length by Grace Gershuny and Kim Dietz, Co-Chairs of OTA's Task Force, in a
In addition to these issues, I would like to offer some other comments. Regarding the proposed aquaculture standard, NOSB has taken the first step toward a useful standard by recommending that new sections of the rule be created for aquaculture in the so far reserved 205.250 series.

However, thinking from terrestrial ecological management systems still infuses NOSB thought, and I urge you to acknowledge and celebrate the differences in aquatic ecological management that can make the upcoming recommendation both more useful in growing the organic system and more practical for those wishing to participate.

The terrestrial provision should not necessarily apply to aquaculture unless they make sense specifically for aquaculture. Therefore, NOSB should recommend, and NOP should implement, renaming the current rules sections referring to livestock, 205.236 to
239, to refer to terrestrial livestock, to help clarify the situation, with the 250 series referring to aquatic livestock.

On farmed aquatic plans, some OTA members have indicated support for the NOSB recommendation, and we applaud NOSB for their substantial attention to this field.

On seed commercial availability guidance, the Joint Committee has made its desires clear and has laid out a number of practices that could help stimulate the growth of the organic seed trade.

The major obstacle for farmers to growth in the organic seed trade cited in the paper, though, was the quality of organic seed, which seems to be left unaddressed. The Joint Committee seems to be proposing a substantial increase in the requirements for certifiers and buyers without necessarily getting at the main cause of the problem.

These steps might be helpful to some degree, but the recommendation does not
give much hope that the problem will be much
closer to being solved, even with the
substantially increased reporting requirements
proposed.

OTA generally supports the
direction of the carefully-crafted and well-
thought-out recommendations of the Organic
Seed Growers and Trade Association, OSGATA.

Thank you.

CHAIRMAN DELGADO: Thank you.

Any questions for Tom?

(No response.)

All right, thank you very much.

On with Jody Biergiel.

MS. BIERGIEL: Hello. Thank you
for the opportunity to address you today.
This is my first time addressing you. Thank
you very much.

My name is Jody Biergiel, and I am
representing CCOF, Organic Certification.

Regarding the materials up for
sunset review, generally, CCOF has a diverse
membership, producing many kinds of products, the handlers. We support the relisting of all materials, as we have historically.

Regarding the two forms of tartaric acid, we also support the relisting of both of those, understanding that it was some sort of historical typo.

(Laughter.)

Regarding the 606 additions, we have one client who will be able to upgrade their product from "made with organic" to "organic" based on one of these additions. So they will be happy to hear that.

However, CCOF would not be surprised if both of the marsala line and sherry, for example, become available organically in the near future. We would continue to require that thorough commercial availability searches are conducted annually, if not more frequently.

Now I would like to comment on the use of materials listed on 605 in or on
products labeled as 100 percent organic.

Certifiers are interpreting the 100 percent organic labeling category a little bit differently. The regulation states that products sold as 100 percent organic must be processed using organic processing aids. This does not seem to be clear enough direction to certifiers, as in the case of chlorine used as a sanitizer for fresh products.

Some certifiers are not allowing chlorine to be used on products labeled as 100 percent organic and some are allowing that use, chlorine, over the Safe Drinking Water Act standard.

Just last week we informed a client that their product would not be considered 100 percent organic by CCOF due to the use of chlorine at levels above four parts per million in water that contacted the product, and the client solicited comments from other certifiers about his product. He provided an email from another certifier demonstrating
that he would be able to call his product 100 percent organic if he went to that certifier. On the phone with me, he said he felt he was at a market disadvantage because of CCOF's take on this issue.

Certifiers also vary in their allowance in the use of sanitizers on the surface of meat labeled as 100 percent organic. This issue extends beyond sanitizers to many items on 605, including the use of nitrogen gas in bagged salad, Diatomaceous Earth, and juice processing or rice treated with CO2.

These examples illustrate a larger issue. Where there is room for interpretation of the rule and certifier interpretations differ, certified operations are figuring out that they can shop around for a desirable answer.

In short, CCOF is requesting clarification as to whether items on 605 that directly contact food, not all of which are
necessarily processing aids, are or are not allowed for use on a product destined to be labeled 100 percent organic. Is the intent of the 100 percent organic labeling category to apply to a very limited scope of products or all organic product that may also be using allowed materials? It appears to CCOF that this has become a complicated issue of semantics about what is and is not a processing aid.

More generally, CCOF would like to make the NOSB formally aware of the impacts of differing certifier interpretation and encourage the NOSB and NOP to provide rule clarifications in order to prevent this certifier shopping in the marketplace.

Lastly, CCOF is requesting clarification as to whether DHA and other omega-3 fatty acids are allowed under the nutrient, vitamin, or mineral listing on 605. CCOF does certify a company using this material as a supplement in baby food. But
recent complaints have surfaced against the use of this material. CCOF would like to know either way if this material is allowed for use in organic production.

This question extends to a general discussion of accessory nutrients, like other fatty acids and other health-promoting compounds and their allowance in organic products.

Another client has requested the use of DMAE and choline in a product labeled "made with organic". Although we have not allowed the use of these substances, there is increasing market pressure to accept a very wide interpretation of the vitamin and mineral allowance.

Please clarify whether nutrients, vitamins, and minerals should be interpreted to include only actual vitamins or whether it can be extended to other substances that could be considered essential for growth and development.
Thank you.

CHAIRMAN DELGADO: Any questions?

Joe?

MEMBER SMILLIE: Right.

MS. BIERGIEL: Hello.

MEMBER SMILLIE: This 100 percent thing, I'm not sure that all the NOSB members are up-to-speed on this, but as the certifier rep, I have to tell you there has been a great deal of disturbance in the forest on this one.

Again, it is an NOP issue, and it hasn't been on our work plan. But the NOP, the current thinking of the NOP seems to be -- and please correct me if I am wrong -- seems to be that almost anything is considered a processing aid when it comes to the 100 percent claim.

That means if you take grain and put it in a silo and add Diatomaceous Earth, totally allowed, and then filter that Diatomaceous and send that grain out, that grain loses its 100 percent status.
If you take CO2 and -- what's the word? -- I hate to use the word "fumigate" -- you know, put strawberries through it, those strawberries are not 100 percent organic anymore because the CO2 isn't organic.

If you take nitrogen and 100 percent olive oil and put that nitrogen as a packaging aid, was our previous interpretation, then that olive oil cannot be 100 percent, even though it fulfills every other requirement.

This is kind of a bit of a shock to the certification community. It has caused a lot of consternation in the industry, to the point that the 100 percent label has been problematic from the very beginning of this regulation.

I can't tell you how many hours I have spent explaining to clients and prospective clients, "No, you can't say it's 100 percent, even though everything is organic in it, because the processing aids weren't
organic."

It was hard enough; now it has become almost impossible. Basically, I think all of us in the certification world are saying, please, don't make 100 percent claims.

It has created this kind of real problem in the industry, and I am not sure everybody is aware of it. It is not on our work plan. I'm not sure what we can do about it, other than conference with the NOP to at least come to a decision of how we're all going to move forward, because everything like this does create this certification shopping. We just about eliminated certification shopping to some extent, based on money and service, and now with these different interpretations coming back in as people explore the regulation, it is coming back.

So we need to act quickly to clarify and create that common ground. I am not sure that all of you were aware of this 100 percent issue, but we have had to deal
with it. The ACA LISTSERV has had a number of options, and perhaps Pat will speak to that tomorrow or the next day, but it has become a serious issue, but I don't see it on any of our work plans.

As far as the second issue of the vitamins, minerals, and other nutrients, as allowed in 104.20, that is, if I am not incorrect, that is going to be on our work plan, Julie.

MS. BIERGIEL: Thank you.

CHAIRMAN DELGADO: That was yes from Julie.

MEMBER SMILLIE: That was a very reluctant yes though.

(Laughter.)

CHAIRMAN DELGADO: Any other questions? Steve?

MEMBER DeMURI: This is in response to you, Joe. No, I was not aware of the issues with 100 percent, but I am glad I am now.
MS. BIERGIEL: Thank you.

MEMBER DeMURI: I do think it is something we need to work on pretty quickly.

MS. BIERGIEL: Yes, thank you.

CHAIRMAN DELGADO: So there we have the action item. Very good. I like to hear that.

Any other questions, participating from the program, clarifications? Barbara?

MS. ROBINSON: What did you want, Joe?

MEMBER SMILLIE: Did I present it --

MS. ROBINSON: Yes, you did, and the program will take a look at it.

MS. BIERGIEL: Thank you.

CHAIRMAN DELGADO: Kevin?

MEMBER ENGELBERT: Joe, what about the instances where there are requirements above and beyond organic standards for sanitation, things like that? How does that play into your decisionmaking with 100
percent?

MEMBER SMILLIE: Well, to go back to a previous decision, we do not regard a sanitizer as a processing aid, as long as it is rinsed off and does not come into contact with the final product.

So, in other words, if you clean your line with a sanitizer, it's a clean rinse, a sanitized rinse, as a manufacturing facility, you have to prove to us that there's no residual left. So we don't think it is an issue. That is our current stance.

MS. BIERGIEL: If it doesn't contact the product and there's no residual --

MEMBER SMILLIE: Right.

MS. BIERGIEL: -- it is not an issue.

MEMBER SMILLIE: Right, but the Diatomaceous serves the carbon dioxide. We are talking about nitrogen, carbon dioxide. You know this is like what we breathe every minute, this stuff, you know. You can't see
it.

MS. BIERGIEL: Right.

MS. ROBINSON: Rigo? Wait a minute, Rigo.

CHAIRMAN DELGADO: Barbara, please.

MS. ROBINSON: There is a definition of a processing aid in the regulations, and the sanitizer is not a processing aid. It doesn't say -- nowhere in the definition of a processing aid is the word "sanitizer". Okay?

MEMBER SMILLIE: But Diatomaceous Earth, carbon dioxide, nitrogen are processing aids under your definition.

MS. ROBINSON: Yes, but they are not added to food.

We'll look into this further. Okay?

CHAIRMAN DELGADO: All right. Any other questions for the presenter?

(No response.)

Thank you very much.
MS. BIERGIEL: Thank you.

CHAIRMAN DELGADO: At this point we're going to take a well-deserved break. We will come back at 3:15, and the next speaker will be Emily Brown-Rosen.

(Whereupon, the foregoing matter went off the record at 3:09 p.m. and went back on the record at 3:24 p.m.) CHAIRMAN DELGADO: We are ready to resume our public comment.

At this point, Emily Brown-Rosen from the PCO -- we are ready to start our public comment.

Emily, thank you for being with us. Please start.

MS. BROWN-ROSEN: Okay, thank you.

My name is Emily Brown-Rosen, B-R-O-W-N R-O-S-E-N. I work for Pennsylvania Certified Organic as the Policy Director. Thank you very much for the chance to speak to you here again today.

Pennsylvania Certified Organic is
an accredited certifier. We have about 500 clients. We have filed a number of comments that should be in your book on various different topics, materials, grower groups, seed. But today I am going to focus my little five minutes here on the materials definition issues. I don't think anyone has talked about this yet. When should something be agricultural and when something is non-agricultural? So I will be the first.

If you have questions about any of our other comments, feel free to ask me later. Also, we have two other people that will address some of those issues coming along.

Previously, I posted a comment in support of option D. I should say, starting out, that I was a member of this Materials Working Group, this collection of different individuals who worked quite a bit on that lengthy proposal that we gave you. I think it was a really good process. It was a really good discussion. We came up with lots of
different ideas. It was a hard one because there was a lot of difference of opinion, but we gave it a shot, and I came out in support of option D.

But having thought about it further and having read other people's comments, which is all part of the process, I have now revised my opinion. So I am handing out another one.

I have a new option I am supporting, and I am calling it option B-plus. I will explain this. It is not A. It is not perfect. Nothing will ever be perfect, but I think this is good enough. So I will explain where I got this from.

This option B is based on the proposal that commercial availability is required for everything on the list that's 205.605 and everything on 205.606. I think this really makes it simple. Initially, we had rejected doing this because it seems like it is too much work to prove availability of this other section of the list, but we are
doing this already with 606 as far as certification goes. I think we know how to do that. A lot of the things on 605 will be fairly obvious that they are not possible ever to be organic. So it won't be that much of a stretch to add this to that.

From reading CCOF's comments, which I support on this issue, they pointed out this does provide more incentive to develop organic forms of all the substances on the National List. It gives us back that order of preference; we want organic whenever available.

And as Oregon Tilth has pointed out, we need to get back to the old, original thinking that there is sort of this order. You know, organic is best; then if you can't find something organic, something natural is best, and then something synthetic on the list. That really fell out when the final rule got published, but it is something worthy of trying to bring back.
So I think this proposal does that.
It will keep the section (a) and (b), synthetic, non-synthetic, so that's there for identification purposes, and then people will have to justify that they are not using organic if it is available.

Now this also requires that we drop the term "non-agricultural" from the title of 205.605. So everything listed on 605 will just be non-organic substances allowed in food processing. So it won't be one way or the other, it's agricultural or non-agricultural. It is just a substance that has been reviewed that is allowed. If you can possibly find a way to make that organically, that is the form of it you should be using.

So there's no barrier. It's because it's not classified as non-agricultural, like right now the NOP's Q&A says that yeast is non-agricultural so you cannot make it organically. So that nomenclature problem will just disappear.
because we won't identify it one way or the other.

Now this is my change here. I suggest that, in addition to this major change, we use the definition of non-agricultural substance that Oregon Tilth has proposed. I will repeat. Gwendolyn nicely wrote up, "A substance that is not raised in or derived from an agricultural system, such as a mineral or atmospheric gas. For the purposes of this part, a non-agricultural ingredient is also anything technically impossible to be organically produced." So Gwendolyn went on to explain that "technically impossible" refers to either a lack of standards or the current production methods available for the substance in question are limited to materials and practices that are not consistent with the standards for an organic product.

So this is something that is doable. This is something that I think will
1. be a very bright, clear dividing line for NOP
to say, "We don't have standards for
microorganisms. We can keep microorganisms on
the list."

I'll finish my sentence and then
you can ask me questions.

CHAIRMAN DELGADO: Yes, if you can
wrap up.

MS. BROWN-ROSEN: Okay.

Keep microorganisms on the list,
but you could also put baker's yeast or the
types of brewer's yeast that are available
organically on 606.

I want to point out that attached
to my comments I have printed out a page from
the AFGO manual listing the 45 different kinds
of bacterial and fungal microorganisms that
are used in livestock feed. I can't even
pronounce these names, but at this point in
time I don't see them being available for
organic livestock, and therefore, let's just
keep microorganisms on the list at 605, and
you could do that with this proposal.

All right, any questions?

CHAIRMAN DELGADO: Okay. I just want to make sure, did you get a copy of Emily's proposal?

MEMBER HEINZE: I was going to point out we had a little miscommunication gap. So this side of the table has the written comments; this side of the table doesn't. So we'll get them to you.

CHAIRMAN DELGADO: Thank you for that.

Okay, now any questions?

We'll start with Dan followed by Gerry.

MEMBER GIACOMINI: Just so I understand your B-plus, the clarification on the definition of non-ag, which is a fairly significant change, is coupled with the fact that you're dropping the term non-ag out of the title of 605, correct?

MS. BROWN-ROSEN: Correct.
CHAIRMAN DELGADO: Gerry?

MEMBER DAVIS: You mentioned that list of all those microorganisms. Do you have any comment on the importance of -- I know you say they are being used, but is there any centering at all on certain ones that are vitally important and others are just occasionally used?

MS. BROWN-ROSEN: Well, I will say, from the standpoint of someone who reviews livestock feed additives all the time, that you see all of these in multiple combinations all the time. It is considered a very important part of a healthy diet for ruminants to prevent other medical problems that would require medications or treatment.

So I can't judge whether one is better than another one. I know the formulatios all have their reasons why they think certain combinations are better for certain purposes. So I would say they're in everything.
We will commonly see a livestock feed additive that has 30 or 40 ingredients, including maybe five or ten microbials and then all the vitamins and the different things for different purposes. So there is a lot of work reviewing those products to begin with.

So if we had to get organic certificates for all of them, we could do it, but I don't think it is going to happen any time soon.

CHAIRMAN DELGADO: Dan?

MEMBER GIACOMINI: Just a comment on that, Gerald, as an animal nutritionist working a lot with dairy cattle ruminants and these types of products, a large part of what these products are trying to do is a balance of enzymes in the rumen. It is very likely that the optimal enzyme supply balance is not even -- it may be three of these bacteria species that are used very minorly now, but they just haven't put them together yet.

So you have the regulars now, and
the favorite, the A list. It may be that two
or three or four or five from the B list may
end up being the best thing in two to three
years. So it would be very hard to just try
and start splitting hairs on where on this
list the best is going to come from.

MEMBER DAVIS: So you would concur
that there is a vast amount of differing
concoctions being marketed in feed? I mean
that list is reflective of what's actually
being used, just like she said?

MEMBER GIACOMINI: Well, the
technology of bringing these to the animal, to
a great extent, is a technology in being able
to get the billions of different species that
are in the rumen already fed back to the
animal in a product where you are still
getting to them in a live state. There may be
changes in technology and maybe modifications
down the road where this list may be obsolete
in five years.

MEMBER DAVIS: So it may be a bit
MEMBER GIACOMINI: Well, the answer is always going to be a shotgun rather than a rifle because it is going to be the balance of amino acids, but what BBs go into that shotgun is going to be changing constantly also.

CHAIRMAN DELGADO: Was that clear enough, Gerry?

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: Okay. Any other questions?

(No response.)

Very good. Thank you, Emily.

Up next is Gwen Wyard, followed by M. J. Marshall.

MS. WYARD: Good afternoon, members of the Board, NOP staff, and ladies and gentlemen of the gallery. My name is Gwendolyn Wyard. I am presenting today on
behalf of Oregon Tilth.

We are a membership-based nonprofit organization. Our mission statement is to support biologically-sound and socially-equitable agriculture through research, education, advocacy, and product certification.

The topic for this afternoon is the definition of materials, namely, agricultural versus non-agricultural. The comments in their entirety were submitted to regulations.gov, so you should have them and all their gripping details in your book.

We also submitted comments in conjunction with PCO on the 606 review process, and I believe those are going to be addressed in later comments, but if you have any questions for me, at the end of my five minutes I will be happy to answer them.

I also was on the Materials Working Group, and I have some comments with respect to the options that were offered up in that
document.

We start off our comments by laying down five key concepts that should remain central to this discussion. While all are equally important, in the interest of time I will highlight only two.

No. 1, the NOP definition of organic production, and No. 2, 205.605 should be reserved for substances that technically cannot be organic.

With respect to the Materials Working Group discussion document, we are tossing another option in for discussion. It is referred to as option Tilth. It could have been option DD, it was suggested, because it is largely based off of option D, but we're sticking with option Tilth.

There are some significant differences that I would like to point out. Option D adopts a 2005 clarification on the definition of agricultural product. We would like to see only part of that guidance
adopted, namely, the following: Agricultural products are those that are managed by humans, and managed by humans refers to the intentional act of gathering, producing, raising, or growing domestically or in designated wild harvest areas by persons for human or livestock consumption.

Oregon Tilth does not agree that lines between agricultural and non-agricultural should be drawn based on an organism's taxonomy. The focus should be whether they are a living organism managed by humans and intended for human or livestock consumption. The focus from there on out should be whether they can or are produced and handled in accordance with the act and the regulations.

The definition of non-agricultural should either be revised or removed completely. We feel a revision, rather than complete deletion, is more appropriate because the general concept is very ingrained into our
regulation and is extremely useful when explaining why certain substances such as water and salt are allowed in or excluded from certified products.

Therefore, we recommend the following definition: Non-agricultural, a substance that is not raised in or derived from an agricultural system such as a mineral or atmospheric gas.

For the purposes of this part, a non-agricultural ingredient is also anything that technically cannot be organic. It is the same definition as B-plus.

We support the change in the title of 605 as presented in option D. Drop the word "non-agricultural" and refer to non-organic substances only. This approach provides a place for non-organic inputs that are either non-agricultural substances or substances that do not belong on 606 because they cannot be certified to the organic production or handling standards.
We support retention of agricultural, non-organic non-synthetic, and non-organic synthetic as categories because they cater to the organic preference stepwise approach of using materials which, I might add, has been lost in time.

Yeast -- hang onto your knickers. While Oregon Tilth cannot positively point to yeast as being agricultural in a traditional sense, we can say that yeast are living organisms and their production relies primarily on agricultural material that is available in organic form.

We recognize that yeast production has definite agricultural and environmental implications, and we feel these should and can be addressed by applying organic principles to yeast used in organic food.

Option Tilth offers the following fodder for thought: Retain microorganisms on 605 as non-agricultural substances and clarify that yeast products can be produced.
organically using non-organic yeast seed covered under the listing of microorganisms on 605.

While Oregon Tilth strongly believes the handling requirements of 205.270 provide adequate standards for certifying organic yeast, we accept that the larger community may feel more comfortable if organic yeast guidelines are further defined. The appropriate place to do this is in a guidance document that would ultimately need to be circulated by the NOP for public comment via The Federal Register, adopted if favorable, and posted to the NOP website.

Once processing guidelines for organic yeast products become available via the NOP website, specific products such as baker's yeast and nutritional yeast could be petitioned to 606 as agricultural products subject to commercial availability.

Under this working theory, a distinction can be made between a
microorganism classified as non-agricultural substance and the organic processed product that can be produced when the microorganism and substrate are formulated in accordance with requirements of processed organic product.

One last sentence?

CHAIRMAN DELGADO: One last one.

MS. WYARD: This approach would continue to allow direct-fed microorganisms to be allowed as non-synthetic, non-agricultural livestock feed supplements while continuing to support the organic production of yeast products listed on 606.

Thank you very much.

CHAIRMAN DELGADO: Thank you, Gwen.

Any questions? Steve?

MEMBER DeMURI: Without having both yours and Emily's proposal side by side, can you explain the difference between yours and her B-plus?

MS. WYARD: B-plus applies
commercial availability to both lists. So it merges the list. It doesn't actually merge them, but commercial availability is applied to 605 and 606.

I have made a distinction between 605, which contains products that cannot be certified organic, and 606, which are products that can be certified organic. I have included these categories, like I said, along with synthetic and non-synthetic. So there is this progression of organic preference.

Otherwise, they are very similar.

CHAIRMAN DELGADO: Any other questions?

(No response.)

Thank you very much.

MS. WYARD: Okay. Thank you.

CHAIRMAN DELGADO: Up next is M.J. Marshall.

Julie, you had a comment?

MEMBER WEISMAN: Well, no, it was with regard to a different person on the list.
CHAIRMAN DELGADO: Yes.

MEMBER WEISMAN: I don't believe she is in the room, and I do believe that they are signed up tomorrow.

CHAIRMAN DELGADO: Tomorrow.

MEMBER WEISMAN: As of yesterday, that was my impression.

MEMBER HEINZE: Julie, she asked and I told her that that wasn't possible.

MEMBER WEISMAN: When was this?

MEMBER HEINZE: It was an email late yesterday, and I said that it was too booked, and I'm sorry.

MEMBER WEISMAN: Okay.

CHAIRMAN DELGADO: So we are skipping M.J. then, and next up is Grace Marroquin, followed by David E. Adams.

MS. MARROQUIN: I'm back.

(Laughter.)

Good afternoon. My name is Grace Marroquin. I'm President and CEO of Marroquin Organic International, based in Santa Cruz,
California.

I founded my company in 1991, and we are importers and suppliers of organic ingredients.

Before turning to discuss yeast as an agricultural product, I have a brief comment on tartaric acid. Organic tartaric acid is available. At this meeting, the Handling Committee will make a sunset recommendation that tartaric acid remain on the National List both as non-synthetic on 605(a) with an annotation "made from grape wine", and as synthetic in 205.605(b) with an annotation "made from malic acid".

My company can supply organic tartaric acid made from grape juice extract. Since this organic version of organic tartaric acid is now available from at least one source, and grape juice is an agricultural product, it is my opinion that non-synthetic tartaric acid made with grape juice or grape wine should be listed in 606.
Turning now to the Materials Working Group report, since July 30th, 2004, I have been asking this Board simply to recognize yeast as an agricultural product. I appreciate the work that the Materials Working Group has done. I also served on this group.

I am grateful today that Kevin Orell, a former Chair of the NOSB, Goldie Caughlin, former member and officer of the NOSB, Lynn Clarkson, a leader in the organic community, have all submitted comments in support of our request. I am pleased that Dave Adams of Savoury Systems International is joining us today to voice his support.

Before organic yeast became available on the market, yeast was classified on the National List as a non-agricultural under 605(a). This means organic yeast cannot be a required organic ingredient.

Organic food processors do not have to use it at all. They are free to use conventional yeast and do not have to search
for an organic alternative.

Organic yeast uses an organic grain substrate and absolutely no synthetic chemicals in its production process. Conventional yeast, on the other hand, is made using synthetic chemicals. I have to remind you about this every time, but I will. Ammonia is the nitrogen source. Sulfuric acid and caustic soda lyes are used to regulate pH. Synthetic vitamins and synthetic anti-foaming agents are used, and the waste water is a major problem.

In the organic yeast production, the waste water is used to further make organic products. Nearly two years ago we thought this matter was on its way to being resolved in September of 2006, when the Handling and Materials Committee voted unanimously, eight to zero, to recommend to the Board that yeast and dairy cultures be listed on 606 as agricultural products. At the Board meeting in October of 2006, the
Board discussed this but deferred action.

We all understand the OFPA does include fungi, including yeast and other microorganisms, in its definition of agricultural product. No one on the Board or from the NOP had challenged this.

At this meeting, the Board will be reviewing poria fungus extract for listing as an agricultural product on 606. The NOP and the Handling Committee have simply accepted this petition for a fungus as an agricultural product. No one has questioned the status of fungus as an agricultural product.

While the Committee voted not to approve this petition, it did so on other grounds. Yet, the Board has still not acted on a unanimous recommendation from the Handling and Materials Committee of 2006. We see it as the principal reason for the impact it will have on livestock feed, which is understandable. Livestock feed is the reason we have a stalemate on recognizing yeast and
other microorganisms as agricultural products. The Materials Working Group report is a reflection of this stalemate.

Okay, here we go, option G. Option G is working within the framework of what we have right now, which is OFPA.

CHAIRMAN DELGADO: You have one minute.

MS. MARROQUIN: All right. Okay. Option G, keeping the existing definition of non-agricultural substances in the NOP regulation, it identifies a bacteria culture as not a product of agriculture. This would mean livestock operators could continue to use non-organic bacterial cultures in their feed as a supplement allowed under 205.237(a).

Processors using bacteria dairy cultures could continue to use them without the need to search for an organic alternative.

Two, since organic yeast can be available for food and feed, recognize yeast as an agricultural product and transfer yeast
alone to 605(a) -- from 605(a) to 606. A definition of non-agricultural substance, the NOP regulation identifies bacteria cultures as not a product of agriculture. This does not apply to yeast. Yeasts are fungi, not bacteria. This is a well-known scientific distinction.

Three, keep the existing listing of microorganisms as non-agricultural in 605(a). This is the same approach the EU has recently taken toward yeast in its regulation of 834/2007, blah, blah.

CHAIRMAN DELGADO: Okay.

MS. MARROQUIN: Yes.

CHAIRMAN DELGADO: Thank you, Grace.

Any questions? Joe?

MEMBER SMILLIE: Grace, we've got to get into the details. So I would like to ask you why, to the two options that we just heard, wouldn't your problem be solved by those options?
MS. MARROQUIN: Yes. I like those options, too, but that is an act of Congress. I might be dead by the time anything happens on that because it has taken four years already. I hate to say that.

There's also yeast and other items, ingredients like this, could be certified as processing standards. I think there have been clarifications that said, if 95 percent of the ingredients on substrates are used, they are considered an organic product. So that would be one avenue we could take.

I like B-plus. I like the various options. But, again, we are working within the framework of OFPA, and I thought that's what NOSB is to do, is to make and serve and clarify the regulations within OFPA.

MEMBER SMILLIE: Well, you join the Pollyanna crew?

MS. MARROQUIN: Yes, right, but I do think, you know, these other options that are being presented are good options.
MEMBER SMILLIE: The criticism of them is they take regulatory change.

MS. MARROQUIN: They take an act of Congress, which is like an act of God.

No, I mean, aren't you talking about changing OFPA in some of those cases?

MEMBER DAVIS: Didn't I hear Gwen --

CHAIRMAN DELGADO: Hang on a minute, Gerry.

Are you done with her?

MEMBER SMILLIE: For now.

CHAIRMAN DELGADO: For now, okay.

MEMBER DAVIS: I'm sorry. I'm trying to sort this out in my own mind, listening to Gwen and Emily. I thought I was hearing them saying they have to redefine the word "agricultural". I heard them dropping non-agricultural out, but I thought -- I guess I am wrong, but I thought I heard them mention that agricultural should mean this. Well, OFPA already says what agricultural is.
MS. MARROQUIN: Is there a lawyer in the room?

(Laughter.)

CHAIRMAN DELGADO: Can you state your name, please?

OFPA is a statute -- this Board is assigned in OFPA to advise the Department on how OFPA should be implemented. So this Board has to operate -- this Board and the Department of Agriculture have to operate within the four corners OFPA.

Now OFPA says that in order to have an organic product, it must first be an agricultural product. If you blur the distinction between agricultural and non-agricultural, and you make a nice, big, happy list, and you say, "Now here's this nice, big, happy list," and if someone can come up with an organic version of something on this list,
fine, it will be an organic version, but that organic version has to be an agricultural product. So you can't get around the fact that anything that is going to eventually be organic has to pass muster as an agricultural product.

That is why we are suggesting in this latest option that we have, option G, consider that yeast is an agricultural product and leave bacteria and the other microorganisms as non-agricultural.

MS. MARROQUIN: And again, this was all framed within moving forward from the idea that we have to work within this framework of OFPA. If it was possible that we don't, then all these other options are all very good options. I mean not all of them. I like B-plus. I like Tilth. But again, we're bound by the law.

One last thing: Organic preference has been mentioned here, but it is the reason my company is here. Because it was a great,
fun challenge to look at those lists and see what on that list can we make organic, and there are plenty of things. Lecithin can be, glycerin, but why aren't people petitioning these? There must be reasons. It takes away the challenge of producing organic ingredients.

CHAIRMAN DELGADO: Very good. All right, the Secretary, please.

MEMBER HEINZE: You'll be relieved to know I don't have a yeast question. Now I have a tartaric acid question.

So you have that available? Is that what I am hearing you say?

MS. MARROQUIN: Yes. We haven't brought it in. It was three years in the making because they were trying to make baking powder, and we have it made with organic baking powder, which no one has to use, of course.

But because of that, they had to produce a tartar, and they were trying to get
rid of the phosphates. So they were able to develop this. But again, the issue came up and it was like, oh, dear, do I really want to do this?

MEMBER HEINZE: I will admit, as a member of the Handling Committee, sometimes I feel like I'm stuck in a chicken-and-an-egg thing on the sunset. We saw this with lecithin a couple of years ago, that someone did say it was available, but yet it wasn't in a form that industry could use. Yet, what you say is, until it is off the list, industry won't be incented to use it.

I do feel a bit stuck sometimes.

MS. MARROQUIN: Yes.

MEMBER HEINZE: We all have the same goal.

MS. MARROQUIN: Right.

MEMBER HEINZE: Get things off the list, but it does seem --

MS. MARROQUIN: Organic is about chicken and eggs.
MEMBER HEINZE: Okay.

CHAIRMAN DELGADO: Dan?

MEMBER GIACOMINI: Thank you, Rigo.

Not a question, but just a reminder to everybody: We will have a presentation tomorrow by the Materials Working Group. Depending on how long all the presentations fall within our time limit, there will be discussion.

CHAIRMAN DELGADO: Very good. Thank you.

MS. MARROQUIN: I want to thank you all again for all your patience and understanding and attention to the matter.

CHAIRMAN DELGADO: Before you leave, are there any other questions for Grace?

(No response.)

Okay, thank you.

Okay, I understand that M.J. is present at this moment, M.J. Marshall. Is that the case?
MS. MARSHALL: That's it.

CHAIRMAN DELGADO: Okay, you're up.

After M.J., we'll have David Adams.

MS. MARSHALL: Sorry I was late. The train was a little late, believe it or not.

I'm M.J. Marshall. I'm the Director of Government Relations for the Flavor and Extract Manufacturers Association.

Along the lines of the discussion that you were just having with respect to ag versus non-ag, I just wanted to give you an update as to where the flavor industry is with respect to those discussions.

Certainly, FEMA shares the concerns for the integrity of the program and the tremendous efforts that have gone into all of these discussions of late. We have made enormous progress, I think.

We have had our own internal FEMA Task Force looking at this issue. We have had twice monthly meetings with more than 20
company participants. Then at our recent annual meeting, which was just a couple of weeks ago, we had some presentations on the organics issue, and we have been giving these to a wider audience within our organization to try to educate the members as to the concerns that we have about the definitional issues.

Certainly FEMA wants to help reach a solution to ensure business continuity in a way that will satisfy the producers of organic products, the certifiers, and the regulators.

I would also stress that we have also been working with the certifiers very closely on this issue as well. I think that is an important point.

We will also continue to work closely with the Materials Working Group and, as I said, the certifiers. We want to help try to resolve any outstanding concerns with the definitional issues by achieving a solution that we believe will provide a consistent approach to the challenges that we
On a final point, we believe that the solutions must support the program and ensure the integrity of organic products.

CHAIRMAN DELGADO: Well, thank you.

Any questions? Barbara?

MS. ROBINSON: M.J., I'm glad you came. I just would like to say that, as a matter of fact, I got an email the other day and it was not from FEMA, but it was from someone -- I can't remember his name now.

MS. MARSHALL: A member of FEMA?

MS. ROBINSON: I'm not sure. It is a gentleman out in California who has been working with flavors for quite some time.

It was an extremely educational communication about natural flavors, the way actually that they are annotated on the National List and kind of problems with the original annotation, linking it back to FDA's definition of a natural flavor.

So, unfortunately, I was on my way
here, and I didn't really have time to -- it was like a three-page email when I printed it out. So I want to go back and look at that and then go back and look at the regulatory citation at FDA, and then we probably do need to talk. Because like I said, it was really educational about the FDA regulations governing natural flavors.

MS. MARSHALL: Which FDA has said that they are not going to define, "natural" that is.

MS. ROBINSON: Actually, there is some regulatory history there.

MS. MARSHALL: Well, there's definitely history --

MS. ROBINSON: Yes, right.

MS. MARSHALL: -- but what I'm saying is that they've come out recently and said they weren't going to try to define natural --

MS. ROBINSON: Right.

MS. MARSHALL: -- any further than
they already have.

MS. ROBINSON: But I guess what I am saying is that we still have more work to do delving into this.

MS. MARSHALL: I agree. So that is why I wanted to come and participate today --

MS. ROBINSON: Right.

MS. MARSHALL: -- just to give the Board a status report on where we are --

MS. ROBINSON: Right.

MS. MARSHALL: -- and to reiterate our concerns and our goal of trying to find a workable solution.

MS. ROBINSON: And so is ours. So is ours. I just wanted to reaffirm that with you.

MS. MARSHALL: Yes. Well, if that's an email you would feel comfortable sharing with me --

MS. ROBINSON: Oh, I would, absolutely.

MS. MARSHALL: Yes, that would be
great.

MS. ROBINSON: Because I would like your feedback on it.

MS. MARSHALL: Yes, okay, and we can have some follow-up after that.

CHAIRMAN DELGADO: Okay, thank you.

Joe, you had a question?

MEMBER SMILLIE: Yes. A member of FEMA participated in the Working Group.

MS. MARSHALL: Okay.

MEMBER SMILLIE: Has FEMA looked at that document, and do you have any comments to make on that document about which option you may be leaning toward at this point?

MS. MARSHALL: I am really, Joe, not comfortable commenting on that. I would say that, yes, we have looked at the document, but we are still having some internal discussions about it.

CHAIRMAN DELGADO: Any other questions?

(No response.)
Good. Thank you very much.

MS. MARSHALL: Thank you.

CHAIRMAN DELGADO: Up next is David Adams, followed by Kelly Shea.

MR. ADAMS: Good afternoon. Thank you for the hearing. I'm Dave Adams from Savoury Systems, President and owner. We are a natural ingredient company working with products for the food industry.

We are making organic baker's yeast extract. This is a natural flavoring material. It is a very stable product. It has been around for centuries really, baking yeast and reliable low allergen.

We have been making this for about three years now in the U.S. It is sustainable, as you grow it on a carbohydrate source, molasses and sugar, which yields a nutritious, protein broth for flavor and nutrition, kind of like chicken broth, if you will, but it is vegetarian. So it has a big benefit and it is a sustainable product.
We respect the efforts of the members of the Materials Working Group and look forward to a decision on the issue here.

We have looked at options also. We wrote a letter about (c), but really it doesn't resolve the issues with all the dairy cultures and the microorganisms and everything else that are a bit complicated.

Yeast is a little simpler product and reliable. So what we have come up with also is the option G. Tilth also suffices for the same program to sort it out, but I think that would work well.

Comparing it to EU, there is a similarity if we used the other issue, the production standards for organic yeast. The EU recognized yeast as eligible for organic certification in food and feed and had issued production standards.

So if we need standards, the EU are pretty standard; we could use those as a model. Here again, standards should not be an
obstacle.

Also, if the NOP continues to keep yeast as a non-agricultural substance, NOP-certified manufacturers will continue to rely on conventional instead of organic yeast, while the EU could soon start blocking organic imports from the United States unless they contain organic yeast.

Again, I think you've got a fast program from Grace Marroquin on the option G and its similarities. So I won't belabor that issue.

But the purpose of NOP regulation is that new organic ingredients are developed for processed products. There is an organic preference that should favor the use of these ingredients, and we see option G as the best one now that would be in perfect interest of strengthening the organic integrity of processed food products by finally requiring the use of yeast in organic form if it is commercially available.
Thank you.

CHAIRMAN DELGADO: Thank you.

Any questions?

(No response.)

All right, thank you very much.

MR. ADAMS: Good.

CHAIRMAN DELGADO: Next up is Kelly Shea, followed by Zea Sonnabend.

MS. SHEA: Hi, Everybody. I'm Kelly Shea with WhiteWave Foods, better known to most of you as Horizon Organic Dairy and Silk Soymilk.

I want to thank the people at USDA's Egg Marketing Service, NOP, and members of the NOSB for all the effort you put into preparing for this meeting. For a lot of us, we travel here for the meeting, but we know how many hours and days have gone into preparing for the meeting.

As well, a welcome to Mr. Flamm to the Board.

So I am here today to offer public
comment on a number of issues of importance to
the organic community.

No. 1, we want to show our
continued support for the renewal and
reaffirmation of the following materials to
the National List: Karaginan, Agar Agar, and
cellulose.

As noted in the Handling
Committee's reaffirmation of the above
materials, numerous comments in favor of
relisting, with no comments opposed, were
received in the months following the November
2007 meeting.

Secondly, we thank the Board and
the public for the discussions around the
definitions of ag, non-ag, non-synthetic,
synthetic. Proper definitions will allow for
consistent interpretation of the rule and
transparent decisionmaking. As well, it will
encourage further production and availability
of organic inputs.

So I would ask the Board that you
request the Materials Working Group continue the efforts begun and that our next report would be delivered at the autumn NOSB meeting.

As you can see, even since the last time the Materials Working Group stopped working, we have had a number of new options. So I think it would be great if we had an opportunity to go back and come forward at the autumn meeting with another document for you that would be more advanced.

I want to talk a little bit about organic seed. So in organic dairying, it is as much about raising grass as raising cows, and farmers face difficulty locating good quality organic seed with a high germ rate that is suited to organic farming practices, when it can be located at all, and specifically grass seed.

So I want to really thank the NOSB for the document you put together. I think it is the best work to date.

I also want to thank Mark Cool at
Seeds of Change for the great service he has done to the organic community with his public comments on this important issue over the last few NOSB meetings.

So some of the seeds that farmers struggle to find in their areas as organic are yellow sweet clover seed, red clover, crimson clover, a good two-row barley that is going to produce good straw, stands well, and doesn't lodge, sudex, tritecti, which is a lot better for grazing.

So we are going to be compiling further information on this. Ed Maltby, the Executive Director of NODPA, has offered to join us in putting a call out to organic dairy farmers in order to ascertain what other seed varieties they cannot find as organic.

I think there has been a lot of focus on the vegetable seeds, as we have heard, but less on cool season and warm season grasses, and some of the annual forages.

But here's a question: So if I
have compiled this list of seeds that are hard
to find as organic, then what do we do with
that? I mean it is a little odd to think I am
going to send that list to every seed supplier
here in the U.S. There is not sort of a seeds
wanted database. There's databases of
existing seeds. So just a little something to
take away as you go back to look at reworking
your document.

So organic, as you know, is under
attack from many levels today. We've got
price issues, supply issues. We've got a lot
of imitators coming onboard.

I really thank the NOSB for the
work that they have done to promote organic as
the only third-party certified products
produced under protocols that benefit the
environment and provide food and fiber that
can be traced back to the farm. Organic has
been called the poster child for biosecurity
and country-of-origin labeling.

The USDA organic seal must meet the
expectation of the organic consumer. So we thank you for the work that you are doing.

Last, but not least, something we have talked about before -- I will be done in less time than that, Katrina (responding to time limitation on speakers) -- we urge USDA to act quickly on the two critical priorities for the organic dairy community today, the immediate publication of the pasture rule with very clear metrics for compliance, at least 30 percent dry matter intake from active grazing, and not less than 120 days of the year. We all know most dairy farms can graze many, many more days of the year than 120 days.

Lastly, as opposed to an advanced Notice of Proposed Rulemaking on origin of livestock, we really need to go right to a proposed rule. We did an ANPR on pasture. It came out in April of 2006. So it is just a long road coming.

I think the whole community is aligned on what we want out of origin of
livestock. So we could probably dispense with an ANPR.

Thank you.

That was really more for them and less for you.

Thanks.

CHAIRMAN DELGADO: Thank you, Kelly.

Any questions? Joe?

MEMBER SMILLIE: Kelly, I appreciate your comments that the Materials Working Group should go back and further refine the great work that you have already done. You have obviously chosen that route rather than seeking a recommendation for the November meeting.

I just wonder, do we need to take that time? Do you think that we should take a little more time rather than try to come out with a recommendation?

MS. SHEA: Yes. Well, we might be able to have one by then, but let me tell you,
the calls were some of the most amazing calls
I have been on in a long time. You had a lot
of members of the community on these phone
calls.

I've got to tell you, the first
"how long" was just resurrecting history,
right? So Brian and Grace and everyone that
was on the phone call going, "Oh, member in
'95," and "member in '92," and a lot of you
that sit on the Board have a hard time finding
all this history. So it was just rich mining
to pull all this together.

Then, once we got it all together
and made sure nothing was left out, the time
was already half gone, and then it was time to
start really eating that and digesting it and
deciding where to go from there.

So it is not finished. Could it be
November? I think -- ask the team -- yes,
probably, but I would rather underpromise and
overdeliver.

MEMBER SMILLIE: I would be remiss
-- which option are you leaning toward? I am doing a survey of everybody who speaks to it?

(Laughter.)

MS. SHEA: I'm not saying yet.

(Laughter.)

MEMBER SMILLIE: You're not saying?

MS. SHEA: No. I don't have a position on it yet for public consumption.

(Laughter.)

CHAIRMAN DELGADO: Barbara, you had a comment, following by Jennifer.

MS. ROBINSON: Yes. I should have mentioned this this morning when I was doing the NOP update, and I apologize for forgetting to do this, but we have decided, Kelly, to omit the ANPR on the origin of livestock and go straight to a proposed rulemaking.

MS. SHEA: Praise the Lord. Thank you very, very much.

CHAIRMAN DELGADO: Jennifer?

MEMBER HALL: Whichever direction that the Materials Working Group does go, if
it goes back to that group, I do want to really applaud that group's work. I really appreciate how collective it was and how the results of it, at least to date, were really exploratory about the different options and kind of bringing the Board good information to digest and think about what the impacts of those are and kind of not a dictum about which direction to go and kind of "my way or the high way" sort of a thing.

So if it does go back to that group, I would really appreciate a similar sort of a presentation, maybe fewer, that go through that sort of option and implications, but it was quite helpful for me.

MS. SHEA: Thanks for saying that, Jennifer. It was painful, but what we kind of want to be able to do is preserve this sort of history for the future because I'm almost getting 50, a lot of us are getting older; we are going to want to leave this information so people will know why the decisions were made
that were made, right? So thanks, you guys.

CHAIRMAN DELGADO: Any more questions for Kelly?

(No response.)

Thank you very much.

Next is Zea Sonnabend, followed by Claudia Reid.

MS. SONNABEND: Well, Kelly's comment about mining history is a perfect segue to what I have to say.

Zea Sonnabend, California Certified Organic Farmers.

CCOF recently passed the half a million acres mark in certified organic acreage with over 1800 clients.

The decisions that you make affect great numbers of us out in California. We hope sometime we will get you to come out to California and have a meeting, or at least to the West Coast, so more of our people can give some input to your process.

Thank you for the opportunity to
address the NOP and NOSB. I want to talk about materials and a little bit about seed.

First of all, I came to my first NOSB meeting in 1993. We were brought in, a few of us in the industry, to give introductory reference to the first NOSB members, at which time I said there's a nice definition in the OFPA about synthetic, and it is good, but it needs a little bit of clarification and elaboration, particularly as it applies to things like extraction, formulation, agricultural, and non-agricultural, and other definitions like that. Combustion was one of them.

Over the years, a number of attempts have been made by NOSB to work on the synthetic definition and elaborate on it. Since 1995 maybe, when Richard Steward did some work on synthetic, there's not been any finished pieces that have proceeded to clarify what extraction means and what types of extractants are necessary, formulation issues,
and then of course the agricultural issues that you are dealing with now.

So some of us in the industry that review materials and work with them are stuck on a number of things, and you, in fact, since you may not know it because many of the petitions were deferred before your time, but there are deferred petitioners sitting there waiting for you to come up with clarifications on synthetic and non-synthetic to make a decision.

Therefore, I urge you, in conjunction with this materials discussion document on agricultural, to pick up the last piece done by Rose Koenig and fellow NOSB members that has really good information on extraction things and other issues. It may not be quite done, but it is really time to make a decision on this and to move forward on this issue, because once you get synthetic, then you can proceed to agricultural and some things can fall into place.
Part of that is to acknowledge that synthetic distinctions are not necessarily the same for handling as they are for crops. Much of the recent work done was done only from the handler point of view and neglected some of the crops realities.

So, for instance, one of the deferred petitions is soy protein isolate. Soy protein isolate as a food ingredient would be able to be acceptable in organic products because potassium hydroxide is on the handling list, which is used as the extract for the soy protein isolate. But its petition for use as a fertilizer in crops is not considered to be acceptable to extract something with potassium hydroxide and use it on crops. So the Committee at the time got bogged down in deciding whether it was synthetic or natural and has tabled that discussion for several years now. So I do urge you to pick that up.

For the agricultural and the discussion paper, I have submitted some
written comments. We support option B in CCOF. We can go with the B-plus thing, but we like option B because it is the simplest, and simple is what you need. Your life is already really complicated, and so if you just drop the non-agricultural issue, subject everything on the list to commercial availability, which we actually do for the most part, that would enable yeast to be on the National List, and if it is commercially available organically, it would be okay, and if it wasn't, then the "non" would be okay.

So we think that B is the simplest choice. We would like you to make a decision on this as soon as possible also.

Now regarding the petitions -- and this sort of leads into the new website -- we appreciate your effort to make the website uniform with the USDA. The petitions portion of the website turned into really an incredible dinosaur. I was having real trouble, trying to get ready for this meeting,
figuring out the status of where petitions were because you have to go to each letter and look at each one individually, instead of being able to see a chart that has them all there, and you can sort the chart in different categories.

So I really hope you will try to work on that, so it is more functional for us and yourselves. Along those lines, there was terminology that was unclear about where a petition actually stood, like in some cases -- and there's some actual wrong information on some of the petitions. I know this because I was the TAP contractor to the NOSB from 1994 through 1996. So the older petitioners, I'm largely responsible for making sure they moved through onto the National List.

I don't have time to go over every single entry in the petitions database to clean up all the mistakes, but I will do what I can when I find them.

So, anyway, there are several
petitions that we really would like you to see
addressed that have fallen by the wayside.
One of them is the soy protein isolates.

Another one is the terpines petition, which at the time got turned away because the EPA ruled that the terpines could be added to List IV. However, then when you made a declaration about the new inerts policy, it ruled out the terpines which were decided after 2004.

So the terpines are still in a gray area, and the cleanest way to solve it would be to take up the petition, send it to TAP review, and either put it on the National List or not, so that we can know the answer to terpines.

Another example of a petition wrong on the database, which I feel still needs work, was the one on phosphoric acid as a crop production aid. When you go to the website, it gives a TAP review for phosphoric acid for handling and says nothing about it for crops.
It was petitioned as a stabilizer for fish, and the Department was giving some strange rulings at the time about non-synthetic and synthetic. Therefore, they just wrote a letter to the company saying they could use the product, and this is not really adequate. This needs to be addressed by a TAP review. So really I hope you send this on for a TAP review.

Then I do echo what some of the other people have said about TAP reviews should be done for everything put on the list. If you have a streamlined TAP process for 606, I can understand that, but you still need objective information. It needs to be transparent, so that people can see it and comment, so that if a person was growing organic okra, they could step forward at this meeting and say, "I'll grow it all, all that you want," or whatever, like we saw some of at the meeting last spring when some of the other things were reviewed for 606. But we would
like to see transparency and objectivity.

Okay, so on to the commercial availability of seed. We do applaud your efforts to keep working on this very complicated and hard-to-grapple issue. We were one of the main people complaining about the previous recommendation which put too much burden upon certifiers to have to put information that is normally now kept on farms that we inspect, and it was asking us to compile it and send it in.

So we appreciate that you have thought a lot about it and you have put out a good, thoughtful piece in the introduction.

We also support the growth of the fledgling organic seed industry. You will hear later from the Organic Seed Growers Association, which is a newly-formed organization that we would like to support.

However, we still feel that some of the details in your seed availability proposal are fairly cumbersome, and now the onus has
shifted a little bit away from the certifiers and onto the growers. It is still asking for collection of information that normally we only review on the farm. So we would like you to keep working on it, but I don't think our growers are going to be happy with the way it is.

Lastly, I was the person who mainly pushed for the petitions for tetracycline and streptomycin to get onto the National List in the first place when they were added. I understand that you have a new recommendation for an additional tetracycline product. I understand that you came to the Committee recommendation without doing an additional TAP review on that new product.

Even if it is essentially the same, as they claim, to the existing material on the list, they are petitioning a new use for it for use on peaches for bacterial spot, and that has not been TAP reviewed. No peach growers have asked -- I'm on the last sentence
-- no peach growers have asked for this that I know; maybe some will go forward today. No study of the alternatives for uses on peaches has been conducted.

    So I think you are correct in either turning down the recommendation or deferring it until you do a proper TAP review on the subject because you really need to do a TAP review for each use that is on the National List.

    CHAIRMAN DELGADO: Thank you, Zea.

    MS. SONNABEND: Thank you.

    CHAIRMAN DELGADO: Any questions? Yes, Tracy.

    MEMBER MIEDEMA: Thank you, Zea.

    I want to make sure I understand what the burden is on farmers or certifiers in feeding back that information on organic feed.

    MS. SONNABEND: The proposal, as I understand it, says that a grower has to make a master list of every seed they use and then send it around to all the seed companies that
they buy from and ask if they have any of those varieties organically.

Now we allow the grower to show us the seed catalog from Johnny's, and we know that if Johnny's doesn't have it in their catalog, that sending them a list is not going to make them have it if they don't have it already. So we accept the Johnny's catalog as evidence of here's what organic varieties are available or not.

We don't make the grower write it all down onto one master list. We question the grower about each variety that they are using non-organically and say, "Why are you using this?" Then we write much of it in our report.

But if they are growing three hundred varieties, as Harriet is, we don't ask every single variety every year. We look at what they get every year. We ask them about the ones that we feel are key. We don't make them turn in the completely master list. They
keep it with their own OSP on their farm, the lists of what they use.

Most growers, many growers are very protective of what varieties they are growing and they don't want them turned in, even to file reviewers to see, much less to some third party to see, if it might disclose their identity in relationship to that variety.

MEMBER MIEDEMA: Okay. A follow-up question then: If the end game is to get more organic seed available, do you have any alternative suggestions to making that demand transparent to the marketplace?

MS. SONNABEND: Yes. We look at it as a continuous improvement in a situation. So we don't look for an absolute you contacted three people or you used "X" percent. What we look for, continuing effort and improvement each year in what they are doing.

I think that at this point the best solution on the whole is for maybe like the Economic Research Service or one of the
granting agencies for data collection in the
USDA to do the market research about what
varieties those are or give a grant to one of
these groups who are interested in organic
seed to do the market research to see which
varieties are most widely grown that are not
being grown organically, and also to ask
processors, because a big area of this gap is
in seeds for processing which processors are
requiring certain agronomic traits.

So you shouldn't force the growers
to have to supply the seed companies with data
that they really need to collect themselves as
market research, and you should do what you
can to get certifiers to keep -- you know, you
have to have a recommendation like you have,
but it has to be one that is like keep
tightening the screws, so that all the
certifiers keep tightening the screws to some
extent.

CHAIRMAN DELGADO: Katrina,
followed by Gerry.
MEMBER HEINZE: You talked about continuous improvement. Do you see that with the growers that you certify, that they are increasing the amount of organic seed they are using every year?

MS. SONNABEND: Yes, and I also see concurrently to that more organic seed is becoming available, including some organic hybrid seed, which a lot of our growers need for their market characteristics.

It is slower than maybe some of us would like. It is certainly slower than the seed companies would like. But I think this really comes into partly an enforcement issue also because a few of our certifiers who were meeting yesterday said, well, the USDA auditors, they never check to see that we are enforcing the seed rules; it might not be on their auditing checklist. So, therefore, if they are not even looking at the very minimal amount of things we are doing now, how are they going to put more things in place?
So just starting to write up the
certifiers who aren't doing anything about it
would be a step to helping there be more
organic seed.

CHAIRMAN DELGADO: Gerry?

MEMBER DAVIS: You partially
answered my question in what you just said
about NOP. What suggestions would you have
for the NOP then on things that they could do,
should do, to get all the certifiers to be as
proactive as perhaps CCOF is on seeing
improvement in the growers?

MS. SONNABEND: Yes, a couple of
things. One is make sure that the auditors,
the accreditors, do look at the organic seed
rule and how it is being applied on an even
basis, so that the certifiers all know that
the USDA is looking at them. Once they don't
look at them a few times, then they think, oh,
we can get away with it.

The second thing is that the big
problem for certifiers in actually enforcing
the rule is that it says you have to use organic seed if an equivalent variety is not available. Well, equivalent in your recommendation has a very broad definition. It has no teeth in it that we can say to anyone, okay, this is not equivalent to that, as a certifier, because we just say, "Well, what characteristics are necessary?", and the grower will say, "Well, I have to have early blight resistance in tomatoes."

We'll say, "Okay, well, you know, here's these varieties that are early blight resistant." But they will say, "Oh, well, this one doesn't work because of this; that one doesn't work because of this." We can't say, "You're wrong; this doesn't work."

So we would encourage you, in keeping to work on this issue, to perhaps appoint a task force, which I believe that there will be plenty of seed people willing to serve on, that could help get at this equivalent issue, what's an equivalent
variety, to give certifiers guidance on how we
could say more to people: This is the
equivalent or this isn't equivalent. I think
a task force made up of certifiers, seed
company people, and growers would be
potentially a direction to go in.

CHAIRMAN DELGADO: Are you done?

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: Kevin?

MEMBER ENGELBERT: Zea, could you
give just some rough numbers on what you think
the increase in organic seed use is each year
with your huge number of acreage?

MS. SONNABEND: Yes. Okay, and it
varies a great deal in crops, as other people
have mentioned. The increase has been much
greater and faster in rice, which is a big
crop for us, or grain crops. In fact, in
cover crop seed, that is one of the biggest
uses of organic seed because that is easiest
to get organic source. But the vegetable
crops, some of them, it is still quite small.
So I would say in vegetables, since the last maybe three years, I have seen it double, but it has doubled from less than 1 percent to 2 or 3 percent.

I also have seen, though, some companies -- and this is a skill issue, unfortunately. If you are the smallest grower and you grow 100 varieties on a quarter acre, you don't have much clout with the seed company when you say, "I want organic seed." If you have 20,000 acres, and you go and you say, "I need these agronomic characteristics. I'm looking for something," you've got a lot more clout.

So from that point of view, we might lean on the big companies equally as hard or even harder, knowing they have more ability to influence it. We are seeing the most improvement among the bigger companies who have the most power to do something about it, including that they can contract for whole seed crops, for instance; they can transition
their own land, if they want to produce their own seed, and they can do other measures that the smaller growers can't do.

So we definitely are seeing improvement, but there's still a good ways to go.

CHAIRMAN DELGADO: Any other questions for Zea?

(No response.)

Okay, thank you very much.

MS. SONNABEND: Thank you.

CHAIRMAN DELGADO: Next is Charlotte Vallaeys, followed by Jim Pierce.

MS. VALLAEYS: Hi. My name is Charlotte Vallaeys with Cornucopia. Thank you for the opportunity to make public comment. We really do appreciate it.

My comments will be on hexane extracted oils containing DHA and ARA. I know that a lot of certifiers would like clarification on this, and I hear it is on the work plan.
Currently, these oils have not been reviewed by the Board. They do not appear on the National List as approved substances, nor do accessory nutrients appear on the list. But, nonetheless, these DHA and ARA oils are currently added to all organic infant formula on the market and some organic milk as well.

I would like to stress to the Board why this is an important issue. It is important not just because these are added to infant formula without having been approved, but because some infants are getting sick from these additives. So, actually, I make these comments not just as a Cornucopia staff member, but as an expectant mother and really on behalf of many mothers who have contacted me.

When they do, when they email or call me, they ask, what type of formula can I give to my baby that doesn't contain these oils? And I have to tell them, "I'm sorry, but there is no organic infant formula that
would be a safe alternative for your baby."
There is no organic formula that doesn't contain these hexane extracted algal and fungal oils.

Clearly, this hurts the infants whose parents cannot turn to organics as a safe alternative, but I would also like to stress that it hurts the organic industry as a whole when consumers can't turn to an organic formula as a healthier, more highly-regulated, and safer product, which, frankly, organic consumers expect that, and deserve that, and lose confidence in organics when these decisions are made, not to benefit babies, but to benefit a handful of companies.

So I'd like to share some of the findings which are in our report, which I will submit, so it will be available for you to look at.

We filed a Freedom of Information Act request with the FDA, and this came out of conversations with healthcare professionals.
and mothers. And we found that, indeed, many
mothers have submitted adverse reaction
reports to the FDA.

And I'd like to stress that this is
not just, okay, my baby was given, say, a
dairy formula, had diarrhea and vomiting, and
I switched to a soy formula without DHA. This
is really when they switched to an equivalent
formula, the only difference being that it
didn't have DHA and ARA.

And often -- well, actually, in all
of these cases that we documented, symptoms
disappeared, usually within 24 hours. And the
most common symptoms in newborns and babies
are diarrhea and vomiting.

I'd also like to note something
which is covered in the report, which is that
these oils -- well, that the vast majority of
peer-reviewed scientific studies show no
benefits to cognitive development of term
infants from these DHA-fortified formulas. So
there really, at this point -- there is no
scientific evidence that would support adding these oils to formula to benefit the infant. And there is nothing in the organic standards that would indicate that these oils can be added legally to organic foods. Yet, as I mentioned earlier today, if a mother is searching for a DHA-free formula for her baby, she will not find one. These algal DHA and fungal ARA oils are not on the National List as approved substances, nor are byproducts of microorganisms.

An initial legal complaint about these additives was filed in 2006, and was dismissed. The compliance officer noted that, quote, vitamins, minerals, and accessory nutrients, unquote, are allowed when the actual regulations state -- and here I quote from 605 -- nutrient vitamins and minerals in accordance with 21 CFR 10420 are allowed.

Now, DHA and ARA are fatty acids. This is basic nutritional knowledge. Fatty acids are not vitamins; they are not minerals.
That's the first point.

Then - since I am running out of time, I will make this quick - 10420 is an FDA regulation which states that the FDA does not encourage the indiscriminate addition of nutrients to foods. So this is really -- it's a fortification regulation, and the FDA has not required DHA and ARA to be added to infant formula. For example, the American Academy of Pediatrics has not recommended it, either.

Cornucopia filed a second legal complaint, and -- well, we'd like to point out that the NOSB is charged with the task of reviewing materials -- okay, I'll end it here.

Just one last line: I think it's important to note that babies are getting sick from these, and I'd just ask you to at least keep baby formula, if we could at least keep that safe from these indiscriminate additions, that would be good.

Thank you.

CHAIRMAN DELGADO: Thank you.
Any questions? Yes, Hugh?

MEMBER KARREMAN: It sounds like we need to review DHA and - what's the other one? - ARA --

MS. VALLAEYS: Yes.

MEMBER KARREMAN: -- with TAP reviews if they are not vitamins or minerals, and they're - you cited - didn't you cite CFR whatever it is saying --

CHAIRMAN DELGADO: Remember, we can only review materials if they are petitioned.

MEMBER KARREMAN: If they are petitioned, right.

CHAIRMAN DELGADO: So that would be the normal process to follow, and we can leave it at that, unless there's any other clarifications, questions.

MEMBER DAVIS: Can there be a negative petition brought to say, these materials should not be in organic products?

CHAIRMAN DELGADO: Absolutely, yes. So any other questions, comments?
Does that clarify your question, Hugh?

MEMBER KARREMAN: Yes.

CHAIRMAN DELGADO: Okay.

Well, thank you very much.

MS. VALLAEYS: Well, we have submitted a legal complaint, so it's really at the compliance level, I think.

CHAIRMAN DELGADO: That's part of the program. Our main function is to review materials and recommend those.

MS. VALLAEYS: Okay. Thank you.

CHAIRMAN DELGADO: So thank you very much.

Okay, next is Jim Pierce, and I also want to give you an update while Jim walks up to the podium. We are halfway there in terms of public speakers, and we have about 20 minutes before we finish, according to our agenda. So I will request the Board and the speakers to summarize their recommendations,
observations, or comments. If they so can, it will be greatly appreciated. However, I want to make sure that we are not sacrificing quality of comments for the sake of time.

Jim?

MR. PIERCE: Okay. For the record, I'm Jim Pierce, former certification czar at Organic Valley, now the Global Certification Program Manager for Oregon Tilth Certified Organic.

I'm still having trouble saying that since the all one word "Organic Valley" has become part of my vernacular, like nuclear.

The most exciting thing about the offer to work for Oregon Tilth is that I honestly believe that the pragmatic solutions to the nascent quandaries of this relatively young national organic program require an open, honest synergy between NOSB, the NOP, and the accredited certifiers, and I want to be part of that solution.
Also for the record, you may have heard rumors that I jumped ship from manufacturing to certification solely for the privilege of gaining access to the ACA LISTSERV. Not true.

(Laughter.)

Others claim it's because I would do anything to attend Mark Bradley's NOP certifier training. Also not true.

(Laughter.)

Or maybe, just maybe, I am positioning myself ever so strategically for the certifier seat that comes available on January 24th, 2011, Joe.

(Laughter.)

I'm thinking, however, we will need a decidedly more democratic administration before that particular snowball makes it through Hades.

Hopefully, in the intervening three years, you can put a lid on commercial availability, ag/non-ag, hydroponics, private
label, hopefully.

I am no longer certification czar, but I remain in a position where I can address you, the fine folks of the National Organic Standards Board. So, on behalf of Oregon Tilth, here are our comments on multi-site certification and seeds:

Regarding multi-site certification, as was made clear by our comments last November, Oregon Tilth is breaking ranks with most of the other certifiers. Our position remains that, with solid, auditable internal control systems, the model currently being applied to small holder producers could be applied more broadly.

But - and this important - but, in the interest of fairness and integrity, certification of multi-site operations must remain limited to producers only until guidance is final.

Although certification of retailers is optional, it's a good thing, and should be
encouraged, since it gives consumers an added
degree of assurance, and lends further
credibility to organic claims.

The appendix developed by the CACC
and the OTA Task Force is also a good thing,
which will help you write the final
recommendation. Write rules not for cheaters,
but for compliance. Fraud is fraud, at a
single site, or a multi-site.

605.400(f)(1) and (2) are sharp
enough teeth to bite the butts of cheaters.
Initial review of each and every site the
first year is critical, as is inspection of
every new site, every previous non-compliance,
and every complaint in subsequent years.

The Accredited Certifiers
Association can assist you in developing a
weighted matrix for reinspection based on the
appendix criteria outlined in order to achieve
consistency among themselves.

Two important elements of a
successful multi-site certification plan are:
one, the audit by an organic inspector of the documentation from the internal auditors' inspection of 100 percent of the sites and, two, that the plan for certifying multi-site operations will be written, submitted, and approved for credibility by the NOP.

In the next two days, you will be dealing with two pieces of business regarding seeds: commercial availability, and Dextron used for seed coating. As you know, biodiversity in agriculture is seriously threatened, especially in developing countries. The Crop Committee's recommendation to tighten accountability while still allowing deregations where legitimate need can be proven is strict, yet fair, and will serve as a good model for foreign agencies.

Several of the specific requirements in the recommendation are overly prescriptive, however, and I would refer you to the Accredited Certifiers Association.
comments for cut-and-paste solutions.

The recommendation to reject Dextron as non-essential is troubling, since Dextron is commonly used as a binder in seed coatings by suppliers that do not necessarily cater to organic farmers, but who do provide unique or heritage breeds with obvious potential in a system of organic production.

If the synthetic substance, Dextron, in this case, is not compatible with organic principles, then certainly, it should remain prohibited. But if it's used to bathe a baby, then perhaps it shouldn't be thrown out.

As I commonly do from this podium, I ask you to challenge the good work of the Crop Committee, and then decide for yourself if Dextron should be approved or rejected.

So we all look forward to the next three days of deliberation. Thank you for the opportunity to address you, for your tireless dedication to your work, and good luck with...
the ag/non-ag thing.

And, yes, Virginia, hydroponics can be organic.

(Laughter.)

CHAIRMAN DELGADO: Thank you, Jim. Any questions for Jim?

(No response.)

All right, thank you so much.

MR. PIERCE: Thank you.

CHAIRMAN DELGADO: Next is Liana Hoodes. On deck is Kristy Korb.

MS. HOODES: Good afternoon, all. My name is Liana Hoodes. I'm with the National Organic Coalition.

We want to thank you for the opportunity to speak in front of you, and also for the hard work and long hours that you all continue to put in. It's just incredible, excellent work.

The National Organic Coalition is a national alliance of organizations representing farmers, environmentalists,
consumers, industry members, and others concerned about the integrity of the national organic standards.

The NOSB has an important mandate: to consider petitions for materials, and make recommendations regarding changes to the National List.

In 2007, we saw a record amount of new substances added to the list. Forty-eight new substances have been added in one year. Of these, 38 are non-organic ag substances allowed in organic food that are considered to be currently unavailable, or of fragile supply in organic form.

However, some fundamental policy questions regarding interpretation and classification of the National List remain unanswered. Despite the fact that 38 substances were added as agricultural, as you know, there is still no clarification of the distinction of the definition of agricultural and non-agricultural.
In addition, the distinction between synthetic and non-synthetic is not clear yet, either, and this is fundamental criterion for consideration of materials on the National List.

It's time to put the horse before the cart, and make some fundamental policy decisions before any more materials are added to the list.

The National Organic Coalition respectfully requests a moratorium on the recommendations to add any substances to the National List until the following actions are taken:

A final recommendation on synthetic/non-synthetic and agricultural/non-agricultural determinations get adopted.

Publication of the final rule for the 38 substances added to the 205.606 as interim final rule that addresses the public comments and questions about those substances.

TAP reviews must be conducted for
any substance recommended for the National List. And until the money is available, we consider that materials should not be reviewed.

We respect and admire the efforts carried out by the NOSB to prevent the disruption of the organic industry. However, without independent, objective TAP reviews, the NOSB cannot make an informed recommendation on materials petitioned for inclusion on the National List.

The NOSB needs scientific, technical advice, and better access to historical decisions in order to prevent mistakes, and that's a lot of information for you all to have to compile on your own, without the TAP reviews helping add that information.

More comprehensive reviews are needed for substances proposed for 205.606. The environmental and human health impacts of agricultural practices used to produce non-
organic agricultural ingredients petitioned for addition to 205.606 need to be evaluated using the criteria in OFPA.

Questions regarding substances on 205.606 need to be answered for the regulation to be uniformly implemented. These include: How is a permitted substance identified? Specifically, are certifiers and their clients to use the chemical abstract services number, or some other standard of identity? What formulants may be used with the items on the National List? Are items that appear on 606 subject to restrictions or annotations limiting source, processing aids, or type?

The NOP should develop a policy that permits the NOSB or the TAP contractor to review and summarize confidential business information.

When a material is approved, and there is no TAP, and the petition redacts all the manufacturing information, it is impossible for anyone trying to implement the
regulations to determine if a substance in question conforms with the substance approved by the NOSB.

Given that it's been very rare that substances are removed from the National List by petition or by sunset, we think it's prudent that the NOSB take the necessary time to resolve these questions before more materials are added. The establishment of a strong policy framework will make NOSB future decisions more credible and consistent.

And we also request that a streamline process be developed to petition for removal of substances on 606, since they may become available in organic form much more quickly than the five-year sunset.

And I'll also say, with regards to okra, I just received an email from the Southeast African-American Organic Farming Network, a new group of the entire Southeast of African-American organic farmers, that said: you wouldn't believe how much okra is
grown down here. And they said to really consider, ask the farmers how much okra there already is before you allow the discussion on commercial availability.

CHAIRMAN DELGADO: Okay, thank you.

Steve?

MEMBER DeMURI: From the Coalition's perspective, can you tell me why you think it is that we get petitioned constantly for things to be added to the list, but we very seldom, if ever, get petitions to have things removed?

MS. HOODES: I know, from our perspective, it was always a goal of ours to begin -- because it's hard enough work for you -- first, let me say that I believe that the NOSB itself could petition them to come off, but that that -- with the amount of work you have, that isn't going to happen.

And so it was always one of our goals to consider trying to do that. And as a coalition of non-governmental organizations,
we -- given the amount of work that goes on to try to advocate for organic, it falls way to the bottom of our list because of the amount of expertise needed to understand the materials enough to petition them off. But it is, for instance, something that we thought would be possible to do when this program began. We thought, well, that would be a great role for us, and it's just not possible. We're unable, in our many groups of our coalition, to perform that task.

There is, obviously, commercial advantage to wanting a material on, and very little to getting one off, is basically what -- and we don't have the resources, for instance. That's one reason, but not the only.

MEMBER DeMURI: I appreciate your explanation. I still do not quite understand the dynamics there. I would think that we could get more petitions to take things off.

MS. HOODES: Yes, and it would be
great to be able to do it. It takes a huge amount of effort and expertise, and it's hard to garner that, for instance, in the non-governmental organizations, and I don't know where else that happens, what the impetus is to get that done. It really should.

In addition, and I believe we'd like to look into the idea of how you petition annotations to be added, or brought back on after the sunset. I mean, there's lots of places where we need to be able to do petitioning in places other than where the petitioner has a commercial advantage to do it, and I don't know how that happens.

CHAIRMAN DELGADO: Okay. Any other questions?

(No response.)

Thank you again.

MS. HOODES: Thank you.

CHAIRMAN DELGADO: Next is Kristy Korb, followed by Mark Cool.

MS. KORB: Hello. I am going to be
reading a letter on behalf of Miles McAvoy, the President of the National Association of State Organic Programs, and it's a very short letter. I'll be very brief, because it is 10 til 5:00, and unlike you all, I can leave and go to the bar at 5:00. So I will be very quick.

(Laughter.)

CHAIRMAN DELGADO: Thank you.

MS. KORB: In a vote taken at a regular business meeting on May 13th, 2008, the National Association of State Organic Programs Board of Directors voted unanimously to oppose the April 3rd, 2008 NOSB CCAC recommendation entitled, `Further Guidance on the Establishment of Commercial Availability of Organic Seed.'

I'd also like to clarify, Oregon Tilth agrees with this position of NASOP.

In the Board's view, the requirements proposed would be extremely burdensome to diversified organic row crop,
and vegetable productions, and organic certifying agents. Of special concern are vegetable farms, many of which produce tens or hundreds of vegetable varieties in a season. The additional recordkeeping burden contained in the CCA recommendation could force many of these farmers to abandon organic certification.

In our collective experience, organic growers understand the good faith and documented effort to source and use organic seed are required, and the costs cannot be used as a factor to determine commercial availability.

They have good systems in place to evaluate organic seed availability, and use information networks that include seed companies, farm input supply companies, and organic farmer peers.

They maintain reasonable documentation of whether the seed they use is organic or not, and there are efforts to
source organic.

It's a flexible system that is adapted to the needs of the individual organic operations, and it is working.

The CCAC recommendation would impose additional requirements that will cost organic growers time and money. The additional recordkeeping will not increase the availability of organic seeds.

The requirement that this information be submitted to the certifier, tabulated, and forwarded to a recognized organic seed trade association would be time-consuming and expensive to both the grower and the certifier. The NASOP Board does not support this recommendation.

Additionally - and this is Oregon Tilth speaking - our understanding is this issue is largely complaint-driven by the seed industry, and we encourage the program to address these issues where we believe this problem lies. In other words, if growers are
not required to use organic seeds, and have not sufficiently demonstrated that the specific seed is not commercially available, than the issue is with the certifier. It doesn't take this kind of prescriptive requirement. The program needs to address it on the certifier level.

Thank you.

CHAIRMAN DELGADO: Thank you.

Any questions?

(No response.)

Okay, thank you very much.

Next up is Mark Cool, followed by Pat Kane.

MR. COOL: Hi there. My name is Mark Cool with Seeds of Change. We are a 100 percent certified organic seed company.

Before I start, maybe a historical perspective: you all may not be aware that Baltimore actually is the home of America's first seed company. In the ESPN Zone building on the Inner Harbor, there is a building right
next to the ESPN Zone, which is the home of
the Clark Seed Company, which was founded in
1831, and that's where the first European
ships came into America, offloaded their seeds
for distribution to the American Northeast.
So we are at a very historical place, just so
you guys know. Of course, since then, we have
developed a very well-run American seed
business.

My comments today are going to be
on the commercial availability of seed,
205.204.

We are very thankful to the Crops
and CAC Joint Committee for their
recommendations, which I very strongly
support.

A comment was made a couple of
times today about the commercial availability
and use of organic seed and organic farming
systems. In vegetables, so in direct food
crops, there is still a very, very, very small
amount of the organic farms that are using
organic seed. So we've had an NOP program in place now for six years. So in the words of Dr. Phil, "How's it working for you?"

We're not really doing a very good job getting organic seed as a beginning of the chain into the conscience of America. And I believe that the current recommendation goes a long way to provide support for that.

I would ask that the NOSB vote in favor of this recommendation from the Joint CAC/Crops Committee, pass that to NOP. And one thing I will offer to NOP is, both from an organizational and association perspective, as well as from a private company perspective, we will offer all of our support in getting into the details of actually making some of these recommendations come to fruition. Implementation of this, of course, is the important part, and there's a lot of discussions about that.

What I want to do here briefly is step back a second, and maybe explain for the
Board's benefit some of the reasons why, as a seedsman, I believe that there should be more organic seed available.

Currently, all, literally all, in vegetables, of food crops, all of the seed that is used, all of the organic varieties that are being sold, are actually mimics of the conventional varieties. Someone takes either an heirloom, or a traditional or rare variety, which is available in conventional form, produces it organically, or nowadays, more and more people like ourselves are taking conventional hybrid varieties, which are needed by the growers, have uniformity, vigor, other characteristics, we're producing those one generation under NOP rules, and calling it organic seed, and selling that. It is perfectly legit.

That isn't the end goal of this industry. What we are doing is adding no real value. This is the first step in trying to develop what I call organic-specific
varieties.

It's ultra-important, in my mind, that we, as an organic industry, which is just fledgling and just beginning, that we actually try to, if we can, go back 50 years and, just like the conventional industry, start developing varieties which the farmers need.

So the goal that we have as an organic industry, and what you can do to support that, is we actually want to find out from the farmers what the traits are that they need. You can think of a whole number of characteristics and traits that organic varieties should have, very different than conventional varieties.

So the end goal, in my mind, and the vision I have for my company, is that we will develop what I call organic-specific, or low-inputs ag-specific varieties, products that do well, they are completely separate products that do well under an organic farming system. Then you're adding true value to the
organic farming community.

And by the way, those products also can be used by conventional farmers because they require less inputs, have higher quality traits, et cetera. And in my mind, that is going to form a basis for kind of a whole revolution in the way that we look at food production, food distribution, and food use in the USA.

So those are my comments on that point. I, again, would like to offer support to NOP for making this happen.

A couple of comments have been made about a couple of the concerns, or questions, or issues that people have about organic seed. No. 1 is there's a concern, there was a concern raised earlier about seed quality. Seed quality is very, very important for a farmer, obviously. A farmer has to have very high quality seed.

Seed quality isn't under the purview of NOSB. Seed quality is governed by
the Federal Seed Act, which has very specific regulations in place, and also has a recourse system in place if a farmer does not have high-quality seed. Organic seed, any other seed, has to meet Federal Seed Act requirements, period. That's not your job; that's someone else's job, but I just wanted to make that comment here.

Two other concerns that have been raised are the potential certifier liability, and I guess the confidentiality issues with growers. I believe those are important issues to think about and discuss. I don't believe those are things that are hurdles in our way towards the use of more organic seed.

A couple other comments that have been made are equivalency, and the burden of documentation. Briefly, equivalency, in my mind, is actually kind of, frankly, a moot point right now. Equivalency is something that seed companies and farmers talk about every single day.
When we go to a farmer to sell that person seed, we talk about equivalency. We don't call it that, but we talk about, how does this product do on the farm. It's very, very important for a seed company and a farmer to have an understanding of the requirements, both from a production, agronomic, and marketing perspective of how that variety does. So these are things that we well understand, we deal with every day.

A comment was made before to form a task force to actually look at these things, and I think it's a very good idea. The stakeholders, seed growers, seed companies, and farmers can sit down, in my opinion, very easily, and figure out a way to define equivalency.

With that, thank you. If there's any questions, I'd be happy to answer them.

CHAIRMAN DELGADO: Okay, questions?

Gerry?

MEMBER DAVIS: Mark, what do you
think of the comment that was made just a few minutes ago about, really, if the NOP would just enforce the rule through their accreditation, and ask the certifier more persistently, what are you doing to prompt your growers to keep making improvement in using more organic seed, what do you think of that concept as the way to solve the impasse in vegetable seeds, for example?

MR. COOL: Yes, you raise a very good question, and I think it's a very valid point. I think the NOP has a very strong role to play in that regard.

I believe that, you know, I'm very much in favor of the idea of deregations, like everyone else is, and I believe that the discussion should simply be a farmer sitting down with a certifier, and providing a list of the products that farmer wants to use, telling the certifier which ones he can't find organically and why not, NOP overseeing that process to make sure it's fair, and
transparent, and reasonable, and working that system from that perspective.

I think that the documentation requirement of then sending that list to someone, and we can discuss who someone is, in my opinion, really isn't a huge deal. Farmers write everything down they do anyway.

I believe in confidentiality. So we have to find a way to give that list to someone without disclosing private information. But I think NOP can have a strong role to play in actually kind of overseeing that to make sure that, indeed, those seed varieties are not available, and their training and their push to the certifiers should be to enforce the current legislation, frankly, as much as they can.

CHAIRMAN DELGADO: Any other questions? Joe?

MEMBER SMILLIE: Just following up what Gerry said, in our document, which we are hoping to tweak and get it right, do you think
that it's the seed company's responsibility to gather that data? We're hearing pushback from certification agents, and possibly from farmers that they represent, or that they speak for in some cases - we haven't heard from farmers directly as yet - that that's burdensome. It's burdensome, and not necessary.

Do you feel -- you know, where is the onus? Is it up to your trade associations and your members to go out and get that information, and not have the certification agents and growers provide that, or is that going to be essential for you to, for your industry to move forward?

MR. COOL: Well again, the comment is made that very little of the food production in America is produced using organic seed. So something is wrong.

I believe there's probably two answers to your question, Joe. One is, as a seedsman, my job is, indeed, to go to the
market and find out what farmers want. So we do surveys all the time. We talk to farmers all the time. We try to figure out what varieties, what traits, what characteristics, what's lost, et cetera. That's a very important part of our job, and we make those available.

The second thing is, there has to be some kind of a transparent, open, public system that gives lists of -- and we've called this before, opportunity list, so it gives an overview of what types of products are being searched for by farmers. And that is something I think that would benefit the industry, because the reality is very few people have stepped up and formed an organic seed company, and the reason is because we don't see what the demand is, and what the opportunity is. So we have to have some kind of a way of, I guess, promoting the idea that people do want organic seed, and then specifically what traits, and then we can
provide that for them.

So it's kind of a dual responsibility, in my belief.

MEMBER SMILLIE: I share your concerns. I mean, we always hear the comment, don't dilute the organic standards. And sometimes the suspected dilution is pretty, pretty small and narrow, but here we have something that is in the regulation: Thou shalt use organic seed. And yet, the compliance levels are the lowest compliance levels in the entire industry. For anything that we look at, the compliance level to that regulation is incredibly low.

MR. COOL: Yes.

MEMBER SMILLIE: So I think Mark's right, something's wrong, and this is our first attempt to add something to a regulation that is already in place, and to try and figure out without burdening farmers; that is the last thing we want to do. But we've got to get better compliance levels on the
MR. COOL: I believe, Joe, that you and Gerry's proposal, your recommendation, which hopefully you all vote on in favor, goes a long way towards doing that in following the intent of the NOP rule from '02.

An example would be the inputs industry, where fertilizers and pest control methods are currently certified organic, and there's full compliance and full availability of a lot of innovative new products that have been developed in the last six years because there's the requirements to actually use those. And because there's been the requirement, and the enforcement, and the compliance, this industry has grown to the benefit of the farmers. Farmers have access to a lot of new products.

That same thing doesn't yet exist in seed. And again, our vision is to eventually do that, within a couple of years, develop organic specific varieties which add
value to the farming and organic community.

CHAIRMAN DELGADO: Any other questions?

(No response.)

Okay, thank you very much.

MR. COOL: Thank you kindly.

CHAIRMAN DELGADO: At this point, I have been requested to take a break. I think our Board members need it. And we'll be back here in 10 minutes. That's 15 minutes after the hour.

(Whereupon, the foregoing matter went off the record at 5:05 p.m. and went back on the record at 5:16 p.m.)

CHAIRMAN DELGADO: We have a quorum.

Pat, please proceed.

MS. KANE: Thank you for providing the opportunity to comment today. I'm going to talk briefly about two issues from the Accredited Certifiers Association, for which I am the coordinator. We represent 40
First, I'd like to thank the NOP certification agencies.

for the trainings they provided earlier this year for us, and for addressing the materials review issue, and proceeding very swiftly to resolve that, and permit certifiers to contract for materials review. It will greatly help.

Thank you for the website, and we will continue to provide input on the website.

I am here to comment today on the commercial availability of organic seed recommendation. I did hand out our written comments.

We would like to stress that ACA members currently require that organic producers justify the use of non-organic seeds and monitor the recordkeeping of this effort maintained by the farmers. In our experience, the use of organic seed is growing steadily. Rather than expanding the requirements for all producers and certifiers, complaints regarding
a lack of enforcement of the organic seed requirement could be handled through the NOP accreditation process.

We feel that this document contains useful suggestions for monitoring the use of organic seeds, and we feel that accredited certifying agents, to request them to collect seed lists and forward this information to an organization, not knowing if the information will ever be utilized, is a requirement that does not have a regulatory basis either in the Organic Foods Production Act or the National Organic Program regulations.

In addition, requiring farmers to submit lists of their seeds to companies for verification of the lack of organic seed is burdensome and unnecessary, as the majority of seed companies produce catalogs which identify the organic seeds.

Currently, ACAs do monitor the use of organic seeds through the Organic System Plan. The OSP is then verified by the
inspector, and producer documentation is reviewed.

Producers must supply information on the seeds used on an annual basis. Many ACAs provide seed resource lists to producers.

The NOP regulations contain a definition of commercial availability. There is an increasing number of seed companies offering organic seeds. There is general agreement among ACAs that the use of organic seeds is increasing annually. Promoting and marketing of organic seed is not the responsibility of the ACA.

The requirement for producers to send their list of seeds to multiple companies for verification of lack of organic seed is burdensome. We do not have regulatory authority over seed company vendors and cannot monitor their activities. Since this will be done during a peak of seed ordering, it is likely that no response will be received from the companies.
We would like to suggest a more proactive approach by seed manufacturers and also the use of various seed database programs and opportunities such as through OMRI.

Increased participation by seed marketers in the OMRI seed listing website would provide more exposure for organic seeds. All marketers of organic seeds should be encouraged to participate in the website.

Additionally, one of our members based in Europe pointed out the European Union countries utilize seed databases that are easily searchable to determine if organic seed is available. Seed producers and traders introduce their available varieties; producers log in and search the varieties they need. They also can go to the website and fill out a form of why the variety they are desiring is not available, and they can send this to their certifier.

I would also like to comment briefly on multi-sites production. The
majority of ACA members feel that group certification should apply to only grower groups and should not be extended to retailers, handlers, processors, or restaurants.

We tried to answer the 13 questions and we didn't get to all of them. We needed more time. But I did supply the answers in my comments to you.

CHAIRMAN DELGADO: Okay, thank you.

Any questions? Joe?

MEMBER SMILLIE: Would it be possible in the near future that you could get us information from your European members who may be also NOP-accredited on exactly how it works in Europe? Because I have heard this, too, but, unfortunately, I don't have any real-life experience with it. It shouldn't be too hard to get, the EU database, the way it works in the EU.

MS. KANE: Right. Right. Well, it's in the individual countries.
MEMBER SMILLIE: The member states, yes.

MS. KANE: So I did go on the United Kingdom one, and it was really easy to use. I did provide the link in my comments. But I can do that.

MEMBER SMILLIE: Is this maintained by the member state regulatory authority?

MS. KANE: I believe it is, yes.

CHAIRMAN DELGADO: Any other questions?

(No response.)

Okay, well, thank you very much. Next is Woody Deryckx, followed by Brian Kozisek.

MR. DERYCKX: Hello, and thanks for pronouncing my name correctly. That's awesome. It's a rare treat.

CHAIRMAN DELGADO: I did? Well, wonderful.

MR. DERYCKX: Yes, my name is Woody Deryckx, and I'm real grateful for a chance to
talk to you wonderful people, and thank you for the good work you are doing. I am really grateful to be able to represent the membership of the Organic Seed Growers and Trade Association, also known affectionately as OSGATA. We might have been running short on acronyms featuring the letter "O", so we decided we would make another one.

We submitted our written comments on the seed availability issue. They're all available to everybody, is that right?

Ms. Francis: That was the Regulations Stockup.

Mr. Deryckx: The written comments we submitted? I'm sorry.

Ms. Francis: They were submitted to Regulations Stockup, correct?

Mr. Deryckx: Oh, okay.

Ms. Francis: Right? I think so. So they're in your books, yes.

Mr. Deryckx: I won't read them. I don't have time to read them. So I would like
to hit some of the high spots and just speak
directly then. You have those.

CHAIRMAN DELGADO: Yes.

MR. DERYCKX: Great. I ask if you
would attend to this. That's great. We
carefully chose our wording on those.

I'm an organic farmer in the
beautiful Skagit Valley of northwestern
Washington State, and I'm an organic seed
grower. In fact, since I heard the words,
"Thou shalt plant organic seeds," I decided
that was going to be my next chapter in life,
to grow seeds for organic farmers, to provide
my organic farming friends with good seeds.

OSGATA is our new trade
association. Our aim is to be nationwide in
scope and to promote the evolution of a
vibrant and diverse, high-quality organic seed
industry, so that all organic farmers can have
a wonderful selection of excellent seed
to grow.

Our membership on our board is

NEAL R. GROSS
COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
(202) 234-4433 WASHINGTON, D.C. 20005-3701 www.nealrgross.com
dominated by organic producers, farmers, by our bylaws, but we also have seed companies and affiliates, organizations and regular farmers and consumers on our membership. So we are a membership organization.

We want to support your Joint Committee recommendations, both the original 2005 version and the one that is currently before you. We think it is a very good start. It takes our movement in the right direction.

However, we are concerned that there are a lot of challenges in the implementation. That is why our main point, I think, in our comments on this issue is that we call for formation of a dynamic task force with representation from the stakeholders in this issue to help NOP and NOSB work through the issues of implementation of this as things go along, as things change.

Overall, we support all five of your recommendations. I won't be able to go through them in detail here, but they are in
the written comments.

In the first place, recommendation one, the database, we have a few beginning databases, as you know, and they are really a refreshing addition to the system. People are using them, but they have a long way to go before they are really effective.

Most of it is just getting them used, getting people to come and use them, put their products on there, go to them to look for their seed needs. As Kelly Shea mentioned a little while ago, it would be really nice to have a counterflow where seed needs are posted as well. The OMRI list we feel is probably the best one right now. OSA, which is our sister organization, Organic Seed Alliance, we have one that works pretty well, and AFTA has one, and there's a few others. They are all really good and real helpful, and I think that is a really good start.

So your recommendation one is spot on. There may need to be issues about funding...
and supporting that, but it is certainly in the right direction.

Your second recommendation about equivalency, I want to break that into two parts here. The first part is seed quality, which has brought up by other people giving their testimony today.

Seed quality for us is absolutely a rock solid requirement that we are providing the very best quality seed that anybody could ever ask for, equivalent or superior to conventional in terms of all the parameters that are measurable.

You're kidding. I'm just getting started (in response to time signal).

(Laughter.)

All the parameters that are measured, in terms of purity and viability, germination and vigor.

But the other part of that issue, though, is suitability for agronomic and marketing considerations. That is where we
say we need this task force to help work this out over time, and so forth.

Your second or your third recommendation, I would like to say that reporting things back, as a grower, I can tell you that I am asked for an awful lot of information from my certifiers. I am pleased to provide it, but it would really be nice if there was a simplified, standardized instrument of reporting this vital information, and that everybody had the same thing and had it in advance, and they just had to check boxes and fill in blanks.

Most certification applications that I have dealt with are basically like this. So it is kind of a real convenient way to add this on, if the certifying community feels like they can do it. As a grower, gee, I feel like I'm already providing all this information. Let's use it. Let's have it usable in a way so that it passes on to a database that other people can use.
As a seed grower, I am really interested in what people need. I am really interested. We are actually developing new varieties and cleaning up the old heirlooms.

CHAIRMAN DELGADO: Woody, your time is up. Can you just wrap it up, please?

MR. DERYCKX: And we are doing this for the organic farmers.

I sure welcome any questions you might have.

CHAIRMAN DELGADO: Thank you.

We have Joe, followed by Jeff and Gerry.

MEMBER SMILLIE: Woody, what do you think of our recommendations four and five?

MR. DERYCKX: Thanks, Joe.

(Laughter.)

I think processor delineation on that is really right on. I spent 15 years in the organic vegetable and fruit processing industry, and I handled an awful lot of seed. If you had told me that I needed to go out and
get organic seed, I would have gone out and
gotten organic seed, just as when my boss
asked me to go out and get millions of pounds
of organic frozen IQF peas and okra, I did it.
You know, we went out and found the growers.
Yes, okra's not exempt. But, anyway, I like
that and we like that.

As for five, there again, we are
really excited about this reverse flow of data
back. We are concerned about growers' proprietory needs for privacy, and so forth, as has been pointed out. But if we can just get a database bringing us information of what is needed out there, we are going to develop the new varieties. We are breeding. We are going to produce this stuff.

I am always asking my customers -- my customers are catalog seed houses mostly -- what are your customers looking for; what are the traits you are looking for? I am going out and I am looking for genetic material, selecting out the most vigorous lines and
working on getting horizontal resistance to
the diseases that we face, and so forth, and
putting these out there as organic seeds.

MEMBER SMILLIE: Thank you.

CHAIRMAN DELGADO: Jeff?

VICE-CHAIR MOYER: Yes, Woody, as
sort of a quick survey of your association
members, how much organic seed currently goes
unsold?

MR. DERYCKX: Oh, very little, I'm
happy to say.

VICE-CHAIR MOYER: So you're
selling all you're producing?

MR. DERYCKX: Anything that doesn't
germ well goes unsold, anything that is not of
quality. But I am happy to say that I have a
few hundred pounds right now I would be happy
to sell you of some real high-quality spinach
seed, and it grieves me to know that organic
farmers are planting conventionally-grown
spinach out there while I've got sacks of it.

VICE-CHAIR MOYER: Well, that was
the reason I asked the question. Is there
seed that is going unsold that should be sold
to organic growers or are they buying
everything and there's really not that much
left?

MR. DERYCKX: I'm not an authority
on this, but my impression, Jeff, is that we
are trying to keep up with demand, to be
honest with you.

VICE-CHAIR MOYER: Thank you.
Okay.

MR. DERYCKX: But as a caveat to
that, let me say that I am not making a living
at this yet after working on it for four years
because my business is all real small seed
lots. You know, 200 pounds is about as big as
-- it is really a lot of detail work.

I think that we need to have a
little bit more encouragement on this in the
program and a little bit more broad-scale
adaption and uniformity across, so that it is
fairly applied, so some growers are not just
ignoring it and others are going out and really making an effort and paying more for seed and everything, so that we can move to the next step. There's a lot more potential there.

There's an awful lot of carrot seed, organically-grown carrot seed, produced in Washington State that goes all to Europe, and very little of it ever stays here and gets planted in the United States.

VICE-CHAIR MOYER: Okay.

MR. DERYCKX: They're real happy with that seed when it gets to Europe.

CHAIRMAN DELGADO: Gerry, followed by Kevin.

MEMBER DAVIS: Woody, your new seed organization -- OSGATA? --

MR. DERYCKX: OSGATA.

MEMBER DAVIS: We contacted OMRI to ask them, since they have a lot of experience with their database so far, with the mirror image, the needs database, not what's
available now, but what is needed. The gentleman I talked to mentioned that, in concept, they were okay with participating with that, as the one who maintains the database, but they estimated that it would take one full-time position, say $50,000-$60,000 a year, for one person to maintain that database and keep up with it.

What would your organization say about funding that? I mean, is that a reality with the size and scope of your association so far?

MR. DERICKX: Well, my organization is having a hard time finding two nickels to rub together right now. We are just starting up, and actually we are kind of mooching off of the Organic Seed Alliance, which is our sister organization that kind of spawns.

We would go look for funding. We would want to put together a broad-based consortium of interested parties to go out and try to find some support.
But, saying that, I really can't speak to that directly because Brian Baker is here from OMRI, and he knows all that and I really don't.

MEMBER DAVIS: Well, I just meant funding. Has your association talked about that like, well, what if they ask us to fund this? Does it seem doable or does it seem like way out of reach for a fledgling --

MR. DERYCKX: It costs money to run these databases. Again, I don't know how much because I'm not doing it.

I wish that, in your wisdom, when you suggest that we do things, great things like that, that you send a big check to cover the cost as well.

(Laughter.)

But we are really excited about trying to find resources in what comes out of the new farm bill, knock on wood, and other sources, private foundations, and so forth, and growers' fees, and so forth. You know,
the industry is going to grow; we are going to be making some money. We are going to be putting it back into infrastructure, but right now it is in the developmental stage.

So funding is a limiting factor on this kind of stuff. It costs money to do these databases, as I am sure it costs money to put the information in them.

CHAIRMAN DELGADO: All right, Kevin?

MEMBER ENGELBERT: Yes, briefly, Woody, when the organic industry got off the ground, there were no organic seeds. I used to buy conventional because it was all that was available, and I bought them a year ahead of time to let all the treatments supposedly lose their effectiveness. So that is where we started from with this rule, basically a loophole, if you will, of why you don't have to have organic seed.

Eventually, we would obviously hope you will have to have organic seed. How long
do you think that the industry may take the industry to be able to get to the point where, if the rule was changed to say organic growers must have organic seed, period, could the demand be met? How long would that take?

MR. DERYCKX: I think it would be amazingly head-spinning fast, if everybody wanted it to happen, if everybody really wanted it to happen.

As I look back over the last 30 years and have seen the growth in all the other aspects of this movement, it has been astonishing. I think in five to eight years we would have 90 percent, and we would not only have that, but we would have the beginnings of all new, wonderful kinds of varieties coming in and heirlooms restored and cleaned up, you know. It is a really exciting day.

This is why, after all the other things I have done in organic farming for 30 years, it is why I dropped everything and went
into growing organic seed, because it is the
most wonderful, exciting thing to come along,
and we are going to have a great time with it.
But we just need to keep it moving.
You are doing good things, and I
really recommend adopting the recommendations
that you have there and forming the task force
and letting us help.
CHAIRMAN DELGADO: Jennifer?
MEMBER HALL: So I find myself in a
really difficult spot because if I follow your
earlier logic about, if somebody tells me to
go find organic, I went and I found it -- and
I can't find it stipulated any clearer than it
already is in the rule that the mandate is
organic for seed and planting stock.
So I'm kind of caught because I am
quite reticent to saying something louder,
making it more expensive and more burdensome,
that I feel is already stipulated. So I am
trying to find, where is it really broken?
Because I don't think that this recommendation
necessarily resolves where we are right now in a productive way.

    This is going to cost considerable amounts of money, just like a databank would.
    That seems more valuable to me than sending paper all around.

So I feel really stuck because I feel like the very origination of organic integrity is to start with the seed. That is what we are then protecting along the chain of command or chain of custody.

But I don't know. I mean I don't want to vote no certainly on something that I think is such an important thing, but I don't feel like it is the right solution necessarily.

Can you comment on that? We have told people to go find organic. Based on what you said before, like you, I believe that demand should solve the problem. So where is that demand breakdown? And is telling someone to do it by filling out forms going to resolve
it?

MR. DERYCKX: I don't know. It is a big world out there. That is an interesting question.

If I may indulge your patience with an anecdote, I get out in the field quite a bit. One of the things I do is drive all the way across the State of Washington to the dryer parts to grow onions in a certified organic field on a mixed farm, a very large farm.

The field is all certified organic onions, and all that, except for a few hundred square feet out in the middle where I do my trials and grow my propagating bulbs, in collaboration with the farm owner, the manager, is all planted to hybrid conventionally-grown onion seed.

Considering that, you look out over this 100-acre field of onions and you realize that the seed came from a farm somewhere else where pesticides that are nowhere near safe on
food crops are sprayed and soluble fertilizers
used in great amounts, and so forth and so on,
it is all behind this; it is the footprint of
that seed that went into that field. It could
be, and should be in a few years, I think, all
organic. Don't you agree? It might as well
be. It ought to be.

That field gets inspected and
certified every year. I guess I am thinking
that, if they are showing progress in looking
for organic seed, if they are trialing
varieties, and they do it by my going out and
doing variety trials on their place for them,
but if they are trialing varieties, if they
are following the guidelines of your current
recommendation, they are going to be moving in
that direction. It won't be too long before
we will be supplying the seed for that farm as
organically-grown seed, and that would be a
good thing.

MEMBER HALL: Thanks.

MR. DERYCKX: Does that help at
(Laughter.)

MEMBER HALL: Thanks.

CHAIRMAN DELGADO: Dan?

MEMBER GIACOMINI: On another issue related to the Board, and I wish I had remembered to ask Mark this, do you individually, or your group, have a comment on Dextron?

MR. DERYCKX: I don't.

CHAIRMAN DELGADO: Okay, any other questions for Woody?

(No response.)

Okay, thank you very much.

MR. DERYCKX: Thank you. Thank you all.

CHAIRMAN DELGADO: And we are moving on to the proxy for Brian Kozisek. We don't know who that person is. No one present?

MEMBER HEINZE: They didn't get back to me about who that would be.
CHAIRMAN DELGADO: Okay.

MEMBER HEINZE: So he was going to be here, then he said he couldn't; he would send a proxy. They never let me know.

CHAIRMAN DELGADO: We will move on then.

The next one is Becky Goldburg, followed by Tom -- I can't read my own writing -- Richardson. Is it Tom?

MS. GOLDBURG: Thank you. I am Becky Goldburg, and I am going to speak on behalf of the Keep Antibiotics Working Coalition. I will distribute our comments.

I also have some aquaculture comments I didn't distribute earlier that are from Steve Craig, who is with Virginia Cobia Farms, and he asked me to pass them out, although they will not be presented orally.

Thank you.

Well, as I said, I'm Becky Goldburg. I spoke earlier. I am a biologist with the Environmental Defense Fund, a
national nonprofit organization. My comments now are made on behalf of something called the Keep Antibiotics Working Coalition, which is a coalition of health, consumer, agricultural, environmental, humane, and other organizations, including the Environmental Defense Fund, which has over 9 million members.

We at KAW are dedicated to eliminating antibiotic resistance due to agricultural uses of antibiotics, especially the inappropriate use of medically-important antibiotics in farm animals.

I am going to comment today in support of the Crops Committee's recommendation to deny the petition to include on the National List tetracycline for control of all diseases on crops as registered by the EPA.

I want to remind you that at the April 2006 NOSB meeting KAW commented in favor of sunsetting the antibiotic streptomyacin and
tetracycline to control fire blight on fruit trees. Unfortunately, on a split vote, the NOSB chose not to sunset these antibiotics because of their usefulness for fire blight control.

However, KAW's concerns about use of medically-important antibiotics for fruit production continue. We have two types of concerns.

Our first concern is that the use of antibiotics on fruit trees will likely make at least a small contribution to the growing crisis of antibiotic resistance in human medicine. Modern molecular tools for tracking the movement of genes make clear that antibiotic resistance is an ecological and not just a medical problem.

The use of antibiotics selects resistant bacteria, whether in orchards or hospitals. Even if these resistant bacteria are not human pathogens, gene transfer mechanisms special to bacteria allow these
microbes to spread their resistance genes from any particular orchard bacteria to other unrelated bacteria, including pathogens.

Although the odds are low that resistance genes from any particular orchard bacterium will end up in bacteria harmful to humans, such highly unlikely individual events become probable, given the vast numbers of bacteria present in soil, water, and living organisms.

In short, the antibiotics in orchards increases the load of antibiotic resistance genes in the environment, and thus, likely contributes, at least modestly, to medical problems with resistant bacteria.

Health agencies and experts have expressed strong concerns about the potential for pesticidal uses of antibiotics on fruit trees to contribute to resistance to medically-useful antibiotics.

In 1994, a company applied to EPA to register another antibiotic, Gentomyacin,
as a pesticide to control fire blight on apples and pears. The Centers for Disease Control and Prevention, Food and Drug Administration, and the American Society for Microbiology all expressed their disapproval of the proposed registration because Gentomyacin is an important human drug. The result was that the company withdrew its application in 1999.

Particularly relevant in one of its comments to EPA, the Centers for Disease Control and Prevention argued that, and I quote, "consideration should also be given to the reduction and eventual elimination of the environmental" -- in other words, pesticidal -- "use of streptomycin and tetracycline."

A second concern is that antibiotic use in organic fruit production is inconsistent with consumer expectations. Concerns about antibiotic use in animal agriculture led to the current prohibition of
antibiotic use in animals used to produce organic foods, a standard that the Keep Antibiotics Working Coalition strongly supports.

We expect that organic consumers no more want apples, pears, or peaches from antibiotic-treated trees than they want milk or hamburgers from antibiotic-treated cows. If there were to be broad publicity about antibiotic use in organic fruit production, the result might well be reduced sales of organic fruit.

The upshot is that expanding the use of tetracycline in organic fruit production would be wholly incompatible with both the principles of organic production and consumer expectations.

We urge the NOSB to support the Crops Committee's recommendation and not to allow on the National List a broadened use of tetracycline in organic fruit production.

Thanks.
CHAIRMAN DELGADO: Questions for Becky?

(No response.)

Well, thank you very much, Becky.

MS. GOLDBURG: Okay, thanks.

CHAIRMAN DELGADO: We move on to Tom Richardson, followed by Brian Baker.

MR. RICHARDSON: Good afternoon.

I'm Paul Richardson with Agro Source. I appreciate the opportunity to speak with you this afternoon.

We are here to discuss the petition that we made for oxytetracycline use under the organic rules and the listing by NOP. I wanted to step through that with you, but in order to sort of frame the argument and frame the case, I do want to be clear that what we want to do is really separate two issues.

One is the petition that we made for our oxytetracycline hydrochloride under the current listing that exists and being consistent with that versus the broader issue...
of whether oxytetracycline should be used generally for organic purposes. We think those are two different issues.

So, with the rebuttal we provided, the main things that I would like to discuss are the interchangeability of oxytetracycline, the petition that we provided, the sunset review that you conducted not too long ago, and then, finally, our request for approval of the petition.

When it comes to the interchangeability, first and foremost, both oxytetracycline hydrochloride and calcium are both oxytetracycline. From a regulatory perspective, when you look at the statements that EPA has made over many, many years, there's some real consistencies that show there.

In 1993, under the re-registration eligibility document, the READ on both molecules, which included both molecules, the EPA stated, and I quote, "There are no
differences for regulatory evaluation purposes between oxytetracycline hydrochloride and oxytetracycline calcium."

From a regulatory perspective, therefore, EPA recognizes oxytetracycline hydrochloride to be equivalent to oxytetracycline calcium.

Then, further, in 2006, under the tolerance reassessment that was done, the TREAD, EPA reviewed oxytetracycline hydrochloride and calcium within the same document and together and, again, made no regulatory distinction between the two. They used one interchangeably with the other, data for one to make decisions about the other in all cases.

Then, additionally, and even more importantly from the standpoint of the Board and the NOP, the oxytetracycline hydrochloride petition that we provided within the technical evaluation report cited oxytetracycline calcium and recognizes the two molecules as
equivalent.

The test states, and I quote here again, "In cases where no information is available specifically for calcium oxytetracycline, related and relevant information for the parent compounds, oxytetracycline and/or oxytetracycline hydrochloride, a closely-related compound, is provided and cited accordingly." Thus, the TP recognizes the interchangeability of the two molecules as well.

Then, finally, within the market itself commercially, both our product, Fireline 17, and the competitive product, Microshield 17, are both recognized as interchangeable for purposes of use.

That is also important from a couple of perspectives. Probably from your perspective, most importantly, is that we are not talking about changing the amount of oxytetracycline used. This is really more, from our perspective, it is just simply a
commercial competitive issue. They are either
going to use our product or they are going to
use the competitor's product because they view
them as interchangeable.

As far as our petition is
concerned, a denial of our petition for the
hydrochloride ignores the questions already
answered through relisting of oxytetracycline
through the Board's sunset review.

What we are trying to understand
is, if this denial occurs, it really
constitutes a favoring of one compound over
the other.

With the sunset review, I think you
know the things that occurred between 2006 and
2007, the approval of oxytetracycline calcium,
there are also things that have been approved
that don't even cite the salt, hydrochloride
versus calcium, or anything else. So it just
happens to be in this case that they have
listed specifically calcium, but, again, when
you look at the evidence, it is clear that
they are looked at equivalently.

Just to summarize, with the EPA READ, the TREAD, the NOP's decisions, and the TP commercial equivalency, we believe there is equivalency there. The relisting that has been done, we would ask that you give us, please give us consideration in this from this perspective. That is all we ask.

Thank you very much.

CHAIRMAN DELGADO: Thank you.

MR. RICHARDSON: We will be around.

If there are further questions, we will be happy to answer those.

CHAIRMAN DELGADO: Thank you for that.

Any questions from the Board? Hugh?

MEMBER KARREMAN: In the letter you sent out that we got, you mentioned that oxytetracycline, something about the essential need for it in organic agriculture. Truly essential?
MR. RICHARDSON: Fire blight is a devastating disease. It occurs under very specific circumstances of moisture and temperature and inoculant. When those things occur and fire blight takes off, it will kill trees; it will not only start destroying branches, leaves and branches and fruits, it will kill a tree, and it will kill whole blocks of trees. If you are next door with a farm to someone that has a fire blight outbreak, it can be devastating to you as well.

So it is a very serious problem. There are years where it really isn't a bad blight year and you might get by with very little treatment, very nominal treatments, without any use of oxytetracycline or streptomyacin or anything else like that. You might use things that are considered more benign.

But there are circumstances and there will always be times, and we have seen
this in other parts of the world where basically there is not a positive view of antibiotic use, but they will go a few years and then they will have a bad year, and the authorities will start to allow it again because it is so devastating.

MEMBER KARREMAN: So what do we say to veterinarians and farmers that are denied that use when you can use it on fruit trees?

MR. RICHARDSON: And again, we are not arguing whether it should or shouldn't be allowed by you. We are saying that you have allowed it in the sunset review. You relisted oxytetracycline in its calcium form. All we are saying is we should also be listed. If you decided on some other perspective on this, we are not trying to argue that it should be listed, that it should on crops and not in animals. We are just saying that, because it is listed, we should be listed. That is the only argument we are making.

We do not feel we will contribute
anything to the load that already exists of oxytetracycline that is used.

CHAIRMAN DELGADO: Gerry?

MEMBER DAVIS: I don't have a question, but I do have a clarification for the benefit of your company. I see in the comments that you put before us in writing, as well as what you talked about here, your emphasis on the oxytetracycline molecule being close enough to the same, handled the same, and the need for it in apples and pears.

I don't dispute what you are saying. The biggest issue we had with this material in the petition was that you asked for all EPA-registered uses to be allowed, which in your case, so far at least, only includes peaches and nectarines or other stone fruit?

MR. RICHARDSON: Ours included apples, pears, peaches, and nectarines.

MEMBER DAVIS: Peaches and nectarines?
MR. RICHARDSON: In the proposal, yes.

MEMBER DAVIS: Peaches and nectarines?

MR. RICHARDSON: Yes.

MEMBER DAVIS: So it was the expanded usage to peaches and nectarines which we deemed as not absolutely critical in peach and nectarine production. We checked with people and asked them that question: Is this really needed like it is in apples and pears? And there is no consensus in industry, in the organic industry, that it is needed for peaches and nectarines. We didn't take so much issue with your claim about some of the other stuff.

I also wanted to point out that, for the vote that was taken the last time for the sunset renewal at College Park, it was a split decision, and one vote less for the material, it would not have been relisted. So there was a considerable dispute over whether
it even should stay on the list, even for apples and pears. But, in my opinion, the only reason it passed was because it was so devastating, particularly on pears, that fire blight is so devastating that we didn't want to injure organic growers that truly didn't have another option.

MR. RICHARDSON: The peach and nectarine use is a new use, and I think it is perfectly appropriate for this Board to make that decision as to whether they believe it should or should not be --

MEMBER DAVIS: But, anyway, I didn't want your company to go away with not being informed of really what was the driving force behind our vote.

MR. RICHARDSON: Well, I appreciate that.

MEMBER DAVIS: Okay.

MR. RICHARDSON: I appreciate knowing it. Again, that follows with the logic of the argument that we have made. We
included that as part of our petition, but you may want to segregate that out and say we have a decision on peaches and pears; we have a decision on apples and -- or peaches and nectarines and a decision on apples and pears.

CHAIRMAN DELGADO: And tomorrow, Gerry, you will have more time to expand on that explanation and justification.

Any other questions?

(No response.)

Thank you very much.

MR. RICHARDSON: Thank you very much.

CHAIRMAN DELGADO: Next is Brian Baker, followed by Julia Sabin.

MR. BAKER: Thank you, Mr. Chair, members of the NOSB, members of the NOP. Brian Baker, Research Director, Organic Materials Review Institute.

OMRI appreciates the NOP's clarification on materials review and explicit public acknowledgment of our work issued
earlier this year. That acknowledgment circulated to NOP-accredited certifiers has helped answer many longstanding questions and enables us to better serve the NOP’s accredited certifying agents, the organic industry, and the public.

OMRI offers itself as a technical resource, institutional memory, and vehicle for information collection and dissemination on materials decisions made in organic production and handling. People need consistent and timely answers in a way that is readily understood, clearly explained, and broadly supported by all stakeholders.

OMRI serves as an information resource to the public, and we ask that the NOSB make decisions that are clear and consistent with precedent. We understand that there are many unresolved issues that need to be addressed, but it should be done in a way that does not create more confusion by being inconsistent with precedent and a widely-held
consensus of what is permitted and what is prohibited on organic production and handling.

Recommendations, decisions, and guidances that abruptly change the status of materials without opportunity for public comment can result in confusion, conflicting interpretation, and endless debates. We use citric acid, cheese wax, glycerin, and soy protein isolates as examples in our written comments submitted to you prior to the meeting. Classifying use as agricultural will have implications for the black mold used to make citric acid as well as for the yeast fed to livestock. If the NOSB decides that cheese wax is natural, then all kinds of petric chemical from benzene to xylene could be considered allowed in organic production.

Being animal drug formulators, they are always asking us what kind of glycerin they can use for formulations other than teat dips. The soy protein isolate petition has been before you for a number of years. Many
of you have been appointed since that petition was received, and it is awaiting clarification on what is synthetic and what is not synthetic.

OMRI urges the NOSB to conduct an independent TAP review on every petition received and make those findings open to the public prior to any making of recommendations to the NOP.

In our experience, petitions can have inaccuracies. They can omit relevant information. They don't always include the information needed to evaluate against the criteria. Like the petitions, the technical reviews themselves need to be subject to public review and comment.

The NOP and NOSB are urged to draw upon the scientific and technical resources that are in the organic community, not just OMRI, but look to the many fine researchers in the Agricultural Research Service who are doing work on organic systems, in the land
grant institutions, and public institutions, Organic Farming Research Foundation. There are a number of technical resources out there to draw upon, and we feel that resource needs to be better used.

Some petitions are technical. Reviews don't address the OFPA criteria at all, and we have found that most of the petitions for agricultural products do not contain the information on the pesticides and other farm chemicals that have an impact on the environment and human health.

These can't be casually dismissed as insignificant. Organic food cannot be presented as an alternative to conventional farming practices when practices used to produce ingredients used in organic products and carry the USDA label have been grown with conventional practices.

So OMRI asks the NOSB to hold up making recommendations on 606 items until the questions raised by public comments on the
June 27th, 2006 Federal Register notice are addressed. As OMRI begins to review items that are on 606, not organic agricultural ingredients on 606, for their compatibility with organic production, we need answers. I plan to comment more tomorrow.

Thank you.

CHAIRMAN DELGADO: Thank you, Brian.

Any questions from the Board?

Okay. You have one?

MEMBER HEINZE: Do you think consumers don't understand that the items on 606, when they are used in a finished product, are conventional when they are labeled as conventional on the ingredient listing? They are not labeled as organic. I guess it seems that consumers would understand the implications of that.

MR. BAKER: Do consumers know the pesticides that are used to grow those products? Do they know the pesticide residues...
contained on those products? Do they understand that, for example, non-organic peppers have a very high rate of non-compliance with the FDA's tolerances for illegal residues? I think not, and I don't see that information being reviewed by the NOSB. I don't think that information is being conveyed to the public.

MEMBER HEINZE: They clearly don't understand the specifics, but I think they do understand that those ingredients are no different than the other conventional. So if it is a conventional pepper used in an organic product, that is the same as going to the grocery store and buying a conventional pepper. So I think, from a risk, they might understand that.

MR. BAKER: Perhaps, but they see the USDA organic logo on the packaging. They think that the National Organic Standards Board is reviewing these things that are not organic for their implications on human health.
and the environment. They trust the system.

MEMBER HEINZE: Okay, thanks.

CHAIRMAN DELGADO: Any other questions? Yes, Julie?

MEMBER WEISMAN: Yes, I wanted to also address Brian's issue. Well, let me ask you a question. I think the issue that you are having is that, when things are approved for 606, you don't see where the issues of persistence of things in the environment are being addressed in the evaluations. That was the point that Jim Riddle made earlier.

I think that we do need to look at the petition. I think that there is some work that the Board has to do to look at the petition criteria evaluation checklist and be clear for ourselves, since 606 is a new process, it's not applicable to certain things and certain things it is. There may be some confusion that does have to be addressed. I think that there is a point there.

I think, also -- I'll leave it at
that. That is the end of mine.

MR. BAKER: Okay. Is there a question that I can answer there?

MEMBER WEISMAN: Well, okay. Not anything that is different than what Katrina asked you.

MR. BAKER: Okay. I think the message was heard.

CHAIRMAN DELGADO: Okay, any other questions?

(No response.)

Okay, thank you, Brian.

MR. BAKER: Thank you.

CHAIRMAN DELGADO: Up next is Julia Sabin, followed by Patrick Arndt.

MS. SABIN: Good afternoon or maybe good evening.

(Laughter.)

This will be very, very short and sweet.

CHAIRMAN DELGADO: Thank you.

MS. SABIN: My name is Julia Sabin,
and mainly I wanted to introduce myself to you as the new President for the Organic Trade Association's Board of Directors, and also to thank you, the National Organic Standards Board, for all the significant personal sacrifice and dedication that you give to this industry. It is very much appreciated. Volunteer boards require an immense amount of work, and I thank you.

Also, I wanted to thank the NOP, and specifically Barbara Robinson. She is not here, but please thank her for me, and her team for all the hard work and amazing commitment to the organic community as well.

Then, finally, the OTA staff remains very excited to continue to support and work hard for the organic community as we move forward together.

And that's it. So I get the award for the shortest statement today.

(Laughter.)

Thank you.
CHAIRMAN DELGADO: Thank you, Julia. Congratulations on your appointment.

Any questions for Julia before she leaves us?

(No response.)

No?

Thanks again.

Who's next? Patrick Arndt, followed by Peggy Miars.

MR. ARNDT: Hello, everyone. My name is Patrick Arndt. I am a Certification Specialist with Pennsylvania Certified Organic. As you can see, I am speaking as proxy today for Melanie Saffer. She is our Certification Director.

I would like to focus my comments on various materials issues before the Board. We filed more detailed comments previously that should be in your meeting book. Here are the key points:

No. 1, TAP reviews are needed for almost all materials, including any material
petition for 205.606 that is not a single ingredient raw agricultural commodity. We understand there have been budget issues, but now that more funding is available, we expect that these will resume.

It is not acceptable or adequate to rely on a petitioner's information, which quite naturally can be biased in favor of the petition's substance. This can lead to incorrect decisions and set precedents that cause more problems later. We have noted some specific errors in our submitted written comments.

No. 2, as a certification agency, we are required to have documented policies for decisionmaking and treat all clients equally. We make decisions daily regarding determination of compliance for inputs and ingredients for organic producers and handlers, and these decisions need to be consistent.

We feel that the NOSB should be
following similar standardized procedures when reviewing materials. Specifically, we request you complete your deliberations on agricultural versus non-agricultural definitions before any more materials are added to 205.606.

We also need clarification of the definitions of synthetic and non-synthetic substances.

No. 3, we have filed a joint comment with Oregon Tilth regarding the status of the 45 materials now listed on 205.606. When we review our clients' ingredients used in organic products, we need to understand better what the restrictions are for these substances.

These questions were asked last year, and now that we have been reviewing colors in detail, we are asking again. Can they be produced using synthetic solvent extraction? Can they be formulated with other non-list carriers and additives?
Colors can include other additives like maltodextrin or starch. Do these have to be organic?

Either NOSB should be reviewing the manufacturing process and additives used in more detail and considering these issues or it should be clear that certifiers need to review these substances and limit approval to products formulated only with substances on the National List. Certifiers are not all reviewing these substances the same way as is.

No. 4, specific crop and livestock materials. Cheese wax should be deferred for proper identification of the substances involved and correction of the evaluation form to indicate that petroleum products are, in fact, synthetic.

Dextrin for seed coating needs a TAP review before the decision is final.

Detracycline, we agree the annotation should not be changed.

Fenbendazol, we support addition as
a parasiticide.

Thank you.

CHAIRMAN DELGADO: Any questions?

(No response.)

Okay, thank you.

MR. ARNDT: Thank you.

CHAIRMAN DELGADO: Moving on with Peggy Miars, followed by Sam Welsch.

MS. MIARS: Good evening. Thank you for pronouncing my name correctly. I appreciate that.

CHAIRMAN DELGADO: Wonderful.

MS. MIARS: My name is Peggy Miars, and I'm Executive Director of California Certified Organic Farmers. CCOF is a nonprofit organization, and as you heard earlier, we represent more than 1800 certified operations and half a million acres in organic production. We certify nearly 80 percent of the organic farmland in the State of California.

Today I am briefly addressing three
topics. First is grower groups.

I would like to thank the Certification, Accreditation, and Compliance Committee for their work on the issue of grower groups. CCOF’s position remains unchanged from the last NOSB meeting.

CCOF has not and does not certify grower groups. We believe that, in order to uphold the integrity of organic and provide the oversight that consumers demand, that each grower should complete the full certification process, including an annual onsite inspection by an accredited certifier.

We believe that handlers, processors, retailers, and restaurants should not be allowed under group certification.

We do acknowledge that grower groups have been allowed, in order to enable small growers to achieve certification, which increases the amount of farmland under organic production. However, we believe that grower groups should be phased out of the NOP. As
long as they are allowed, participation should only be available to growers producing less than $5,000 in U.S. organic sales.

We do not believe that the proposed grower group model increases the ability to detect non-compliance. In fact, it might be easier to hide non-compliance issues if the operator wants to.

We have spent more than five years educating consumers about what organic means under the NOP and what organic certification means. Some consumers are already questioning the integrity of organic and the organic seal. We believe that the issue of grower groups will continue to confuse or add to the confusion of consumers and will add to the loss of confidence and trust in the organic seal, which would impact the entire organic marketplace.

Unfortunately, we have not been able to participate as part of a committee or a discussion group on this issue, but now that
we do have a full-time Policy Director, we are prepared to participate in continued discussion on this issue.

The second item is regarding the Methionine petition. We support the Livestock Committee's recommendation to add an annotation with the expiration of October 1, 2010, to enable time for commercial development of non-synthetic alternatives to Methionine. I understand a task force is currently working on researching alternatives, and we support those efforts.

And the third area is some miscellaneous items, primarily for the NOP staff. We do ask that the NOSB and NOP please remember that certified operations require proper notification and due process when rule changes are made. This includes clarity and interpretation and a clear timeline for communicating and implementing the changes. Making verbal comments in certifier trainings is not sufficient. Each certifier must be
notified in writing, so that all certifiers receive the same information at the same time.

We are still waiting for a pasture recommendation and a rule on origin of livestock. The lack of clarity is detrimental to livestock operations and the entire organic community.

We want to thank you for allowing certifiers to contract with OMRI and WSDA for materials review. We appreciate that very much.

We want to thank the NOP staff for their efforts to update the NOP website, as many people have said today. While improvements have been made, I know you realize that more improvements are needed. I won't go into detail here, but we probably will be submitting comments directly to the staff.

We congratulate you on the increase in the NOP budget, and we ask that you share with us how that money is going to be put to
good use to benefit the organic marketplace.

We appreciate the work of the NOSB and the NOP, and we thank you very much for your time and consideration.

CHAIRMAN DELGADO: Okay, thank you.

Any questions from the Board?

(No response.)

Okay, thank you.

MS. MIARS: Thank you.

CHAIRMAN DELGADO: Next is Sam Welsch, followed by Katherine DiMatteo.

MR. WELSCH: Hi. I'm Sam Welsch with One-Cert, one of the accredited organic certifiers.

I have already submitted written comments on hydroponics. They are not organic. Organic comes from the soil. Hydroponics has no soil. I think that message we have tried to make pretty clear.

Group certification we have supported for small holders, preferably those who are producing less than 5,000. Again, I
made more comments in writing. I won't read
those to you. I would be happy to answer any
questions you have about those issues, but
today I want to spend a few minutes talking
about some other topics.

Regarding materials, I hope we
don't mess with the definition of
agricultural. It may be difficult for some to
deal with the way it is, but we have enough
problems with confidence in the organic seal.
When we start messing with definitions like
agricultural that make sense to most
consumers, it is something that comes from the
farm. When we start to include microorganisms
and other things in the definition of
agricultural, I see that as doing nothing but
harming the overall advantage or overall image
of organics.

We already have a definition in
livestock that includes other non-plant life.
So if we need to have a way of certifying
yeast, it is already in the rule. It is other
non-plant life.

   It is certainly possible to have a separate section for the certification of yeast or other microorganisms that may need to be certified. So, very clearly, we have a continuum, agricultural on one end, non-agricultural on the other. It is not discrete baskets. There's a lot of things in between that may be somewhat less well-defined, but if we are looking at what can be certified, there may be another segment of the rule that we need to have that includes those things under the non-plant life that can be certified in definitions on what requirements go into that.

   We have heard that yeast is being certified because it is made with organic substrates, but yet, at the same time, other fungi are being certified with using conventional, even GMO, substrates to be grown on. That is what is currently allowed by the NOP, because there are no rules that have been developed for mushrooms, just like there's
been nothing for greenhouses, apiaries, beekeeping. Those are things that we were promised before the rule was fully implemented back in 2002, but are rules that have not yet been promulgated.

I just wanted to mention a separate issue. Somebody mentioned there was formula manufacturers. We do certify a formula manufacturer that does not use hexane fatty acids in their products. So it is possible. There is an organic product on the market for that.

Regarding group certification, we hear a lot about how an internal control system improves functioning or the oversight for retailers and other multi-site operations. I just want to point out that in 205.201(a)(3), it requires a description of monitoring practices and procedures to be performed and maintained. This is something that is required in an organic system plan of all operations. The fact that they do that
with an internal control system, with multiple sites, is very good, but nothing in that application or that type of monitoring says that those sites don’t all need to have an annual inspection.

So it is good to have the internal control systems in place regardless of the type of multi-site operation it is, but it doesn’t eliminate the requirement that an annual inspection take place in each of those.

I also wanted to endorse the comments of others who made statements today, such as Gwendolyn Wyard and Emily Brown-Rosen, about the clarification of ingredients on 606.

I also agree with the comments about the so-called cheese wax. I think we should actually call it synthetic hydrocarbon, which is its proper name. It is not made from cheese, just to be clear.

(Laughter.)

So if it is going to be listed, it should be listed properly. I think it was
misidentified in the recommendation from the Committee, and I think it needs to go back to Committee for a correction before it should be approved, if it is justified to be approved at all.

I also agree with the OMRI statements that additional rulemaking should be required before we add additional items to the list.

And I will add my voice to others who support the requirement that TAP reviews be conducted before many of these items be added.

CHAIRMAN DELGADO: All right, thank you.

Any questions? Joe?

MEMBER SMILLIE: Which option do you currently favor from the Materials Working Group, if any?

MR. WELSCH: None of the above.

MEMBER SMILLIE: Option A was status quo, wasn't it?
MR. WELSCH: Yes.

MEMBER SMILLIE: Is that what you are supporting?

MR. WELSCH: I am supporting that we actually need some rules for certification of some of these products that are not clearly crops or livestock --

MEMBER SMILLIE: Right.

MR. WELSCH: -- things like mushrooms, even greenhouses. You know, these have been on the table since before the rule was implemented and they are still not complete.

MEMBER SMILLIE: Right.

MR. WELSCH: It is just one of many things on the list that are creating problems today because they were not completed within that time limit.

MEMBER SMILLIE: Okay.

CHAIRMAN DELGADO: Dan, followed by Kevin.

MEMBER GIACOMINI: You mentioned
that we shouldn't mess with the definition of agriculture. One of the things in the process of what we are trying to do, and what the Working Group is trying to do, is find what we do need to do to move forward on this.

We actually don't have a definition for agriculture. Are you proposing that that is something we should do?

MR. WELSCH: I probably misspoke. I mean agricultural product. There is a definition in the law for that.

MEMBER GIACOMINI: But it doesn't mention anything about a farm.

MR. WELSCH: Well, I think if you look up the commonly-understood -- if you look up agricultural in any dictionary, you are going to have what is the commonly-understood meaning, which will include farm. We don't have to create meaning where it is commonly understood.

CHAIRMAN DELGADO: Kevin?

MEMBER ENGELBERT: Yes. Could you
give an example of fungi that is being grown on a GMO substrate, Sam, that you mentioned?

MR. WELSCH: Most mushrooms. It was a question that was asked or presented in training, "Can you use GMO substrate like corncobs for raising mushrooms?" And we were told yes.

CHAIRMAN DELGADO: Any other questions?

(No response.)

Thank you very much.

Moving on to Katherine DiMatteo, followed by Harriet Behar.

MS. DiMATTEO: Okay, thank you very much. My name is Katherine DiMatteo. I'm on the Board of the International Federation of Organic Agriculture Movements, which is, obviously, a global, democratic, membership-based organization that has been in existence since 1972 and has contributed to the worldwide discussion of organic standards and agricultural principles for organic.
I'm going to read this because it is long. So I apologize -- no eye contact.

IFOAM thanks the Certification, Accreditation, and Compliance Committee for the appendix to the discussion document on certifying operations with multiple production units, sites, and facilities, and for inviting discussion and comments from the organic community.

IFOAM appreciates the careful and thoughtful consideration that the CACC and the National Organic Standards Board are giving to this important recommendation.

IFOAM also thanks the National Organic Program for allowing the use of the 2002 NOSB recommendation on grower group certification as guidance for the certification of grower groups under the National Organic Program.

These comments address both the appendix and some of the questions posed by the Committee.
The guidance provided in the appendix greatly improves the understanding of how to implement appropriate and rigorous controls within operations with multiple production units, sites, and facilities. There is much in the appendix that IFOAM supports: Section 2, Section 3, especially the criteria for clustering of members or subunits into a production unit, including the guidance that an upper limit on the number of subunits included in a given production unit should be based on the feasibility of effective oversight by management personnel and factors such as size and accessibility of the subunits. We also support Section 4, No. (d), the role of the internal control system.

IFOAM does not agree with the key premise that there is a distinction between initial and renewal inspections of production units, sites, and facilities, presented in Section 4.

Although the language in Section
205.403 of the NOP rule appears to distinguish between initial and subsequent onsite inspections, IFOAM does not believe that it was the intent of this provision to suggest that subsequent onsite inspections might be less complete than the initial one. To make this distinction between initial and renewal inspections would diminish the rigor of the certification system for multi-site operations.

IFOAM recommends the NOP accredited certifying agents perform annual audits of the internal control system of the group, annual inspections of each production unit of the group that includes a sampling of members or subunits based on both risk assessment and random selection, and annual inspections of handling facilities and sites of the group and production units.

The internal control system personnel must directly observe and check all subunits at least annually to ensure that the
organic system plan is implemented.

    The criteria written in Section (c) under "Inspection" should be written to reflect factors appropriate to members or subunits rather than production units.

    IFOAM does support the recommendation and reasoning for random sampling, but would apply this to members and subunits rather than the production units.

    We applaud the Committee for their excellent work on the role of the internal control system, in particular, the statement for the person seeking organic certification to be in compliance with the NOP, all non-compliances detected at the production unit site and facility or at the subunit or member level are required to be reported to the certifying, not just to the internal control system.

    You have the rest of this in front of you, but I just want to read my last paragraph.
IFOAM urges you to recognize that multi-site operations are not simply a collection of individual farms that are collaborating to market crops or are organized to avoid rigorous certification oversight and verification. This system for certification of multi-site operations that includes having a functional internal quality assurance system together with an annual inspection and evaluation by an accredited certifying agent offers a sound and robust organic guarantee system that protects organic integrity. This system offers two levels of control as opposed to one. It also encourages group organization, which enhances the overall capacity of individual members within the group to institute and further develop good organic management practices.

The continuation of multi-site operations is critical to the organic community worldwide.

Thank you for the opportunity to
comment.

CHAIRMAN DELGADO: Oh, you are very welcome. Thank you.

Any questions?

(No response.)

All right. Okay, thanks again.

MS. DiMATTEO: Thank you.

CHAIRMAN DELGADO: Next up is Harriet Behar.

MS. BEHAR: Is everybody still awake?

CHAIRMAN DELGADO: We're still awake.

MS. BEHAR: Okay, I am going to give comments for the National Organic Coalition, of which MOSES is a member. It is on grower groups. There is only one copy of my comments, but I believe Liana is bringing you some more.

I would like to thank the NOSB Certification, Accreditation, and Compliance Committee for the further consideration of
these grower group certifications. However, we are very disappointed that the previous document presented in November has not been withdrawn or reworked to reflect the many public comments, including our own, that objected to this approach.

Instead, the Committee has presented a new appendix outlining guidance for certification of multi-site operations. The unnecessary inclusion of handlers, including retailers, into this proposal remains a great weakness that jeopardizes the protections needed for small farmers in the developing world who have successfully used the grower group model in order to have access to certification and the organic marketplace.

Handlers that operate multiple sites, locations, and facilities are currently certified as single operations under the existing regulations. There is no need for any guidance designed to weaken the inspection protocol for these entities.
There may be need for specific guidelines or regulations for retail certification, as this is voluntary, but this is a separate issue that should not be conflated with the problem at hand, which is a producer/grower group certification.

We are in general support of the OTA Group Certification Task Force comment on guidance for producer group certification. We believe this document provides the needed depth of consideration of important issues relative to certification of producer groups, including guidance on the preferred management structure of an internal control system, conflict of interest, and training, criteria for inclusion in a production unit, and the inspection protocol, including risk assessment.

We particularly support the OTA position that all production units are inspected annually, and discussion of what is a production unit, that definition, and how to
decide that is part of the larger document which you will get in due course, I hope.

I also want to answer some of the questions that you put out there, such as: Does a process of random external inspection levels based on risk criteria provide enough oversight of individual locations or is there a need to guarantee all locations are externally inspected at some minimum frequency?

Under that, we support the One-Cert discussion, and we feel that random selection is not sufficient. Selection must be first based on risk criteria with any farm in the group that is high-risk being inspected annually, with the remaining low-risk farms may be randomly selected using a method that guarantees no more than five years between external inspections on any farm.

Then I guess the other one here that I am going to answer is: How will the multi-site model improve the National Organic
Program? We feel that the multi-site model will not improve the National Organic Program. Retailers added to the existing structure will only improve the bottom line of retailers.

The grower group model with needed clarifications will continue to provide organic certification in an alternative model for small holders around the world who would otherwise not be able to certify with no loss of integrity of the USDA standards. The marketplace will be assured of continued availability of such important commodities as coffee, chocolate, bananas, et cetera.

In conclusion, the NOSB should work to adopt a consensus document that establishes guidelines for small holder group certification and limit this guidance to this arena only. There is no demonstrated need or convincing reason that handlers should be afforded eligibility under this proposal to weaken their protocol for the necessary
individual site inspections.

We hope that the organic retail community will take the necessary leadership in this discussion and insist on dropping this idea in order to protect consumer confidence in the organic certification of all items.

Growing groups represent some of the world's most vulnerable farmers. Therefore, it will be vital to exercise extreme caution, adequate implementation timelines, and full transparency, including adequate opportunities for public comment, when applying changes to the current model in place.

CHAIRMAN DELGADO: All right, very timely. Thank you.

Questions for Harriet?

MS. BEHAR: Again, that is from the National Organic Coalition.

CHAIRMAN DELGADO: Great. Thank you.

Next is Leslie Zuck, followed by
David Guggenheim.

MS. ZUCK: Hello. I thought would be last. I'm kind of used to being last with a name that starts with Z-U, you know, almost last anyway.

(Laughter.)

Hi. I'm Leslie Zuck, Executive Director of Pennsylvania Certified Organic. I have been sitting here all day just trying to think what I ought to comment on. So many issues, so little time.

(Laughter.)

But I decided that the best use of my time and yours would be to try to address some of the questions I have been hearing from the Board throughout the day. So I will do that.

I heard Joe say -- well, it wasn't really a question, but he is concerned that we need to get better compliance levels on the use of organic seed. I continue to be sort of confused about why it is perceived that this
is such a big problem warranting quite a lot of effort on the part of your Committee and Board.

I mean, are we seeing documented complaints? Is it mostly anecdotal information from seed companies that would really like us to help them meet the needs of growers and find the organic seeds that they really need?

Frankly, we have not really seen this as a problem, and the organic seed availability is not stagnating. It is certainly not slowing. At least what we are seeing is that it really does increase every year. I mean it started out -- and that is like since 2002. I mean it was non-existent before 2002. The first couple of years were pretty slow. I mean there really wasn't anything.

So we have been seeing it increasing every year really in the last three to four years. I am pretty amazed, actually,
that there is as much available that there is, knowing what it takes to develop seed.

There were several questions about the burden that your recommendation would place on the certifiers and producers. I think Zea and Harriet really responded to those questions well.

On my farm, I am certified by a very reputable ACA in Florida, and every December I sit down with my stack of seed catalogs and I start with the Johnny's and the Fedco and the Seedway catalogs. Johnny's and Fedco are in Maine. They are the major East Coast providers of organic seed. Seedway is in Pennsylvania. We certify them, and I know for a fact they work very hard to add organic seed to their line.

So I go through and I flip through the catalog, and if I see something that is what I want and the organic variety is available, I order it. So I will have the order form; I have the invoice, and
essentially that is my documentation.

Then the very well-qualified inspector from the reputable ACA arrives at my farm in the summer. I will show her -- she will look at all of that stack of seed catalogs. She will look at my invoice. She will look at my order form, and she will see that I have been using a significant or at least a reasonable amount of organic seed on my operation, and she will check a few things. She knows Brandywine tomatoes are available organically and Detroit dark beets, and she will just make sure that I am using those, and I am.

All the information to assess compliance is there. It is looked at, and a determination of good faith effort is placed in my inspection report that goes back to my certification agent. But if I am going to spend additional time to write all that down and make my list up, it is going to take several more hours on my part, and it may not
seem like a lot, but I am going to be asking why. As a certifier, I am going to be getting asked why by my several hundred clients who are going to want to know how I think that is a reasonable use of their time.

Because, so far, up until now, we have been managing fine without having them to send list of seeds that they want to the seed company. If I write out my list and send it to Johnny's and Fedco and Seedway, and say, "I'm interested in all these 80 or 90 varieties. Are they available?", they are going to think I'm daft. They are going to say, well, check our website, check our seed catalog; that's what they are there for. So that is kind of going to be a hard sell, at least to my clients, I think.

At the certifier level, there isn't anybody that really has a nanosecond to spare, much less a staff member to devote the time needed to collect and enter into a database seed lists containing hundreds of varieties.
from hundreds of farmers.

I figure at a minimum of 15 minutes each, that is over 100 staff hours, and these guys will tell you we're not afraid of work, but I do have a hard time convincing staff of the necessity of such a huge task to fix a problem that we really don't seem to see as being a big problem.

Okay, I feel as a certifier I really can't legally require a client to submit confidential business information to me that would be ultimately used for another purpose. I would have a problem with that. I could get sued. I don't want to get sued. So I would rather not have to do that.

Contract growers was asked -- I think it is already covered in the rule. Efforts to find organic seed have to be in their OSP, just as well as it has to be in any grower's OSP. So I think it is there. That was your No. 4.

If you have any questions about
multi-site -- I have one question and one
comment that is one-sentence long, which I
would be happy to answer.

CHAIRMAN DELGADO: Okay, any
questions for Leslie?

MS. FRANCIS: Do you have any other
comments?

(Laughter.)

MS. ZUCK: Just one really; it is
very short. I am wondering why the 36-month
phase-in period is there for the 100 percent
inspection every year. I mean 100 percent for
the initial year.

At least the rule I have back in my
file clearly requires that now. I think any
ACA that is not inspecting every production
unit prior to initial certification should be
politely questioned by NOP about why they are
not doing that now, because I can't read the
rule any other way.

So my question or my comment, that
was it.
CHAIRMAN DELGADO: Okay. Any other comments, questions?

(No response.)

Okay, thank you very much, Leslie.

MS. ZUCK: That's a first.

CHAIRMAN DELGADO: Next up is David Guggenheim. No pressure; you are the last one on the list.

MR. GUGGENHEIM: Can you hear me okay?

CHAIRMAN DELGADO: Yes.

MR. GUGGENHEIM: Okay, and I want to thank the Board for their flexibility in getting me in. I suppose I should thank the U.S. District Court for not calling me in for jury duty today. There was some uncertainty about that.

Good afternoon. Good evening.

I am Dr. David Guggenheim. I'm a principal in Aquaculture Development. It is based in Pittsburgh, Pennsylvania.

I think it is also relevant to
mention that I am President of One Planet One Ocean in Washington, D.C., a conservation organization.

Three and a half years ago, I left my post at the Ocean Conservancy as Vice President because I got very excited about the fact that I had a glimpse of the future: closed-containment, land-based aquaculture. These are systems, next-generation systems, that recirculate 99 percent of their effluent, have no discharge, use no chemicals and no antibiotics, can be located close to where their products are consumed. I saw this as the future of putting fish on the table. You may recall I made a presentation on this technology at the Aquaculture Workshop.

Today I want to talk about one point, and that is really focused on a request that the Board reconsider the inclusion of the sunset provision for the use of fish meal and fish oil in aquaculture.

The organic certification addresses
both concerns for human health as well as concerns for the health of the environment. In the long term, it is my belief that providing this flexibility will be a net benefit and significant benefit for the environment, and here's why:

Without question, from my experience and that of my colleagues, next-generation, closed-containment systems represent a quantum leap in the sustainability of aquaculture, both in terms of the attributes of aquaculture itself, but also in terms of, when scaled up, their capacity to actually reduce pressure on wild fish populations and ocean ecosystems.

The U.S. is far behind Europe and Asia in adopting this technology, and now we can add South America to the list. Our primary technology partner, UniAqua, based in Denmark, has just begun construction on two facilities in Chile, each 1,000 tons for salmon. These are facilities that will
support the complete rollout of salmon, completely contained land-based systems.

Over the past three and a half years, I have been on the front lines working with industry executives and potential investors who, despite a 15-year track record overseas, haven't really heard much about this technology, view it as something new and scary, and therefore, a high risk.

But the possibility of an organic certification for their product has been a major factor in bringing these potential investors closer. The challenge is that most of the commercially-viable species in this country are omnivores. Salmon represents about 60 percent of the fish that we eat, obviously, an omnivorous fish.

We at Aquaculture Developments are committed to eliminating completely the wild-caught feed component to the fish that we are growing. At the workshop, we committed to a five-year phaseout period, which I think was
faster than just about anybody else.

That is for two reasons: the time needed for research as well as time needed for economies of scale to kick in. It is technically possible for us to grow organic feed, essentially the prey species for these fish, but the economics don't work yet. The economics will work when there is enough of these facilities there. Therefore, it is a chicken-and-egg problem.

The sunset provision will have the effect of stimulating the right kind of industry for aquaculture and take a major step forward toward again protecting and restoring ocean ecosystems.

This is not about weakening the National Organic Program. Taking a larger and longer-term perspective, this is demonstrating leadership and profoundly transforming the way this country puts fish on the table.

Thank you.

CHAIRMAN DELGADO: Thank you.
Any questions? Yes, Hugh?

MEMBER KARREMAN: Thank you.

So even though when we are coming up, we are trying to come up with standards for all aquaculture species and not just salmon -- I've tried to kind of stay clear of just saying salmon because it is not just about salmon. But how would you answer some of the groups that would say, well, salmon have to have their natural runs to be in the organic, you know, to demonstrate their natural behavior, and whatnot? I mean, how would you answer that with the setup, you know, the system that you are proposing?

MR. GUGGENHEIM: I suppose there's two paths you can take in responding to that question. One is a biological and technical path, and the answer is that the technology now exists to grow these fish and grow them out to a commercially-viable size, and to do that completely in indoor contained systems.

So it is doable. These fish are
healthy from a physiological perspective, and they are commercially viable.

I think there is another path, and that may be an ethical path. That is more of a gray area, something I don't think I can respond to because I would be giving you my own personal feelings about that. But I think all of us would have different perspectives on that.

I think it really comes down to the individual species and what their needs are. I think, from my perspective, I have seen eels, I have seen baramundi, the Asian sea bass. I think personally it comes down to the physiological health of these animals. If you look at them and they look healthy, and they don't appear to be adversely impacted at a physiological level, I think that is a good indication -- again, this is my personal belief -- that they are doing well, even if some of their behaviors have been affected.

I think there are others who might
suggest that it is just wrong to do that, but
I think that is more of a personal choice.

CHAIRMAN DELGADO: Any other
comments, questions?

(No response.)

Well, thank you very much.

MR. GUGGENHEIM: Thank you again.

CHAIRMAN DELGADO: On that note,
ladies and gentlemen, members of the Board, we
are finished with the public comment section
for day one of our meeting.

We will recess until tomorrow
morning at eight o'clock a.m. I will ask the
Board members to be here 10 minutes before the
hour.

I also would like to ask the Board
members to gather here to discuss logistics
about dinner.

Thank you very much for all of you
who stayed behind to listen to our meeting.

Until tomorrow.

(Whereupon, at 6:47 p.m., the
proceedings in the above-entitled matter were
recessed for the day, to reconvene the
following day, Wednesday, May 21, 2008, at
8:00 a.m.)
The Meeting of the National Organic Standards Board convened in the Chesapeake Room, Holiday Inn Inner Harbor, 301 W. Lombard St, Baltimore, MD, pursuant to notice at 8:00 a.m., Rigoberto Delgado, Chairman, presiding.
BOARD MEMBERS PRESENT:

RIGOBERTO I. DELGADO, CHAIRMAN
JEFFREY W. MOYER, VICE-CHAIR
KATRINA HEINZE, SECRETARY
HUBERT J. KARREMAN

Adjourn
8:02 a.m.

CHAIRMAN DELGADO: Please take your places, we are about to start. Good morning to all and we're starting with day 2 of our meeting. And I am calling the meeting to order. Thank you, Madam Secretary, make it official. Thank you for that, as well, Julie. I hope you all had a pleasant rest last night. We have a heavy schedule today. We're going to start with a presentation on materials and recommendations on the part of all the committees, and then we'll follow with another session of public comment.

In the first place, I would like to ask the Chair of the Policy Committee, Dr. Barry Flann, to give us his presentation on the recommendations on both the changes to the policy and procedure manual and also to the new member guide. Barry.

MEMBER FLANN: I always need lots of help. Thank you. Thank you, Mr. Chair. The Policy Committee, everything we do is a real team
effort and the committee consists of Bea James, Hu Karreman and our Chair Rigo Delgado. And today it will be no different. I'll lead off with the first of our recommendations and then Hu is going to report on our other recommendations and then followed finally with Valerie Francis who always gives us tremendous help on every committee meeting and Valerie will make the final report on -- from the Policy Committee.

Our first recommendation is a change in the Policy Development Manual, on Section 1 page 6 of the NOSB Mission Statement under carrying out the mission, we propose adding the words, "or deletion from". The statement would then read, "Review petition materials for inclusion and/or deletion from the national list of approved and prohibited substances from the national list". This is to conform with the language in the regulations and yesterday there was a number of comments on this very subject.

The second recommendation, Section 1 page 6 of the NOSB Mission Statement under
carrying out the mission, combine Items 4 and 6, also add "timely" in the statement and "make full use of communication channels". The statement would then read, "Communicate with the organic community, including conducting public meetings, soliciting and taking public comments and provide timely information and education on the NOP, making full use of communication channels".

That's the recommended changes in the - the first recommended changes and Hu will carry on from here.

MEMBER KARREMAN: Thank you, Barry. The second change -- let's see, it's number 3, right, Barry?

MEMBER FLANN: Number 3.

MEMBER KARREMAN: On Section 8 of the National Organic Program material review process, we want to add the paragraph describing how we deal with petitions, their handling if they're withdrawn by the petitioner and the proposed paragraph would be placed immediately after Phase 6, page 35 and it would read regarding withdrawal
of petitions, "When a petition involving materials are withdrawn by the petitioner, the Board shall suspend its review and recommendation procedure. In the case of a petition not involving a material, board members have the option of completing its review and providing a recommendation or guidance. In the case of a petition previously withdrawn is then resubmitted, the Board should review it in the order that it is received. That means that a withdrawn petition should be considered a completely new request and then falls to the end of the queue of materials pending review. And of course, the petitioner can withdraw a petition at any moment during the process of review by the Board during public comment or prior to the Board's voting on the petition. So petitioner should have the opportunity to withdraw a petition with the intent of improving it, getting new information, new data, research and only that. It is the hope of the Board that petitioners will not abuse this privilege with the intent of finding agreeable
members in subsequent submissions as our Board changes over." So you can withdraw a petition to add research data, resubmit it, but it will go to the end of the line and you can do that at any time. Okay?

The other update we want to do to the New Member Guide is that we want some of the NOSB members suggested the addition of two sections to the New Member Guide which include adding hyperlinks to past Board recommendations and also a list of common technical sources that we can use as Board members and that should improve the process of conducting our business and training of incoming members to get them up to speed as needed.

So the recommendation would be -- recommends two updates to the New Member Guide document, addition to Chapter 5, Section B, suggested best practices, making the most of your conference calls and meetings, of a descriptive paragraph and a link to the final NOSB recommendation table and also addition to Chapter
5 suggested best practices of a new section called F, list of common technical sources used by NOSB members. So that's the two recommendations. I can go in a little more detail for Recommendation 1.

CHAIRMAN DELGADO: I think that will be enough.

MEMBER KARREMAN: Is that enough?

CHAIRMAN DELGADO: Anything else you want to add, Barry, to that?

MEMBER FLANN: No, not to that.

MEMBER KARREMAN: Yes, as Valerie is scrolling through there, there's a whole long list of hyper-links to various government agencies and NGOs and other professional societies that would be added into the New Member Guide which should be pretty helpful. And we should be open to adding to that kind of as needed. I don't know if that might have to be in the recommendation that it's open for updating.

CHAIRMAN DELGADO: It doesn't have to be in the recommendation and I think it is well-
understood that it will be a living document and updated as needed. Are there any questions for the members of the Policy Committee. Yes.

MEMBER FLANN: There's still one, we'll let Valerie make her report and --

CHAIRMAN DELGADO: I apologize for that.

MEMBER FLANN: -- and then we'll take questions.

CHAIRMAN DELGADO: Please, Mr. Chairman, continue. Before that, let me allow Mr. Richards to provide us some comment. I believe this might be relevant. Yes, sir.

MR. MATTHEWS: I just have one question with regard to the timing of the withdrawal.

CHAIRMAN DELGADO: Mr. Richards, can you hold on, on that, please? Matthews, I'm sorry. It's quite early. I apologize. Let's listen to the last item presented by the Policy Committee and then we'll come back and answer specific questions. Valerie, please.

MS. FRANCIS: One thing that's been
requested a lot is having a list of all historical recommendations by the NOSB and sort of their status. And some go back, way back, 1993, `94, `95. And as people ask questions, too, about recommendations that are sort of lost in the institutional memory, I've been collecting those questions and indicating where they are, in what meeting of what page, of what transcript, little by little and I've amassed quite a document.

They recently -- they've been going through a process of migrating the entire website, so now I'm going to have to go back and update all those links. And so just communicating the status of we're working towards it. It's one of those projects that you tuck in and you do as you go and it's -- I'm hoping it will be a useful thing. I'm not quite sure how it will all fit in on the new website but my webmaster will work with me on that as we get closer to bringing that forward. So, just to let you know, I'm working on it.

CHAIRMAN DELGADO: Okay, now, we're open to questions. Mr. Matthews.
MR. MATTHEWS: I just need a little clarification on the withdrawal and then resubmission. Clearly a petitioner can withdraw their petition at any time. But is it my understanding or is my understanding correct that once the Department has spent thousands of dollars reviewing the material, and the report comes out, that the person would be allowed to resubmit so the Department would spend thousands of dollars a second time?

MEMBER KARREMAN: I would -- can I try to answer that?

CHAIRMAN DELGADO: Please, yes.

MEMBER KARREMAN: I would think that with the resubmission process that it's limited to just new data that you would only need to take that into account on top of what was already accomplished. That would be my understanding, but -- or my thinking.

CHAIRMAN DELGADO: That seems to be the spirit of the proposal, is that correct, Mr. Chairman?
MEMBER FLANN: Yes.

CHAIRMAN DELGADO: Are you satisfied with that response?

MR. MATTHEWS: Yes, I'll want to think about it more, though. I mean, I just have a problem with, you know, spending thousands of taxpayer dollars to rereview something, so we'd have to work with the contractor to make sure that we weren't repaying for everything. It's still going to be expensive to re-analyze the material with the new data. So I mean, I will still cost us a lot of money.

CHAIRMAN DELGADO: But just to clarify, you're saying that you will not have to start from zero; is that correct?

MR. MATTHEWS: Oh, I would think we would not have to start from zero but I'm not saying that it wouldn't be of substantial cost to do it a second time.

CHAIRMAN DELGADO: We have Jennifer, correct, followed by Dan -- well, Dan, followed by Tina. Dan.
MEMBER GIACOMINI: Mr. Matthews, I believe the -- and maybe it would need some clarification. I believe the intention of the recommendation is regarding the NOSB. It's not a directive to the NOP that if it's a completed petition and it's been fully reviewed, the we're requesting that you re-review it. It's just a matter of us trying to prioritize the materials and the volume of materials that come to us that we try and deal -- get the older materials that have been sitting on our desk for a long period of time, we try and get those taken care of.

The intent, I believe in this, is simply saying that the date that we're going to look at is when we receive this document, when we receive the petition is not three years ago and now that the petitioner has said, "Reactivate that petition", we are faced with looking at something, "Well, that's -- we've had this for three years". It's to say that we've had this as of today and the one we got last month, we received from the program last month, has time-wise a higher
priority than this one which received today even
if this one has been in existence for three years.

I think it's an NOSB directive, not an NOP at all.

MR. MATTHEWS: Okay, so then I would
understand that what you're saying is that they
would withdraw the petition long enough to submit
additional information to the Board and the Board
would be acting on that without going back to the
contractor for additional work.

MEMBER GIACOMINI: That would be your
decision but it wouldn't be impacted by this
recommendation. That would be just, you know,
Bob's normal evaluation of petitions as they come
through and new material, new information comes
through.

MR. MATTHEWS: Okay.

MEMBER GIACOMINI: But we've had some
petitions in the recent past that have been
withdrawn and the petitioners just like come back
and say, "Okay, we want you to look at it again
now". I'm not even aware that they submitted any
new information.

MR. MATTHEWS: Okay.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: Can I ask what happens now to petitions that are withdrawn officially? I guess that would be a question for Richard.

MR. MATTHEWS: That's going to depend on what had already taken place previously. I mean, if the petition came in and it was withdrawn before we did a TAP, well, then obviously, it would go to the Board and then they would create whatever questions they have for the reviewers, and then it would go out for the TAP review.

MEMBER ELLOR: If it was reinstated or withdrawn? So, yes, I think the issue is here, petitions that have gone through the process, it looked like it wasn't going to go the way the petitioner wanted, so they were withdrawn. What happens with those now?

MR. MATTHEWS: Bob? Normally, when they're withdrawn there's nothing that happens with them. They're done.
CHAIRMAN DELGADO: But I think the concern is, do you destroy those documents or the record has disappeared or what's happened? Is that your question?

MEMBER ELLOR: Right, yes, they're still on the -- you know, the spreadsheet with a -- sort of an open -- go ahead.

MR. POOLER: This is Bob Pooler, NOP. If the petition is withdrawn, then that is the end of that petition. Then a new petition -- if the substance were to be brought up again, a new petition would have to be submitted. If the petition is going to be considered at a later time, then the petition is deferred until such time as the supplemental information is provided and taken up and put back on the work plan of the respective committee.

MEMBER ELLOR: Okay, and deferred is a decision we make and withdrawal is a decision the petitioner makes.

MR. POOLER: Well, yes, essentially, yes.
CHAIRMAN DELGADO: Any other questions?

Kevin?

MEMBER ENGELBERT: Did the committee give any thought to -- with your concern that the petitioners will not abuse the privilege of being able to withdraw a petition until more favorable or agreeable members in subsequent meetings? Did you give any thought to not accepting a resubmission unless there was new material presented with the petition so that it couldn't simply be held?

MEMBER KARREMAN: I think he means, basically that if they resubmit it, there has to be new data. We need to require that instead of pulling it and sending it back in three years later when there's different board members. Is that what you're saying, Kevin, just to make sure there's new data, you know, as we're asking for specify that. Okay?

CHAIRMAN DELGADO: Okay, that is a proposal presented by one of the members, good. Well-articulated. Mr. Chairman, would you like to
add something to that?

MEMBER FLANN: Well, I think that was discussed and I believe we felt that we could not limit somebody submitting a petition. I mean, essentially, we're treating it like it's a new petition and they could submit anything they wanted to, so we really couldn't control it. But we did discuss that several times. So maybe that's either a legal point or a procedural point that could be cleared up, whether we could require that. I think I'm right, Rigo, that we thought in final that we could not limit what somebody submitted. It was up to them and not up to us to determine that. Am I correct?

CHAIRMAN DELGADO: That is correct and there is also a good proposal. My recommendation would be for the committee to get together and discuss that specific item and see if you need to make any additions to your current recommendation. Okay?

MEMBER FLANN: And I think we probably would need some guidance on that point.
CHAIRMAN DELGADO: Will do. So it's up to the committee and we'll be able to discuss that. Any other question for policy? Jennifer, followed by Dan.

MEMBER HALL: My comments have to do with the resource list and I think it will be quite helpful to new members, and I would just like to encourage and solicit the aquaculture working group to compose a list of links that we could add to this, that would be pertinent to those topics.

CHAIRMAN DELGADO: Thank you. Dan.

MEMBER GIACOMINI: I'm concerned with in recommendation number 2, on the Policy and Procedure Manual, the expectation that you're potentially placing on Board members with the statement "making full use of communication channels". We're all volunteer Board members. We have certain things that we can get to and certain things that we can't. I can kind of see this as becoming an expectation that we're going to be expected to be on all the O sites.
If someone calls and says, "I've got a meeting 500 miles away, come and tell us what's going on at the NOSB", it just seems like there's a potential expectation/burden that is -- could be placed on from this wording that I'm a little concerned with. We're volunteers and we're putting in all the time, sometimes more time than we can afford now.

CHAIRMAN DELGADO: Response.

MEMBER KARREMAN: I think I can answer that, Dan. The intent of that was not that. The intent is that to make full use of the internet, snail mail, all kinds of communication that way such that farmers that are not on the internet will be apprised of information. Wasn't that what we were talking about?

CHAIRMAN DELGADO: I believe that was the intent. Correct me if I'm wrong, Mr. Chairman.

MEMBER FLANN: No, that is correct. We wanted to make sure that as we go more and more in the internet communication, that we did not forget
about people that were not so connected, that we provide information to them also and it was felt that we -- I guess we never thought about it the way you're describing as putting a burden on it. We just wanted to make sure we had a policy of getting information out to all the stakeholders and all the publics we deal with and they receive this information in a timely manner, that it's meaningful and what they were doing. And it's -- and I think we feel that that is a role, an important role of the Board is the communication with the public. And we just -- we're trying to strengthen that a little bit in the manual.

CHAIRMAN DELGADO: Any clarifications that you would like to submit then? Was that a clear explanation?

MEMBER GIACOMINI: It's a clear explanation of your intent. I just -- I'm not sure that that's -- you know, a year down the road when someone is reading that, I'm not sure that that's going to be the same as what their expectation is going to be from reading that
statement.

CHAIRMAN DELGADO: Okay, thank you.

Jeff.

VICE-CHAIR MOYER: Thank you, Mr. Chairman. Hu, I've got a question for you regarding that same topic because you do tend to work with a lot of non-internet connected folks in your practice. Are they made aware of these meetings? Do they know they exist? Do they know they can make public comment? Do they choose not to? I know we did see one letter that was scanned into the system but is that something that they know they can do currently, since everything is posted on regulations.gov, which is not within their purview?

MEMBER KARREMAN: Since you asked about my farmers, let's say, my clients that I work with, I would say that in my personal communication with them out in the barns, they know a meeting is about to happen or has happened. They want to know what's going on. I would say you know, we had our meeting in State College,
which is about as close to Lancaster County where
I'm from, as it will ever be. Well, Baltimore is
pretty close, too, and they weren't really there.
So I think that's not because there's not
communication of meetings coming up. I'm not so
sure that they have time to get away or they have
the absolute interest that others may. But I
think they should not be neglected as far as
communication channels. Does that help?

I mean, that was the intent basically.

VICE-CHAIR MOYER: Well, just I'm a
little concerned, you know, with Dan's comment and
thinking about like what Valerie might have to do.
You're going to have to put a notice in the mail
of all these things? I mean, how are you going to
-- we don't have their addresses.

MEMBER KARREMAN: Well, I think what we
were -- the discussion, if I remember right, was
mainly talking about the internet and the
hyperlinks and it was kind of -- and I said,
"Whoa, whoa, whoa, hold on, you know, my farmers
don't use that", and that's why we came up with a
more inclusive statement rather than just kind of quick internet, you know, expression of the news or hyperlinks.

CHAIRMAN DELGADO: Is that clear?

Kevin.

MEMBER ENGELBERT: Yes, if I understand this recommendation properly, the only changes that are made are the underlying words "timely", and "making full use of communication channels". The italicized that aren't underlined were already part of the recommendation. So there's no real huge change as far as what's required. It's just the emphasis on using all means to communicate.

VICE-CHAIR MOYER: That was the intent.

CHAIRMAN DELGADO: Good clarification.

Any other comments, questions? Very well. Well, thank you very much. That was a clear presentation, lively discussion. Appreciate that and we can move onto the next topic which involved the Materials Committee and I will yield to my colleague, Mr. Dan Giacomini.

MEMBER GIACOMINI: Thank you, Mr.
Chairman. The presentation from the Materials Committee, we do not have a voting action item under discussion today for this meeting but this portion of the meeting will be a tag-team between myself and some members of -- the co-chairs of the Materials Working Group and so within our time frame, we're trying to devote as much time toward the discussion of that document as possible.

As a result, I'm going to give a short presentation, hopefully short presentation on the materials, an update on the material status of things, but it's not as complete as I've given in the past and I will -- I could possibly go over some things fairly quickly that are even on the slides purely as an essence of time, not a matter of trying to get around any information.

But we've gotten back in the habit of doing this on a regular basis at meetings and you can go back to prior meetings and look at those presentation documents for a more full explanation of things.

So to move onto that, we'll have a
brief discussion of the National List of Allowed and Proved Substances Petitioned and Sunset Review Items, the material view process, national list criteria, sunset review criteria and some final notes. Next slide.

The National List of Allowed and Proved Substances is broken down into crops, livestock and handling, Section 601, synthetic -- for crops it's synthetic allowed, 602 is non-synthetics prohibited. For livestock, Section 603 is synthetics allowed, 604 non-synthetics prohibited. For handling Section 605 is non-agricultural, non-organic substances allowed. Section A is non-synthetics and Section B is synthetic materials. So all non-agricultural, non-organic in processing as opposed to livestock and crops must be on the National List.

606 for handling non-organically produced agricultural products allowed as ingredients in or on processed products labeled inorganic. The petitioned items and sunset review items for this meeting, status at the time of this
meeting, we have recommendations for 601 with three items as listed. 603 has two items as listed, one of those having two separate recommendations. We have no 605 item recommendations being considered at this meeting.

Section 606, we have, I believe it is 20 items being considered at this meeting. Sunset items at this meeting, we have tartaric acid being reviewed for sunset, for its listing both on 605A and 605B and we will be reaffirming -- voting to reaffirm or not the sunset recommendations from the fall 2000 meeting, so that we are following the proper governmental guidelines that we give -- in case there was any consideration, reconsideration due to additional public comment that was allowed in the timing from the posting of the Federal Register Notice on sunset.

At the time of this meeting, in the NOSB pipeline, that's our pipeline not the NOP's pipeline, we have the substances listed by the sections shown. And you'll see underneath 606 is asterisk next to yeast, that is a petition to
consider the transferring of yeast from 605 to 606.

And the material review process, it is a minimum time frame for the National Review Materials' review of 145 days being an absolutely minimum. That's not necessarily what happens, but that is the minimum. Under the material review process a minimum of 14 working days for the petition to be received by the NOP and reviewed for completeness and upon determination of completeness by the NOP, the petition is forwarded to the NOSB materials chair. That is the optimal situation if the petition is perfect at its original submission. This could take much longer as communication goes back and forth between the program and the petitioner. Once the material is passed on, the petition is passed onto the NOSB and the materials chair, the materials chair forwards the petition to chairman of the designated NOSB committee, crops, livestock or handling that would be handling and evaluating that petition substance. The petition is re-
evaluated for completeness, determination of requesting a TAP and that information is passed back to the program.

So that is the time frame at the beginning of the process. At the end of the process, 60 days prior to the NOSB meeting, the TAPs have been received by the program and sent back to the -- they're sent onto the NOSB. The TAP is reviewed. It's posted on the NOP website for review and public comment. Committee recommendations are posted and within 45 days prior to the meeting, public comment is accepted by the NOP and posted on the website. So we have a beginning time line and an end time line. Do not assume that those two time lines that we're talking about are necessarily touching. There could be -- there's constant work on the petitions, but it does take time and that's why we're talking a minimum of 145 days.

At the NOSB meeting, the committee recommendations are submitted. Further comments are accepted from the public and all public
comments are taken into consideration, and action is taken by the full Board regarding the committee recommendation. During the entire process, we need to remind everyone that all communication between petitioners and the NOSB should go through the National Organic Program.

CHAIRMAN DELGADO: Okay, just a reminder, and excuse me. Let's make sure we have our phones off and we do have someone paying for drinks tonight. We'll take care of recording the name later. Please continue.

MEMBER GIACOMINI: National List criteria, and for all general substances, petition -- the potential of such substance for detrimental chemical interactions with other materials using organic farming, the toxicity and mode of action of the substance and of its breakdown products. Number 3, probability of environmental contamination from use or misuse and the effect of the substance on human health, and number 5, the effect of the substance on biological and chemical interactions in the agro-eco system.
Number 6, alternatives used to using
the substance and the compatibility with a system
of sustainable agriculture. The one section that
I did cut severely from previous documents is
discussed in the processing age and age events,
since we had none of those being discussed on the
National List at this meeting, for the matter of
time, I deleted that section and please refer to
the Fall 2007 Meeting Materials Presentation for
reference.

For 606 which is agriculture and
potential commercial unavailability or potential
fragility of supply, NOSB will consider why the
substance should be permitted in the production or
handling of organic product. Current industry
information regarding availability and history of
unavailability of the organic form and the
appropriate form quality or quantity of the
substance. The industry information includes but
is not limited to region of production and the
number of suppliers and amount produced.

Current and historical supplies related
to weather is also considered. Trade related issues and any other issues that may be present -- that may present a challenge to consistent supply. The sunset review criteria taken from OFPA, no exemption or prohibition contained in the National List shall be valid unless the National Organics Standards Board has reviewed such exemption or prohibition as provided in this section within five years of such exemption or prohibition being adopted or reviewed by the Secretary has renewed -- and the Secretary has renewed each exemption or prohibition. So everything needs to be reviewed by five years, reasserted by the program, by the Board in order for relisting.

The sunset process is not used to petition a new item or substance of the National List and it is not used to change an existing annotation. Now, the sunset review criteria, the NOSB must solicit information and comments to re-evaluate substances against the same criteria used for National List posting. New evidence must be presented to overturn a prior Board's decision and
remove an item from the National List. Exemptions were accepted because the evidence allowed showed substances were found to be not harmful to human health or the environment. The substances were necessary because of the unavailability of synthetic alternatives and/or the substances were consistent and compatible with organic practices.

Final note, all public comments are currently handled through regulations.gov website, handled according to the appropriate Federal Register docket and governmental agency. The new process sets deadlines for having public comment posted prior to the meeting and all public comment received by the NOP will be made available and is made available to the NOSB members for review in advance of the respective vote whenever possible.

And finally, a listing of relevant websites for the National Organic Program, National Organic Standards Board and regulations.gov. Thank you, Mr. Chairman.

CHAIRMAN DELGADO: You're welcome. Any questions? Julie?
MEMBER WEISMAN: Hello?

CHAIRMAN DELGADO: It is working.

MEMBER WEISMAN: Okay. I just -- I am very reluctant to take any time away from the second part of the materials presentation this morning. However, in terms of 606 and in light of some issues that have been raised during the written public comment period and the spoken public comment period yesterday, I wanted to acknowledge two situations.

One, the slide that was up there had a little note at the bottom that no TAP reviews for 606 items. And while that is the case currently, there was public -- there -- it has come to light through very thoughtful public comment in the last few months that some of the items on -- that notation assumed that single agricultural products, raw or processed, were what were being petitioned and that was a common sense notation, that those should not be TAP reviews. It has been pointed out that a number of the color materials that were petitioned at the last meeting are
formulated products and do need to be looked at further. So I just want to say that I think that, that -- not that there will be whole TAP reviews but it is understood that those materials need to be looked at more carefully, not just assumed that it's all agricultural product in there.

CHAIRMAN DELGADO: Just as a clarification, so you'll be treating each case on a case-by-case basis?

MEMBER WEISMAN: Well, I don't even -- you know, I think that we haven't even really -- we haven't had a full and depth of discussion as a committee even, the Handling Committee or enough discussion with the program yet about how to respond, but I did want to acknowledge these very well thought out comments were made and that was not ignorant of them.

The second thing that has come up during comment is that you read a list of the evaluation criteria for 606 items, and I also wanted to point out that more than one comment has been made in recent weeks about which of -- we put
a lot of work recently into the evaluation criteria that are specific to 606 in terms of evaluating the supply and the fragility of the supply. But there are other criteria, evaluation criteria, that do apply to 606 items just like 605 A and B items not the same ones, and many of them are not applicable and it may -- we will also need to look and make that more consistent and have it be very clear which ones are -- very clear, you know, like question by question by question and that that is also something that we are not -- we're not ignoring.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: The development of the TAP process has evolved a bit. It's a fairly new development that I don't have a full grasp of but there was discussion at the program level with other branches of the government or other offices, I guess is the more proper term, regarding the TAP status of the 606 items that we did pass.

The absolute -- as I understand -- do you want me to deal with this, Barbara, or do you
want to try and attack this?

CHAIRMAN DELGADO: Barbara, can you clarify it, please?

MS. ROBINSON: The Board is the -- you are a technical advisory panel. You can do that TAPs on 606.

CHAIRMAN DELGADO: Dan, do you have -- was that clear enough? Do you want to comment some more?

MEMBER GIACOMINI: No, I mean, that's the status from the program and you know, there -- I think it's going to be an evolving situation. We'll just see how it goes, what does need to be further outside review.

CHAIRMAN DELGADO: And why way of clarification, we've discussed this at the Executive Committee level and we are in the process of redefining when to deal with the specific TAP, whether we need to farm it out to third parties or use our own resources within the program, because as pointed out, we have our in-house expertise and we can always tap into that.
Yes, Julie.

MEMBER WEISMAN: Well, also I wanted to introduce the language that -- of a technical review is a word that we've been using which is a bigger concept than just a TAP which is a very specific thing that we normally and historically have associated with outside contractors. Is that a fair distinction?

MS. ROBINSON: What's your question, Julie?

MEMBER WEISMAN: The technical review, as we have been discussing it lately as distinct from what we have historically farmed out to subcontractors which were always called TAPs.

MS. ROBINSON: Correct.

MEMBER WEISMAN: Okay.

CHAIRMAN DELGADO: And also the Policy Committee has part of their work plan to help out and develop the procedures as to -- to identify when to use those different resources, outside or inside resources. Any other questions? First of all, have you concluded? Okay, do you wish to
proceed with some other item?

MEMBER GIACOMINI: Yes. The next item under the material section for this morning is a presentation from the Materials Working Group. I believe Kim and Gwendolyn are going to offer up that presentation, if they would come up, please.

MS. DIETZ: Good morning. We practiced but we didn't figure out who was going to stand or sit. We're going to dance, too. Okay, good morning. My name is Kim Dietz and most of you know me but for the new member, I'm a past NOSB member, five years. I chaired the Materials Handling Group and was a Handler Representative. So at the last meeting, I kindly volunteered to handle something called -- or to form something called the Materials Working Group. And Gwendolyn and I co-chair that group.

I just want to read to you the summary. And you've all received a copy of our paper. On the last page, "The members of the Materials Working Group represent a broad spectrum of backgrounds and segments of the industry. All of
us have strong opinions about the subject with extensive implications for the meaning of an organic label and its potential for application to all aspects of food and agriculture, including a host of other consumer goods that were not considered with OFPA was drafted.

We recognize that it would not be easy to resolve many issues surrounding the definition of non-agricultural substances and its impacts on what products may or may not eventually be able to be organically produced." There's 22 individuals on this working group. Most of us have been in the industry for a very long time and to say the least, our conversations were heated many times, but I think we're working very good and functioning very well together.

I'd just like to take a moment to tell you that the group is independent. We're not an affiliation of a task force of the NOSB. We're not an organic trade association working group. We are individuals and the purpose of that was so that everybody could be welcome and we encourage
everybody to participate. So anybody out there who wants to join our group, please come see Gwendolyn and I at some point.

The other thing, I'd like to thank OTA because they did offer us to use their conference line weekly. Twenty-two people on a weekly basis was very expensive, I'm sure. So thank you, OTA. And they also volunteered Grace because she needs time to draft the documents. We couldn't have done it without Grace, so Grace, thank you as well.

With that, I'm going to just turn it over to Gwendolyn. We're going to kind of tag-team this a little bit. We want to get right into the meat of it because there was a lot of questions about the working group and the different alternatives, so Gwendolyn.

MS. WYARD: Okay, quite the topic for this early morning. Valerie, I'll just give you the key there when to turn over. I want to jump right into the definition of non-agricultural. This is the little bugger that's put us into this
fine mess. The definition is ambiguous. The first part of the definition, it has a couple examples. Mineral, minerals have gone largely uncontested. Bacterial cultures, on the other hand, that's really been the stumbling block for three plus years now. We haven't really moved the discussion forward.

The very important discussion that we've been having but it's been whether yeast and other micro-organisms that are cultured on organic substrate can be considered agricultural. That's really where the focus of the discussion has been. The second half of this definition is even more complicated. The idea expressed is that a fraction of an agricultural product can be non-agricultural if the agricultural identity is no longer recognizable. But how do we quantify or qualify words like "identity" or "unrecognizable"? Is it how it looks, how it tastes, how it smells? Is it DNA analysis? Is it memory? How do we recognize something? And if a picture tells 1,000 words, up in the left-hand, top left-hand corner
that's a quar plant and on the top right-hand corner is a pile of white powder. I can't tell what agricultural product that pile of white powder came from but it is in fact, quar gum. And gums are provided as an example as a non-agricultural product. However, quar gum is listed on 606 as an agricultural product.

Xanthan gum, however, is listed as a non-agricultural synthetic in 605. That's an orange down in the left-hand corner and you can't see it, but that's a little bowl of kind of an oily yellow substance. That's essential oil. I can't tell that it came from an orange, but I know that it came from an orange and natural flavors are listed on 605 as a non-agricultural product.

Essential oils meet the FDA definition of a natural flavor, readily available in organic form, but certifiers do not require people to use organic essential oil because they're listed on 605 as non-agricultural.

So the current fine mess, as I put it, derives from the presumption that a substance
categorized as a non-agricultural substance product, cannot be organically produced since Section 205-102 requires that only an agricultural product can be labeled as organic. However, substances listed as non-agricultural are available in organic form because they're either derived from an agricultural product which fits the definition of non-agricultural, or and this is very important, they're manufactured using at least 95 percent agricultural material by weight or volume at formulation.

So one or more of their components, 95 percent are agricultural. The whole kit and caboodle is not agricultural but it can be organic as long as the rest of the five percent complies with the composition requirements. So examples that we have are natural flavors, yeast, glycerine, that was the case with colors when they were on 605. So the status of a substance becomes hot to touch, because it determines its placement on the national list, its legibility for certification and whether it's subject to
commercial availability.

Another central and complicating factor in this discussion is that some of the substances listed on 605 and 606 such as kelp, yeast, bacteria, are permitted as non-synthetic additives and supplements in livestock feed. If they're classified as agricultural, processors can use them when they're commercially available in organic form, while livestock producers must use organic if they're agricultural, regardless of their availability in the right quantity, quality or form. So the composition requirements are different between processed products for humans versus the livestock composition requirement. It creates an inequity if you have processors allowed for commercial availability but livestock producers would have to use the organic form.

So that's the problem in a nutshell. This is the problem that this group tried to tackle and Kim's going to provide you with additional background on where we've come from. So next slide, please, thank you. And I forgot to
do that next slide, but I already said all that, so good morning, all right.

MS. DIETZ: Okay, very quickly, the background for this. The Materials Working Group, when we first started this, we took about a month to put together a binder, and Gwendolyn has a copy of that binder right there. It's a huge binder, but we felt was important that we had all the historical background on all of the issues regarding ag and non-ag. So we went back and gathered definitions. We went back and took past recommendations from the Board.

So we really wanted to make sure everybody started with the same foundation. Then we took and became what brought forward to you this paper. So just from a background from an NOSB perspective, in July 2005, there was some guidance on the definition of agricultural based on taxonomy. At that time, yeast was classified as a non-agricultural and not having any fruiting bodies. So this issue even goes back before that because I think Gwendolyn even through organ till
had brought up a discussion paper in 2003 or 2004.
So this is an ongoing issue.

In September 2006, public comment
demonstrated that yeast fit under livestock and
the recommendation at that time recognized yeast
to be agricultural. In October 2007, we had the
new paradigm, continuum approach and public
comment denoted that the past NOSB work was not
incorporated, so thus, we have the Materials
Working Group to help you so that you can fold in
all aspects. We know that we need to have a new
paradigm, but we also don't want to lose sight of
the past work that the Board has done.

And another one of the issues we have
is that this seemed to be focused around yeast,
when it's really not -- it is the problem but the
bigger problem is just the definition of
agricultural and non-agricultural. Next slide,
please.

Okay, from -- when we started this
project, we actually took that last paradigm
recommendation and we wanted to globally look at
synthetic, non-synthetic, ag, non-ag and a lot of the other issues that needed to be resolved.

However, in the sake of time and focus, Dan and I and the group said let's just work on ag and non-ag right now.

So what we did is we focused the group, we tried to develop a definition of agricultural that would enable everything else to be non-agricultural. So in the book or in the packet that you have, there's a great appendices of the different definitions of agricultural and Rich Stewart did a great job of putting that together for us.

Some of the discussion on if or how to eliminate the need to distinguish between agricultural and non-agricultural, and those are the options that Gwendolyn is going to go through in just a minute with you. We did have a lot of disagreement on whether an agricultural product must be produced on a soil-based farm which is also going on in some other discussions in other areas as well. And we also had ongoing
disagreement about whether all life is agricultural if managed by persons for human or livestock consumptions.

There's also included in our paper a list of questions that need further clarification and a lot of this discussion is -- will be vetted out in those questions and the group is committed to taking this the whole way and any other issues that you want us to help you vet out as well.

So our next slide is options to consider and we've put a chart together to help go through all of these different options. We don't have B plus or triple D or option F or organ tills on there. We stopped at a point which we knew you needed a recommendation or a paper to talk about but we will take everything that's based out of this meeting and take it back to the group and come forward again with probably just a couple options so that we don't have so many to consider.

MS. WYARD: Could you go back to A? There we go. Okay, I'm going to run through A, B, C, D, E and F, try to give you just the focus on
how it would effect commercial availability, the
definition of non-agricultural micro-organisms and
then the effect on livestock so that we can kind
of compare and contrast and get you comfortable
with what these options represent. But first, I
really want to drive home that these are ideas
that were discussed by the group as possible
scenarios. They're avenues to be explored.
They're not recommended actions. They're not
comprehensive and they're in no order of
preference, so there's the disclaimer. And also,
you know, additional analysis is needed in a huge
way on the potential impact of each of these on
the industry.

So this is really just to get
everybody's juices flowing, start looking at some
different solutions, possible solutions, some
working within the box, some outside the box. So
A is status quo. This is the current situation
that we're in. You know, it's been going on for
three plus years now. Most people don't really
find the current situation, the current definition
of non-agricultural to be acceptable. As we worked through all the various options and worked through our discussion, I think there were some people that said, "Actually status quo is not so bad, let's figure out a way to work this out through guidance documents, other discussion. Let's just keep it as it is," but, you know, we're in a situation where the materials that are on 605 and 606 don't represent definitions. They don't represent what's available out there in organic form. So I think that most people agree that there is going to need to be some regulation change. We don't want to touch OFPA but we think that there's going to need to be some regulation change.

So with Option B, Option B drops non-agricultural from the regulation all together. Okay, it removes the definition and it also removes the word "non-agricultural" from the heading of 605. Commercial availability would apply to all items listed on 605 and 606. Microorganisms would be retained on 605 unless they're
viewed as clearly agricultural. We still are retaining the word, "agricultural" in 606 but removing non-agricultural from 605. So basically, it leaves everything listed on 605 as ambiguous. We're not identifying it as being either agricultural or non-agricultural.

The -- so it still leaves us needing to determine what is clearly agricultural, which is a potential problem, and it also is a potential problem is if you don't clearly identify something as agricultural, if it was on 605, could it be organic, since 205-102 requires agricultural products to be organic. And then as far as how it affects livestock, it depends on you know, whether the substance in question is listed on 605 or 606, so that one wasn't really clear.

In C, the definition of non-agricultural is retained, but it's changed to drop bacterial culture. So mineral would be included. The whole second half of the definition, the problematic one that talks about isolated extracted, that whole part is lopped off.
Bacterial culture is dropped, mineral is retained as the only example.

So commercial availability, no change. It applies to 606 listings, and then microorganisms would be petitioned for listing on 606, because bacterial culture, the idea here, bacterial culture would be dropped, so they would be able to be petitioned to 606. And then, in that case, it would require organic yeast to be used in feed, and I put that asterisk there because there's some question as to the interpretation of whether or not supplements need, in livestock, need to be organic.

There's clarification on the NOP Q&A website that supplements do not need to be organic, but there's also clarification that any agricultural component of the feed needs to be organic. So an example is a lick bucket. The lick bucket, the mineral part of it wouldn't need to be organic, but the molasses in there would need to be organic. So, if you're requiring the agricultural carrier in a supplement or a mineral
to be organic, one would presume that, if you classify the supplement itself as agricultural, that would also need to be organic. But there is some question about that interpretation. So, and if there was a clarification that supplements are just either synthetic or non-synthetic, than this whole question of livestock supplements, agricultural yeast needing to be used, would go away.

Okay, next slide. Option D, Option D changes the definition of non-agricultural. It retains mineral and bacterial cultural. It applies -- commercial availability, then, would apply to 606, but not to 605. And the definition would be a substance that's not a product of agriculture, such as a mineral, or a bacterial culture. Micro-organisms would stay on 605, as per the guidance on the agricultural definition. So this Option D adopts the NOSB guidance on the definition of agricultural. This is guidance only. It's not a change to the OFPA definition on an agricultural product. It's just guidance that
talks about agricultural products being something
that are managed by humans, and then it goes on to
describe the types of organisms.

It breaks out, it looks at what
organisms photosynthesize, which ones have
fructifying bodies. So this is the guidance that
basiclly draws a line between fructifying bodies and
non-fructifying bodies, and it separates out, it
basiclly draws the line as yeast as being non-
agricultural, because they don't have fructifying
bodies.

Micro-organisms, and then the effect on
livestock; there would be no effect if they're
viewed as non-agricultural, and listed on 605.
So 605 items, they could be used in products that
are going to be organic, but items listed on 605
wouldn't have to be sourced in organic form.

E adds a definition of an agricultural
system. It adds a definition of an agricultural
system, and it adds a definition for a non-
agricultural system. The idea here is that, in
considering public policy, and the intention of
Congress, it becomes necessary to further define the systems of agriculture that express the principles of organic farming. So for this reason, a definition of agricultural systems would be added, and this change would effectively remove the issue of what is agricultural, and it would focus on which products could be produced by an organic system.

The definition of an agricultural system would then determine the environments where organic integrity could be established, and further, this definition prevents the unrelenting expansion of organic into systems in which the regulation has not provided standards for. This option that is presented, the definition, in this one, is that it's a land-based system that cultivates soil-producing crops, livestock or poultry. So this option would only remove the issue of what is agricultural if everyone would agree that an agricultural system is a land-based system that cultivates soil producing crops, livestock, or poultry.
Micro-organisms, in this case, would remain on 605 unless they're raised in an agricultural system, and non-organic micro-organisms would be allowed in feed, again, unless they're from an agricultural system. In F, we are merging 605 and 606. We're removing commercial availability from the regulation entirely, gone. It's either organic, or it's on the list.

Micro-organisms would be allowed as non-organic. They could be petitioned for removal specific to -- they could be petitioned for removal specific to available -- if they're available as organic, and then micro-organisms would remain on 605, 606, allowed as non-organic, removed, and if they were removed, the impact is not entirely clear.

So the idea here is that we're living in a world where, you know, our economy is based on supply and demand, and commercial availability doesn't work. So if you're using, either an organic ingredient, or something that's on the National List, and if the item on the National
List becomes available, then you petition to remove it, and we improve the system and the process for removing items from the National List once they become available in organic form.

So that's an overview of the options, and I want to -- as far as, at the end, with questions about these options, we want to invite members of our group up to address the various questions, because, you know, we all collectively had a hand in creating these different options, and certain individuals are going to be able to explain them much better than I can. So once we get to that point, all of you Material Working Group people out there, be ready, we might bring you on up here.

MS. DIETZ: Next slide. So in summary, you can see this is a very confusing issue. Clarification is crucial, and the list needs to be cleaned up accordingly. And that, as you can see by all the different options, and definitions and list requirements should encourage the development of organic food ingredients and feed. Changes to
the regulation should be minimized, and resolution
must be consistent with OFPA.

And this is for you folks; the NOSB
needs to address the discussion questions, and
further explore the impacts of the options
presented, and explore additional options, and we
certainly are there to help you with that, but our
vision, I guess, is that we take the fact, we
summarize even more so a couple of options, and
work closely with the NOSB to help guide us on
what you need from us next. And we're certainly
willing to do that.

So with that, the discussion questions,
and I know, just based for time, you get Nancy.
Dan?

CHAIRMAN DELGADO: Any questions? Dan?
MEMBER GIACOMINI: Yes. I, fortunately
or unfortunately, I'd like you to touch on one of
the sections of the document that you didn't
discuss that's outside of the options. One of the
debates that we had at the last meeting was the
concept of agricultural synthetic. I know, as a
member of the committee, and from reading the document, it looks like a product can lose its agricultural nature, and that an agricultural product can become a synthetic, according to this data, where it fits in our definitions.

Would -- could you, like, discuss that, and would you say whether -- is that a -- sort of the mind of the majority of the people, members on the committee, after that document was prepared?

MS. DIETZ: Would you just go to the next slide, because that is one of the questions that we do need to clarify. So if you look down on the third one, Can agricultural product also be synthetic, if so, can it also be certified organic? So yes, we did discuss that in length. I don't -- unless there's somebody else here, I don't think we actually came up with a definite answer. This was a question that we do need to answer to move forward, and I can't say whether or not we had a majority that felt that it could or couldn't. By the time we got to these questions, we were on some of the last calls. So I would say
that we'll take that back, and we will answer
these questions, as well, and hopefully, that's
good enough. Go ahead.

MS. WYARD: I don't have an answer, but
I just want to point to a little bit more of our
discussion, and also to a committee working draft,
an NOSB committee working draft document that
you'll receive in your notebook. And it goes back
to, it's the processing, handling and labeling
committee working draft from 1993 on the
organization, the setup of the National List, why
things were placed where they were placed, and the
thinking behind agricultural, non-agricultural,
synthetic, and non-synthetic.

And one of the ideas in that document,
which I just misplaced underneath of everything -
that was clever of me. Here we go. This is
verbatim from that document. It says, the term
synthetic should not include the effects of normal
food processing activities. In other words, the
term synthetic should not be applied to an
otherwise non-synthetic substance that's
formulated or manufactured by processing, as processing is defined in the Act. In this respect, there's no such thing as a synthetic -- wait, that stopped.

Okay, now I go on and say, "in this respect, taking that into consideration, there would be no such thing as a synthetic agricultural product, but a processed agricultural product. So, we have to keep in mind that, you know, that second part of the definition of non-agricultural is very, very important. If you decide to remove that second part, you're basically -- unless you provide guidance elsewhere, you're saying something starts out as agricultural, it's never going to lose its agricultural status. That second part is the part that you would want to point to and, you know, maybe work on further defining words like recognizable and identity. Can the agricultural ever be processed out of the agriculture?

And with the definition of processing that we have, lopping, chopping, mechanical, I
mean, it goes on and on and on, and ends up with saying, and otherwise manufacturing, we don't put any restrictions on processing. Some practices, yes, but generally speaking, you know, you can process the beegeegees out of something, and call it organic. So we have to be really careful if you -- you know, if you say something is synthetic, and it's organic. So, and I've always said, it's a processed agricultural product, versus a synthetic, because you have chemical changes.

If you look at the definition of synthetic, chemical changes occur, whether you're talking about the Maylard reaction, you know, cleaving of your -- if you're taking triglyceride, and, you know, breaking your fatty acids from your glycerine backbone, chemical change happens. It's my new bumper sticker. So I mean, that's just some food for thought in all of that.

CHAIRMAN DELGADO: All right, thank you. Any questions? We have the Secretary, followed by the Vice Chair.
SECRETARY HEINZE: I do not have a question, but I do have a thank you. Having participated on most of your calls, the amount of work contributed by everyone on the Material Working Group is astounding. I mean, you met for months every week. Everyone brought everything to those calls, and you had hefty debate. So it is greatly appreciated, and we're looking forward to partnering with you as we, hopefully, wrap this up sooner rather than later. So thank you.

MS. DIETZ: You're welcome.

CHAIRMAN DELGADO: Jeff.

VICE-CHAIR MOYER: I do have a question, Kim, but before I give you the question, I'd like to second what Katrina said. Having not been on any of these calls, but knowing the vast amount of work that these calls take, I also appreciate, along with the rest of the board, all the work you've done. But my question is really, I guess, for Gwen. Yesterday, you talked about the Tilth option, which was sort of a D plus, and somebody, I think it was Emily, talked about a B
plus version. How do those things change what you have in this summary chart, or what other things are in there that we might consider looking at?

MS. DIETZ: And we'll actually take those options back, as well, and add them on, and delete some off on these options, so that it's clear as a group recommendation, because we didn't look at the Tilth option, or the D plus, or the B as a group, so just out of process, we'll take that back, as well.

MS. WYARD: Okay, Valerie, can you go to the next slide for Option D? As far as addressing Emily's B plus, I would call Emily up here to cover that one. So Option Tilth is a variation of D. And the major changes is that we -- Option D adopts the 2005 clarification on the definition of agricultural, and that it goes on to split hairs, in my opinion, between the -- you know, basically looks at the taxonomy, and says, you know, this one photosynthesizes, and has fruiting bodies, therefore, it's agricultural, and this one does not, therefore, it's non-
agricultural. So we did not accept that entire
guidance on the definition of agricultural.

    The part that we did adopt, and again,
this was guidance, and I think there might have
been a misunderstanding yesterday. We're not
suggesting a change to the definition of
agricultural product at all. We're simply
adopting guidance that would further explain that
agricultural product, raw or processed, intended
for human or livestock consumption, there's the
OFPA definition. We're saying, further guidance
would say that agricultural products are those
that are managed by humans, and managed by humans
is the intentional act of gathering, producing,
raising, growing domestically in designated wild
harvest areas by persons for human or livestock
consumption. So that's the first changes that we
have lopped off part of that guidance.

    We've also changed the definition of
non-agricultural in Option Tilth, and that
definition was a substance that's not raised in or
derived from an agricultural system, such as a
mineral, or an atmospheric gas, and then we've
gone on, and we've said, for the purposes of this
part, an non-agricultural ingredient is also
anything technically impossible to be organically
produced. That's the same definition that Emily
has in B plus, but in Option D, we're still
retaining -- we're removing the word non-
agricultural from the 605 heading, so 605 become
just non-organic ingredients; 606 are agricultural
products.

We have a definition for non-
agricultural. 605 is for ingredients, substances
that cannot be organic. So in that list, you
would have minerals, atmospheric gas, things that
would be clearly non-agricultural. You also may
have items that are not agricultural, but perhaps
they could be organic, so citric acid. Because
currently, now in time, it's not technically
possible to have organic citric acid. People are
working on it, but it requires the use of
materials that aren't on the National List. So
that would be an example of something that
technically can't be -- you know, be produced in organic form, now in time, but that could change. So then citric acid would go over to 606 once it becomes available in organic form.

Option B plus just applies commercial availability to both 605 and 606. And Emily, did you want to -- Emily?

CHAIRMAN DELGADO: Before we -- Katrina, you had a question for Gwen.

SECRETARY HEINZE: I have a question about Option Tilth.

MS. WYARD: Okay.

SECRETARY HEINZE: So, if I understood what you just described correctly, would that mean that some of the items that we've recently put on 606 might better be on the --

MS. WYARD: 605?

SECRETARY HEINZE: -- the reclarified 605, so, for example, like, I'd have to think through some of the materials, but maybe something that couldn't be processed, and I'm going to make this up, so this may be factually incorrect, but
I'm hypothetical here, maybe like the soy protein concentrate, right, that starts as an agricultural, goes through some processing, cannot today be certified organic, but one could imagine in the future that it might be.

MS. WYARD: That's not --

SECRETARY HEINZE: Under Option Tilth, might that better exist under 605?

MS. WYARD: Yes, that's the idea, and it's an interesting discussion, because there are some people that feel that 606 items, they're -- they're just agricultural. Whether or not they can, you know, maybe they're not available at all, because they can't be. For example, fish oil. The standards aren't there.

SECRETARY HEINZE: Right.

MS. WYARD: Or they're available, but not in the quantity, quality or form. So there are some people that, it's an agricultural product, it goes on 606, period. But there's another school of thought that you can't put -- that anything that's on 606, it should be able to
be available in organic form. It should be able
to make or source it in organic form.

If you're requiring operators to source
it, well, there are no standards for it. If it's
not out there as organic, it shouldn't be on
there. So those are some --

SECRETARY HEINZE: But certainly some
of the recent comments we've had about, maybe
there's some processing aids, for lack of a better
word, that are used to make some of those 606
items, those might better belong on 605. It's an
interesting option.

MS. WYARD: Yes, that's what we were
getting at. So, fish oil, for example, would be
on --

SECRETARY HEINZE: That's lots to
debate.

MS. WYARD: Yes, yes.

CHAIRMAN DELGADO: We appear to have
two more questions, and I'd just remind you of the
time. It's 9:25 at the moment, and please be
brief. We'll start with --
MALE PARTICIPANT: I can wait till after.

CHAIRMAN DELGADO: Very good. Hu?

MEMBER KARREMAN: I was just wondering if it's possible to hear from Brian Baker from OMRI, because they review a lot of materials. Do you have any input?

CHAIRMAN DELGADO: Can we have a specific question, Hu?

MEMBER KARREMAN: Well, which option would you go for? If you want to hold off on --

CHAIRMAN DELGADO: Brian, excuse me. Brian, I think we can skip on that. This is a discussion item, and we would need a precise question to address that. So I apologize for that, and I would like to go for that. I'm sorry, we're moving forward with --

MEMBER KARREMAN: I did ask the question, actually.

CHAIRMAN DELGADO: Let's go ahead, please.

MR. BAKER: The answer is real short.
OMRI sent it to the Advisory Council; we're discussing it. We're not -- we are open to all the options, and even those that are not put forward today.

CHAIRMAN DELGADO: Great, appreciate that shortness. Okay, we'll proceed with --

MS. BROWN-ROSEN: So you wanted me to say what was different about B plus compared to the--

CHAIRMAN DELGADO: Yes.

MS. BROWN-ROSEN: It's very similar, it's very similar. The only difference really is that commercial availability applies to 605 -- did I lose you? You're scrolling up on the chart, okay -- on B, so basically, it's the same as B, you drop the title non-agricultural. So 605 is non-organic substances. We apply commercial availability to 605 and 606. So to me, what that does, I mean, it does all the benefits of what Gwendolyn was trying to promote there, same definition, but you don't have this crisis of, does it belong in 605 or 606. It's not as hard a
decision for the Board in the sense that, you know, wherever it is, if there's organic sources available, it has to be used.

And the fact that it's not clearly identified as agricultural, non-agricultural in 605, I don't think that's a big problem. Mr. Siegel thinks it's a problem, because he thinks that use must be identified as agricultural in order for it to be sold as organic, but with the proposed definition, I think it works. I mean, you have -- if it can be made organically, technically possible, then actually we would be considering it agricultural.

So, I mean, you know, not everything in the world is on 606, and yet we certify all these things. So, I think it's got flexibility. We probably need lawyers to look at this, but I just think it makes the decision making easier, and it -- we also did do these decision trees, which we can revise to show these new options. I would encourage you to go back to look at those. I think it will become much easier to work through
those once we've cleaned up this type of
definition.

CHAIRMAN DELGADO: Thank you. Follow-
up question. Yes, Joe?

MEMBER SMILLIE: It's a general
question to the group, and I'm sure you guys
thought of this, but did anybody consider --
because again, organic is like, considered a soil
base, but yet, you can do things organically for
some of these things that are not considered
agriculture.

Did anybody consider going beyond 607,
and creating a 608 for non-soil based, possibly
organically certified or grown products, such as
the infamous yeast, and many others?

MS. GERSHUNY: Well, we didn't discuss
that specifically, although Gwendolyn did make it
clear, I think in her, you know, not technically
possible discussion that some things, we might
say, are not technically possible, because we
don't know how they make bacteria or, you know,
what all the ingredients are. There might need to
be standards developed, you know, we might decide, or you might decide this is, actually, something we want to support or not, so I mean, that's where you could put new standards. You know, you could develop other sections, or in the body of the processing rule, too, if it was felt to be within the scope.

I mean, you know, we have seen a huge expansion of scope in, you know, cosmetics, shampoo, you know, all this stuff. So, I mean, if we had standards, and if there was agreement, that would be technically possible.

CHAIRMAN DELGADO: Okay, any other questions? I just want to say that also I'm really grateful for your participation to the group, Kim, Gwen, the OTA as well. This is a fantastic example of how the public can come in and provide constructive, synthesized input, and we're looking forward to the summary of the three solutions so we can review those. Thank you. Any other comments on your part, Mr. Chair?

MEMBER GIACOMINI: Materials is
Okay, we move onto the next topic, and that involves the Compliance, Accreditation and Certification Committee, and Mr. Smillie?

MEMBER SMILLIE: Well, in that vein, again, the public input to NOSB is the fuel on which we run. I mean, basically, we can sit as a group, and come up with our discussion papers and recommendations, but it's the input, that's the purpose of this meeting, and in that vein, that's where we are in the Certification, Accreditation and Compliance Committee's discussion paper.

And I just make sure everybody realizes, it's a discussion paper, not a recommendation yet, because we are seeking to build a public record on this very important and complex issue. We want to hear all the voices, and even though we really want to get to a place to make a recommendation, we don't want to rush. We want to make sure that all the voices that are out there are heard, and given time, because it is...
a global issue. I think it's one of the things that really affects the global organic agriculture, not just the U.S.

So we want to hear that, and basically, where we are at in the process is we are really getting fabulous input. We believe that the first discussion paper was presented. The overwhelming response that we heard was that we want more detail. We want to hear more -- you know, we don't understand some of the terms used. We don't understand some of the concepts, such as a single OSP, and an internal control system, and we want more detail on that.

So the committee, especially the lead author, Tracy, who will take over this presentation in a second, basically went back and provided our second discussion paper, which is part of -- it's Part 2 of the overall approach, and basically, we had a very robust discussion within our Certification Committee, which consists of six people. I won't go through it all, but it's listed, and we said, you know, there's also
a lot of discussion on a lot of these issues, and
what we want to do is go back, and be really
specific about which questions we want the
community, you know, the global community to
answer. So we created a list of questions that's
part of this document that we are seeking feedback
on.

So we are, once again, looking for the
public to give back to us direction, and we want
to continue that dialogue. So now I think I'll
let Tracy take over. Tracy is the principal
author, and has done enormous amounts of work, and
looking into globally, again, all of the people
who have -- whether it's ISO documents, or, you
know, years of work that IFPO has done on this
issue, and what she'll do now is present this
document once again, and we are seeking input on
it.

MEMBER MIEDEMA: Thank you very much,
Joe. Mr. Chair, my colleagues on the Board, and
members of the audience, I wanted to first start
out by thanking the people here who have submitted
comments, both written, and have come up to the
podium to present their comments. There was a lot
of commentary unrelated to the specific content of
the guidance document, and I wanted to address
that first. The guidance document itself is quite
lengthy. It's highly detailed. We really tried
to get into the nuts and bolts of how these
internal control systems work.

There's a lot of question marks around
whether or not adequate organic certification can
be achieved through some sort of sampling
protocol. And that's what this document gets
into, and I want to take time here, with my
colleagues on the Board, to walk you through that,
but it's important, first, that I acknowledge some
very strong opinions that are coming to us over
these couple days, and I expect to continue to
flow in.

First of all, I want to thank the OTA
task force. I've been participating with that
group as a non-voting member for about a year now,
and Grace Gershuny, Kim Dietz, and Tom Hutcheson
are really leading up that effort, and I expect they'll be submitting their comments tomorrow, and the work that this task force is doing.

And I'll tell you, you know, I've really been working lock step with them. They've been willing to take our questions from the committee, and draw on the strength of 20 people to flesh out those questions. Something -- you know, for instance, how do we address conflict of interest in an internal control system. And so you'll see some strong similarities between what appears here in the discussion documents, and, for instance, the OTA task force.

Many others, you know, like I said, about 20 people on that group. I wanted to thank Jim Riddle for his comments. You know, there is a characterization that this idea of looking at this issue as a multi-site certification is somehow a justification -- I think you said, a justification for one certifier's insistence on retailer certification. And you know, Jim, it's just -- that's just not the truth. That's just
not where this is coming from. You know, what was put on trial in October, 2006 with the appeal decision, was whether an internal control system, you know, could serve as some sort of proxy for inspection. And it turned out, when that appeal decision came down, that there were stakeholders affected throughout the industry.

And, you know, grower groups, it turns out they were on shaky legal ground. It turned out retailers that were using this construct were on shaky ground, and out of basic fairness, these multiple stakeholder groups need -- you know, need to be looked at. So, you know, there's just no hidden agenda. And I want to dispel that right up front.

I want to thank the work of the National Organic Coalition. Leanne, Joe Mendelson, Lynn Cody, I have felt like your following of this issue has been very thoughtful, very regulatory based, and I just know that we're reading those comments very closely.

Harriet, you continue to stay really
locked into this discussion, and I have followed your comments even before this came up. As a committee, you had given a comment. You were, I think, the very first person to comment, and I did want to respond to one thing you said about the high turnover rate among retailers, and that somehow being a barrier that's unique, and could pose problems for a sampling protocol, or an internal control system. And just, you know, somebody who works at a farm, and sees seasonal labor, and an organic farm, a certified organic farm, I see an awful lot of turnover every year with seasonal employees coming through, so I don't know if there's data to support that, but if you have it, I'd be happy to take a look at it.

CCOF, and Peggy Miars, again, a group that's been really engaged in this, and generally speaking, is not amenable to grower groups. I think yesterday, you characterized CCOF's position as wanting to phase out the concept of grower groups. Sam Welch, my takeaway is that you're of a similar mind, that they're just -- it would be
better if there was always direct independent third party inspection of the smallest divisible unit, which -- well, you're shaking your head, so I want to make sure I don't mischaracterize your position there, and I'll let you speak for yourself later.

I found, of course, an extremely important stakeholder in this discussion. They represent more of these grower groups than any other organization around the world. They have been the leaders, bar none, in the development of internal control systems, and really, you know, people getting together, clustering together under very rigorous criteria, and bringing organic to the marketplace.

Some others that have also weighed in, Pennsylvania Certified Organic, yesterday, I wanted to respond to one comment, which was, you know, the idea of the 36-month phase-in, and really, that was to allow folks to comply with the clustering of production -- of members, and of production units. The status quo can't go on.
You know, there are some problems out there in the way grower groups are run, and I'm going to get into that in a second.

But, you know, it's also, we don't want to yank the rug out from people. We've seen that. It happened. There was a big uproar. We're not going to take that strategy. So that's simply to allow a smooth assimilation of new standards, or new guidance. Accredited Certifiers Association, I know you're staying really close to this issue, and have very strong opinions about who should have access to an internal control system as a means of organic certification.

Lastly, Marty Mesh, I will be very disappointed if I don't get to hear a comment from you. You and I have had lots of very interesting conversations, so I look forward to continuing that. All right, well, so getting into the document itself, the idea of disadvantaged small holders having -- being the only ones to be able to get together as a group and get certified, flies in the face of rigorous organic standards.
I absolutely believe we should be promoting people around the world who are disadvantaged, and/or small holders being grower groups, but not because they're small or disadvantaged, but because they're organic. And if others can use that same construct, and still be organic, than the construct works. So what we have on the screen up there is a big fat table of contents of what this document goes through, and what have we got here, maybe 10 minutes left?

CHAIRMAN DELGADO: We have five minutes.

MEMBER MIEDEMA: Five minutes, okay. So let me just highlight some areas of the document that, you know, where there was some real depth of thinking. The first is, you know, what conditions have to be in place before you can even consider multi-site operation, you know, to seek USDA certification. So at the beginning there, you know, you must be organized as a person according to 7 CFR 205.2. So if you have a bunch of disparate
parts, first of all, you've got to legally be one.  
Second, you need to be seeking certification with 
a certification body that can actually handle the 
job. We've kicked around different ideas for how 
to get there, you know, should it be a separate 
category of certification. That idea has been 
tossed out there, and I've heard the program isn't 
necessarily amenable to that for some sound 
reasons, but we know it's got to be a certifier 
that knows how to peer into complex organizations, 
and they have to be able to demonstrate that to 
the NOP. The practices of these multi-site 
operations must be uniform, and reflect a 
consistent process or methodology using the same 
inputs and processes. 

For growers, participation in the 
multi-site operation is limited to those growers 
who sell all of their organic production through 
the group. Multi-site operations must use 
centralized processing distribution, marketing 
facilities and systems, and one last item here 
that's important; record keeping protocols must be
consistent. You can't have the record-keeping look different from place, to place, to place, because you're going to have one outside inspector. Your internal surveillance and review is going to happen through the internal control system, and consistency is going to be really important.

Okay, the next part of the paper really talks about the organization within the multi-site certification and, you know, I threw in this term clustering, so the clustering of members or subunits in the production unit. And what we did is we came up with quite an exhaustive list of what it takes to get together. You must be bound by a shared training regimen, for instance. You must operate under the single organic system plan, and that particular section that relates to your piece of the puzzle.

Now, that's going to require an adjustment to the status quo where members might be acting as autonomous members under a single OSP. You know, going forward, members are really
going to need to organize into production units to share best practices. And, you know, I know there was a feeling on the part of IFPO that maybe the training regimen we proposed was overly burdensome. I would push back on that, because I think training is really fundamental to this working.

Next, we go into the facility or site, and an area that I heard everyone on this board, in our comments and discussions we've had in the hall, et cetera, and I heard members of the audience say, there's not enough detail around retailer certification. The section that deals specifically with retailers is quite brief in this document. It's found on page 4. Grower groups have had 20 years to flesh this stuff out. Retailers have had about four years. So yes, there's history that's going to need to be drawn on for grower groups, and there's going to be criteria that are going to continue to need to be fleshed out.

OTA has volunteered to pull together a
task force in that regard. So, you know, we know we've got additional resources. Just moving through quickly a few other highlights; we're proposing that, in year one, this is looking at sampling protocol. I'm jumping ahead to now, year one, 100 percent inspection rate of all production units, sites or facilities. And that's giving credence to the importance of an extremely thorough audit off the bat, and an understanding of how much risk there is, because, you know, later, and I spent a lot of pages talking about -- a lot of information here talking about risk factors.

We need to get to those, and the only way to do that is to look at all the parts right off the bat. Segueing in there, moving into risk analysis, I believe it's 19 points we called out that help guide inspection. Inspection cannot just be a random scatter-shot thing. We need to focus our attention on hot spots, but it's not enough to just pinpoint. We do need a random -- we need to keep people on their toes. And people
need to know that, at any given year, you might get randomly selected. So, you know, the idea there was that, of the people selected for inspection, 25 percent would be random.

Another area the program asks for more help with, and fleshing out, was the role of conflict of interest, and so we exhaustively went into that. Jim, I know that was something that you said you wanted to see more data on, and I just -- I want to direct you to, you know, pages 8 and 9. There's a lot of information in there. And then lastly, we gave some pending issues that reflect some of our internal discussion that we were having in committee, and some unresolved questions among committee members that we continue to invite the public to respond to.

CHAIRMAN DELGADO: Okay, any questions from the Board? Yes, Jennifer?

MEMBER HALL: First, I'd like to thank Tracy. She did an exhaustive search, and real outsourcing to get a lot of information and input
to compile this guidance document. But I'd also
like to represent a faction of the committee that
did have a different voice, and as a result of us
not being unified, that is why the pending issues
are reflected here instead of kind of more
traditional minority opinion.

I would say that all of us -- and I
don't want to speak for everybody, but I think
that there is a half of the committee that
definitely sees the value in grower groups, and
sees the strength of a really good internal
control system, and Tracy did a great job of
really adding merit to that risk assessment, and
all the different components of that.

So we decided, instead of doing a
minority opinion, to try and get feedback on the
components that a variety of us, for different
reasons, had different questions about, and to
solicit those in a question format to try and get
specific feedback. So I just kind of wanted to
put that out there that, as a committee, like Joe
said, there was a lot of robust discussion, and I
I feel good about what's put out here, but I'm also very genuinely thankful for the feedback that we've gotten that will help direct us to our next phase.

CHAIRMAN DELGADO: Any other questions from the Board?

MEMBER FLANN: I'd just like to comment.

CHAIRMAN DELGADO: Barry, please.

MEMBER FLANN: I just want to echo what Jennifer just said, since I'm part of that half that she just described.

CHAIRMAN DELGADO: Very well. Tracy?

MEMBER MIEDEMA: Just one last note, I forgot to thank Oregon Tilth, and I thought it was noteworthy in yesterday's comments that both Tilth and IFOAM are not uncomfortable with the strength of an internal control system's role in other sectors of the organic world. They believe -- seem to believe that it's rigorous enough to stand up in different sectors of the industry, and happen to be the two organizations here who,
correct me if I'm wrong out there, represent the
most grower groups. I just wanted to add that.

CHAIRMAN DELGADO: Okay, any other
questions? Katrina, followed by Dan.

SECRETARY HEINZE: I haven't been part
of your discussions, but I did want to weigh in as
someone who is very familiar with internal control
systems. It's obviously something that a large
food processor, like the company I work for, uses
to manage our food safety programs, which,
arguably, are very critical. And I have a great
belief in the construct. It allows us to have
very firm control over the foods we produce. So,
from that perspective, I very much support the
effort that the committee has made in support of
that type of construct.

I am concerned about how the expansion,
outside of grower groups, would be viewed by our
organic community. Certainly, that is not a
technical, you know, perspective, but I think it
is a factor that we need to weigh as we make a
recommendation, because ultimately, we are a
marketing program, and we get judged by the
comfort our consumers have in what we do.

And I recognize that that's perhaps an
unresolvable problem, right? That it's a
construct I very much believe in. I think it can
work. I think it can work for all the different
types of groups that you've talked about, right?
Grower groups, retailers. It can absolutely work
in all those cases. I'm just not sure our
community will accept it in all those cases.

So I just wanted to get that
perspective out, because I do think that factor
weighs in the recommendation that we make, much as
we might get frustrated by that.

CHAIRMAN DELGADO: Do you have a
response?

MEMBER MIEDEMA: Yes, I do. It's an
important question, it's a worthwhile question,
and frankly, it can be looked at now. This is not
a future thing we're talking about. There are
retailers today certified using this construct.
So we don't have to wait until the future to find
out, you know, through some sort of survey.

Lots of us have done informal surveys.

Sam, I know you have your own -- you've talked to people, and believe that consumers are not at all friendly to the idea. I have found there -- I have had absolutely different findings at trade shows. I've just used those opportunities interacting with people to pose a question. So, you know, if somebody has formal data, independent third party data, that helps us get to that answer, I think that would be great to bring to bear.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: Thank you. And again, thank you, committee, for all the work you've done on this. But I think, and I'll try to be extremely -- extra brief, because I think I'm sort of echoing Katrina's comments. But to say it slightly differently, I think, for me, this comes down to two questions, and it comes down to a question of concept, and it comes down to a question of scope.
I think it's one thing -- the ICS, as you discuss, is sort of the means that you're using to get there, but are we -- do we have agreement within the organic community, consumers, producers, stakeholders, regulations, and everything else, that a -- that a farmer that makes $5,001 in the United States has to pay for an annual inspection to get the benefits of being organic, but yet, I don't even know if they exist, Fair Trade Coffee in South America gets a bit of an exemption. And how are we going to handle that structure?

And we've had a lot of debate, and we've had guidance documents and things. I think, then, to take that to the next phase on a scope level, it is the same ICS format, but it's a different question, and different refinement, and really getting into the meat of the issue of how to make sure that it's going to work, and be accepted, just to pick another company, and I know they do exist, that how this thing will allow Whole Foods not to have to have every store
inspected annually.

I think there's a difference between the concept and the scope. We had public comment yesterday asking us to just -- the committee to just go back, finish off the grower groups, and then bring up multi-site, and I'm not so sure that I see a lot of -- that I see a problem in going that route.

CHAIRMAN DELGADO: Joe, followed by Jennifer.

MEMBER MIEDEMA: I just first wanted to respond to the 5,000 hurdle that you threw out. You know, what we're talking about here is the exemption for a producer that produces less than 5,000, and that gets thrown around a lot as sort of the, let's just limit this to producers that grow less than 5,000. And, you know, let's just return to why that exists here in our program.

That's to promote market entry, and to get people up and running. You could be a bagillionaire, and only sell $5,000 worth of organic, and still receive the exemption. It's
not a disadvantaged help out program, per se, and that's how it kind of gets framed as being used, and how it should get used internationally.

It's -- you know, this is agriculture marketing service, and this really promotes the marketing. So I am concerned about that number getting used as sort of the, you're no longer disadvantaged now, and you shouldn't get to be part of a group number.

MEMBER GIACOMINI: I don't see that number as a disadvantaged number; I see it as a number of a level of participation. And if, at that level of participation, which is not even adjusted for inflation, it doesn't matter how much money the guy has anywhere else, but if that's his participation in the organic industry, according to the regulation, if he's in this country, he has to pay for an annual inspection. It doesn't matter if the annual inspection is a burden for him or not, but he has to pay for it. Whereas, a grower group in some other part of the world, each guy doesn't have to pay it, regardless of how big
they might be individually.

CHAIRMAN DELGADO: Please wait to be recognized. We have Jennifer, followed by Joe.

You yielded to -- okay, Joe.

MEMBER SMILLIE: Just to follow-up on that, there's two -- the direction that the committee is going is clear. We're very much hoping that OTA and/or others will convene, you know, a working group for retailers to discuss -- to flesh out more of the supposed, you know, probable differences between the approaches.

And the word retailers has come to the fore because it seems to us, at this point in time, that they're the only other sector group that could fit the rigorous criteria that we've set down. Katrina mentioned, you know, that her system is for their processing facilities, and that's true. Processing facilities, everywhere between the producer and the retailer, have internal control systems quality, but there's also other criteria that I believe would eliminate them from consideration.
You know, the single OSP, that's -- and other factors that, if you go down through the criteria, I think, and I want to be pointed out if I'm incorrect, that everybody in between a retailer and a producer, just, I do not believe, with what we've set out, they could fit at all. The single OSP is a very sharp razor that will slice them out.

It just so happens, through whatever it is that's in intelligent design, that retailers and producers seem to be the ones that can fit these criteria. Our next task, as a committee, is to continue our work with this document, and to start to explore the retailers section with the help of OTA and/or others, individuals and groups, that will contribute to the discussion, and to see whether, indeed, the community will accept the proposition that - and I'll limit it to retailers in my discussion - will accept the proposition that retailers can function under a multi-site document or not. That will be our next step. That's where we'll go, and hopefully, we'll come
back with more information and erudition in November, not necessarily with a recommendation.

CHAIRMAN DELGADO: I like that clarification. Jennifer?

MEMBER HALL: There's been some discussion about scale neutral, and sector neutral, and I look at this a little bit differently. I don't question the merit of an internal control system, one that's good, and has a good background to it, and execution to it. However, I do see the rule, as published, as the bar that we aspire to, and that being independent operations, getting annual inspections, and I see it more analogous to when we allow a material with an annotation.

It's solving a specific problem with a specific solution, and so I see the application of grower groups as doing a similar thing, that, due to real issues with supply of certain products, that this is -- the grower groups is a potential solution to that specific problem. So that's where the scope of applying it -- otherwise, I
have challenges with that.

CHAIRMAN DELGADO: Any other comments? Any other comments from the chair, chairman of the -- thank you. We conclude that section. I appreciate that, and I encourage the chairman of the committee, and the members of the committee, to take the public input from the -- input from the Board, and incorporate that into the next step of your process.

Right, we are due for a break, and at the same time, we're running late, so let's break for five minutes. I know that's brief, but I want to get us back on schedule. So we'll see you here in five minutes.

(Whereupon, the above-entitled matter went off the record at 10:02 a.m. and resumed at 10:11 a.m.)

CHAIRMAN DELGADO: Board members, please take your places. Calling Board members, take your places, please. We will resume our meeting right now and it is the
turn of the Joint Crops and Compliance Committee to come and discuss their document on Commercial Availability of Seeds.

MEMBER KARREMAN: Rigo, I'm going to cede that to Gerry, that discussion, I mean, but he's not here right now. Okay.

CHAIRMAN DELGADO: Mr. Davis? All right, we have both committee chairs for the CACC and the Crops Committee. I'm assuming Mr. Davis will start with a presentation on the Commercial Availability Guidance for Seeds. Mr. Smillie.

MEMBER SMILLIE: Yes, I little history. It's a joint committee recommendation and that's because the Certification, Accreditation and Compliance Committee submitted a recommendation on commercial availability that included both seed and 606 items. The public feedback was clear and precise. They wanted us to bifurcate that recommendation, that's a fancy word. They wanted us to split that
recommendation and have separate recommendations. So listening to the public as we do, we said, yes, that's a reasonable request, so the CAC committee basically put forward and passed their recommendation on commercial availability and then passed the work that we had done up to that point on seeds to Gerry and the Crops Committee.

So, in a certain sense, Mr. Chair, we have -- our committee sort of done our work on it and passed it down to the Crops Committee and they were going to take their expertise in the agricultural realm and craft the recommendation for commercial availability on seeds.

CHAIRMAN DELGADO: Mr. Davis.

MEMBER DAVIS: Thank you, Mr. Chair. This is a complicated issue as we all know and I wanted to start the discussion by pointing out one of the -- a part of the discussion that was in the written recommendation. The Crops Committee and I,
myself in particular, don't feel that leaving this situation as it stands right now in status quo in many -- in several sectors of the seed availability issue, leaving it as it is will perpetuate the current situation which is that in certain sectors, like vegetable seed, there is little movement in the direction of increased supply of more organic seed.

And a lot of that in hearing from the organic seed industry at previous meetings, last fall and previous, was that this is because growers aren't telling their seed suppliers that, "I've got to have organic seed". They're just relying on the loophole and shuffling some papers to make it happen.

I acknowledge the many comments from several certifiers that say they see really good movement in increased organic seed availability for their growers that they're certifying. No doubt there probably is a lot of movement in the right direction with
agronomic crops such as soybeans, corn, the larger field crop type things that are more clear-cut and maybe less specialized on the requirements of what seed is required. But being a California grower and working in that realm with vegetables, the farm I work for, we do 30 different vegetables. It's probably up to more by now, and all kinds of different varieties within each individual vegetable.

The seed industry has -- I believe, has to have a clear call to want to produce more seed and if the loophole is in place, it's a big obstacle, and that's my opinion. The committee wanted to highlight that the further development of the organic seed industry is the key to increasing the commercial availability.

The goal is to promote the continued growth and improvement in organic seed production and subsequent usage by organic growers without hurting or putting undo burdens on those growers. Achieving the
goal of the healthy, viable organic seed industry is important, not just so we can comply with the regulation but it's important when considering that the pathway of the conventional seed industry is more and more geared towards genetically modified biotechnology, you know, developments that will continue to develop and progress and evolve to a much different type of seed program and breeding emphasis than organic growers need or will need for the long term. We would not -- the organically grown movement will not benefit from allowing the organic seed production industry to stagnate in the current situation in some sectors, vegetable seed, for example, to allow them to stagnate while the conventional seed production sector moves on to the likely future situation in which traditionally bred and produced seed is only an after-thought, sort of relic of bygone days, that they don't put much emphasis on and eventually, it could -- unforeseen things
1 could happen where we really jeopardize the organic movement seed supply.

A vibrant organic seed industry would be expected to be the best guardian of proven traditional seed varieties and methods as well as the likely source of new innovations in organic growing methods that will result in excellent quality seed, in sufficient quantities to supply the market need at reasonable cost. I understand in many ways that's not the case right now but I think as an advisory board, the NOSB should take the pulpit in some ways to nudge, help nudge the situation in a positive direction. And our approach that we took for this further guidance was to heavily suggest that giving the organic seed industry market information that they need to develop and help make it happen is a key step.

Some of the comments that were received that I think are especially relevant to the situation. Another key factor is...
making an even playing field for certifiers to be making sure that they review growers'
commercial availability searches for seeds the same way, that we don't have a situation where many of you certifier representatives who have stepped up and say, "Well, we see improvement. We're pushing our growers to improve on more and more organic seed"; but there may be other agencies, certifying agencies that don't take that tact at all and they're just shuffling a little bit of paper and saying, "Okay, you satisfied the requirement of proving that you couldn't get organic seed".

So but I think we -- how do I say this -- for the program I don't know if implementing enough ACA training consistently enough would really realistically change that situation where you have some certifiers actively involved in encouraging their growers to use more organic seeds and you have others who see no real enforcement issues, no problem off of their -- you know, coming from the
program as far as accreditation problems for
their certifying agency. So they -- the
squeaky wheel doesn't get any -- the non-
squeaky wheel doesn't get any grease if they
don't think it's a big issue that's being
thrown at them from the program, that they
need to make sure growers are showing an
improvement in how much seed they're accessing
if they're not already doing that.

Some of the -- I think this is kind
of a work in progress. Some of the
problematic points that I wanted to make sure
that I'm hearing correctly from members of the
industry who have provided written or oral
comments. One was that in the document, we
mentioned that there needs to be written
responses from seed suppliers to the producers
in response to their list that they supplied
to them and that more than one said that
getting written responses from seed suppliers
is not really dependable.

The grower can't count on that
supplier answering. You know, a small grower
can use the catalog itself to show the
response but there may be growers who don't
order from catalogs but also don't get a
response from their seed supplier showing that
certain varieties weren't available
organically.

I take note of the comments also on
growers' concern that their confidentially of
the varieties that they want to use, if they
feel their confidential and they don't want to
make that public knowledge, that they have
that right to not have it made public
knowledge.

Another good point, I thought, was
several of the certifiers saying that --
asking for all this grower and certifier
commitment of effort to gather these lists for
the grower to first make the list and put it
down in a form that is readable to someone
else and the supplying it to the certifier.
The certifier passing it onto whoever it's
going to go to, to commit to that effort
before a tabulation and publication vehicle
even exists is probably asking for too much
and I hear that comment.

Another good point was the need for
standardized list format, if we're going to go
there. We're requiring growers to do a list.
The tabulation of the data base of the organic
seed need would really be stumbled by not
having a standardized list format. And also
how do we create a uniform database,
harmonized database. I want to turn that back
to Joe Smillie to comment on that.

MEMBER SMILLIE: Yes, that's one of
the things that's come up and our
recommendation was criticized for being rather
fuzzy, throwing it out there to some
organization as unspecified. And I think we
need to do some work on that. To me, I would
like to see the NOP take some leadership on
that one and come up with a solution as how
they'd like to see that database created.
That doesn't mean the NOP has to run the database but I think that the NOP in concert with some of the organizations that have already stepped forward, either one or a combination of OMRI, ASA and OSGATA or whatever it is, Woody, OSGATA.

I mean, we've got the expertise in the community to put that together and I think that that's what we want to encourage. And I would just point out not being derogatory of the US's efforts but the EU has this organized. It's not perfect in the UE and I think we can learn from what they've done and learn some of the mistakes they've made in doing this, because there have been some flaws in the EU regulation, but in the EU each member state has that database and it's a fairly active one and our colleagues, our USDA accredited certification colleagues in Europe, don't have such the problem that we do. So I think that through some combination which the NOSB encourages, but doesn't necessarily want...
to format, we would encourage the NOP to take a leadership role in working with some of our organizations to create a harmonized, unified, you know, seed -- organic seed availability and demand database, because what was pointed out yesterday is the information has to flow both ways.

It's not just good enough to say, "That's what's in Johnny's catalog". I mean, Johnny might want to know, you know, what they should be -- where they should be heading also. So I think that that's one of the key factors that we want to promote. I'm not sure what role the NOSB will play in that but that's one of the things that we want to bring to the NOP's attention.

CHAIRMAN DELGADO: Jeff.

VICE-CHAIR MOYER: Thanks, Gerry and Joe. I think you did a great job of pulling that together. Having sat on that committee, I know there was a lot of discussion and it was difficult discussion on
how we're going to spread the burden around
because I think clearly we all agreed that we
wanted to give greater movement and faster
movement in the acceptance of using organic
seed and as a farmer, you know, the idea of
the burden that we were talking about placing
on farmers to collect those lists came up and
was discussed. But I know from talking to
other farmers that clearly they don't believe
that they really need to use organic seed and
we have to change that perspective. So we
needed to come up with some sort of a tool
that would allow us to do that. We also, in
terms of spreading the burden around, you
know, we were trying to put some of the burden
on the program both in terms of sort of giving
the input to the certifiers that this is an
important issue. We heard yesterday that many
of the certifiers felt like it's not part of
the audit trail. It's not part of what's
really discussed at training overly, and so
there's not a lot of great importance put on
that and so they don't see it pushing that
onto the farmers.

So I think that, you know, we put
some of the burden on the program for that and
as you heard, Joe suggests, you know, we're
asking the program to take up the challenge
and figure out some way of directing the
management of that list, whether you manage it
yourself or have somebody else do that, we try
to do that.

We also put some of the burden on
the certifiers by saying, "You need to make an
impact, an impression on your farmers so that
-- on your producers so that they are giving
you this seed list", and I think we're forcing
farmers to take up some of the burden by
creating that list.

I think farmers, the farmers I
talked to, are willing to do that if they felt
that their confidentiality was protected and
that the list actually went somewhere, meant
something, and did something. If it's just
another piece of paperwork and that they --
and energy that they have to expend to send a
list out into the black hole of data that they
never get a response from or have access to
use for, then I think it becomes a sad point
for them.

And by the same token, we're trying
to put some of the burden onto the seed
suppliers, forcing them to connect with that
list and with the farmers so that you know,
while I don't agree with everything in this
recommendation, it seemed to be the best tool
that we could come up with, with spreading the
burden uniformly across everybody and getting
off the dime and moving forward.

CHAIRMAN DELGADO: Any other
questions? Kevin?

MEMBER ENGELBERT: Yes, I'd like to
second that also and make people aware that we
just simply deny that there is still a
problem. It's disappointing that the seed
growth hasn't increased like it should,
organic seed usage, and it's a tremendous investment for these seed growers to develop and grow this seed and unlike conventional growers that can simply take leftover seed, retreat it, put it up for sale again next year, organic seed can't be treated and a lot of it goes bad.

So we just thought, we have to do something to move this industry forward. And like Jeff said, spread the burden around and get this moving. And again, farmers that use organic seed aren't going to be faced with any additional paperwork, any additional problems. It's only those that are trying to get around this regulation or these -- the intent of these rules that will have to really do more work to prove that they actually cannot get certified organic seed.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: I kind of want to restate a little bit of what I said yesterday and I would -- my preference would be not to
institute more paperwork to solve the issue, 
that there were some comments, I think from 
Pat yesterday saying that certifiers should 
not be in the position of being a promoter or 
a marketer of organic seed and I fully agree 
with that. However, I do think they are there 
to enforce the regulations, and that as a 
certifier, they do need to make sure that the 
grower is following the letter of the law and 
it's clearly stipulated that every effort 
needs to be made to find organic seed. 

So I do think that the burden of 
proof is on the grower to do that and that it 
would only take a couple of times for the 
certifier to say, "You're not doing this and 
there is organic seed available and I'm sorry 
that it's in the ground already," but it's 
quite readily available and that certain item 
can't be sold as organic this year, which does 
not disband your entire production, but that 
it would just take one or two instances of 
that to overcome what's concerning to me that
growers don't -- I mean, in your words necessarily, see it as their number one concern, that it's something that they need to be really aware of and making sure they're doing their due diligence about.

And that, for me, it's tied together then with enforcement, that there are certainly a host of other things that this rule stipulates that are never questioned as important and they are very strongly enforced.

CHAIRMAN DELGADO: Yes, Tina.

MEMBER MIEDEMA: I have to say I had a lot of reservations about this recommendation but it was the three people on the committee who would actually be effected by this recommendation, that we're very much for it and thought that they could -- that the investment of their time would be worth the result that tipped my hand toward voting for it on the committee.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Yes. Not being a
farmer or on the Crops Committee, I am struck
by the similarity between the struggles around
this issue and some of the questions that we
keep wrestling with and hearing about in the
handling community on issues around 606. And
it sounds to me like -- I guess I'm asking
this as a question to the rest of my fellow
board member; I hear two separate issues. One
is the question of seed that's available and
how to require people to use what's available.

But the second one is that in many
cases there is nothing available and there's
this question which is also critical in 606,
how does the supplier community become
incentivized to supply these items? And I
guess one thing that I'm not clear about is
like what percentage of crops are currently
being grown from organic seed right now, like
what is -- what percentage is available is
organic? Like, how far -- what additional has
to be created that's not there right now?

CHAIRMAN DELGADO: That's a fair
question. Gerry.

MEMBER DAVIS: I'll respond to it.

I would base it on comments received yesterday from the public on the amount that it is, you know, various certifiers said, "We see good progress in corn, soy beans, so on and so forth", whereas there's a fairly high percentage of those growers that grow those crops using organic seed.

A comment from CCUF from California that deals with a lot of vegetable growers that they're thinking it's probably only two or three percent of that market is organic seed, and they see it, it's doubled, I think the comment was over the last couple years, but it's gone from one or two percent to two or three and I know speaking for our farm, we access -- we already do something like this where we submit a list to our seed suppliers, and being a large farm, we get a response and they say what they can find for us organically and many of the varieties we use are organic
but a lot of the hybrid varieties is a big problem.

There's kind of a bit of a gridlock in vegetable seed hybrids on being organically produced, that of sufficient quality and quantity.

MEMBER DAVIS: Was that clear?

MEMBER WEISMAN: Yes, thank you.

CHAIRMAN DELGADO: Any other questions? Okay. Well, thank you very much, both of you. Then we can move onto the next topic which is again, the Crops Committee. Before that, I want to remind the public, if you have signed up for public comment today or tomorrow please go back and make sure that your signature appears on those sign-up sheets. And if your kind enough -- just the registration, I stand corrected. Go back, make sure that your signature appears in the registration, is that correct? Okay.

SECRETARY HEINZE: For each day
that you're here. We need a count of every
day we have to report who is here.

CHAIRMAN DELGADO: Thank you for
that clarification. Okay, back to Mr. Davis
to talk about Crops Committee.

MEMBER DAVIS: Okay, for out
petition materials for this meeting, we have
three, tetracycline, cheesewax and Dextrin and
I'd like to start with tetracycline. The
petition is for adding tetracycline which is
specifically oxytetracycline hydrochloride as
plant disease control for all diseases on the
crops registered by the US EPA on the National
List, adding it to 601, Item I-10 and with a
note we put in which would effectively remove
the current annotation if we were to do so, I
believe, but that is probably up to
discussion, but the committee voted six no,
zero yes, one absent to reject that petition
based on we felt that particularly with
reference to adding all crops which
effectively would add peaches and nectarines
to the crop list that could use these materials. In reference to that we felt it was not necessary. The reason tetracycline is on the list for apples and pears even though it's very contentious material, many, many people in the industry and consumers probably alike, shutter at the thought of antibiotics being sprayed on organic crops. So there's a lot of problems with -- a lot of resistance to the use of materials like this in organic.

So for that reason, we did not feel that for peaches and nectarines it was so needed that it could overcome the basic incompatibility and consistency with the rule. Apples and pears, the reason they're on there, as I started to say was that the damage from fire blight in pears specifically, is so devastating that entire orchards can be lost and the previous board that looked at this material last in Sunset a couple years ago, had a split decision, it was a very close vote and allowed it to stay on the list mainly
because of the dire need that pear growers particularly have for the material. Otherwise it would not have been relisted in my opinion because I was there.

This material, we rejected it basically because we did not want to add it to more crops. The petitioner is here and made comments yesterday that they would be willing to represent the material for just apples and pears and to change their petition. In trying to analyze this on the fly here at the meeting, I'm not exactly sure of the proper policy and the way it should be, but the best I can tell, probably if that is the petitioner's wish, they should come forward and state that for public record what their intent now is and we can decide what to do with the material.

CHAIRMAN DELGADO: Would the petitioner of tetracycline come up to the forum and state their intention for the petition, please? And if you can state your
name and your rank and file.

MR. RICHARDSON: Yes, Taw Richardson, President of AgriSource.

CHAIRMAN DELGADO: Can you get closer to the microphone, so our recorder can -- and if you would, spell your name, please.

MR. RICHARDSON: T-a-w, Taw Richardson, and yes, as stated, we are willing to withdraw the portion of our petition that deals with peaches and nectarines and limit it to pears and apples to facilitate a decision on the part of the Board related to the component.

CHAIRMAN DELGADO: Thank you. Any questions for the presenter? Mr. Davis?

MEMBER DAVIS: I have no further questions for Mr. Richardson.

CHAIRMAN DELGADO: Thank you very much.

MR. RICHARDSON: Thank you.

MEMBER DAVIS: I believe the proper thing to do would for the Crops Committee to
convene at this meeting, perhaps this evening and this afternoon, and discuss this development and decide whether we proceed with a vote on the recommendation as it stands or possibly defer it for the fall meeting.

CHAIRMAN DELGADO: Very good.

Questions no that specific topic? We have Tina first followed by Jeff.

MEMBER ELLOR: Well, while the whole group is here, our options are probably several. We could send it back for TAP because it is a different chemical, correct, or not a TAP, a Technical Review.

CHAIRMAN DELGADO: Technical review.

MEMBER ELLOR: Or is it possible to add it to the current listing rather than make a separate listing, either of those two possibilities.

CHAIRMAN DELGADO: Gerry, can you clarify that? What is the intent of --

MEMBER DAVIS: You're absolutely
correct. There have been statements made that
even though the EPA considers and regulates
tetracyclines, you know, the current one
that's on the list is Oxytetracycline calcium.
This one is Oxytetracycline hydrochloride.
The EPA considers them as the same and the
petitioner in written public comment went at
great length to explain all of that. But
there have been several comments saying that
this should have a technical review done in it
because it is a different material. I don't
have a comment on what's the right thing
there. It's beyond my expertise to say what
is right.

CHAIRMAN DELGADO: Very good, so
again, you will take that back to your
committee and make a decision by tomorrow.

MEMBER DAVIS: Right.

CHAIRMAN DELGADO: Jeff?

VICE-CHAIR MOYER: Yes, the other
question that the committee had really needs
to probably addressed by the program which was
if we do reconsider this material, obviously, we are going to do that, and put it on the list, given the fact that at the last Sunset process tetracycline barely passed by I believe it was a six to five vote if my memory serves me correctly. Would this necessitate or put this on the list for a five-year period at Sunset or would it simply be an addition of the new chemical compound name on this existing list in which case it would Sunset in only two and a half years along with the existing tetracycline?

CHAIRMAN DELGADO: That is a question for --

VICE-CHAIR MOYER: Does that make a difference in how the Board views this material? It would be nice to get a comment on that.

CHAIRMAN DELGADO: Can we have a comment from members of the program, please?

MR. POOLER: This is Bob Pooler, NOP. This essentially is a new material.
It's different from the calcium complex that's currently on the list, so it would have to be a separate material at this point.

CHAIRMAN DELGADO: So it is a separate material and the count will start again, correct, five years? Thank you for that. It does not effect the old one, that's correct. Next is Katrina. She passes and we have Dan.

MEMBER GIACOMINI: Gerry, for those of us that are not crops folks, on the list currently, could you give -- just clarify the way these two annotations are listed. We have streptomycin for fireblight control in apples and pears only and then we have tetracycline Oxy-Tech, calcium for fireblight control only. If we're putting the tetracycline, the new tetracycline in the -- sort of under the category of the existing Tet, what's the difference in those two annotations?

MEMBER DAVIS: They sound different but effectively, they aren't different because
fireblight only exists on apples and pears.

CHAIRMAN DELGADO: Right, any other questions?

MEMBER KARREMAN: I would think -- you were talking about the options you can take today, either having a committee meeting at some point, and I'm not on your committee, I realize that, but -- and maybe changing the annotation to what the petitioner wants, or deferring it. I would suggest we vote on it, vote on the material at this meeting and not defer it.

I don't think a TAP needs to be done. If the other Oxytetracycline is already on the list, functionally it's the same. And you know, I'd say we should vote on it, at this meeting.

CHAIRMAN DELGADO: Any other comments? Jeff?

VICE-CHAIR MOYER: Although that being said, Hu, we just heard from the program that it is a different material and is going
to be viewed within the program as a different material and it does have a different CAS number with the EPA.

MEMBER DAVIS: So that's an interesting quandary we're placed in with exactly what to do.

CHAIRMAN DELGADO: Again, that's a question for the committee to resolve. Any other questions from the Board? Okay.

MEMBER DAVIS: Moving onto the next material, Cheesewax, in response to some of the public comment received yesterday, specifically referring to some of the -- on the recommendation form, the responses, the documentation responses, the committee acknowledges that some of the comments made perhaps, should have been deleted and we are going to also convene on this and remove some items.

But I jumped ahead a little bit, excuse me. The petition is for inclusion of micro-crystalline Cheesewax and the CAS
numbers mentioned are three CAS numbers
because it's three different wax-type
materials, paraffin, a couple other things,
that account for those CAS numbers. And it's
added to the National List as a production aid
in log grown mushroom culture and with the
stipulation made without either ethylene,
propylene, co-polymer or synthetic colors.

We voted as a committee to put this
material on the list. It's very small usage
but effects dramatically a small segment of
the organic producer community. They are
asking for help on this because they are stuck
because they don't feel they have another
option. Some of the comments that we made in
the documentation section referring to
petroleum or crude oil that the petition
itself had some opinions about crude oil and
petroleum as semi or natural material and we
did not intend to construe that we agree with
that petitioner's position on that by our
responses in the documentation section.
So we will work on removing some of those specific things that don't change our answers specifically. They're just part of the documentation and the backup. So we will expunge those and show them at the meeting tomorrow before the vote.

The next material is -- oh, discussion, I'm sorry.

CHAIRMAN DELGADO: Yes, are there any questions from the Board? We have Tina followed by Steve, yes.

MEMBER ELLOR: I'd just like to say, I've looked at this petition exhaustively. I am in the mushroom industry. I work for a mushroom farm. We don't use this material. We don't grow mushrooms this way. This is used by a very small, very small growers, very small segment of the industry and they did a huge amount of work on this petition, and I have to say there was no obfuscation, however you pronounce that, on this petition. It was very straightforward.
They provided a tremendous amount of information. It just turned out to be a lot more complicated than I ever could have anticipated from such a simple-sounding substance. So I think with going through it thoroughly, looking thoroughly at all the CAS numbers that, you know, I feel pretty good that -- and I went out and talked to some of these small producers and mostly on their own, they don't use colored Cheesewax, but it would be good to eliminate that possibility.

CHAIRMAN DELGADO: Okay, Steve.

MEMBER DeMURI: Tina just answered my question. I was going to ask her specifically as a mushroom producer, for her opinion on this material and she just gave it, so --

CHAIRMAN DELGADO: Thank you.

Katrina?

SECRETARY HEINZE: I can't find it exactly right now, but there was one written public comment that gave a lot of detail on
this material and had questions about whether
the CAS numbers were accurate. I was
wondering, could you speak to the public
comment? I'm rifling through my binder. If
I find it, I'll be more helpful.

MEMBER ELLOR: Yes, I went through
the petition and there was, I don't know, 180
pages of it or something, and picked out every
CAS number I could find and looked it up, so
that's how we got the information that we
have. If I missed a CAS number, then, you
know, certainly I'd like to know that, but we
listed specifically only three CAS numbers
that we're going to allow on here and as far
as I know, I took those out of the petition.
I looked them up and if we made a mistake
there, then you know, whoever made that
comment maybe could come and see us.

CHAIRMAN DELGADO: Any other
questions? Okay, thank you. We can proceed
to the next one.

MEMBER DAVIS: Thank you. The next
material is for Dextrin petitioned to be used as a binder in seed coatings with placement on the National List 205601N as seed preparations. One change that I think the committee will agree to, we may have to vote on it, but it's a small one. In Section B there for substance fails criteria category, the sentence, "Non-synthetic starches", I wanted to changed that to "Binders".

And there was one other place in the documentation in further pages that says the same sentence essentially. What seed coating companies use for their binders and their materials in their process, I've learned from talking to several of them, are quite secret and they really won't give you specifics of what they are very much. So for us to say they're starches, I can't say I know that for sure. So we'll use a more generic term of binders.

We voted as a committee four no, zero yes to reject this petition in that we
felt that it failed criteria category 2 and 3, that it wasn't essential for producing organically approved seed coatings and that it -- for Category 3, it was not compatible with and consistent with organic regulations in that adding synthetics to the list when there is available options is not compatible with the rule.

And one -- there are currently a couple examples of organically approved seed coatings from two different companies that are on the market and although they were not willing to state what they are using, the -- and because of certifier confidentiality, the certifier that certifies that as organic can't tell us that either, but we are sure that they are all using organically approved materials.

So, the committee voted to reject this because there are other seed coatings using organically approved binders, not Dextrin. Any questions?

CHAIRMAN DELGADO: Questions from
the Board? Dan.

MEMBER GIACOMINI: In your notes on
the material, you referred to hydrochloric
acid as a source of a pH change or stabilizer.
They refer to food acids. I'm not sure that -
- or food approved, I forget their exact
terminology. Can you address the issue of
whether this is going in as a pH stabilizer or
is it initiating a chemical change?

MEMBER DAVIS: From reading the
petition and which I believe the petition does
not say hydrochloric acid, I believe that was
from an internet search that I did, but
regardless of the acid, the acid itself is not
a problem. It's the statement that the
petition made that the acid is sprayed on the
natural starch and a polymerization process is
initiated by that acid treatment. So it's not
a pH adjuster. It is actually the material
that stimulates a chemical change.

And I guess we could receive
comment if that is incorrect but I don't think
that's been put forth.

CHAIRMAN DELGADO: Okay, any other questions? Very good, thank you and I appreciate the work of all the members of the committee. I know you went out of your way to contact suppliers and talk to producers and did a thorough investigation. Right, moving on and also including Gerry, we have Dr. Karreman with Joint Crops and Livestock Committee.

Sunset material, I'm sorry, I was getting over-excited, thinking that we were ahead of the schedule. So my apologies. Back to you, Gerry.

MEMBER DAVIS: I was wondering what you were doing.

CHAIRMAN DELGADO: Yes, I tell you I have no excuse this time.

MEMBER DAVIS: For the Sunset material questions, there was additional public comment received after the November meeting vote on these materials, so we needed
as a committee ro reaffirm that we had looked at those public comments and that they did not effect in any way the outcome of our vote. So we -- that's what this item is about.

Just to say that in response to the additional comments received after the November 2007 NOSB meeting and vote, the committee reaffirms its recommendation of November 2007 for the relisting of the following substances in these use categories as published in the final rule; copper sulfate, ozone gas, parasitic acid. EPA lists three inerts for use in passive pheromone dispensers and calcium chloride. Any questions?

CHAIRMAN DELGADO: Questions from the Board? Okay. None. Very good. We'll proceed.

MEMBER DAVIS: Onto the next item, we have a discussion document. The hydroponics issue has been on the Crops Committee work plan since I believe 2001 and
probably because of the complexity and -- of the issue and it's not common knowledge with a lot of people. It's kind of sat there with some work being done on it, so we felt that we should begin the discussion again and move towards an eventual recommendation.

We -- the main -- and there were a lot of public comments received regarding this document. And I thought I should address those quickly, first of all. We -- it is not the committee's intent to certify as organic liquid-based hydroponic growth culture of terrestrial plants. So almost all the comments were addressing that topic that no, you can't go there, you can't go there, and we just wanted to say that through out discussion of it, that is not our intent to go to suggesting certifying terrestrial plants grown in truly liquid culture.

So the intent of this discussion item was to reopen the issue and get public comment from the industry on -- so we can
proceed forward with the proper determinations on should liquid-based, you know, terrestrial plant culture be allowed. I've already addressed that. What systems can be allowed, soiless systems, kind of dispensing with the hydroponic term because it's -- I think the committee feels that it's truly specific to liquid culture of terrestrial plants.

So what other soiless growing systems are possible? What can be certified as organic? I wanted to receive comment on that. In the hydroponic issue, there will need to be guidelines around such things as growing spiraling, you know, plants that are normally aquatic plants, other higher plants that are naturally water -- naturally aquatic species, things like that.

So really the whole intent of this was to stir the pot a little bit and it speaks for itself and just to get the issue opened back up again and start moving in a direction of some guidelines. The Europeans already
have guidelines on this subject. The
Canadians are moving towards -- they already
have some greenhouse guidelines that touch
upon these topics and I'm told that they are
moving towards adoption of standards in the
not too distant future, so we felt it was
timely for the US system to address the topic
and move towards recommendations also. Any
questions? Steve.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: Do you know what
they're doing in Europe? Can you briefly
describe what the standards are there?

MEMBER DAVIS: I'm not sure. It
would take a little time to really spell it
out. There are some differences between what
the Canadians currently allow and what the
Europeans, and there's differences within what
the EU system overall says versus what
individual member states allow. It's a pretty
confusing situation. There was one public
comment, written comment submitted from
someone in the Netherlands that pointed out that currently in the EU overall system that it has -- the terrestrial plants have to be grown in soil but I'm told from investigating it, that that's not necessarily true in all member states. So I don't know where you go with that.

CHAIRMAN DELGADO: Joe?

MEMBER SMILLIE: I just wanted to be sure. You didn't touch on sprouts at all. This was not part of your consideration.

MEMBER DAVIS: No.

CHAIRMAN DELGADO: Any other questions? Okay, well, thank you very much. This time we can move onto to the Joint Crops and Livestock Committee report on the aquatic plants recommendations and Jeff, you'll be participating in that.

VICE-CHAIR MOYER: I will, thank you, Mr. Chairman. The reason that this particular item was handled by a Joint Committee of Crops and Livestock is that often
aquatic plants are grown strictly for the use in -- to sell directly for human consumption. The other use, of course, is for a feed source for fish or fish-type creatures, so that's why it was in a Joint Committee.

If you -- I'll direct your attention to either the board, the visual board, or your notebook item number 8. Basically what we did was we treated aquatic plants just as if they were any other crop, so they fall specifically under Section 205.258(c) in that they have to follow all the rules and regulations that any other crop would have to follow with the exceptions, and that's why I direct your attention to Section A and eventually Section B.

Under Section A you'll see that we are directing aquatic plants to be treated a little bit different. In Section A we're talking about a closed containment system. This would be a pond, a pond-type system that has, for the most part, a soil base. So if
you look at A1, you'll see that any pond with
soil from which aquatic plants are intended to
be represented as organic, must have no
prohibitive substances as listed in 205.201
for at least 36 months, again, treating it
just like we would a field crop because it is
a soil-based pond.

However, if the container or the
containment system is more like a greenhouse
in that it is a pool or a channel or some sort
of raceway, we are growing these plants, we
have indicated that you can have an approved
clean-out procedure to prevent contact or
contamination with prohibited materials, just
like you would in a greenhouse.

You don't have the three-year
transition period there because you're not
against the soil. Section A2 aquatic plants
may be provided dissolved macro nutrients and
micro nutrients including trace minerals and
vitamins listed in 205.601, just like any
other crop would. However, the dissolved
amounts shall not exceed those necessary for
the healthy growth of the plants and such a
culture medium shall be disposed of in any
manner that does not adversely impact the
environment.

And in Section 3, a pond or a
containment vessel must have a berm elevation
to protect any -- basically, it's a buffer
zone, just like you would in a field to
protect any run-off from the surrounding area
to come into the pond, and then item 4, and
this is an important one. We felt that often
times there's a pond or the pond might be
drained to collect the fish out of the pond.
You could not use that time of harvest as a
mechanism to dump the water into a receiving
waterway as a mechanism of purging the pond of
any collected environmental hazardous material
or dissolved fertilizers.

So if you are going to dump the
pond, you must -- the pond must -- the water
coming out of the pond must meet the standards
based on the total maximum daily load
requirement of the receiving waterway as
provided by the current state code. That
deals mainly with US based operations where
you would have TMDL.

In cases where there is no TMDL
metrics, if you look at Item 4(ii) you'll see
that we have listed there based on EPA
guidelines, a secondary treatment that's
listed as 30 milligrams per liter BOD, total
suspended solids where 85 percent removal of
the BOT is attained. Again, giving some
guidance to anybody who wants to grow aquatic
plants under this system, some idea of what
they can discharge into a waterway.

And my understanding from the EPA
folks is that this is sort of the lowest
common denominator that they accept anywhere
and again, we would want foreign certifiers to
adhere to that as well.

Section A5, talking about manure,
we're saying that in this recommendation that
manure from terrestrial animals may be used to fertilize aquatic plants intended to feed organic fish in aquaculture ponds for organic production systems provided the manure is composted in compliance with 205.203, which we had approved at an earlier date.

Aquatic plants may be grown in open water systems. This would be different from what we had just previously talked about with containment systems, in that they can be grown in open water but here you would not be able to use manure-based fertilizers because we don't want people just randomly going out there and dumping manure into open waterways that would have access to non-contained systems.

That, Mr. Chairman, is our recommendation.

CHAIRMAN DELGADO: Okay, questions? Joe?

MEMBER SMILLIE: Yes, I'm thinking about the B part. Was consideration of other
examples, like in open water, like nori
culture for example. In 606 we're working
with a lot of wild harvested aquatic plants
but I'm presuming in the very near future
we're going to be looking at you know, farmed
aquatic plants, and I can think of nori for
one, perhaps clorella, you know, I think is on
our work plan also.

How does this recommendation --
does that interface with that type of open
water organic farmed aquaculture, aquatic
plants?

VICE-CHAIR MOYER: Well, I think it
does. I mean, our main stipulation was when
you are in open water system, you have very
little control of the movement of the water
and we wanted to make sure that people weren't
somehow dumping manure-based fertilizers into
this open water, because that just -- I don't
even think even if we approved it, it would
not be approved by any other agency. You just
cannot do that.
I mean, Dan brought that up in your conversations during the meeting that putting manure in water to begin with is a touchy subject, and that's why we said it has to be composted but --

MEMBER SMILLIE: I don't mean that there's anything wrong with what you've said, it's just that we're going to need a bigger framework with a lot more points of, you know, open water contamination, all sorts of other things if we start to look at, I'll just use nori as an example, nori culture which has been practiced in Maine as well as Japan. Those are open water -- those are farm systems.

They hang out nets, they've got specifications on the culture and how they collect and harvest it. So it is farmed. It's not wild harvested and there will be, I think, other considerations.

VICE-CHAIR MOYER: Are they fertilizing those systems?
MEMBER SMILLIE: No, as far as I know, not.

VICE-CHAIR MOYER: We have not come across any point where they were but I don't know everything, obviously, on the subject.

MEMBER SMILLIE: But like the whole background contamination issues and that sort of thing. I just -- it's a big topic, farmed aquatic plants and there's a number of cultures that don't seem to fit into this recommendation.

VICE-CHAIR MOYER: Well, obviously, like with all of our documents, you know, this guidance document is a living document.

MEMBER SMILLIE: Yes.

VICE-CHAIR MOYER: And as issues come up, we would certainly be prepared as a Joint Committee to introduce those items for further discussion and recommendation.

MEMBER SMILLIE: Well, in our work plan, clorella is there and that is -- that's wild harvest, though, I guess. We don't know.
We'll find out.

MEMBER WEISMAN: There's two algaees, one is --

CHAIRMAN DELGADO: Wait to be recognized.

MEMBER WEISMAN: There are two algaees on our work plan. One is wild harvested and one is close containment and I forget which is which but there is definitely one that is wild harvested, so it will become an issue.

CHAIRMAN DELGADO: Again, I will ask you to be recognized first before you address the Board. No problem. We'll go with Dan and followed by Gerry.

MEMBER GIACOMINI: Thank you, Mr. Chairman. In A5, you're talking about manure and then qualifying it as composted. In B all you're talking about is manure. I would be comfortable and would it not be appropriate to include both manure and composted manure in B?

VICE-CHAIR MOYER: It would be and
we have no problem adding that. We thought we
covered that by saying "in any form." So we
were saying manure, whether it's composted,
raw. Any way you look at it, it could not be
applied, but if the Board felt more
comfortable adding the word "compost" there,
I don't think the Joint Committee would have
problems with that, but I put that to the
Board.

CHAIRMAN DELGADO: Okay, Gerry?

Okay, any other questions? All right, well,

thank you very much, both of you. And we move
on to -- we're on schedule, fantastic, ahead
of schedule in fact. We move onto the
Livestock Committee with Dr. Karreman.

MEMBER KARREMAN: All right, thank
you, Rigo. Our first material for discussion

is one that -- well, it's Fenbendazole and

that we -- let's see the Board had looked at

Fenbendazole as a wormer for ruminants back in

the late `90s in kind of a little trio of

compounds, Ivermectin, Levamisole and
Fenbendazole and I don't know the whole history of it except that Ivermectin passed at that point and Fenbendazole didn't. But regardless, a TAP review was done back then and we relied on that TAP review because at least nothing has changed to Fenbendazole that I know of just as a clinician but -- and I think that is accurate in general. The formulation hasn't changed.

So what we recommended after going through the checklist and everything, we did recommend to allow it in a vote of five in favor and zero opposed, two were absent, but also to maintain the annotation which is a paragraph long, I heard some resistance to those long annotations yesterday, but to keep the annotation as Ivermectin has it right now. Should I read that because -- okay, there is a slight addition to it, okay, right in the beginning.

And the beginning part that I added just from my experience being a farm vet, the
annotation would be for "Fenbendazole only to be used upon a written diagnosis of clinical infestation by a veterinarian," that's the new part. And then it goes on to say, "Prohibited in slaughter stock, allowed in emergency treatment for dairy and breeder stock when organic system plan approved preventive management does not prevent infestation. Milk or milk products from a treated animal cannot be labeled as provided in Subpart D of this part for 90 days following treatment and breeder stock treatment cannot occur during the last third of gestation of the progeny will be sold as organic and must not be used during the lactation period for breeding stock."

This -- we didn't -- we had discussion on this and it seemed to be pretty straight up. I guess the Committee was somewhat relying on my input being that I'm in contact with that realm quite a bit and I can say that it's -- one, it's better than
Ivermectin in the sense that I like that it's a more narrow spectrum. It's got a different mechanism of action. It doesn't affect the dung beetles in the manure. It only -- Fenbendazole only works during the grazing season and that's kind of good. You can't just use it on and on throughout the year but even so, you wouldn't be doing that in organics, but it's just a more limited type use of this compound for specifically gastrointestinal worms, whereas like Ivermectin you can use it for skin-type mange and lice and whatnot.

It's given orally. It's not given by injection or pour-on. There's no long-acting formulation. There's been no resistence to it even in regular conventional agriculture that's been noted. Very low toxicity due to the mechanism of action so it's a pretty safe compound. So anyway, that's the way we discussed it and there were no negative public comments. If anything, I
don't know how many, but they were all in favor of us recommending it.

CHAIRMAN DELGADO: Okay, any questions? Dan?

MEMBER GIACOMINI: As a member of the Committee, it's not a question, but just to make the statement that I don't think anyone on the Committee would want this to have the appearance that we're trying to continually add more parasiticides on the National List for dairy and breeder stock. I think the goal of the Committee is to get the best one. I think it's pretty universal within the industry that we're not -- the organic community and the livestock group Committee or part of that is not happy with Ivermectin.

The Board has passed Moxidectrin in past. It originally met resistance with the program as a macrolide antibiotic which is more a structural definition than an activity definition, and there seems to be some
movement there but how that will proceed is out of our hands.

So the Committee in looking at this wanted to -- decided to proceed with it and sort of when all the dust settles, will look and see what's on the list and hopefully then the community will come back and will look at taking off all but the best one, the best option we would have.

CHAIRMAN DELGADO: Comments to add?

MEMBER KARREMAN: Yes, that's correct.

CHAIRMAN DELGADO: Okay, Gerry.

MEMBER DAVIS: My question for Hu, commonly what is the circumstance when a material like this would be used? I hear all the restrictions of when it can't be used. What's the reality of how it is used?

MEMBER KARREMAN: Generally, I find the weakest link in livestock husbandry and organics and I do work with conventional herds still but not too many, is the young stock
that are weaned that are about one to two months away from weaning or that have been weaned and they're one or two months beyond that up to about 10 to 12 months old. Their natural immune competency is not up to snuff yet, their IGE to live in balance with worm challenge like adult cows can, and so as well, many times, I mean, a lot of farms, you know, the young stock, different batches of young stock go in the same area and parasites love that when animals are in the same area all the time.

And so that's the group that really needs it, really truly, and you know, I take manure samples, look under the microscope for the eggs, see how many eggs there are and if there's only very few and the animals look good, I say, "Don't even worm right now with Ivermectin," but if they look bad and they're heavily infested, I say, "Let's use the Ivermectin," and then start correcting things again in an organic manner. So it's for the
young stock.

MEMBER DAVIS: Thank you.

CHAIRMAN DELGADO: Jeff?

VICE-CHAIR MOYER: Yes, just one last comment, I wanted to second what Dan said in that we would hope that the community after this, assuming it does get approved, would petition the Board to either remove other substances or through the Sunset process get those other materials off so the goal is not to add more materials to the list, but to find the best product out there that fits with the organic production systems.

CHAIRMAN DELGADO: Good comment.

Dan.

MEMBER GIACOMINI: Yes, it's just that that can't happen until it's on the list. It's not -- it can't happen just based on our recommendation. It has to be based on post-final rule.

CHAIRMAN DELGADO: Good comment.

Steve.
MEMBER DeMURI: This is for Hu.

Not having a livestock background, this seems to be a fairly complicated annotation to me. Do you anticipate that any producers would have trouble maintaining documentation to prove these conditions were met?

MEMBER KARREMAN: The annotation, the bulk of the annotation there has been in place for the last -- well, since Ivermectin got on, whenever that was, and the program got started. So producers know that. They truly know that they can't give it to beef stock, beef animals that are going to be slaughtered as beef and they can't give it within 90 days of lactation. Okay.

The only thing that's added on here is that it's got -- the use has to be predicated on a written diagnosis by the veterinarian. You can say, "Well, it's given me work," but you know, honestly, it is an over-the-counter type product, as is Ivermectin, but I really think it's needed
only sometimes and I really think that the healthcare provider really should write down what they found, that they are infested and they need it.

CHAIRMAN DELGADO: All right, Barbara, I believe you had a comment.

MR. MATTHEWS: I have one concern. I recognize that we already say this in Ivermectin about when organic system plan improved preventive management does not prevent infestation. Now we're talking of putting that into a second annotation. That part of the annotation is totally unnecessary. And the reason why I say that is that we already have a regulation at 205.238(b) that says when preventive practices and veterinary biologics are inadequate to prevent sickness, a producer may administer synthetic medications provided that they're on 603. And if anything, what the Board might want to consider doing is what we've already done to 601, which was at the lead-in
paragraph to 601, we reminded everyone, "You have an obligation for fulfilling the practice standards first and when all else fails, you can use these materials. So rather than adding it into every single material or just some materials, you may want to consider putting it into the lead-in paragraph because this provision that you're talking about putting in and which we've already got in Ivermectin, is required of everything in 603.

MEMBER KARREMAN: I don't think it's everything because they can --

MR. MATTHEWS: Okay, you're right.

It's not everything. It's for the medications, yes, all medications are already required that way. And so the paragraph at the beginning would talk about which lettered sections or lettered paragraphs within the section would be applicable to following the practice standards first.

And it's really important that certifying agents be requiring that their
clients delineate in their organic systems plan how they're going to exercise their obligations for preventing sickness in advance. And if it's not in the organic systems plan and they're just allowing the use of the materials, then they're violating the regulations.

CHAIRMAN DELGADO: Hu?
MEMBER KARREMAN: That's fine.

We'll try to go that route. I would just say that perhaps then on any medicine that's listed on 603 but still just staying within Fenbendazole, I would say at least for Fenbendazole, only to be used upon written diagnosis of clinical infestation by a veterinarian. Is that an okay annotation, short and sweet like that?

MR. MATTHEWS: Sure.

CHAIRMAN DELGADO: But that would also imply that you need a second motion to put that clarification at the top of the section, if I interpret correctly. Are you
following that?

MEMBER KARREMAN: Well, I think we'll have to have a Livestock Committee meeting to reduce this bulky annotation here and then in the next few months, probably not in this meeting time, but well, okay, maybe at this meeting time by those faces, we can get that preamble onto 603.

MR. MATTHEWS: Don't get me wrong, I'm not criticizing the bulkiness of the annotation. What I'm clearly or trying to say is that there's a redundancy here because it's already required and if we feel that there needs to be a reminder, the best place to put it is at the beginning of the section so that everybody knows in advance where it's supposed to be.

I have no problem with saying you can't use it in slaughter stock. That needs to be clear. I have no problem with saying that it has to have a withdrawal period for dairy animals. That needs to be stated. So
it's not so much that I have a problem with the length of the annotation. It's the redundancy.

CHAIRMAN DELGADO: Very good. So that will be an action item for your Committee and you'll decide and tell us tomorrow. I believe there's another question, participant, Dan. Hu, do you want to add another comment to that?

MEMBER KARREMAN: No.

CHAIRMAN DELGADO: All right. If that's the case, we can proceed onto the next material.

MEMBER KARREMAN: All right, the next material, let me get that up here for a second, is Methionine. Methionine has an interesting history with the Board. I think it's the only livestock material that's been added since 2002, except for this last batch in December. It was renewed -- let's see the first time it came on and perhaps there's institutional history here but the first time
it came on, it had a three-year time limit put on it, from 2002 to 2005 in the hopes that there would be research to show that there could be non-synthetic Methionine available.

When that time was coming around there was a petition to extend it and right now, we've living under that time line and it would expire October of this year, 2008. So the petitioners requested that the time limit or -- it's not a Sunset but I don't know what you'd call it, just a removal date would just be --

CHAIRMAN DELGADO: Expiration, expiration date.

MEMBER KARREMAN: Expiration date, yes, would be deleted, that's it, so there's no expiration date on synthetic Methionine for use in poultry and I want to specify that it is only allowed in poultry and organic livestock, no other species.

The Committee voted five opposed to that and zero in favor of that action to
remove the deadline date. And we immediately, however, and believe me, we had a lot of discussion on this material, and we can get into that more, but we immediately came up with a new proposal or proposed removal date, expiration date of October 2010 to allow two more years of synthetic Methionine to be used in rations for certified organic poultry.

The reason we went for two years and not just taking the expiration date off totally is because of some work that has been happening and I went to the Upper Midwest Organic Framing Conference this past February and I sat in at Dr. Walter Goldstein's really informative talk on the agronomy of Methionine and high Methionine corn and from what I could glean from that talk, there's high Methionine corn, if everything is ideal commercially available in quantity hopefully within about three year's time. And so I took that into account and I shared that with our Livestock Committee.
And then also during the Aquaculture Symposium, there was a fellow from South Carolina, I forget the company, I apologize, but he talked about insect meal and that kind of thing and showed the analyses and there was Methionine in there and then I think there's some work having been done on fermentation to derive Methionine that way but there's not any hard data from what I understand but there's work on that.

Then, of course, the other way to look at Methionine is that the birds, you know, traditionally, I guess you could say, you know, get their Methionine from pecking at the ground for grubs and insects and whatnot.

So taking in those four factors, I think is why we decided not to allow the extent or the expiration date to just vanish, but to give two more years to hope that the industry, you know, can get over that hump that I think we're kind of almost at the top at from what I'm understanding and so that's
our reasoning on that.

CHAIRMAN DELGADO: Any questions?

Gerry?

MEMBER DAVIS: Hu, the talk that you listened to on the high Methionine corn, I remember getting some information off the internet two years ago on the high Methionine corn and it was probably from the supplier or the breeder of that particular variety or varieties. And they were asking for people to grow this corn so it would be more universally available for organic growers to use for poultry.

Did that talk address what's taking them -- you know, two years down the road, you would think there would be good development so far on that.

MEMBER KARREMAN: Dr. Goldstein is in the room. We can ask him to come up and address that briefly in a moment. I guess, you know, I'm just -- that question, you know, regarding, okay, if you're allowed to use
synthetic Methionine or if there is a loophole to get non-organic seed or other kind of little loopholes that kind of don't, you know, give the full stimulation of organic, you know, progress, I think we as a Board, like you're saying, somewhat are incumbent to maybe move the industry forward and so I think there may not be that many growers but I want to hear that from Dr. Goldstein first, or there may be, but if we don't have them at -- yes, that we have Methionine public comment. Yes, I know, there's a lot of folks here. So we'll hear from them, but to answer his question, perhaps Dr. Goldstein should --

CHAIRMAN DELGADO: Absolutely, I would like to call Dr. Goldstein to the podium if he is present.

DR. GOLDSTEIN: I'm Dr. Goldstein.

CHAIRMAN DELGADO: Thank you for responding. We have specific questions for you and as I recall correctly, the question is, do we have enough sources of Methionine
coming up in the near future?

MEMBER DAVIS: Yes, two years ago there was a call from this developer of the high Methionine corn to you know, we need to get this out here and grow the supply of this corn, so it can be available. What's happened in the last few years that makes it still in the status of not fully developed, I guess, as far as supply?

DR. GOLDSTEIN: Well, we have been moving forward in terms of trying to get seed for growers and we have produced seed, for example in Chile, with help from the Methionine task force this last winter. It's just arrived and we're about to get it out to farmers and to different people who will test it.

We are on a learning curve and a developmental curve with high Methionine corn and the learning not only is agronomic, it's also developmental in terms of getting farmers interested in it, getting seed growers
interested in it, getting the Methionine end user, the poultry producer, to invest in it. So it's bringing along the whole gamut of players that is, perhaps, the most difficult part of the whole thing.

MEMBER DAVIS: And your affiliation is?

DR. GOLDSTEIN: I work for Michael Fields Agricultural Institute. We're a non-governmental organization in Southeastern Wisconsin for sustainable and organic farming, and we've been breeding corn. Our project is a team project together with the USDA and --

MEMBER DAVIS: So your organization is the holder or the breeder of this type of corn.

DR. GOLDSTEIN: Right, we breed corn and we also use corn from our cooperators.

MEMBER DAVIS: Thank you.

CHAIRMAN DELGADO: All right, we have a question for the doctor from Katrina
followed by -- Katrina.

SECRETARY HEINZE: Could you just repeat your affiliation so I can get it down?

DR. GOLDSTEIN: Michael Fields Agricultural Institute.

SECRETARY HEINZE: Thank you.

CHAIRMAN DELGADO: Any other questions?

MEMBER KARREMAN: I have one question.

CHAIRMAN DELGADO: Hu.

MEMBER KARREMAN: I think, you know, with the expiration date, if we give two years now, we're recommending that, will that stimulate these growers that might be growing it or you know, is it just going to kind of keep kind of -- I don't know -- spinning wheels in a sense? I hate to put it that way but we want the high Methionine corn to come in as well as other methods of feeding the birds hopefully, in an organic way, so what's your feeling on, you know, the stimulus for
those corn growers to do that?

DR. GOLDSTEIN: I think the two years is certainly a stimulus. It's also a time in which we could, with the full backing of the industry, the poultry industry, we would be able to get quite a bit of seed produced, perhaps not sufficient for everyone but getting closer. And I have some figures that I'll present later at my presentation on that.

I think the whole thing has to be industry driven. There has to be buy-in from the poultry companies and I'm seeing that happening with the activity of the Methionine task force. I'm very excited about their inputs at this point.

CHAIRMAN DELGADO: Joe, followed by Tracy.

MEMBER SMILLIE: It's both for Walter and Hu. When I heard two years, I thought, you know, that's a short period of time. That's two growing seasons and I'm just
wondering why you picked two years, Hu, and
Dr. Goldstein, whether you think that that's
an adequate amount of time.

CHAIRMAN DELGADO: Hu?

MEMBER KARREMAN: I think the
reason we picked two years partially was based
on hearing your talk out in Wisconsin that in
three years' time if there's ideal conditions,
you have in Hawaii there's corn coming on and
there would be commercially available in
sufficient amounts. That was part of it, if
I remember that right. And that would be in
three years.

But then we also want to see -- I
guess, you know, representing the organic
community, I guess you know, we want to
hopefully see a diversity in diet and not just
-- you know, I mean poultry are omnivorous
animals. They're not herbivores and a lot of
the -- I think the organic birds are perhaps
being fed a fairly herbivorous diet with the
synthetic Methionine. And I think we need to
let the animals express their natural behavior
more and perhaps have a more diversified diet
and therefore, we put two years instead of
three so that some of these other factors that
I mentioned of those four would play in.

CHAIRMAN DELGADO: Do you want to
complement that answer, Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN DELGADO: Please go ahead.

MEMBER ENGELBERT: Also, Joe, as
simple as it seems, the last time it was put
on was just for three years and we decided
that two would make it a full five for the
normal Sunset process and let that be the --

MEMBER SMILLIE: But this isn't a
Sunset process.

CHAIRMAN DELGADO: No, no, it's
not.

MEMBER SMILLIE: And I am a little
confused. Maybe I'll wait until tomorrow but
I'm not quite sure what we're going to be
voting on tomorrow but you'll fill us in on
that because this document simply is rejecting
the removal of the time limit.

MEMBER ENGELBERT: Yes, but then we
-- there's a second document we voted on
immediately afterwards, and I'm -- literally
immediately for a two-year extension after all
our discussions.

CHAIRMAN DELGADO: Okay, so there's
two motions, just to clarify. One is to
reject the petition and the other one is to
extend it two more years.

MEMBER SMILLIE: And I still would
like to get Dr. Goldstein's opinion on the two
years for seed development.

CHAIRMAN DELGADO: That's right,
that's pending. Please, can you answer that
question?

DR. GOLDSTEIN: Well, we're doing
somewhat of a rush job. We're taking the best
corn that we have, we're making trials on it
in different states. We're analyzing it.
We're doing the best we can to get the seed
out within the two years. Three years would be more comfortable. The problem is that we need to make some fundamental changes and fundamental things have to come into place.

We have a new product. We have a price issue, what's it going to cost? There has to be relationships established between seed companies and the poultry companies that aren't there in place right now. There has to be incentives for farmers to grow it, so the farmers are the other link that has to be worked out. Two years, we certainly could have quite a bit of seed there, particularly if industry was willing to invest in growing seed in Chile for a winter period, we probably would have sufficient seed.

So there's all these different factors that are in play here.

CHAIRMAN DELGADO: Okay. Tracy, followed by Jennifer.

MEMBER MIEDEMA: If we get it wrong in our prediction that there will be non-
synthetic alternatives available by October 2010, what will start happening and how soon to the chickens, the eggs, the organic egg industry?

MEMBER KARREMAN: Well, that's definitely why we didn't take the -- that's why we didn't allow the expiration date to actually take effect this October, okay, because we don't want to see just a disruption in the industry.

But we certainly want to have the stimulus to look for alternatives and this has been discussed twice before by two Boards and here we're discussing it again and Dr. Goldstein and others are trying to do as good a research as they can. But I'd like to -- Dan, do you mind if I -- you know, Tracy's question was regarding the health of the birds and whatnot and the nutrition. Do you have some thoughts on that?

CHAIRMAN DELGADO: Before we continue, do we have any more questions for
Dr. Goldstein. I want to make sure that's the case. Jennifer.

MEMBER HALL: Thank you. Dr. Goldstein, mine is similar and I'm curious in your trials, if it's strictly the growing of the corn or if it is -- if it does include trials on the impact of what I see as the end user which is the bird?

DR. GOLDSTEIN: Both. Agronomic trials to find out what the yield penalty might be for growing these corns relative to growing normal hybrids, but also feeding trials together with our colleagues from University of Minnesota, Organic Valley, we've done both broiler and layer trials with our corn, with quite favorable results.

CHAIRMAN DELGADO: Okay, any other questions for Dr. Goldstein? Tracy, are you satisfied with the answer so far?

MEMBER MIEDEMA: I don't know that I got an answer to, you know, how soon would we start seeing effects and what are the
effects, I mean, just in lay terms of someone not very familiar with what the benefits are of Methionine to eggs and to the birds? What would start happening, you know, say, two months in?

CHAIRMAN DELGADO: I believe, Dr. Goldstein, could you answer that and then --

DR. GOLDSTEIN: I believe my colleagues, who are going to give testimony a little bit later on will answer that. I think they're quite prepared in that direction.

MEMBER MIEDEMA: Okay, that's fine, thanks.

CHAIRMAN DELGADO: Okay, in that case, thank you very much for addressing our group. You have a comment, please proceed.

MEMBER GIACOMINI: Okay, the evolution of this petition was ongoing and rigorous, I think, and there was a minority opinion that's expressed and in the recommendation and I would just like to make a few points that led to that point as the one
no vote on the Livestock Committee and the
writer of that document, that part of the
document.

It was very disturbing to me,
number one, for the petition to be saying that
we're very close to an alternative but the
solution that we want you to deal with right
now is to take off the incentive and the push
to -- of any expiration date at all. That
didn't seem to make a lot of sense to me.

One person I was talking to
yesterday said that that was based on the
advice of an attorney and I guess all I'll say
for that is maybe sometimes you should talk to
another attorney because that does not go --
did not go over well with the Committee.

The second part of that, as we
looked at the data that was presented with the
document, and the possibility of looking at a
two-year expiration date, three year, whatever
we were going to look at, I'll repeat what I
said at the last meeting, that I would be --
I would never want to see a loss of the poultry industry or any part of it because of such a restriction and a loss of such a small amount of the diet as what we're doing with Methionine.

But that being said, we have to really need it, and the data that was presented with the petition was essentially -- it did discuss the theoretical pure diet type effects of having no Methionine; health, immunity, feathers, cannibalism, all sorts of things. But when the data was presented that looked at specific trials with additional -- the additional Methionine removed from the treatment, the only data that was presented was less growth. There was no immunity, there was no health issues presented.

And being someone who works in the industry and the livestock sector of this, the ability to match conventional performance rates is not a justification to add synthetic substances to the National List in my mind and
I don't think we do that in other sectors. So I'm more than welcome and I hope we have some presentation of some real health issues, not just theoretical of pure diets where no Methionine was present, but based on current diets with current feeds, modern feedstuffs, where we're looking at what that difference would be and I'm not even saying that it would take a lot.

There was one public testimony that was handwritten and scanned in where it was simply a gentleman saying, you know, "I raise birds, and birds will die." That's almost enough because it's a real testimony and it's not just theoretical. But if we are going to give a performance exemption on this product and we are going to go put it on in two years, simply for consistency and there's parts of the industry that will want to tear me apart on this, but simply for consistency I don't see limiting it to poultry. If we're going to -- if all the presentation that they can make
is performance, we've got aquaculture coming up, we've got pet food issues, we've got other things that will probably be coming up before this two-year expiration date is done and giving this exemption only for one small sector of the industry when the only data presented is performance, I don't think is consistent. But I would more than welcome and hope that we see some real health data presented.

CHAIRMAN DELGADO: Thank you for that comment. Any other questions related to the proposal? Okay, should we --

MEMBER KARREMAN: That's it for the livestock presentation right now.

CHAIRMAN DELGADO: Okay, thank you very much. It is now 10 before 12:00 o'clock which is very good. I appreciate the fact that we are ahead of schedule. The next item on the agenda is the welcome lunch period. So we'll recess for lunch and come back here exactly at 1:00 o'clock if you will, 1:10, so
we can continue with the scheduled agenda.

Thank you.

(Whereupon, a luncheon recess was taken at 11:51 a.m.)

A-F-T-E-R-N-O-O-N S-E-S-S-I-O-N

(1:05 p.m.)

CHAIR DELGADO: Okay. We have a quorum and we're back in session. We'll continue with the second part of our agenda for today, and that includes Livestock
Committee with Dr. Karreman talking about aquaculture.

DR. KARREMAN: All right. Thank you, Rigo. So we're going to talk about our recommendation, proposed recommendation for the use of fish meal and fish oil in the proposed aquaculture standards. It's posted up there on the screen.

So, basically, we needed to clarify the fish meal/fish oil issue since we put that on hold since last spring as a contentious issue that has to be kind of balanced within the organic community. And we had our symposium last November, which I think we all still feel was a very good educational day, and we learned a lot from that. And so then we, as Livestock Committee, re-huddled over many phone calls, definitely the vast majority of all our phone calls since December until early April about fish meal and fish oil, and taking into account what the Aquaculture Working Group had proposed, and came up with,
based on very sound science from their
producers and Ph.D. nutritionists, as well as
the symposium panelists, as well as, for sure,
public comment, the following points kind of
helped come up with this recommendation that
we posted, which has been posted already on
the site.

So while respecting current
knowledge of the nutritional needs of aquatic
animals for fish and fish oil, there are
potentially certifiable organic alternatives
becoming available, but to what extent is an
open question. Certified organic fish meal
and fish oil would be expected to become
increasingly available as the aquaculture
industry would grow. To insure that the diets
are nutritionally complete at the beginning of
any aquaculture program that might start, we
propose that the aquatic products of other
certification systems be allowed via 7 USC
6505, Section 2106(b).

By doing this, we would reduce the
depletion of existing wild caught fisheries as a direct feed to any industry that would start here, as well as promote aquatic products from organically managed and, hence, sustainable systems that are already elsewhere established, like with the Soil Association and Tourland, and that's what we're kind of -- that was our thinking there. This will allow the nascent USDA certified aquaculture industry the needed time to establish enough basic feed for itself.

And since aquatic species are considered livestock under OFPA, we should also promote their natural behaviors. And since many species of fish - and, honestly, the Livestock Committee certainly was looking at the whole spectrum of fish. I mean, not that we talked about every fish species, or family, or genus out there, but not one specific kind of fish that guided any of our thinking, it's to incorporate them all. But a lot of species are piscivorus, or eating
other fish in the ocean, and that should be a
goal of nutrition in organically managed
animals, so that they're eating a natural
diet.

And then we talked a little bit
about the fish oils that the organic consumers
that consume fish also don't want to probably
have any terrestrial type of animal parts
being fed to organic fish. We took that into
account. And, also, the need for the -- if we
only feed plant-based feeds to the marine
fish, their Omega-3 content, which is
something that the consumers look for, might
not be there, or in a different kind of fatty
acid profile.

An earlier version of what the
Livestock Committee was talking about would
have included that fish meal and fish oil from
wild caught fish, and other wild aquatic
animals produced from sustainable food grade
fisheries, or sustainably managed foraged
fisheries could be allowed in the following
step-wise levels. No more than 12 percent during year one through five, and then no more than six percent during year six through eight, and no more than three percent during year nine through ten, with the percentages being on average over the production cycle of the aquatic animal life. That is still retained in the Minority Report that is attached to the back of this proposal.

We also had talked about in our conference calls discussions between December and April about creating a provisional-type label until there would be enough fish oil/fish meal harvestable from certified organic fish. And that would have had a 10-year life span, as well. But that did not make it into our recommendation, so with all that background, we would like to insert - I'm going to do the aquaculture feed first, but we also have .251 we'd like to insert, the Origin of Aquaculture Animals, but I'm going to do the Aquaculture Feed first, and that's
205.252. Let's see. I don't need to read through all of them. Which one was that? Sorry, just trying to find where -- I don't have to go through all of them, do I?

(Off the record comments.)

DR. KARREMAN: Okay. Sorry. So we're recommending to insert .252 A-M as posted, and we voted yes, in favor, one opposed, and one absent, as far as aquatic feed. There was a minority opinion from the one no vote, and perhaps that dissenting opinion, you might want to talk about the minority opinion, so if I may give it to Dan.

CHAIR DELGADO: Dan.

MEMBER GIACOMINI: Thank you, Rigo, and Hugh. In reviewing this topic, and I apologize to everyone, appearing as Mr. Minority Opinion today, but I started looking at this, trying to consider all the stakeholders, and all the options, and from my own background, and education, and experience. And it seems to me that with the growing world
population, a diet of high Omega-3 fatty acids is going to continue to be a positive health aspect for the human population. And if we're going to meet that, we want to try and do that without devastating our ocean fisheries. And in order -- and if there are problems in conventional aquaculture, can we work with the fundamental basics of the organic principles? Granted, we're not dealing with soil, but can we use those principles to improve on the problems that we're seeing in the conventional aquaculture to help us achieve these goals. And so that was my framework, and where I'm coming from in trying to work through this information to come up with a workable solution.

My opposition in the wording of the existing report has a couple of points. Number one is that I question our ability to essentially tell the secretary what to do, to we currently do not have any full equivalency agreements on organic regulations with any
countries, as I understand it. Telling the
secretary to make it okay, and just call
organic, all the foreign organic fish meal and
fish oil seems very presumptuous to me.

I, also, am very uncomfortable with
the inequity that that puts on -- would put on
the U.S. Organic Aquaculture farmers part of
the industry; whereas, I could see fish meal
and fish oil being traded between the salmon
and the sea bass people in Chile, and the U.S.
farmers wouldn't have any access to it, but
Chile would be shipping in organic sea bass,
and organic salmon to our regulations.

When I further look at the
regulatory issues involved, and I look to
OFPA, Section -- we have the issue that we
keep coming back to of, if it's organic, it
has to have an organic diet. And the -- but
when I look to OFPA, it not only says that,
and even though in my reading it may say it a
little bit differently in OFPA than it says it
in the regulation, it also has Section 2107
that says that with certain consultations, the Secretary shall allow wild caught to be certified or labeled as organic. And with those two sections in there, I guess I'm going to give credit to Congress that maybe some other people wouldn't necessarily want to get. I think they were aware that both parts were in the Bill, and that the fact that that is there, maybe there is some intention of - I don't know what it is - but maybe there is a way through the regulatory process that this can be found, a working solution to this can be found. And I would like to give the industry and the regulators the opportunity to try and discover that, rather than just presenting them with a document that does not have those points.

Finally, I have a fundamental -- a final point that makes me extremely uncomfortable, on the one hand, but I think it's something we need to recognize on the other. We keep hearing that wild caught
cannot be organic because of a number of reasons. Some of that is contamination, but
the essence of it is that they are not managed, and that they are not "agricultured."
If wild caught fish, in my mind, are not agricultured, then they should not be considered livestock. And if they're not considered livestock, then the fish meal and fish oil from those would be viewed entirely differently as being sourced from livestock, and being sourced from an agricultural source.

So, I think that's an aspect that hasn't been looked at at all. And I realize that may not be a very popular idea, but I think when I really sit down and look at what OFPA says, the law says, that's kind of the conclusion I come to. That then brings us to the question of what is the definition of livestock, which just lists aquatic species, which seems to be a little contradictory in that sense also. But I -- to come around, I have a number of problems with the report,
with the recommendation.

I recommend that we go back and institute the step-down, insert the step-down language into the recommendation to give the rule making process and the stakeholders a chance to see if there's a workable solution that does fit in with the way we are currently looking at regulations and laws.

CHAIR DELGADO: Back to you, Hugh.

DR. KARREMAN: Thanks, Dan.

Certainly, those discussion items are very clear in my mind still from all our calls.

Under OFPA, livestock definition does include fish used for food, it's not just aquatics, so it's difficult with OFPA. But since it does say wild caught can basically be considered, that's why I think we came up with that foreign certified that may use live caught, or wild caught, just their carcasses, trimmings and whatnot could be used for fish feed, but never to be sold here in the U.S. as final human product, those fish, just the
trimmings. Because if the industry is going to start, it's got to have something to start with. You've got to feed the animals, and after a lot of deliberations, and you were part of it, we all were in Livestock, I think we feel that we came up with the best possible way to start the aquaculture industry, and honestly not just tilapia and catfish, because that could take a very, very long time. And if they're farmed, they might not have the right profile of essential fatty acids and whatnot, that other fish that might have been fed wild caught would have, that are certified organic under sustainable conditions and whatnot. And so that's how we came up with the foreign inclusion.

And, also, from public comment, actually, from George Lockwood and their public comment, is to go back to what they proposed last year, essentially. However, in a way, if we would consider foreign certified allowable, but also include our prohibitions
on the fish feed coming in as foreign certified, but that that fish, carcasses, viscera, and whatnot trimmings have to be from animals that were not give parasiticides, and not given any antibiotics. And, Joe, you mentioned that yesterday, how that's very limited, it sounds like. And perhaps they could do that in those areas, and then we would be relieved of that major hurdle with the antibiotics and parasiticide use.

We feel that this is our best try, after a lot of talking. And the minority report also reflects our thoughts and discussions, and we just -- I guess we need to know a little bit perhaps how the Program feels about looking at foreign sourced certified feed for fish. We haven't really gotten any feedback from the Program at all on that, but the provisional label, I think we got some feedback where that just probably won't fly.

CHAIR DELGADO: Would members of
the Program like to comment? The answer appears to be yes, but they need time to find the answer. Are you ready?

 PARTICIPANT: Not yet.

 CHAIR DELGADO: Let's continue with other questions, and then we can come back to pose that. Jeff?

 VICE CHAIR MOYER: Hugh, the other point that I think was brought up, I brought it up yesterday, but it was brought up a lot during our discussion, was that in light of the fact that we don't have a certification program for aquaculture currently, foreign certified fish products are being sold in the supermarket today in the United States as human food. And what we're talking about is taking a byproduct from them, and using them to feed fish that would now be certified under our standards, so I think the standard that we're proposing is quite a bit higher in terms of the proportion of the foreign certified material that would be consumed by humans in
this country from what it is, down to the current lack of any standard.

CHAIR DELGADO: Good point. Okay.

Dan, you had a comment.

MEMBER GIACOMINI: I just would like to clarify something that you just said a second ago there, Hugh. As I remember, the Aquatic Working Group said that they preferred their 12 and 12, but they would accept the step-down as a reasonable -

CHAIR DELGADO: Thank you. Any other comments? Joe.

MEMBER SMILLIE: I'd be pleased to provide a gap analysis of a limited number of foreign certification programs; namely, two, that shows where and when they could be out of compliance with our interpretation of the U.S. regulations, so there's two caveats there. It's just, it's an interpretation of where they could be out of compliance. But we could
-- I could come up with that document, if that
-- if the path that you're headed down proves
fruitful, and there is some consideration of
allowing it, we could come up with a gap
analysis that showed the difference between
current foreign and national aquaculture
programs that are -- where they could possibly
be out of compliance with the interpretation
of the current regulations; namely, the
parasiticides and antibiotics, if that channel
proves fruitful.

CHAIR DELGADO: Any comments on
your part? I believe Barbara is ready to give
a response. Please go ahead.

MS. ROBINSON: Let me understand
this. You want the Program, or you want to say
that the feed which is made from the fish,
which is not organic, you want to accept that.
All right? But the fish itself, the filet,
you're not going to allow as food for humans.

DR. KARREMAN: If this proposal is
accepted, yes. Once that would happen, if
this were to take place, that foreign
certified organic fish can be used as chum, or
feed.

MS. ROBINSON: Correct.

DR. KARREMAN: Then the Program
here would be rolling, and there would be no
more foreign certified filets on the market
anymore, because then the -- isn't that what
we're talking about? They'd have to meet our
standards. Sorry. Once the standards here
would be in place, the only foreign stuff
coming in would be to feed USDA certifiable
organic fish. There would be no not tour land
or whatever filets on the market in Florida or
whatever.

MS. ROBINSON: This is illogical.
You're not being logical about this, I don't
think. You know, it's not good enough for us
to eat, but it's okay to feed to fish.

DR. KARREMAN: Just for regulatory
purposes, yes.

MS. ROBINSON: All right.
(Laughter.)

CHAIR DELGADO: Let's have -

MS. ROBINSON: And, moreover, we have -- as I recall, excuse me. As I recall, we lost a lawsuit over this issue.

VICE CHAIR MOYER: If I could attempt to clarify the comment, Barbara, that Hugh is making, and that this proposal is making. What we are stating in this recommendation is not that we take uncertified product. We're taking product that is currently not certified by U.S. standards, because we have no U.S. standard.

MS. ROBINSON: Understood.

VICE CHAIR MOYER: And right now, there's currently fish on the market today that is being sold as certified organic, under private label in this country.

MS. ROBINSON: Right.

VICE CHAIR MOYER: What we're suggesting, the recommendation suggests is that we use the trimmings from that fish, not
the fish itself, but the trimmings from that fish to supplement, to be the portion of the feed that represents the fish oil and fish meal portion of the feed for fish that would then be certified under U.S. standards. All other portions of the feed would have to fit under the U.S. standard until the point where there is enough U.S. market to supply the oil and meal content portion. Does that help?

It's very confusing, I understand.

DR. KARREMAN: Would it also perhaps help to maybe call that, going back to the term "supplement", we have like a foreign certified organic fish meal and fish oil supplement.

VICE CHAIR MOYER: Well, it is, but

DR. KARREMAN: Instead of like a feed.

VICE CHAIR MOYER: It is, but at 24 percent of the -

DR. KARREMAN: I realize that.
VICE CHAIR MOYER: -- food, that's a heck of a supplement.

MS. ROBINSON: Well, we need to -

CHAIR DELGADO: Let's make sure. Barbara, are you going to answer that?

MS. ROBINSON: We need to think about this, but it's -- because -- let us think about this. You know, I'm loathe to give you answers just off the top of our head. We usually get into trouble here, but it's just -- because I really do want to make sure that there's a logic and consistency here.

Jeff, you raise a good point. I mean, I do need to know, first of all; we need to know are we just talking about the supplement part of this?

VICE CHAIR MOYER: Yes, we are talking about the 12 -- currently, what we're talking about is the 12 percent fish meal, 12 percent fish oil, which is -- if you add that up it's 24 percent, if my math is correct, so it is a fair chunk of the diet. Too much to
actually be called a supplement, but it is that portion of the feed that is unavailable currently from any organic source, because we have no organic standard in this country. And so, taking the fish that is currently being accepted by consumers as organic under private label, and taking just the portion of that that's not being sold here for human consumption that's currently the viscera and the trimmings, using that to create the oil and meal portion, because it is coming from a certified organic - it's not our standards, we understand that - but it is currently accepted by the public as certified organic, or as organic. Using that portion to fill that niche of that -

DR. KARREMAN: And we could have a phase-out, as well.

VICE CHAIR MOYER: Right. But once they want to sell fish in the U.S. to our standards, all of that material would have to meet our standards, so it's a very -- I mean,
it's hard to tell at this point what that window would be until even those trimmings would meet our standards. But if they intend to market any of their fish product here in the future, they would have to adhere to our label, thereby, those trimmings would have to adhere by our label, too. Gets us out of the wild caught version, and it also gets us away from the idea of a step-down version, which, in my mind, has tremendous potential for failure in the marketplace with consumers. If you have a step-down process, and the industry fails to meet that, by the rule, what would happen is one day it would be organic, and the next day it wouldn't. And consumers have a hard time understanding how the product they bought yesterday was certified, and the product they buy today doesn't have certification, because we didn't make the alternate sources of fish meal and fish oil available through research over the next seven to ten years, whatever it works out to be.
That's very confusing to people in the marketplace, I think. It would be to me.

CHAIR DELGADO: Okay.

MR. MATTHEWS: I would say that it's probably no more confusing than when we went from accepted standards worldwide to the NOP. And under the NOP and the Organic Foods Product Action of 1990, if you want to sell label or represent in the United States as organic, it has to be produced to our standards. So I really am having problems with producing to a different organic standard, and then representing it, selling it in the United States as an organic feed for fish.

I would, if I were on the outside, I would be arguing well, why can't I use Germany's feed for my dairy cows? Why can't I use Chile's feed for my hogs? Why can't I use New Zealand's feed for my lambs? But even if it is at a supplement level, I mean, it's still being represented as an agricultural
product, so why can't I use some other country's agricultural product in the production of any other livestock, other than an aquatic species?

I don't -- I'm not sure that the attorneys would tell us that that is legal. And I'm also suspicious that Mr. Harvey would file a second lawsuit on the feeding of non-organic feed to U.S. organic animals.

CHAIR DELGADO: Very good. Thank you. The Program will respond later, it's my understanding, so we'll move on to the next question. We have Kevin, followed by Katrina.

MEMBER ENGELBERT: I'd like to try to address a few of the points that are made. The first is, with the feed from a foreign source, this is simply trying to bring in an oil that's not available in the current system. We were told that a step-down system would not stand up to lawyer scrutiny, that wild caught would also not stand up to -- wild caught fish oil and fish meal would not stand
up to the scrutiny of all the regulatory
bodies that the measure would have to be
approved by. So this is what we've come up
with.

And as far as the feeding for
dairy, cattle, or any other product, this
market is already established in the United
States, and those feeds would have to meet
USDA NOP program requirements. If it did, and
somebody thought it was cost-effective to
import it from a foreign country, they could.
But right now, we don't have those standards,
and this was the only thing that we could come
up with that would allow that to take place.

CHAIR DELGADO: Right. Katrina.

SECRETARY HEINZE: This is a
complicated issue, so I'm trying to understand
it in my simple mind. This really is for fish
who are piscivorus. Is that right? And as I
understand it, what you're trying to do is
find a way to kick-start that industry. And
so you've looked at a couple of different
options, wild caught was one, this foreign is another, the step-down is another. And what you're struggling with is, which one will pass regulatory scrutiny. Am I getting it right?

CHAIR DELGADO: Kevin, you want to respond?

MEMBER ENGELBERT: Yes. We've been told that the foreign certified organic, they don't know. Everything else we've been told won't pass the scrutiny. And the one mistake we've made with our recommendation we need to add to, and Hugh will read it off, is under (A), we assumed that everything else would have to meet our standards. And we need to be specific about that, and add in this one section to (A) to make it perfectly clear that everything else about this foreign certified has to meet our standards as far as substances or prohibited materials, or anything like that.

CHAIR DELGADO: Okay. Katrina, you had a question?
SECRETARY HEINZE: Well, I was just going to follow-up with, it does seem then that an NOP response would be helpful to get you to how do we do that kick-start in the way that's right.

CHAIR DELGADO: I believe that Barbara wants to comment, please, and we'll follow with Julie.

MS. ROBINSON: I just would like to say, the Program has never said that - at least I hope we have never conveyed to you that there can be no wild caught standards. We have a law that says that there can be wild caught standards, and the Program has certainly never issued any kind of statement that said there can be no wild caught standards. And if you somehow have gotten that impression, that's a mistake.

DR. KARREMAN: Well, I apologize, but we have been under the impression, maybe from various other stakeholders or whatever, that that just won't fly.
MS. ROBINSON: Well, you know -

DR. KARREMAN: And I've always wondered about it.

MS. ROBINSON: We've heard that some consumers may not want wild caught standards, but USDA has never made that statement.

DR. KARREMAN: Yes. You know, and some of us have wondered about it, because it is sitting there in OFPA that it can be considered. But then, apparently, to make it into regulation, we've been under the impression that that just won't fly.

MR. MATTHEWS: Well, it's allowed by -

CHAIR DELGADO: Please wait to be recognized, please. Mr. Matthews.

MR. MATTHEWS: It's allowed by statute, and we've had a work plan on the book for years. In fact, it was just republished for wild caught, and that stimulated a lot of phone calls to me as to what's happening on
Well, the bottom line is nothing is happening on it. It's just that we renewed the work plan, and so basically a previous board said no. There's a work plan that's out there because after the board said no, the statute was amended. So if this board wanted to move forward with a different decision from what the previous board did, well, then that's perfectly within their right.

Right now, there's no wild caught because there's been no recommendation by the board to develop standards for it. But that doesn't mean there couldn't be, so we've never said you cannot do it. Only the board has said you cannot do it.

CHAIR DELGADO: All right. Julie.

MEMBER WEISMAN: Yes. This may be opening up a different can of worms, but what is the downside of setting the standard that for the moment, only herbivorous fish will meet? And then those fish are being produced as certified organic at some later date, there
will be a certified feed source available that will then allow piscivorus species to then be certified organic.

CHAIR DELGADO: Dan, do you want to address that point?

MEMBER GIACOMINI: I believe there's already enough of a recommend passed that would accomplish that, once it makes it through rule making, in the practical rule making side. The second part of what you asked there is the fact that you are what you eat, to a certain extent. And those fish do not eat the diet that raises their oil levels high enough to achieve the kind of numbers that they're going to need, that they're looking at to be needing to feed the piscivorus.

CHAIR DELGADO: Any other comments? Yes, Tracy.

MEMBER MIEDEMA: This is just a little bitty one, but we refer to these trimmings as imported certified organic, and
I think that's a point of confusion, because that makes it sounds like it's USDA certified organic, and happens to be imported, and so just as a clarification for language, if we said organic non-USDA certified.

DR. KARREMAN: Sure. We can figure that in.

CHAIR DELGADO: Okay. Joe, followed by Jennifer.

MEMBER SMILLIE: Well, this is itty bitty to the itty bitty. It shouldn't even be foreign, it should be private standards. That's the word you want to use.

DR. KARREMAN: Okay.

MEMBER SMILLIE: Private standards.

DR. KARREMAN: Very good.

CHAIR DELGADO: Jennifer. Any other comments, questions?

DR. KARREMAN: I think, George, did you have -- George Lockwood, did you want to say something?

CHAIR DELGADO: Mr. Lockwood, can
you -- Dr. Lockwood, please approach the
podium and address your -- do you have a
specific question, Hugh, or do you want to
allow -

DR. KARREMAN: I just thought I'd
let Mr. Lockwood have some input here, since
they put so much time into this, and he's head
of the Aquaculture Working Group.

CHAIR DELGADO: Please do, sir.

MR. LOCKWOOD: Thank you, Mr.
Chairman. I'm George Lockwood, Chair of the
Aquaculture Working Group, your Technical
Advisory Panel.

We have a number of concerns about
the proposal, and hopefully, maybe some
comments I can make will help clarify some of
your thinking. We are concerned about
implementation under 2105(b), it's never been
done. When you determine an equivalent
standard, are you going to have to go and
determine that all of Natureland's standards
are equivalent, or just that having to do with
fish meal?

We also have concerns about whether the fish that will be grown for fish meal and oil will be grown to equivalent U.S. standards. We have proposed to the Chair of the Livestock Committee to insert that actually you would grow to two standards, the U.S. standard, and to the foreign certified that you're going to import.

If, in fact, we're able to get through the implementation and equivalency issues, we see that there probably will be a source of meal coming from very large sloppier production around the world. There's already one grower that is seriously considering this. Sourcing oil is a major concern, because the only oil, the only source of oil is the ocean, practically speaking. There are no land crops that produce DHA and EPA which are the Omega-3 fatty acids that are so important.

I would like to give you an example here of salmon, for instance, how this would
apply to salmon aquaculture. Salmon is the third or fourth most consumed fish species in the American diet. The average American eats two to two and a half pounds per capita. It's a very high oil fish in nature and in culture. It requires somewhere between 10 and 20 percent oil for a healthy diet.

In the regulations that you've already adopted in your March 2007 meeting, you adopted under 205.252(j) the prescription of feeding fish the same, from the same genus. In other words, salmon can't be used to feed salmon. That means we would have to turn to some other species for oil. The only other species that will undoubtedly be grown, at least initially, in any quantities are shrimp, tilapia, and catfish. They are very low oil producing fish. We're talking about one, two, or three percent. So if we take the viscera from catfish, for instance, that only has one percent oil in it, we're not going to have much oil in order to develop a salmon
industry. It just won't work.

Another way of doing this would be to grow anchovies, for instance, for example, for the sole purpose of feeding to U.S. aquaculture, salmon, for instance. In other words, what we would do is take wild oil in Europe, grow anchovies, extract the oil and send it to the United States to be used as is proposed. We are, in essence, laundering the oil. That's all that we would be doing. And that just doesn't make sense to me.

As I said yesterday, upon our very careful review, and from a practical point, we just simply don't see how this is going to work. We have made recommendations, and we strongly urge that you seriously consider restoring to what we had proposed, and you acted on on March 27th of last year, our Paragraphs B, C, D, and I. And we suggest that you add Paragraph Q, which is from the Livestock Committee report, that would read something like the following. And I've made
an amendment, and I'll tell you when I get to it.

"Fish meal and oil from carcasses, viscera, and trimmings from the processing of foreign certified organic aquatic animals" - and I would add - "as provided under 2107(b), and otherwise produced in compliance with this section, will be considered organic for use in fish feed only."

So that, basically, is what we would recommend, that you support our recommendations that we labored over very hard, just as you have been doing. We think the Act fully supports this.

For instance, in 2103.11, the Act clearly intends for fish to qualify as organic. In Section 2114(f), provides for the harvesting of wild crops. Section 2107(c) allows wild fish to be organic. 2103.21 provides for products from naturally occurring biological processes. 2110(f) allows the use of supplements, or at least acknowledges the
use of supplements.

In conclusion, the Act states the intent for organic seafood, and provides the legal structure. To effectively eliminate fish oil, there will be no organic seafood. In the absence of a firm standard, foreign grown, foreign certified, foreign labeled salmon will continue to enjoy their harvest in the U.S. market for organic salmon.

Again, we urge the restoring of the paragraphs in our original proposal, which, incidentally, are in our public comment as Appendix A, and the ones that were withheld, they weren't deleted, they were withheld for further consideration, are italicized. Thank you, Mr. Chairman. Thank you.

CHAIR DELGADO: Any questions for George? Hugh? Any questions from the Board for George? Thank you very much.

MR. LOCKWOOD: Thank you.

CHAIR DELGADO: Okay. Any questions for the members of the Livestock
Committee on the part of the Board? Very good. Well, it seems to me that Chairman of the Livestock Committee, you probably need to do some reword, some rethinking.

DR. KARREMAN: Major, big time, probably.

CHAIR DELGADO: Very good. And that concludes your presentation. Do we have anything else?

DR. KARREMAN: That does. The only other thing was that discussion item on net pens, and we're working still with the Aquaculture Working Group on the main -- well, two of the issues are siting the pens, potentially. And, also, the manure nutrient effluent from those pens, and so we've asked the AWJ to be available to answer questions regarding that from the Livestock Committee in the coming months, and hopefully come up with a few alternatives to each of those questions that we can choose from in the public sphere.

CHAIR DELGADO: Very good. All
right. Thank you, again, and I look forward
to having those changes or modification
suggestions from the group.

We move on next to the Handling
Committee, with Mrs. Weisman.

MEMBER WEISMAN: Good afternoon.
Wow! Congratulations, Rigo, we're still on
schedule.

CHAIR DELGADO: We're on schedule,
yes.

MEMBER WEISMAN: I hope I'm not
going to mess it up, but there's a good chance
that I will.

(Laughter.)

MEMBER WEISMAN: We have on our
agenda two classes of things. We have
petition materials, and we have some sunset
items. I think the first thing that we have
on our agenda are the petition materials.

There were originally posted on the
agenda two items for 605, which have both been
deferred, one because we felt we did not have
sufficient time to -- in the case of calcium derived with seaweed, we did not feel we had enough time to adequately tease-out the issues. There was also sodium chloride acidified, and that was a late petition that did not really have adequate time for the TAP review that we felt was required, and for that reason it was deferred.

For 606, out of the 20 materials that are listed on the -- that are indicated on the agenda, 16 -- four were deferred, and actually one also was withdrawn in the weeks prior to this meeting, so I think that means that we have 15 petitions to present today.

Now, before we actually present the petitions, I did want to make a couple of some comments, some sort of opening comments about 606, in general, to attempt to address some of the comments that we have received, both written ahead of the meeting, and so far during our public meeting.

The first thing that I wanted to
clarify, from our point of view - no, not just from our point of view - I want to clarify, the Handling Committee and the NOSB in considering 606 petitions, is not deciding commercial availability. That is the job of the certifier. That's number one.

The second thing I wanted to clarify is that when materials are deemed appropriate for 606 by the Handling Committee, they will be listed based on the Board's finding, if either of two situations are found to exist; that it is not available as organic, period. Now that doesn't mean, necessarily, that the raw agricultural product may not be grown, but it's not available in the form that's needed for a processed product. The second is fragility of supply, so either it's not available, or the supply is fragile. One of those two situations has been found to exist.

The second issue that has been coming up very consistently is the question
about whether listing on 606 is an incentive
or a barrier to the stimulation of the
development of new organic materials to
replace the ones that are being listed on 606.
And the organic community, I think we have
seen, is sharply, and I think pretty evenly
divided on this issue.

I would like to offer a couple of
thoughts on this. As with many things in
life, the answer likely is not one or the
other. Both may be true, and the answer may
differ either case-by-case. I do appreciate
the comments that express concern over the
growth of -- the increase in items on the
National List, and the despair that it's only
going to get bigger, and it's never going to
get smaller. And I guess I want to remind
everyone that even though it feels like we've
been at this forever, because I think for many
people in the room, it's been most of your
adult lives, that the industry and the
regulation in the world of federal regulations
is very young. It's only been in effect for
five years. And I believe that the -- first
of all, as new products begin to understand
the regulation and want to participate, it is
natural that there are going to be materials
that are seen as needed, and petitioned on to
the list.

But I also think that we are going
to see very soon -- I think there are already
-- we are already hearing about petitions that
are being written and formed for specific
items. I'm not talking theoretically here.
I mean, there are specific items that we are
going to see petitioned off the list. And I
know that it seems like it's taking a long
time, but that doesn't mean that that is not
going to start happening with more frequency,
I believe.

The other -- there have been calls
in different ways for a moratorium for listing
any new items for a couple of reasons. One
that was mentioned was a concern about --
well, one was a suggestion that only raw agricultural products should be petitioned on to 606. We can certainly fully discuss all of these. I don't think that that's really a practical approach.

The other is that we refrain from listing items until we have clarification on what, besides the agricultural ingredient, is also included in a formulated product, in a multi-ingredient product. And I have two thoughts about that. One is that, I was very, very interested in the suggestion that Richard Matthews made earlier today, when we were discussing annotations on livestock. And I believe that something like that in the heading of 606 might help clarify what can and cannot be included in a multi-ingredient product on 606.

The second note I wanted to make is that of the 16 petition, of the live petitions as of today for 606, only six are going to be put forward as recommendations for listing by
the Handling Committee, and none of them are multi-ingredient products. So I believe that -- I want to allay people's concerns about the actual petitions that we may be considering for listing at this meeting.

I think that's probably enough opening comment. And I can move into actually looking at petitions, unless there are questions.

CHAIR DELGADO: Any questions for Julie? None. Please proceed.

MEMBER WEISMAN: Okay. I think the -- we have a list in our meeting books. It's in Alphabetical order. We are -- the first two items on that list are the alcohols, the fortified cooking wines. And I'm actually asking different members of the Handling Committee to present different of these petitions because there's so many of them, and you'll get really tired of hearing my voice.

The other note I wanted to say is that there was a whole group of petitions that
were submitted by one petitioner. They were somewhat boilerplate in their presentation, and they were so similar, and we pretty much, I think, are treating every single -- I mean, we had similar findings on all of them, without exception, pretty much, so the bulk of those are going to be presented by Katrina and Steve, with a few stragglers. So I think we'll proceed with Tracy on the cooking wines.

CHAIR DELGADO: Tracy.

MEMBER MIEDEMA: Thank you, Mr. Chair. Thank you, Julie.

I'd like to actually start with the second one. The first two petitions were submitted by the same petitioner, and they included a bunch of their evidence, lack of supply in the fortified cooking wine sherry that supports their petition for Marsala, so I thought it made sense to start with that one.

So we recommended unanimously for the inclusion of fortified cooking wine sherry
to 205.606 to the National List. We felt that it did satisfy in our evaluation criteria, one, two, and four, and number three was N/A, not applicable. Our Committee vote was six yes, zero no. And just a little bit about the petition.

This substance does have unique flavor and fragrance characteristics that are necessary for the prepared dishes that the petitioner makes in their prepared foods. And they were able to demonstrate that it had these unique properties. They also did an excellent job of thoroughly listing fortified wine producers that didn't have any organic available, and organic wine producers that didn't have any fortified wine available. So it was quite an exhaustive list of both of these types of producers. And just sort of as a check, we triangulate, use various means to check availability. Just doing Google searches, it was interesting. The only organic sherry I could find when I put quotes
around those two words, you'd think you've get 15,000 hits or something, just because it's a pretty typical phrase, the only hits I could find was the petitioner begging the industry to please produce some, so they seem to really be out there doing their due diligence, looking for someone to produce these two types of fortified wines, so opportunity out there. Hopefully, this would be one of those situations that we hope happens, where 606 is seen as an opportunity, and spurs an organic version to be made.

The petition for Marsala is almost identical, if I can move on to that one. The only difference is just the unique flavor, profile, and characteristics, some very slight differences in the way the wine is produced. And they use their, like I said, their evidence of going to wine producers and not being able to find any organic versions, going to organic wine producers and not being able to find those two varietals, as evidence. But
they only put that evidence in one petition, sherry. In their Marsala petition, they referred to their sherry petition, which was — procedurally, it would have been cleaner for the petitioner to have went ahead and just repeated that research, so it wasn't siloed off. One petition referring to another just isn't procedurally accurate. But we, as a Committee, agreed that it was sound. And on Marsala, we voted unanimously 6-0 to include fortified cooking wine Marsala on 205.606.

Any questions?

CHAIR DELGADO: Any questions for these two products? Jeff.

VICE CHAIR MOYER: Thank you, Mr. Chairman. My question isn't, necessarily, just for you, Tracy, but for the Handling Committee, in general. And not only specific for the cooking wines, because my question pertains to all of the products that I see listed in front of me. When you look at the list of criteria for every one of them, we
have that it meets the criteria for impact on humans and environment; yet, this is conventionally produced agricultural products, and so it leads me to wonder if there's no human or environmental impact from conventionally farmed products, why are we here? It would seem like just by definition, the fact that they're conventionally produced in the minds of an organic person, it doesn't meet those standards.

Whether we vote it on to the list or not, in my opinion, it fails that criteria. I'm not saying that's grounds to list or unlist it, I'm just saying I have a problem with that.

CHAIR DELGADO: Response from Julie Weisman.

MEMBER WEISMAN: Yes. Well, I think the -- for instance, some of the questions -- I do think that there is some cleaning up that has to be done, that some of these have been -- I mean, I do agree that has
to be looked at, but I also would like to
point out that some of the questions, there
are certain questions on these Category 1, 2,
and 3 of the evaluation criteria checklists
where the notation refers to 205.600(b) and
various numbers under (b). And those are
questions that are really meant only for
synthetic substances. Okay?

Some of these questions are meant
for synthetic and non-synthetic substances,
and I think that where something that would be
an agricultural product that's not organic
needs a little clarification where that fits
in. And I think that they've not been
considered exactly the same on each petition,
and that may, in fact, be something that does
have to be cleaned up.

CHAIR DELGADO: Okay. Tracy.

MEMBER MIEDEMA: I would agree with
Julie, and also add that when you look through
that list of questions, things like is there
a toxic or adverse action of the material or
its breakdown products? We're talking about what happens when that wine is in the environment, not what happens during its whole life span of the grapes being grown. And since 606 is non-organic, it is a given that we're potentially talking about conventional agricultural practices, so I think it's embedded in that we're talking about conventional.

CHAIR DELGADO: That is a key. I just want to clarify 606 is the allowance of non-organic products, agricultural products if there are no organic available, and that's sufficient for now. Jennifer.

MEMBER HALL: In the evaluation, do we consider the percentage of the composition of the product that the material we're allowing is? Is the Marsala or sherry 60 percent of -

MEMBER WEISMAN: This is only for the -

CHAIR DELGADO: Julie.
MEMBER WEISMAN: I didn't wait.

Sorry for jumping the gun, Rigo. It's only 5 percent of a finished product, so the Marsala wine at most can be 4.9 percent or something like that.

CHAIR DELGADO: Tracy.

MEMBER MIEDEMA: And the last thing I'll throw in here is that the petitioner stated very clearly this was for a Chicken Marsala product, and it really made me bristle that this is non-organic Marsala in a product calling itself Chicken Marsala. And my colleagues on the Committee reminded me that that's an enforcement issue, not within the purview of this Board or our Committee.

However, I was really impressed by the way the petitioner handles this, and they on their own website say we're looking for organic Marsala wine. We want everybody to know we're not trying to get away with something, and so it was very -- it was handled really well.

CHAIR DELGADO: Any other questions
on those two products? Thank you. Back to you, Mrs. Weisman.

MEMBER WEISMAN: On our list, which is alphabetical, the next four items that I'm just going to mention briefly are deferred. They are the two algaes that I mentioned earlier today, also black pepper extract and bucholt powder, those four items have been deferred.

I'm going to ask my colleague, Dr. Heinze, I like saying doctor, to present a group of petitions that were submitted by one petitioner.

CHAIR DELGADO: Madam Secretary.

SECRETARY HEINZE: Okay. Thank you for the Madam.

Okay. As Julie said, a number of materials petitioned for listing on 205.606 were submitted by the same petitioner, so I will be presenting five of them, then the rest will come. So the five materials that I am presenting are Chinese thistle daisy extract,
peony root extract, polygala root extract, polygonum root extract, and tangerine peel extract. On a personal note, I do thank the petitioner for the education I got reviewing these.

None of these - so kind of the top line, first - none of these materials are being recommended by the Handling Committee for listing because of not meeting the criteria for Category 4, so that's the commercial supply is fragile or potentially unavailable. We did not feel that the petitioner made that case.

So a little bit of background.

Yes, Kevin?

CHAIR DELGADO: Kevin.

MEMBER ENGELBERT: Yes. Katrina, could you please repeat what the five were that you were going -

SECRETARY HEINZE: I'd be happy to.

MEMBER ENGELBERT: Thank you. I was trying to find that page.
SECRETARY HEINZE: Okay. Chinese thistle daisy extract, peony root extract, polygala root extract, polygonum root extract, and tangerine peel extract. See, I even made Hugh chuckle. All my co-workers chuckled, too, while I was working on this.

Okay. Are we ready?

CHAIR DELGADO: Please continue.

SECRETARY HEINZE: So a little bit of background on these materials. In all cases, these ingredients are intended by the petitioner to be used as nutraceutical ingredients in dietary supplements and foods.

And then, again, in all cases, a little background on how they're produced. The raw agricultural material, so for example the Chinese thistle daisy root, is harvested, dried, shipped to a processor. It's milled, then extracted with water and ethanol. The extracted liquid is concentrated into essential oils. That will be important in a minute, so it becomes an essential oil. And
then it's standardized, mixed with organic -
I can't say this word again - astragalus root
carrier, spray dried and ground into a powder.
So they're all processed the same way.

Okay. So now we get to the heart
of the matter. In all cases, the
justification by the petitioner for the
organic not being available was the same.
What they said, and this is a paraphrase, was
that the sourcing department was continuously
searching for the organic forms, but had been
unable to find them. No information was
provided to explain why the organic ingredient
could not be available, so they just said
we're looking for them, we can't find them,
we're still looking. They didn't really
address this fragility, like what were the
underlying factors that could have made the
organic not available, which the Handling
Committee felt very strongly was necessary
information.

So, as an example, I, and probably
many of you can buy organic tangerines at my local co-op, so what are the technical hurdles that would prevent that peel from the tangerine being used to produce organic tangerine peel extract? And the petition didn't address that at all, which we felt was a problem.

Finally, in three cases, the Chinese thistle daisy, the peony root, and the polygala root, fairly simple internet search found organic forms of these materials. Now, not in this exact form, but either as an essential oil, or as the raw agricultural material. So, again, just because you can find it doesn't mean that it's in the right form, quality, or quantity, but certainly, we would have liked the petitioner to address that, and help us understand, again, what the technical hurdles were.

So to wrap that up, in each case, these materials were recommended for listing on 205.606 consistent with our past practice.
So, remember, motion to list, and then in each case, the Handling Committee vote result was in the negative resulting that we're not recommending them for listing. Did you follow that? Okay. So I am supposed to give you the vote results, so by material, Chinese thistle daisy extract, zero yeses, six nos; peony root, zero yeses, five nos, one absent; polygala root extract, zero yes, five no, one absent; polygonum root extract, one yes, four nos, one absent; tangerine peel extract, zero yes, six no.

CHAIR DELGADO: Any questions on these materials? Hugh.

DR. KARREMAN: Just a general question. Did I understand you right, in that they told you the process where they make the extract, so that they're buying the raw material and making the extract, or what?

SECRETARY HEINZE: I don't believe that's true. They just explained how it's made. I believe they're looking for the -
DR. KARREMAN: The final product.

SECRETARY HEINZE: The final product. From the petition, that would be how I read the petition.

MEMBER WEISMAN: Okay. Now I'm going to turn the mic over to Steve DeMuri, who has a group of similar petitions.

MEMBER DeMURI: Thank you, Julie.

These were all petitioned by the same petitioner that Katrina just had for her five, and these five are as follows; Codonopsis root extract, Jujube fruit extract, ligusticum root extract, Poria fungus extract, and Rehmannia root extract.

MEMBER WEISMAN: Can you do that again, slower? Thanks.

MEMBER DeMURI: Codonopsis root extract, Jujube fruit extract, ligusticum root extract, Poria fungus extract, and Rehmannia root extract. Everybody got those?
Just like the items that Katrina had, these ingredients were also intended to be used as nutraceutical ingredients in dietary supplements and foods. So this petitioner petitioned numerous items all to be used for the same end-use. And like Katrina's five, and these as well, the raw agricultural materials harvested, dried, shipped to a processor where it is milled, and then extracted with water and ethanol. The extracted liquid is concentrated into essential oils standardized to desired concentration, mixed with organic astragalus root carrier, spray dried, and then ground into a powder, so that's the process they supplied to us.

And, again, in all cases, the statements concerning organic non-availability was the same, that the sourcing department was looking for the items, but just could not find them. But, again, like the previous five, there is no information provided as to explain
why the organic ingredient cannot be available in organic form. In all five of these cases that I had, internet search, and also some follow-up phone calls revealed that there were organic forms of the raw agricultural materials available in all cases, but the petitions did not address the reasons or conditions that made their specific process forms unavailable. So for those reasons, all five of these materials failed Category 4 of the criteria.

In each case, the Handling Committee vote resulted in a negative for listing. And the vote results were as follows: for Codonoposis root extract, zero yes, six no, no absent, no abstentions; for Jujube fruit, zero yes, five nos, one absent, zero abstentions; for ligusticum root extract, zero yes, five no, one absent, zero abstentions; for Poria fungus, zero yes, four no, one absent, one abstention; and for Rehmannia root extract, zero yes, five no, one
absent. So that finishes up those five petitions.

There's one other one that Julie mentioned that I had on my list. That was oat bran concentrate that does show up in your list. That's the one that was withdrawn just a few weeks ago, so we do not plan to take any action on that. And that's it. I'll turn it back over to Julie, unless there's any questions.

CHAIR DELGADO: Are there any questions on these materials? Okay. Thank you. Back to you, Julie.

MEMBER WEISMAN: Okay. There's about two more materials that were part of this group from this petitioner, and Gerry is going to present one of them.

CHAIR DELGADO: Gerry.

MEMBER DAVIS: Thank you. The material petition that I went over was Camu-camu powdered extract, and it is from a berry produced in the Amazon, generally, South
America. And it's an extract slightly different than the ones mentioned. It's produced just from juicing and straining the berries, which is then concentrated and spray dried along with organic cassava starch.

The petitioner states that the extract is produced from juicing and straining these berries, and that it has -- the Camu berry has never been available as organic. The berry is harvested in remote wilderness areas of the Amazon flood plain over vast areas which have not been practical to manage under an organic system plan. Being that none of us were familiar with this type of wild harvest situation in South America, one of our members suggested I contact the Instituto Biodinômico, IBD, in Brazil. And in contacting them, they do certify wild harvested Camu-camu as organic, but when asked to check on it further, what they certify is organic Camu-camu as an ingredient of a liquid juice product, not as powdered extract form.
And they report that there is no domestic U.S. organically certified product available at this time. But since the petitioner did not really address why it's not -- that this organically produced Camu-camu from Brazil, why it can't be used, they didn't even talk about at all, they said it was not available. It never has been grown, which didn't seem to be accurate, versus what we found from IBD, so the Committee voted that Category 4 criteria was not met because the petition did not address why organic Camu-camu produced in Brazil cannot be used. So the vote was zero yes, five no, one abstention to not include it on the National List. Any questions?

CHAIR DELGADO: Questions on this material? None. Thank you. Back to you, Julie.

MEMBER WEISMAN: I would like to ask Joe Smillie to present three materials.

MEMBER SMILLIE: Val, we're going to do caramel first, then Kombu, then the
When we were dividing up these, just a little aside on this group. When we were dividing up these materials, those all had big names and looked hard, and so I thought I took the easy ones. Boy, was I wrong. But I'd also like to thank our Chair, who hearing the squeals of pain from the Handling Committee jumped in and brought in the calvary, and Gerry kindly, and Tracy joined the Handling Committee to help out with the materials. So once again, the group work and our wonderful Chair, we got through these materials.

So starting off with caramel color, it was a really interesting petition because the petition for the conventional caramel colors was actually petitioned by one of the manufacturers of organic caramel color. And that, right away, you don't usually see that, but when we got into the petition, and, again, going through Category 1 and 2, basically, in
Category 2 is the substance essential for organic production?

    Well, people in the U.S., at least, want their colas dark colored, so whether that's essential or not, I guess the marketplace says it is. I don't particularly feel it to be essential, but not being a cola drinker, I don't have that problem. But, nonetheless, we quickly got into the fact that various different manufacturing -- it's Category 2, number 5, is there an organic substitute? And I thought yes, there's organic caramel color available. There's at least two companies producing it. But when we got into it deeper, and the petitioner did an excellent job explaining it all, every different manufacturing process, and every different manufacturer has various different constraints, mostly to do with pH, and viscosity, and oh, boy. It's food science world out there on what can be used, and what can't be used. And the petitioner had nothing
to hide. I mean, they produce organic caramel
color, and they're saying we can't produce
this color for all the needs of the organic
manufacturing sector.

So, basically, the petitioner
claimed that these forms were needed. We
checked into the other major manufacturer that
we knew, just to see, check the voracity of
the petitioner's comments. And sure enough,
they backed it up. They said yes, that's the
case. And there's a lot of manufacturers in
this room that know more about this than I do,
but all caramel colors are not created equal.

So we looked at it, and we were
open to the idea. But when it got right down
to it, the main barrier to the production of
caramel color for different uses was it was
cost-prohibitive. That ended up, it wasn't
constrained by supply, because caramel color
is nothing but burnt sugar, basically, more or
less in layman's terms, so it wasn't
constricted by supply or civil unrest in the
sugar world, or any of the usual things. It was cost-prohibitive. And on that basis, we voted. Again, a motion was made to list it. The vote was zero yes, six no, no absent, and no abstentions.

We felt that cost of production was not a significant reason to add it to 606.

Okay. Thank you.

CHAIR DELGADO: Any questions for this material? None. Continue with the next one, please.

MEMBER SMILLIE: The second one. Simply enough, Kombu seaweed. Well, on the surface it's simple, but technically, it would Lamanaria Japonica, Lamanaria Japonica variety ochotensis, Lamanaria Angustate, Lamanaria Angustata variety longissima. We also had a very good public comment that said you can group these varieties into what's commonly called Pacific Kombu, as different from Atlantic so-called Kombu, which the Japanese aficionados would not call Kombu, but which
is called Kombu in the trade, being a type of Lamanaria, but not having those unique qualities of Kombu that are essential for the organic production of certain products.

So, again, is there organic substitute? The answer is there are organic certified seaweeds on the market, and some of them even are similar to Kombu, but they don't create the Kombu-like effect, which is essential for certain foods.

The petitioner did an excellent job, once again, in describing why these characteristics are needed, and why the current production of Kombu at this point in time cannot be certified. And, again, there exists for possibilities for the certification of Kombu under the wild harvest regulation, but for a variety of reasons, these have not been attempted as yet. And that was documented very well on the reasons why, and I haven't got the time to go into them all.

It's possible in the future, but it
doesn't look probable, and we shall see. Because, once again, as Julie said, once a supply of organic Kombu is available, that supplier can petition the Board to remove Kombu from the list. And that is, I believe, a very effective action, and I also believe, and I don't think it's been mentioned yet, but that action, that petition to remove takes precedence in the petition queue.

We followed up, and talked to five or six distributors of Kombu, and kelp, and seaweeds, and that thing. They all verified that they could not find, even though they've searched themselves, for organic Kombu. There was only petitioner, but many people, including some who have been certifying product for many, many years using Kombu in the process, even they, who are well-known for their diligence in finding organic ingredients, simply locate organic Kombu.

So the case seemed clear to us that it certainly met the criteria, and the vote
was for five yes, zero no, and one abstention.

CHAIR DELGADO: Okay. Any
questions? Can you repeat the vote, please.

MEMBER SMILLIE: Oh, five yes, zero
no, one absent, and zero abstentions.

CHAIR DELGADO: Very good. Any
questions on this material? Okay. Can you
please proceed with the next one.

MEMBER SMILLIE: Yes. I would be
happy to. If you believe that, I've got
shares to sell you and a bridge.

The next petition substance is
okra, specifically IQF frozen okra. The
petition was very long, and thoroughly
documented petition. And it basically said
that it's not available. There's certainly a
fragility of supply, but it also wasn't
available at this time. So the two criteria
for the actual consideration were both in
place.

It's an agricultural product, and

Jeff raised that argument that it's
conventionally raised, so, hence, we look at Category 1, Adverse Impacts in the Humans or Environment. We all agree that we're going to move along on that.

Was it essential for organic production? And the answer is yes. The word "gumbo" comes from the African root, which was the description of the vegetable okra. It's not simply a vegetable used for its taste, it's used for other properties, mucilaginous properties, which is why some people love gumbo, and other people can't stand it.

And, also, if you will humor me for a while, is what's called in New Orleans, filet gumbo. Well, in the winter when any okra was not available to the gumbo makers, they had to keep delivering gumbo, so instead of okra mucilaginous agent, they used sassafras leaf, and sassafras was called filet. And that's where the word "filet gumbo" comes from. It doesn't have okra, so perhaps the organic substitute could be
sassafras leaf, which is probably not
available organically either, but real gumbo
lovers are not going to go for it.

So we're on to Category 3, is it
compatible with organic production? One of
the questions we look at, and I know all the
NOSB followers love this one, is the primary
use to recreate, improve flavors, colors,
textures, and things of nutra values lost in
processing? And the answer, no. The value of
this product doesn't replace something lost in
processing. It brings something very unique
to the product.

So then we get to Category 4. Is
the commercial supply of an agricultural
substance as organic fragile or potentially
unavailable? And the answer, according to the
petitioner, was yes, and they documented that.
The petition actually contained long lists of
the different producers and IQF facilities
that they had contacted in the search for this
product.
We double-checked that, and talked to a lot of people. Now, we did not talk to the Southeast African American Farmers Organic Network, but we did talk to a lot of the certification agents, especially those that do a lot of work in areas that have 120 growing days. Marty, don't run out of the room. And they did not have qualified commercial supplies of organic okra available. There seemed to be a paucity of growers that were growing okra commercially. It's a difficult crop. It does not transport well. And matching up a very scarce supply with an even scarcer IQF capability was documented in the petition. That's about all I can say about that.

Quality is not particularly an issue. Quality of okra, doesn't transport well, and it isn't an issue in a fresh market, but in the IQF market, it wasn't such an issue. Quantity just did not seem to be there. And, again, back to the form argument,
what was asked for, and I'm not sure if the petition reflects this correctly, was frozen IQF okra. That was what the petition was for, not fresh okra. I'm not sure if we need to amend that or not.

We talked about it, and we said --

I said, you know, I'm telling you guys, when this goes on the list, there's going to be a human cry because you can grow okra organically. It's not -- it should be that difficult, but the petitioner was exhaustive. Our search of available IQF facilities and growers, and, again, our search was not globally worldwide. We did -- the petitioner did list foreign sources, as well, and we did our best to try and find it. And a couple of members of the Handling Committee, being growers also, worked through their networks, so I wouldn't say it was an exhaustive search, but it was a pretty good search. And based on what -- the document that we received, we voted five yes, zero no, zero abstentions,
zero abstain, and one recusal.

CHAIR DELGADO: Any questions on okra? Yes, Julie.

MEMBER WEISMAN: I just want to double-check. Let's see. Under Category 4, Question 3, the comment. I'm wondering if that was what you meant to write, or if there's a word that was omitted by error. Did you mean to say that fresh okra does keep well, or that it does not keep well.

MEMBER WEISMAN: Thank you.

CHAIR DELGADO: For the record, that correction is being made. And, Dan.

MEMBER GIACOMINI: As it is in a lot of cases, the issue comes down to the words used in the question. It seems -- the question is, is there any okra grown near the freezing facility? I mean, do you have the okra, do you have a freezing facility, or if you have a freezing facility, could you grow
the okra? Do you know how sort of -- I mean, do you think the right questions were asked?

MEMBER SMILLIE: Yes. Again, those -- if you have the okra in commercial supply, and there's not an IQF facility nearby, I still think you could get it done. It would be hard, but it could be done, so it wasn't that we had a lot of okra available, but no IQF facilities. That wasn't the case in this case.

MEMBER GIACOMINI: But what about the other way around?

MEMBER SMILLIE: A lot of IQF capacity, ready to go, and no suppliers? That wasn't the case either, at least not with all the IQF facilities that we contacted. And the list was exhaustive. I mean, I won't say we did the entire list, but we certainly did a big chunk, and none of them said that they never processed nor had abilities to process organic okra.

CHAIR DELGADO: Tracy.
MEMBER MIEDEMA: I just wanted to add. In trying to piece together a crop with a frozen facility is a real trick, and my -- the firm I work at is a large IQF processing facility, and we plan our crops very carefully for their distance from the facility based on the time of year. In the warmer months, our spinach can't travel further than 45 minutes from the field to the IQF facility, or its pretty slimy by the time it gets there. And okra was described to us as one of those crops that grows in a warm climate, and really gets slimy fast, and so I don't know exactly what the radius is. At our farm with about 30 crops, we have it all mapped out exactly how far they can travel, what the radius is. And I don't recall whether that was noted in the petition, but it's a very real issue.

CHAIR DELGADO: Yes, Steve.

MEMBER DeMURI: Just a comment. I can tell you, Dan, that I was involved in a project to try to source some IQF okra for my
company, and we couldn't find it either.

CHAIR DELGADO: Gerry.

MEMBER DAVIS: One other thing to add to the difficulty of putting an IQF facility together with a crop. I believe the farm that I work for was contacted, because we have IQF freezing, we have capacity, we have a very long growing season. We could grow okra if we chose, but one difficulty was that okra is only harvested a little bit each day. It's not grow a crop like peas, and you come through there, harvest it all and freeze it, or you can schedule freezing time. You'd have to be set up to pick a little bit this day, make a little run for an hour or two a day, and keep doing that on and on to make the crop economically feasible. And that might be another complicating factor in why they don't seem to fit together too well.

CHAIR DELGADO: Any other questions, comments? Joe.

MEMBER SMILLIE: I'm also hoping,
and we certainly heard some comments yesterday, and I would ask everyone to take the information you've heard from this Committee, and from the public, and also, hopefully, we'll get some more comments, and to sleep on it.

CHAIR DELGADO: Okay. Thank you.

Back to you, Julie.

MEMBER WEISMAN: Okay. It's my turn. I have one last material that's part of that group of petitions that were all submitted by one petitioner, that's the ginger root powdered extract. And as you have already heard, ginger root powdered extract is manufactured the same way as all of those other harder to pronounce root extracts that you heard about, in that it's extracted. The ginger rhizomes actually are dried and milled, and then they're placed into an extraction kettle with water and ethanol. The liquid is concentrated into essential oils, and standardized. And then those essential oils
are mixed with organic astragalus root, and then spray dried, and ground into a powder. And, again, this is a situation where the petitioner had the exact same comment, that their procurement department is always looking for organic forms unspecified, not mentioning any particular material. And an internet search found, of course, that much organic ginger root is being grown, extracted, and even dried, and none of this is -- not necessarily spray dried onto organic astragalus root, but because no acknowledgment is made by the petitioner that these forms are available, and they do not address why they're -- that they're available, but they're not in the form we need them. Because that simple comment isn't even made, we found this petition not to meet evaluation criteria number four. And the vote on that was zero yes, six no, there were no absent, no abstentions. And this being the last of that
group of petitions, I did want to make the
comment that we had hoped that when these
recommendations were posted ahead of the
meeting for public comment, that the
petitioner might have come to us with some
acknowledgment or some additional information.
That did not happen. We view this -- again,
I have said it before, that this whole 606
process is fairly new to us, and there's been
a learning curve on our part on how to deal
with it. And we believe that there's also a
learning curve out there in the organic
community about the way to petition for these,
so we somewhat view the petition process a
little bit as a conversation between the Board
and petitioners, as we come to a process that
we think meets regulatory requirements, and
the needs of the community.

So if there are no more questions
about that, I'm going to move on to the
petition for -

CHAIR DELGADO: Are there any
questions on ginger root? And we have a
question from the Executive Director.

MS. FRANCIS: Actually, more of a
comment, just to affirm also that the Program
sends out letters informing petitioners that
a recommendation has been made, inviting them
to make comment.

CHAIR DELGADO: And that
information includes the actual determination
from the Committee. Correct?

MR. POOLER: This is Bob Pooler,
NOP. The meeting notices went to all
petitioners notifying them that their petition
was going to be considered at this meeting,
and not the actual recommendation was
included, but I would just say information as
to where the recommendation was located on the
website was included within the letter. So
they were notified, and invited to provide
response.

CHAIR DELGADO: Thank you for that.

All right. Any questions on this material?
Okay. Thank you. Back to you.

MEMBER WEISMAN: All right. We're moving on to Pectin, low-methoxy, non-amidated. And I think that that requires a little bit of explanation and background.

Pectin, everyone should be aware, is listed in two places. It is listed in 605(b), where it's currently notated low-methoxy Pectin. And on 606, it's high-methoxy Pectin. And I think at the time that those listings were made, the reason why low-methoxy Pectin was found to be synthetic was because it was what is called "amidated". In other words, it is exposed to ammonia, and a chemical change takes place.

Pectin is a material that is used for texture to gel certain products. They could be dairy products. I know you can't make jam without Pectin. And, in fact, the petitioner is -- for this material is a jam manufacturer.

Now, what they are petitioning is
not a new material. They are actually petitioning for a certain form of low-methoxy Pectin to be reclassified as an agricultural product, so it may be that this did not exist at the time that low-methoxy Pectin was put on the list, or it may have been not adequately understood at the time, but this petitioner is describing the manufacture of a product that is available, that is low-methoxy Pectin, that is not amidated, that is, in fact, manufactured from apple pumice, which is a byproduct of the juice, the apple juice pressing industry.

So in terms of the evaluation criteria, we found that it met the applicable criteria. And, in fact, in terms of the environmental effect, I think that it seemed to us that the use of this material actually had a good effect on the environment, and that it provided a useful outlet for what would otherwise have been a waste stream that would have had to be disposed of.
And we also believe that in terms of the -- actually, subsequent to the -- yes, there has been no organic form of this Pectin available, because up until now, it has been included on -- low-methoxy Pectin is included on 605(b) as a synthetic. It was not reflected in the petition at the time the recommendation was made, but further discussion with the petitioner indicates that this petition is actually a preparation to the introduction and marketing of organic low-methoxy non-amidated Pectin. So they're actually preparing the ground for an organic form of this material to become available.

And I apologize that this information was not available to include in the recommendation. It was not -- it took place at a conversation that happened at a trade show after the close of the publication deadline, but I thought it was important to note. So the recommendation was made for this material to be listed, and the vote at the
time were five yes, zero no, and one absent.

CHAIR DELGADO: Any questions on this material? Steve.

MEMBER DeMURI: In your discussion with the petitioner, is their intention to petition to have it removed as soon as they have an organic form available?

MEMBER WEISMAN: That's an excellent question. I did not ask it. I was -- I guess I was so impressed that they were being proactive to prepare the ground for an organic material to be introduced, that I just did not have my wits about me. But we can find that out.

CHAIR DELGADO: Any other questions on this material? All right. Julie, does that conclude your section on 606?

MEMBER WEISMAN: If everyone is satisfied. Oh, no, no, it doesn't. No, we have one more material. I'm sorry.

CHAIR DELGADO: That's all right.

Lost track there.
MEMBER WEISMAN: I thought you meant on the material. Okay. Yes, we do. We have one more material that's being petitioned, which is Tragacanth Gum, which is what is called an exudite gum. This is being petitioned for inclusion on 606.

It is actually -- at one point, the Program asked us to consider whether this was already included in gums that are already listed on the National List, because they had been included in discussions at the time that gums were originally listed. And it was thought that it might have been an error that Tragacanth was left off the list. But we felt, especially after looking at the quality of the petition, that for good order sake, it made sense to treat it as a new material being petitioned.

And we found that it did meet all the evaluation criteria. In fact, it is -- the production process is identical to other gums that are already listed. What happens is
a cut is made in the bark of the tree, and the secretion hardens, and the chunk is harvested from the trees, and they are dried and ground into a powder. In fact, I think there was a picture up on the screen earlier during the materials presentation of guar gum, which is a relative, or produced in a very similar manner.

In terms of commercial supply being fragile of organic, there was a lot of information given in the petition about the fact that non-organic Tragacanth gum is even difficult to acquire. All the Tragacanth gum produced in the world comes from Iran right now, and neighboring countries. So, first of all, there are trade issues. No one is allowed to import it into the United States at the moment. However, non-organic Tragacanth gum that they currently use is coming from Turkey, and they are working closely with Turkish growers and processors to increase that supply. And they note that organic
agriculture in Turkey is increasing, and that
they feel that they can foresee in the not
distant future that there can be -- they will
be able to secure supply of organic Tragacanth
gum, but it's not currently available.

And in terms of why this would be --
if there are organic substitutes, there are
other gums available, but Tragacanth has some
unique qualities that other gums do not
exhibit, and that's why there is a call for
it.

So we made a motion that Tragacanth
gum is appropriate for listing -- we made a
motion to list Tragacanth gum on 606, and the
vote on that was six yes, zero no, that was a
unanimous vote.

Oh, yes. There is one annotation,
water-extracted only. Gums do get produced in
other ways. This one being petitioned is
water-extracted.

CHAIR DELGADO: Any questions on
this material? Okay. Thank you. Back to
you, Julie.

MEMBER WEISMAN: That concludes the presentation of materials for 606.

CHAIR DELGADO: Good. Can we proceed with the next section then, sunset materials.

MEMBER WEISMAN: Yes. I think on the -- we had a similar situation with some Handling Committee sunset materials that were voted on at the full meeting. You heard the situation described by the Crops Committee this morning, and the same situation existed for a number of materials that were recommended at the full meeting for re-listing on 605(a), which are Agar-Agar, animal enzymes, Calcium Sulfate, Carrageenan and Glucono Delta Lactone. And then also -- well, I'll do A and B separately.

What happened was because there was an additional ANPR for materials that were due to sunset, and the comment -- it was published in December after our meeting, and the comment
period closed in January, so we just need to acknowledge that comments that came in, in that period did not in any way call into question the recommendation that had already been made. So ahead of this meeting, the Handling Committee voted, five yes, one absent, to reaffirm those 605(a) sunset decisions from the full meeting. And the same is true for the material, Cellulose, to be reaffirmed for 605(b). That was also a five yes, and one absent.

CHAIR DELGADO: All right. Any questions on those documents? All right. Let's proceed to the next item.

MEMBER WEISMAN: Okay. Another situation we've been needing to clean up. When the -- in the multi-phase notice for sunset materials, Tartaric Acid should have been included on A and B with the materials that I just mentioned. And, in error, was not included in those ANPRs, and so, therefore, could not be considered at the full meeting.
And so this, I believe, may be our last opportunity to consider them now for sunset. We have two different forms of Tartaric Acid, one is one 605(a), made from grape wine, and one on 605(b) from Malic Acid. I did want to mention one thing regarding sunset, and acknowledge a comment that was made yesterday about the availability of organic -- we heard that there's organic Tartaric Acid available. And what I wanted to say is that this -- the recommendations were made and posted six weeks before this meeting, I believe. And the discussion about Tartaric Acid has been happening for at least two meetings before that, and so what I would like to say is that the petition for the removal of a newly available organic form of a listed material can be made at any time. I think that there was a lot of time when this information came forward, and getting it for the first time yesterday does not really help our process. So I want to
acknowledge that we did -- we appreciate being
informed that Tartaric Acid organic may be
available now. We have absolutely no
opportunity at this meeting to qualify that
statement. Well, I shouldn't say that we have
no opportunity. I suppose -- I think we
certainly have an opportunity to question the
person who made the comment, but I don't -- it
would still require time for us to verify, and
discuss, and talk about, so I would encourage
that if someone has organic Tartaric Acid
available, that it would have been helpful to
know about it at least in the last six weeks,
not just yesterday.

CHAIR DELGADO: Julie, do you plan
to change your recommendation?

MEMBER WEISMAN: I do not, no.

CHAIR DELGADO: Okay. Any
questions?

MEMBER WEISMAN: But I also didn't
finish saying what the recommendation was.

CHAIR DELGADO: Please.
MEMBER WEISMAN: Okay. I'm sorry.

The recommendation was to list, to re-list both on A and B. We did not receive any comments opposing this. And the vote was five yes, and one absent. There was no dissension on the Committee.

CHAIR DELGADO: Go ahead. Madam Secretary, please.

SECRETARY HEINZE: I wanted to add that our review was complicated by the fact that the current listings on the National List do not include the annotations made from grape wine, and made from Tartaric Acid, so we ended up doing quite a bit of research into past actions of Boards. In fact, went back to the 1995 transcripts, where these were originally voted on. And so one thing that we would ask is perhaps the Program could help with a technical correction to add those annotations, to clean it up for future boards.

We have tried to, in our recommendation, include all that history, so
that five years from now when some of us are not here, and they have to be reviewed, we've provided some guidance. But I think a technical correction might be helpful.

MEMBER GIACOMINI: Thank you, Mr. Chairman. On this technical correction issue, Tartaric Acid is not just sort of a two-way street, it's a three-way street. We have the Tartaric Acid on 605(a) from grapes, where we are modifying a natural product. Then there's also the Tartaric Acid that we have on B, which is coming from Malic Acid. Malic Acid, L-malate is on 605(a) coming from a natural source. Not on the National List is DL-malate from a synthetic source being butane.

We've done the best we can going directly to -- the Committee has done the best they can going directly back to the transcripts, but anyone here with any historical memory of whether that was actually
generic malate with no designation that was
reviewed and voted on for B, or whether the
intent was L-malate being the natural source,
and not allowing the petroleum source, any
historical memory of that would -- in public
comment, or some other form, would be
appreciated.

CHAIR DELGADO: Any other comments?

Julie.

MEMBER WEISMAN: I just wanted to
make one correction on the recommendation for
this. At the very, very bottom, I think it
just needs to be corrected that where it --
okay. She fixed it already. Never mind.

CHAIR DELGADO: What was the
correction?

MEMBER WEISMAN: Well, the correct
was the last three words were made from
Tartaric Acid. That's what's in our books,
and that was not -- it should have said made
from Malic Acid.

CHAIR DELGADO: Okay. Any
1 questions? Jeff.

2 VICE CHAIR MOYER: Just a question

3 for you, Julie, and I don't know if you can

4 answer it. Is the reason that there's two

5 listings there, because they're two totally

6 different materials that are used two totally

7 different ways, or was it a convenience for

8 end-user?

9 CHAIR DELGADO: Do you intend to

10 address that question?

11 MEMBER WEISMAN: Katrina is going

12 to address that.

13 CHAIR DELGADO: Katrina.

14 SECRETARY HEINZE: This gets a

15 little bit to the heart of the definition of

16 materials. It is the same material, but its

17 source is different. So something the

18 Material Working Group discussed in quite a

19 bit of detail, is that a material is not just

20 what you have in the glass, but it is what its

21 original source is, and how it was processed

22 to get to that final result.
Tartaric Acid is the poster child for that. Same material, same thing in the glass, two very different sources, one that the original board felt was a non-synthetic source, grape wine, and one that they felt was a synthetic source. Getting to Dan's comment that historical reasons why they felt it was a synthetic source are a little bit lost in history for us. Does that help?

VICE CHAIR MOYER: Well, it does help, but my question was, do we continue to need both materials, given the fact that one is synthetic, or at least listed as synthetic, and the other is a non-synthetic, if they're both -- and the indication of the report was that the majority of what's used out in the world is from the grape juice. Do we, indeed, continue to need the synthetic on the list?

CHAIR DELGADO: Dan.

MEMBER GIACOMINI: I have the same concerns that you do, Jeff. It's my understanding that there's a slightly
different way, and its characteristics and processing, and maybe we'll hear some comment on that later in the day.

VICE CHAIR MOYER: Thank you.

CHAIR DELGADO: Any other questions? Okay. Back to you, Julie.

MEMBER WEISMAN: That now does conclude my presentation.

CHAIR DELGADO: Okay. Well, thank you very much to you and the rest of the Committee members. Well done. And now we have concluded the review of recommendations and materials, and we're due for a break. It is quarter after the hour. We have a comment from Mr. Smillie.

MEMBER SMILLIE: Before you make a ruling, Mr. Chair, I would humbly submit that we don't lose that time. Would it be possible, unlike yesterday, to see who the first commentors are, and see if they would be ready to go.

CHAIR DELGADO: They are ready,
they say. Let me check with our Executive
Director, and this is a proposal about it. I
propose that we start calling people. If
they're here, fine. And if they're not, we'll
keep their name on the list in the order that
they had appeared, and we'll continue calling
them until we reach the agreed time of
initiation of the comment. Will that satisfy
our legal -

MS. FRANCIS: I have a feeling
they're all here.

CHAIR DELGADO: Okay. So we can
proceed.

MS. FRANCIS: It's the poultry
folks.

CHAIR DELGADO: And we have a
comment from the Secretary. Yes, ma'am.

SECRETARY HEINZE: A break before
public comment would be helpful, at least for
me.

CHAIR DELGADO: And well deserved,
absolutely. So it's quarter after the hour.
1 We'll see you here at 3:30 to start with
2 public comment. Thank you.
3 (Whereupon, the above-entitled
4 matter went off the record at 3:14 p.m. and
5 resumed at 3:37 p.m.)
6 CHAIR DELGADO: We have quorum, and
7 we will continue with our next item on the
8 agenda, and that is public comment. We'll
9 start. Do we have Valerie, have we heard from
10 Marty? They have agreed, so the first one up
11 is Marty Mesh, if you'll please proceed to the
12 podium. We're making some updates here. I
13 will remind the presenters to give your full
14 name and affiliation for the record.
15 MR. MESH: Are you guys ready?
16 CHAIR DELGADO: We are ready.
17 Please proceed.
18 MR. MESH: Marty Mesh, and I have
19 a proxy for Rom, who was supposed to speak
20 yesterday on aquaculture. If you can tell me
21 five minutes into one, then I'll know.
22 SECRETARY HEINZE: Okay. So you
I have two separate five minutes.

MR. MESH: Correct. And three, if you want to be really nice.

(Laughter.)

MR. MESH: So for the new person, Dr. Flann, I'm Marty Mesh. I started farming organically in 1972, on the larger scale in '76. Incidentally, Belleview Gardens Organic Farm has produced a small amount of quality organic okra ever since 1976. I have approximately 160 acres, and my partner has several hundred additional acres, but I can circle back to okra in just a minute.

I helped form Florida Organic Growers, and currently serve as Executive Director of FOG, which operates quality certification services at NACA. Additionally, I serve on the boards of the OTA, which none of my comments serve as official position of, the boards of the National Campaign for Sustainable Agriculture, the ACA, and as President of the board of the Southern
Sustainable Ag Working Group, which again may be relevant to your discussion about organic okra.

I want to welcome you to the board, as well as thank all of you for your tremendous time commitments on behalf of the whole organic community for all the NOSB members. I also want to thank the Department for its positive work on a very small budget, and hope with additional resources, which are long overdue and will increase with time, that the issue of funding is no longer the reason for inaction or delayed action by the Department.

While I'm sure I could focus on the positive work done by both the Department and the Board, let me at least touch on a few other concerns. First, to recap the lack of a simple pasture rule seems to be undermining faith in the U.S. National Organic program, and organic products in the marketplace. The community and industry have been in sync for
years, and the continued delay is negatively affecting the growth of organic agriculture, and the health of the industry.

QCS was the first certifier to certify organic shrimp after the USDA Program Director stated in a public workshop for the organic farmers that if one can produce shrimp organically using the rule, then by all means, put a USDA seal on it, and put it out in the market.

People have been producing organic mushrooms without specific standards, organic honey, and so we thought the statement by the Program Manager enabled a new sector of producers to differentiate product in the marketplace.

Producers invested hundreds of thousands of dollars. We, the certifier, made them source organic feed at considerable cost, and then shortly thereafter, because of the controversy surrounding salmon, USDA reversed its opinion, and said to the get seal off all
the seafood, including shrimp, tilapia. And that has caused considerable market disruption, confusion, and organic shrimp producers to go bankrupt, while foreign-produced shrimp and salmon, in some cases far from compliant with the U.S. regulation, but without the U.S. seal, has taken the place on the marketplace shelf.

And now the recommendation is to reward the producers and the certifiers with more market opportunities; this all in the name of refusing our many years ago suggestion to start with the basics, start with the low-hanging fruit, start with shrimp, tilapia, catfish, and build upwards, but to get started. Those several years to build an industry would have, by my calculations, been completed, if we had ever gotten started to begin with.

Shrimp continue to be held hostage to the more controversial complicated, and not easily solved salmon battles, which,
incidentally, once, if and when the feed
issues are wrestled down, net pens can
continue to hold up the simple peaceful
organic shrimp from gaining its rightful place
on a marketplace shelf. And now, adding insult
to injury, it seems that we need to move QCS
off-shore under the current recommendation.

      Now, the critical feedback from the
technical staff, who have much less baggage
than me, and are joyful at the progress being
made from the recommendations, and I can go
into the specifics on wording that they've
said, but you'll have to ask me later on,
because I'm going to run out of time. So let
me skip right to okra. And I'm happy to come
back and answer any questions on specific
wording suggestions on the aquaculture
recommendations. Or, as Tracy asked, on group
certification issues.

      Okra. As I've said, our farm is
certified, has certified organic okra. Okra
grows well in the south. On the petition it
says CCOF was checked with, and on behalf of agriculture outside of California, and yes, it does exist. And certifiers should maybe more on the ground in areas where okra grows well. You know, I have to raise concerns. I didn't see any list of who was called, and I don't believe I'm convinced that the petitioner has tried to find organic okra, where okra likes to grow. I think this petition may need to be voted down at this point.

At Southern SOG we have not received any communication or outreach looking for suppliers of organic okra. And if a fair and equitable contract was offered from companies like General Mills and Campbells, I believe there may be growers interested. There is certainly production, harvesting, and post-harvest challenges with okra. You have to pick it every other day by-hand, make it worth our while -

CHAIR DELGADO: Marty, your time is up. Can you wrap up, please.
MR. MESH: That's the first guy's wrapped up. Man, I'm ahead of schedule. I could have gone back and done the aquaculture one, but all right.

CHAIR DELGADO: Please continue.

MR. MESH: So make it worth our while as growers, and I'm sure there'll be some folks interested.

Let's see. You have to at least have the courtesy to talk to us in the south before putting conventional okra on the list. Liana mentioned Alrussio, a former member of this board, who now heads an effort to get more African American farmers in the South involved growing organically who had the email. Where is this kind of stuff heading? What would be next? Organic frozen okra ready for frying that doesn't contain organic okra? Call it gumbo made with something, call it whatever you want, but don't call it organic okra.

I believe the petitioner has the
corporate resources to find, or to get a facility located where you need to have it located, down south where we love okra, know how to grow it, know all the wonderful ways to prepare it, and where the differences between organic and non-organic production can be clear, so that organic okra that comes from there will not be confused.

Going back to the aquaculture stuff. Let me at least touch on organic seed. We had concerns on the recommendation, but hearing CCRF say that 2 percent of vegetable seeds are organic, and likely other west coast certifiers, if those numbers are consistent or similar for other organizations, we actually support ramping up the -- something needs to be done to make people use organic seed.

The CACC recommendation for Tracy, you'll have to ask me about. Tetracycline I think is off the list now. Methionine, I think I'm supportive of a three-year, not a two-year -- it didn't always -- things don't
always go perfect. In fact, most things don't, and I would be pleasantly surprised if a new variety can be grown and an infrastructure and relationship solidified within the two-year framework. I would think that highly unlikely given reality. So let's go back to fish.

Okay. On 205.208(b) aquatic plants may be grown in open water systems. You know, our comment was, it's not clear what open water system means. Are we talking about growing in public ponds, lakes, oceans? If that's the case, then this may better fall under the wild harvest area, and not farmed aquatic plants. And if wild harvested, then the staff thought that wild fish can't be part of it, but yet you're allowing wild aquatic plants. They thought there was a bit of a disparity among the two. They also were concerned about how one would manage the possible aggregate, cumulative effect of wild harvesting.
Going to the aquaculture one
itself, 205.2, organic certification for
foreign certifiers shouldn't be allowed for
several reasons. They identified the minority
opinion as being one that they support, that
you can't base it on foreign certifiers. As
of today, all the standards are currently
private standards, as Joe mentioned, and some
standards allow terrestrial animal byproducts
to be certified organic, and you're using it
for aquaculture feed.

I think our solution would be to
allow fish meal and fish oil from rendered
fish facilities to be used as a supplement.
Maybe that's a capital S, Supplement, and a
stair-step reduction method has been proposed
by the AWG, or utilize the statutory authority
to make wild caught fish renderings in organic
livestock feed product.

Live foods on D, clarification must
be provided what exactly constitutes live
foods, insects, worms, and are you saying that
they need to be certified organic, too, was
the question from our staff.

Lipids, they had a couple of
technical corrections on your wording on the
lipids one. And that is, feed for aquaculture
products for human consumption may, and they
thought it should say "must", or "shall not"
containing lipids from sources. That may doesn't
give the regulatory assurance of your desire.
Second line, line two, "except that other
lipids from organic sources", and it wasn't
clear whether or not those other lipids could
or couldn't be from terrestrial animals.

All right. So let's just go on.
If you want to know, you'll just have to ask
me. On the whole, they thought the livestock
recommendations had merits, and we're pretty
happy with them. On J -- well, if you want to
know the technical correction, you'll have to
ask.

CHAIR DELGADO: Any questions for
the presenter? Yes, Tina.
MEMBER ELLOR: Marty.

MR. MESH: Yes, Tina.

MEMBER ELLOR: You wouldn't have any specific recommendations for wording on aquaculture, would you?

MR. MESH: Funny you should ask, Tina. On L, where you have fish meal or fish oil may not be sourced, their wording suggestion was must not be sourced, as opposed to may.

CHAIR DELGADO: Any other questions for the presenter?

MR. MESH: Like on grower groups, maybe.

(Laughter.)

CHAIR DELGADO: Tracy, do you have a question?

MEMBER MIEDEMA: Marty, do you have any specific feedback on the document, the guidance document that was posted; for instance, in the area of conflict of interest, or internal control systems?
MR. MESH: Yes. Kudos goes to Tracy for her work, patience and willingness to listen to very divergent opinions on behalf of all this. We do have a paragraph typed out in red, but I think I have to say that our sense is that the grower group dilemma has evolved to group certification, and we really support it being focused to grower groups for now, and getting this one off the table. For those growers that outnumber all the other growers combined in the world, the most disadvantaged, the most at risk growers in the world for being left out of the organic marketplace, and that we really urge you to focus on what the original issue was, which was grower group certification, for now, and leave the other for another day to have a discussion about. And I'll try to -- we're concerned about throwing the baby out with the bath water.

CHAIR DELGADO: Tracy.

MEMBER MIEDEMA: May I ask a
follow-up question?

         MR. MESH: Sure. You can ask all
         you want, until he cuts you off.

         CHAIR DELGADO: Tracy, please.

         MEMBER MIEDEMA: Would you or FOG
         be able to articulate what the benefits are to
         grower groups of not allowing other groups
         that meet the rigorous criteria?

         MR. MESH: You know, Tracy, I think
         sometimes it's the confidence of a label is in
         the marketplace, and the confidence of those
         people supporting a label is in their hearts,
         or in their minds. And that we've all, in the
         organic industry, heard well, show me the
         science, or where's the science behind it?

         You go, we know it's better. Okay? It's in
         our heart, that sometimes some of these things
         may be passion, and that I'm concerned about
         the baby being thrown out with the bath water,
         that grower group certification may be lost if
         this board continues down the road of trying
         to essentially, for lack of a better word,
shove group certification down the consuming public's mind.

I saw how the pasture issues were framed in the press, or on the internet, and you could debate pasture all you want. But what I know is, it hurt the industry.

MEMBER MIEDEMA: Okay.

CHAIR DELGADO: Tracy, comments?

No. Any other comments from the board, questions? Okay. Well, thank you very much, Marty.

MR. MESH: Thank you all.

CHAIR DELGADO: Up next is Chris Pierce, and after Chris we have Dave Martinelli.

MR. MESH: And I wanted to thank Chris for allowing me to go before Methionine.

MR. MARTINELLI: We're actually just going to do this as a group Methionine presentation.

CHAIR DELGADO: Please.

SECRETARY HEINZE: And you are
which folks?

MR. MARTINELLI: I'm Dave Martinelli.

SECRETARY HEINZE: Okay.

MR. MARTINELLI: Coleman Natural, but I'm actually Chair of the Methionine Task Force.

SECRETARY HEINZE: So we have Chris, Dave, David, and David?

MR. PIERCE: That's correct. I am Chris Pierce.

SECRETARY HEINZE: Okay.

CHAIR DELGADO: You're Chris Pierce.

SECRETARY HEINZE: So you're combining your time.

MR. MARTINELLI: We're all members of the Task Force.

SECRETARY HEINZE: Okay.

MR. MARTINELLI: So what I'm going to do -

SECRETARY HEINZE: So you want 20
minutes.

MR. MARTINELLI: Correct.

SECRETARY HEINZE: This is just purely administrative questions on my part.

MR. MARTINELLI: Okay.

MS. FRANCIS: And could you please each walk up to the microphone and introduce yourself and your affiliation.

CHAIR DELGADO: At this point, yes, please.

MR. MARTINELLI: Okay. Dave Martinelli, Coleman Natural.

MR. PIERCE: I'm Chris Pierce with Heritage Poultry Management Services.

MR. WILL: David Will, Chino Valley Ranchers.

MR. BRUCE: David Bruce, Organic Valley.

CHAIR DELGADO: Okay. Thank you.

So who will start?

MR. MARTINELLI: So I will start. I'm going to go through this PowerPoint, and
then I'm going to turn it over to these three to give kind of their background and perspective, and their experience with trials. So what we'll do, there's maybe a 10 or 15-minute PowerPoint, they'll do their thing, and then we can open it up to Q&A.

CHAIR DELGADO: Very good.

MR. MARTINELLI: So just to kind of get everybody up to speed, I think everybody is familiar with the issue. Obviously, Methionine is a necessary nutrient for poultry production. There's some history with the board, twice you've approved a three-year annotation to allow Methionine in organic poultry production. The Task Force, of which I am Chair, has been working on this issue for the last six years, and I want to say thank you for the opportunity to update you. I had a chance to talk to you in November, kind of what the Task Force was all about. And you urged us to submit a petition at that time, so we've gone ahead and submitted the petition
that's before you. And we're active on a
number of fronts developing alternatives, and
that's what I really kind of want to talk
about today.

To give you a little sense of who
the Task Force is, these gentlemen will speak
with respect to their personal experience, but
it's really a volunteer group of organic
poultry producers. We've aligned ourselves
with partners through a variety of
universities. You're going to get a
presentation later today from Dr. Walter
Goldstein, who is not officially a member of
the Task Force, but we've obviously worked
very closely with him. And I'll hit on some
of the projects that we're currently under
development with him. But all these
institutions have helped us in some capacity,
either with literature review, research,
trials, what have you.

I also wanted to kind of frame it
up for everybody in terms of the scope of the
industry that we're talking about. This is kind of an interesting chart that was pulled together from some USDA data over the last 15 years, just kind of showing the growth of the organic ling and industry, and I've got -- the next slide shows a similar trend for the organic broilers, so I don't want to belabor these, but in both cases you see a significant growth in the last five years in this industry.

And the final point that I want to make around the organic poultry industry is that it touches a lot of other producers in this room. It's not strictly eggs and meat, but it's a variety of products that are, in turn, made from eggs and meat. So when we're talking about Methionine, the impact we're talking about is very significant and wide-ranging.

I think the question of the day is really why do organic poultry producers need Methionine, and is it purely a production
crutch, or are there legitimate bird health
and environmental concerns that appropriate
levels of Methionine in the diet ameliorate,
so we've got a number of studies here that I'm
just going to kind of run through them.

I've actually pulled together for
the board's benefit a listing of all the
reports that were cited in this slide show,
and I'll leave it with Valerie. There's a
variety of papers and presentations that came
out of the literature review which we had
conducted about a year ago by some folks at
Cal Poly Pomona.

This was a study from 1997,
Ambrosen and Petersen, indicating that
inadequate protein decreased feather plumage
and cannibalism in laying hens, so actually
that's decreased feather plumage, not
decreased cannibalism. It's actually
cannibalism laying hens, and actually they
kind of go through two scenarios, that if
you've got inadequate protein in the diet, at
a minimum, you're going to get poor feather
condition and feather pecking, in a most
highly evolved state you would have
cannibalism. Next slide, please.

The other big issue, in addition to
bird health, are environmental impacts. One
of the strategies to overcome low Methionine
diets would be to feed an excessive amount of
other proteins in the diet. And this, in
turn, is excreted by the hen typically as
nitrogen, and also creates ammonia emissions,
so there's been studies conducted at Iowa
State that indicate that for the amount of
protein increase that would be needed in the
diet to provide a higher level of Methionine
to the birds, you would have 150 percent
increase in the ammonia generation and
emission.

If you go to the next slide,
there's a series of reports out of Europe that
I'm going to touch on, because they've been
grappling with this issue, as well. This was
from a 2001 workshop that an inadequate supply of amino acids is not simply a production problem. There was a report from Owen in 2000 that feather pecking on each other feathers in search of amino acid is found when Methionine is deficient in the diet, and that obviously creates a bird welfare problem. Next slide, please.

There was an extensive study that I've got a copy of in this document that was done around organic poultry production in Ireland, where they concluded that obviously the prohibition in the EU on adding Methionine was a serious health concern. Again, around the same issues we're talking about, animal health and environmental welfare. And the fact that you've got to then formulate the diets to have excessive levels of protein.

This, again, is from the report out of Ireland, and I think the take-away here is that Dr. Owen Keene from Heritage Poultry Management Services recommends that Methionine
is needed in organic poultry production in
order to maintain the best nutrition and the
health of all the avian species.

This is a report out of Germany in
2004 on the impacts of raising organic poultry
without Methionine. And, again, copy of the
report in here, but their concluding remarks
are that the -- from the animal welfare and
environmental pollution perspective, synthetic
Methionine should be a legal feed component in
organic broiler production.

And then this is our last European
reference. There was a report done by DEFRA
in the UK, and they talk about without
additional organic Methionine rich protein
sources, Methionine deficiencies will become
more pronounced, and more widespread in
organic poultry production, as the level of
permitted non-organic proteinaceous
ingredients in the diet fall. This will
impact on bird health and welfare.

Also, one of the issues that was
pointed out in the Livestock Committee's review of our petition, and it's a great point, is have we looked Heritage breeds? Do Heritage breeds because they're slowing growing genotypes, do they offer an opportunity to avoid supplementing the diet with synthetic Methionine? And there's actually been some work done by Ann Fanatico out of the University of Arkansas. This is pulled from her latest body of work. There was an abstract done in 2006, where she indicates that the slower growing genotypes do not appear to have substantially lower Methionine requirements, which agrees with previous research, and it's consistent with the conversations our Task Forces had with her, as well.

One of the other points raised in the Livestock Committee's recommendation was about a pasture-based system; to the extent that would be able to provide supplemental Methionine to the birds. It's really -- we
kind of grouped it into two categories.

There's insects and earth worms, and there's
grass. And this slide specifically speaks to
the insects and earth worms.

And if you recall from our November
presentation, both insects and earth worms
carry an elevated level of Methionine, but in
and of themselves, especially in the
quantities found in nature, they don't
typically close the gap between what the
Methionine in the diet is, and what the bird's
actual nutritional requirement is.

Dr. Joe Moritz from the University
of West Virginia has also presented to the
Task Force about a year ago, his findings on
pastured poultry, and this is a take-away from
one of his reports, that Methionine
requirements -- he ran a no-Methionine group
of birds as part of his trial. And, again,
it's in the book here. Methionine
requirements of pastured no-Methionine birds
were not completely met by the forage.
And then this is a report out of Canada from the Manitoba Department of Agriculture, specifically talking about grass. And their point is that grass is not easily digestible by poultry, and so it's not as digestible as the typical poultry diet. And there are tremendous environmental benefits to having the birds outside and foraging, but from a nutritional standpoint, from the standpoint of closing the gap on Methionine, grass itself is not the answer either.

So I'm going to switch gears a little bit. We've talked about some of the problems with Methionine deficiencies, but I really also want to talk to you about the work that the Task Force is currently engaged in. And there's three specific alternatives that we're really focused on and getting funding for, and making some progress with.

I don't want to steal Walter's thunder. He's got a great presentation on high Methionine corn. And obviously you
engaged him a little bit earlier in some questions. I do want to point out that the Task Force has funded two projects this winter with the Michael Fields Agricultural Institute, the project in Chile and the project in Hawaii, and that seed is coming back to the U.S. and being used not only for feedstock development, but also for further hybrid development. And the Task Force has also signed up for this year to fund those, the planting of those seeds and the collection of seeds both for the hybrids and for the feedstock development.

And with the feedstock, what the Committee has agreed to do is we have agreed to buy that grain back and run trials with that, so we will get the benefit of his agronomic expertise. Can this corn be grown? And then we, in turn, will buy that feed, and feed it to birds to see what does it do in the diet, or what is the performance of the birds with that in the diet.
We also are very interested in the alternative of naturally produced or naturally fomented Methionine, and we currently have a proposal that's been put in front of us from the University of Arkansas to do a -- it's a study to do some research, a three-phase project around developing a natural source of Methionine. We've also been in contact with a private party who has -- supposedly is further along on this process, that we've asked to submit a proposal for additional research funding, put their project to us. And what we really want to do is get side-by-side proposals, see which group is further along, and then provide some funding to whichever group can get us to go quicker in terms of bringing this to fruition. We're really hopeful, this is a lot of theory in this concept, but I think from an overall efficacy standpoint, this one has a lot of merit. So this is one we're very keen on supporting and funding.
The third area that we're working in, and Dr. Karreman had brought this up in the November NOSB meeting, you all had a presentation from Neptune Industries, specifically around aquaculture at that point, but this is a company that's engaged in a pilot project to do insect meal. And I've had conversations with them. They are very interested in working with us, and we're very interested in working with them. Their time line is a little bit elongated. Originally, I think, at the NOSB meeting, they were talking about being in production in 2008. Now they're talking about maybe a pilot in 2008, but actually not in full-scale production until 2009. I have yet to see actual specs on what the product looks like, so we can get a nutritionist to look at it, see how it would work in the diet, so that's kind of the next step in this process. And then we can start talking about availabilities and pricings. And, obviously, the big thing
for us is to get it on the farm, do some farm
trials, and see how the birds perform with it.

So what we've tried to do here is
kind of indicate to you what -- address the
concerns that were raised by the Livestock
Committee, particularly, the minority opinion.

There is a full body of research that's been
done on this topic. We are going to continue
to do trials. We actually have a number of
trials in the pipeline on a sufficient scale
to be a viable trial, that we can hopefully
get some real meaningful data back on. We can
talk about that when these folks present
behind me.

Clearly, we've cited improved
performance in the petition. It's our
perspective that improved performance is just
the consequence of healthier birds. You're
not going to get better performance if the
birds aren't healthy, and our objective is
around the health and welfare of the birds.

And, lastly, the point I
illustrated earlier about the size of the industry and the impacts. This is just too important an issue to let go. There's a great concern out there by producers that they simply won't be able to raise organic poultry come the fall if we don't have an additional extension. And the ramifications and repercussions of that go well beyond just the poultry industry, it's really the entire industry that will be impacted.

One of the things that I don't think the Task Force has done a very good job with is communicating back with you folks. You've had a commitment to us to give us additional periods of time to get some work done, and we've kind of dropped the ball in terms of communicating back to you what we are doing. So I think the November meeting was kind of the first step in that. Hey, here's letting you know how your commitment of time is playing out, and our commitment of research and development. So one of the things we
wanted to leave you with is a time line that we've developed around actionable goals, specific trials that we're looking at running, when we're going to get those trials started. We still need to get turkey trials going. We need to get the turkey community kind of involved in this, as well. We've got specific due dates and actionable items for high Methionine corn, for the natural Methionine and for the insect meal. Next slide, Valerie.

I think the most important thing is at the bottom here, that it's our goal to provide regular updates to you all over the next 24 months at your meeting, if we can get a 5-minute slot, or 10-minute slot to say here's where we are, here's the projects we're working on, here's what we're finding out good or bad, here's the progress we're making on research and development. And we'll get Dr. Goldstein to present, as well. But I do want to keep that dialogue open and keep it going during an extension period so you're not left
in the dark wondering what the heck the Committee is up to, and what we're doing. So we'll pledge that to you, that we will keep that line of communication open.

I do want to give these folks a chance to introduce themselves and talk a little bit about their backgrounds, specifically around Methionine. We also have -- I do want to acknowledge, we have a number of producers in the room, as well, folks that we deal with on the East Coast. They're a little bit reluctant to come up here and actually do a full-blown presentation, but I do want to acknowledge the fact that they're here, and they're, again, very interested in this issue.

SECRETARY HEINZE: I'm just telling you, you've got five minutes.

MR. WILL: My name is David Will. I'm with Chino Valley Ranchers, and we're organic egg producers in California. We have actually been working with the Methionine Task
Force for about the last two years, and one of the things we've noticed is that the trial data on layers is very small to lacking, so our company has committed with help of the Task Force. We actually on May 14th set 22,000 layers of which 11,000 will be grown under our normal management program, and 11,000 will be grown with no added Methionine to their diet for the next 100 weeks, or as long as we can without seriously impacting the bird health.

We will be providing regular updates, both visual performance and health updates through the Methionine Task Force. And we'd like to invite any of you, if you're in southern California, we'd be more than happy to bring you out. You can take a look at the birds side-by-side. They will be in sister houses. We anticipate that they will be moved to lay sometime in early October, and have some sort of significant egg production numbers or comparisons some time in mid-December. So we hope to alleviate the
concerns that there hasn't been a full-scale trial with this program.

MR. BRUCE: My name is David Bruce, and contrary to popular opinion, you don't have to be named David to be part of the Task Force. The last time I testified to the NOSB was about outdoor access, 15 years ago when we were just starting the egg program in Organic Valley. Today, the co-op is now over 1,400 members strong. The egg program itself is 87 members in four states, primarily Midwest and here on the East Coast.

And I'm also representing the Poultry and Turkey Production for Organic Valley. So, obviously, our producers have a very strong interest in continuing the allowed use for at least another two, hopefully another three years.

We've been active for the last five to six years pursuing the whole list of alternatives, working closely with universities. We've done three different sets
of fairly small-scale trials, but one with a 
rice brand derivative, one with a potato 
protein, and then working very closely with 
Dr. Walter Goldstein on his high Methionine 
corn ones. And we're going to be continuing 
to do that this coming summer. Those have 
been fairly small-scale trials because of the 
amount of seed that's available, but we've 
been working with Dr. Goldstein and the 
University of Minnesota on that.

We actually talked to them about 
doing a small-scale trial with no Methionine 
in the ration whatsoever, and they were 
concerned about being able to get that through 
the administration because of the welfare 
issues, and the wellness of the birds involved 
in that study.

We are -- also, I'm the primary 
contact in contact with the private party who 
I don't think would mind being mentioned, is 
Dr. Joe Ward. He's on the Iowa State Organic 
Board and he works for a private feed company.
He's developed a bacterial method to do alternatives in Methionine. He's now entered commercial-scale production trials of that, and that will be the next stage, to see whether he can really bring that to market. He's very confident that at some point he'll be able to, so we're each keeping it brief so that we have time for a strong dialogue, so thank you.

CHAIR DELGADO: Thanks.

MR. PIERCE: Good afternoon. My name is Chris Pierce. I'm with Heritage Poultry Management Services. We're East Coast, we're in Pennsylvania. We are a management consulting company that we have a full-time poultry nutritionist on staff. That's Dr. Owen Keene. He finished graduate school at the University of Maryland in nutrition in 1955, and Dr. Keene's is around 72 years old, and he's still going strong. And he's made comment to you as board two times during the last seven years as this
issue has come up.

And from our standpoint, as we work with poultry, our first organic flock was in 1997. So as you remember that chart, as we look at where we were in `97 and move to 2007, we see a dramatic increase in the demand. But we are committed to be part of the Methionine Task Force, as we are only a small representation of many producers around the country that are trying to put the funds, the resources together from our own companies towards providing you the research. And from my behalf, we do not take this issue very lightly. We are committed, I think as you've seen in David's presentation, that we are very committed to serving and providing the answers to the questions you may have.

MR. MARTINELLI: So we'll stop there. And, obviously, if there's Q&A, I'd like these folks maybe to come up, and to the extent there's questions, engage -

CHAIR DELGADO: Okay. Questions?
Gerry.

MEMBER DAVIS: One slide you put up on insects and earth worms mentioned Methionine content was not exactly what you need from them, but then you went to mention the Neptune Industries. Are they selecting certain insects that are different than that?

MR. MARTINELLI: I don't know the exact answer. I suspect it's one of concentration, that in a natural environment the concentration of insects is not going to be anything like the concentration in a meal product, where it's going to be a higher percentage of their diet.

MEMBER DAVIS: So that slide didn't necessarily say the insect by weight is the wrong component of Methionine. It's just the ability to get enough insects, is the problem.

MR. MARTINELLI: Yes. I don't have it with me. There's a chart -- I mean, insects are probably three times the level of the more typical ingredients you'd find in
feed from a Methionine standpoint. But they're a fraction of what the benefit you get from a full Methionine supplementation is. So the idea is, in a normal diet, as a small percentage of the diet in a free ranging environment, you're not going to pick up enough earth worms or insects to make a difference. But if it's feed additive, you probably could make -- it, in theory, could make a difference. We really need to see the nutritional profile to know.

MR. BRUCE: I would just add that that's just one element that shows promise. Again, there's going to be issues like feeding fish meal at a certain level, you're going to have offsets in flavor and that kind of thing, so it's about a diversified source.

CHAIR DELGADO: Katrina, followed by Kevin.

SECRETARY HEINZE: We're back to Katrina's simple questions, don't know a lot about chickens. But I want to ask a question
about the insects and earthworms, as well.

Again, this is a consumer perspective. I'm a
city girl, but my parents retired on a farm,
and my mom has ten, so again, it's not the
same amount, hens. And they go out in the
grass, they go out in the snow in the winter.
She gives them corn, eggs are fine, chickens
are fine. So what are the hurdles to be able
to do that on a production scale?

MR. MARTINELLI: I guess I'm not
really familiar with what -- how many she's
raising, or what she's trying to do. I'm not
familiar enough with that operation to really
tell you.

SECRETARY HEINZE: Okay. Well,

don't worry about my mom's.

MR. MARTINELLI: Okay.

SECRETARY HEINZE: For a long time,
people raised chickens, and they raised them
without Methionine.

MR. MARTINELLI: Right.

SECRETARY HEINZE: And people had
eggs.

MR. MARTINELLI: Sure.

SECRETARY HEINZE: And it worked, so why doesn't it work now?

MR. MARTINELLI: We went back -- as part of our petition, actually, there's -- we pulled feed rations from the 1940s and 50s. And, I mean, the typical additive in feed rations were either table scraps, or some sort of meat meal or bone meal. I mean, in virtually all the diets you look at, that's what you'll find. So there's some way of getting that protein to the birds in the form of a meat byproduct, which is relatively rich in Methionine, and that's the compensating difference.

MR. PIERCE: Can I just add to that? Dr. Keene, who I mentioned earlier, talks about the good old days, the 50s, and 40s when he grew up, and he talked about how the mortality was significantly higher. The life standard and the quality of the bird's
life was much more difficult because of those
elements with feathering and with mortality.
So as we see mortality -- maybe that's not an
answer. The consumer wants to know the
chickens are going to kill each other, so
that's something that's important to the
chicken, so the quality of life is much
different in the 50s than it is today in
regard to the chickens that are surviving.

CHAIR DELGADO: Follow-up question.

SECRETARY HEINZE: And, again, I'm
sure I'm seeing this from a very simplified
version. The only thing killing my mom's
chickens is the fox. They're not killing each
other. I don't think she's feeding them meat.
So it is -- I think from a consumer
perspective, there's an optics thing. Right?
That I can go -- big thing in Minneapolis is
the neighborhood chicken. Everyone is getting
chickens now that they can put in their
backyards, and let them run around in the
grass, so I think it's an optics thing. But
it's hard for consumers to understand, and it
gets complicated by pasture for cows. So
maybe some help understanding that.

MR. MARTINELLI: Yes. I don't know
that we can answer a consumer perception
question. I mean, that's not really -- I
mean, we're more from a nutritional standpoint
looking at NRC values, looking at our history
in poultry production, and we've actually got
speakers following us that actually can speak
very specifically to the science behind it.
I cannot. So, I mean, we can address those
issues, but consumer perception and optics is
kind of out of my league.

MR. BRUCE: Can I just add one
brief amendment to that, and that is that --
to reiterate that Heritage breeds don't have
different Methionine needs. But one of the
ways that that's been approached in Europe is
to have -- it's a density issue, and it's to
have much smaller flocks, and be able to move
the flocks around so they have a much greater
outdoor area. But what they found even in those flocks is without supplementation there's feathering problems, and picking, and the feathering scores of those birds are fairly poor.

CHAIR DELGADO: All right. Kevin, followed by Tracy.

MEMBER ENGELBERT: You've touched on one of the questions that I had for you, but I'd like you to elaborate farther. Before the advent of synthetic Methionine, how were the needs of these birds met? And my second question is, any of these trials that you reference where the grass and these other materials or substances weren't meeting the Methionine needs of the birds, were they ever fed synthetic Methionine as chicks, and then taken off it and put into these trials? Do you know that, because they could develop a dependency on the synthetic, and then when you put them out on a trial and say well, this doesn't work, that could be the reason.
MR. PIERCE: I was going to say I now it was, you could share part of it, but from a diet standpoint, I know fish oil, fish meal, crab meal was an important part of the diet pre-synthetic Methionine to try to elevate those levels. And I know some of those products, of course, are not available at this point to us, so maybe you want to add to that.

MR. MARTINELLI: Again, that's covered in the petition about the diets from 40, 50 years ago. I don't know the answer to your question about whether the chicks were fed synthetic Methionine. We've got the report here. We can flip through it at the break or something and look. I mean, it's a great question. I just don't know.

CHAIR DELGADO: Tracy.

MEMBER MIEDEMA: Valerie, can you pull up the slide that shows the quarter-by-quarter projects. My question is for our Livestock Chair, and maybe for you all to
chime in on.

I heard earlier that the reason we put the, or were suggesting the two-year expiration is to try to light a fire under the development of non-synthetic Methionine. And the indications I'm getting is that there's a lot of irons in the fire out there, and so I'm wondering, at the two-year point, where we're going to be, and whether that's adequate.

CHAIR DELGADO: Hugh, would you like to respond?

DR. KARREMAN: I don't know where we're going to be, but they have a good time line up there for doing a lot of trials, and poultry trials don't take as long, usually, as some of the other large livestock, so that's helpful. The original petition is to take the expiration date off indefinitely. Right? If we did that, would you be doing this?

MR. MARTINELLI: It would still be subject to the five-year sunset.

DR. KARREMAN: No. There's
something weird about that, I think, isn't there?

MR. MARTINELLI: That wasn't our intent, so if it's weird, we didn't mean to be weird.

CHAIR DELGADO: He has a clarification. Dan.

DR. KARREMAN: I do have some questions about that whole thing, but is this two-year time line kind of because of our secondary recommendation here?

MR. MARTINELLI: In part. I mean, I am sincere. I mean, I think part of the problem is we haven't had a strong time line, and we certainly haven't communicated it to you guys. And, I mean, if you're going to give us any time, we need to tell you what we're going to do in that time, not just hey, we're going to work really hard.

DR. KARREMAN: Right.

MR. MARTINELLI: So I echo what Dr. Goldstein said earlier, that two years is a
bit of a rush. I mean, frankly, it's a bit of a rush. We will do the things we're committed to do up there, but I can't look you in the eye and say yes, and we will have an answer.

DR. KARREMAN: Right. Right. No, I understand that part. I just -- this is the second extension on Methionine. Y'all know that, or third, whatever it is. But we just want to -- I guess, we just don't want to keep having this discussion every two to three years. I remember in 2001 when the meeting was at the USDA building there was someone really needing Methionine, and now it's 2008. So, I guess, we just -- we want to make sure that this isn't just an ongoing thing, and that's why we're asking about alternatives and all that.

And, actually, my question, if I may is, what's the typical ration of layers, typical ration that you're feeding with each new batch of layers you get in?

MR. WILL: Depending on the age of
the bird, but our typical ration is the majority of it is an organic corn, limestone, alfalfa, natural salt, and soy. And then on a per ton basis, it's around 4 pounds per ton of Methionine.

DR. KARREMAN: That's pretty standard around?

MR. BRUCE: It's fairly standard, although I would just add to that by saying that our producers are really experimenting with a wide variety of things, field peas, wheat, barley, everything that they could think of because of the current livestock feed situation.

MEMBER HALL: Just wondering, though. I mean, if organics is to promote the natural behavior of the livestock species, I mean, poultry are not herbivores. I mentioned that earlier this morning, I think, and I think we'd like to get to that point. It's like the whole pasture discussion is because ruminants are herbivores, and they need to be
out there and whatnot. Well, poultry, it's a little bit the other way, so we want to see that -- I guess the Livestock Committee wants to see that come in. I'm glad to hear there's variety, but it's still all plant-based, and I guess we want to start seeing some more access to the outdoors, and perhaps some of what Katrina was getting at, incorporated. Not maybe basing all the Methionine on that, but not denying them that particular input as a Livestock Committee, and as a Board, perhaps.

MR. MARTINELLI: Am I hearing you right that it's -- so like the insect meal, earth worm meal, that kind of stuff is the direction you're going?

DR. KARREMAN: Well, I always like to call things when I give talks to farmers or vets, a multi-prong approach, not just reliance on the same inputs, like the ration that I just asked you about. So yes, you know, have a variety.
MR. BRUCE: I couldn't agree with you more, but we, nonetheless, have to address the issue right now. I'd encourage the NOSB to take up the issue of further defining outdoor access for poultry, but, nonetheless, we're on a long time line I'm sure with that, too.

CHAIR DELGADO: Our Director has a point to make. Please.

MS. FRANCIS: I just wanted to remind the Board why they were concerned about moving this material to a traditional sunset rule versus keeping the expiration date, and that the sunset rule puts more of the burden on you to be soliciting whether or not this is still needed. And keeping it on the list, rather than putting the burden on the industry to prove that they still need it.

CHAIR DELGADO: Thank you for that.

Dan, you had another similar comment? No. Okay. Jeff. Hugh, are you done?

DR. KARREMAN: Yes.
CHAIR DELGADO: Okay. Do you have a similar comment on that, or question? I have Jeff here.

SECRETARY HEINZE: Jeff can go first.

CHAIR DELGADO: Jeff, proceed, please.

VICE CHAIR MOYER: Thank you, Mr. Chairman. You mentioned in the beginning of your conversation that, and your points that you had some growers in the room. And I appreciate their reluctance maybe to come to the podium, but I would like to invite them to come up and give their name, something about their farm, briefly where they're from, just so we have some indication of who is here representing the poultry industry.

SECRETARY HEINZE: As you do this, please go very slowly. I'm going to have to write you all down.

MS. MITCHELL: Susan Mitchell. I'm from Lancaster County, and we have been
growing organic chickens broilers for three years.

VICE CHAIR MOYER: Are we allowed to ask questions or not?

CHAIR DELGADO: Yes, we are. Why don't we allow them to present themselves, and then we'll have questions for them.

MR. ZIMMERMAN: Earl Ray Zimmerman. I live in Lancaster County, I'm growing organic broilers for four years. I'd like to comment a little on grandma's backyard chickens. Big issue is phosphorous for the Chesapeake Bay.

CHAIR DELGADO: Excuse me. Katrina, you had a question.

SECRETARY HEINZE: Before you do that, can you spell your last name.

MR. ZIMMERMAN: Z-I-M-M-E-R-M-A-N. If we'd all have 50 chickens in our backyard, think how your backyard would look eventually.

CHAIR DELGADO: Okay. Thank you for that. Comment, next?
MR. MARTIN: Dennis Martin from Lancaster County, Pennsylvania. I've been growing organic broilers for just about two years now.

CHAIR DELGADO: Okay.

MR. STUMP: Lavere Stump from Adams County. I've been raising, I put up poultry barns a year and a half ago.

CHAIR DELGADO: Can you come back?

SECRETARY HEINZE: Spelling, again.

CHAIR DELGADO: Spell your name, please.

MR. STUMP: My first or last?

SECRETARY HEINZE: Both.

SECRETARY HEINZE: Thank you.

MR. KING: Matthew King, farm is in Chester County. And we actually have our first organic flock in the houses currently. We've been raising chickens, I'd be the second generation, broiler operation at this time.
or 15 years.

MR. RANK: My name is Ryan Rank. I'm the Grow-Out Manager with BC Natural Chicken. I'm not an actual farmer, but I'm here with the farmers today. We have many family farms represented with our operation where we grow organic birds. So I just wanted to give a general outlook on who we brought with us here today.

CHAIR DELGADO: All right. Thank you.

MR. FRAN: My name is Tom Fran. I'm from the southern California, work for MCM Poultry, and I have a Bachelor of Science in Poultry from Cal Poly St. Luis, and 34 consecutive years in the layer industry.

CHAIR DELGADO: Okay. Thank you. Any questions, follow-up questions -- one more? Several more. Please.

MS. MILLER: Hi. I'm Denise Miller with Dennis L. Miller farm. We've been growing organic chickens for almost a year.
We're from Hamburg, Pennsylvania, Berks County.

CHAIR DELGADO: Okay.

MR. SMELTER: My name is Steve Smelter, and I work for Kramer Feed, Incorporated in Kramer, Pennsylvania. We are a certified organic feed mill, and we make feeds for organic layers, organic broilers, organic turkeys. And we sell feed both to ourselves for our integrated growing program, and we sell to independent growers for the most part up and down the east coast from Maine to Florida. I work in the retail division, and have the experience, sometimes quite strange experience of dealing with the backyard grower like your mother. I'll come off the phone with a grower who has five chickens, and then I'll talk to some of our large independent retail customers who have 30 or 60,000 layers, so kind of gives us a unique perspective. But we've been doing this for 15 years now, so thank you.
SECRETARY HEINZE: Can you spell your last name?

MR. SMELTER: Smelter, S-M-E-L-T-E-R.

SECRETARY HEINZE: Thank you.

CHAIR DELGADO: Anyone else? Okay.

VICE CHAIR MOYER: I want to say thank you. I appreciate you coming up and giving us that information. It really does put a face on the industry for us. And now, I guess, it's up to you, whether the Board can ask questions.

CHAIR DELGADO: Absolutely. Are there any questions for our group of producers, and also members of the Methionine board?

DR. KARREMAN: I'm glad Lancaster County and Chester County is well represented here. Glad it wasn't a far drive.

I'm just wondering what -- I was hoping to hear what kind of size bird houses you have, and how much of your land is
certified organic with the farm that you have.

MR. STUMP: I've got, what is it, 88,000—no, I started 96,000 birds. I have four houses, and they do have access area on organic rye grass. They can go out and they have windows for natural light. And so yes, we're trying to raise the most healthy bird that we can.

SECRETARY HEINZE: Did you say your name?

MR. STUMP: Lavere Stump.

DR. KARREMAN: You don't have to all go through that, unless you want to.

MR. RANK: I can kind of speak for the group a little bit. We have various farms.

SECRETARY HEINZE: And your name?

MR. RANK: I'm Ryan Rank with PC Natural Chicken, Coleman Natural Foods. We have a variety of farm sizes, anywhere from small houses to a few thousands birds, up to large farms, which Mr. Stump just shared here.
Just give you kind of an overview of what we do.

CHAIR DELGADO: Okay. Any other questions from the Board? Dan, then Hugh.

MEMBER GIACOMINI: I'd like to go back to the Task Force on a couple of issues. I have a couple of different questions, if I can. You indicated that in your typical diet, you have about .2 percent Methionine inclusion rate. What percent of the Methionine that you're feeding is coming from synthetic Methionine?

MR. WILL: That is our added rate. There's a little bit in the feed that is on top of that. But we add about four pounds of synthetic Methionine to our ration.

MEMBER GIACOMINI: So then almost all of -- are you saying then -- I mean, you're not saying all the Methionine. I mean, there's Methionine coming from other feeds.

MR. WILL: Correct.

MEMBER GIACOMINI: What percentage
of the Methionine in the diet is synthetic?

MR. WILL: About two-thirds.

MEMBER GIACOMINI: Okay. Valerie, could you go to the, I believe it was a pasture slide on the Mortiz study. I guess I partly take exception to a statement you made, that just in a general sense, faster growing birds are healthier birds. That's kind of like saying the fastest growing birds, or anything that's not growing the fastest is not as healthy as something growing faster. We know in a general sense that slightly under-feeding is the healthiest animal in a species, so I take exception to that.

And in this study, it's looking what a -- stating a deficiency in Methionine. Is this based on the production level of the birds in the study, or based on a preferred growth level that they wanted to achieve? Were the birds out-performing their Methionine intake, or was it just less than what they would have liked to see the birds perform?
Because Methionine requirement is directly tied to the production level that you're trying to assume, and the production level comes down when the production level comes down, and I'm going to come back, again, as I started this question, disagree with your statement that the healthiest birds in the house are necessarily the fastest growing ones.

MR. MARTINELLI: Well, I would disagree with my own statement. If that's what I said, it's not what I meant. The point is that the slow growing genotypes don't necessarily have any different Methionine demand than the faster growing birds. And what I meant to say was that the birds, healthy birds are typically higher performing birds. So yes, you will see an incidence of higher performance out of birds that are given supplemental Methionine, but it's our belief that it's because the birds are healthier.

CHAIR DELGADO: Hugh, followed by
Kevin.

DR. KARREMAN: Last autumn, was it last autumn, Tina? Tina and I were shown a couple of poultry houses in our area, and I was glad to get those tours, and learn a lot from that. One thing I was a little worried about, when one of the owners was there, I just said well, how big is your farm? And he said, 88 acres or whatever it is. I said, certified. Right? No. It wasn't, and it really was kind of shocking that these two poultry houses were on not certified land. So that would -- I think in agriculture, and especially organic agriculture, you've got to have a tie between the animals and the land. That's the way it's always been, and that's what we try to do in organics, I believe.

I'm not saying all the time out there or anything, but I was like well, how are those poultry birds going to be getting their outdoor access as it is in 239(a), I think? It's a little bit -- it was
troublesome. Do most of -- I'll just leave it
at that. Just wanted to make a statement.

CHAIR DELGADO: Okay. Kevin.

MEMBER ENGELBERT: I'd like to get
back to the point of healthy birds and their
productivity, and how you measure that. I
mean, are you looking at mortality rates, or
what do you use to judge -- what criteria are
you using to make that statement?

MR. MARTINELLI: Well, the criteria
we looked at, the measurable things we could
observe were mortalities, egg size, rate of
lay, bird weight, feed conversion, all those
sort of things, a variety of metrics depending
upon the bird. Obviously, there's also
observation that goes into it, too. And our
field people could tell if we have birds that
we either withheld methionine or gave them
less than the targeted amount of methionine,
they will tell you they can just look at the
birds and tell which group was the low-
methionine and no-methionine group.
MR. WILL: I just want to add to this. We actually had an opportunity to walk into poultry houses in first-time producers about a month and a half ago, right after the OTA, and these birds were about 40 weeks old, and when we walked in, they were completely featherless from the backs of their necks to the vents. There were no feathers on the ground. They had been picked clean, because when we looked at the ration, these birds were low in methionine. It was about 15 percent low in the ration of methionine consisting based in their ration. Their production was excellent, but their health and general well-being, the mortality was just starting to shoot through the roof. They picked all the feathers off. And we actually just in that house for a short amount of time, actually saw cannibalism happening because those birds were having nutritional challenges.

CHAIR DELGADO: Kevin.

MEMBER ENGELBERT: Would the
concentration of birds in that house have any impact on that? And did they have any access to the outdoors?

MR. WILL: They had -- they were a cage-free flock, so they did not have access to the outdoors. However, they were not solid walls, so they did have the environment interacting with them. And their density was at or above industry-accepted standard.

CHAIR DELGADO: Any other questions? Dan.

MEMBER GIACOMINI: When we're looking at a compound that's supplying two-thirds of your requirement needs, I don't have a chance to go through an exhaustive search, but I just have -- as a nutritionist, I have a database for amino acids on my laptop here, and over the last couple of days, I've run a number of feeds.

Even if we look at one of the more enhanced versions of corn for Methionine being a corn gluten meal, you'd have to look at like
a 200 time increase over conventional to get anywhere close to the amount of Methionine that you'd be supplying.

I'm trying to understand how -- that doesn't seem like it's going to be -- I mean, it's going to help, but are you really sincerely coming to us and telling us that you think that in three to five years, between corn -- I mean, you're going to have to have exclusive processing centers, you're going to have to have supply chains that will just be incredible to manage, insects, a little bit of fish meal, worms, or are just going -- or are you going to come back, and are we going to need Methionine forever to meet the production levels that you really want with the health that you're claiming that you need.

MR. MARTINELLI: That's an extremely fair and legitimate question. For boilers, when we looked at the diets, you get really close with corn gluten meal, which is not approved for organic production, but which
you cited, and high-methionine corn. I mean, you get really close. And I guess my perspective would be, I'd like to try that diet and see what sort of -- see how the birds look, see what sort of results we get. But I think your question is great, because it really illustrates -- I know there's a lot of frustration around gosh, you've had three years, you had another three years, you guys aren't doing anything. And I don't -- it's not that we're not doing anything, it's we've got a tall order. I mean, what you're describing is the crux of the problem. This ain't easy, and it's -- we will do everything we possibly can, but I can't deliver you a two-years from now, 36 months from now we'll have the solution.

MEMBER GIACOMINI: Well, I think the crux of that problem is, on our side, at least on my side, is very close to an absolute commitment seeming to be on your part of wanting to maintain conventional growth rates.
And there doesn't -- I'm not hearing a great acceptance to well, we can come back 10 percent and we'll be able to do there, we'll be able to do this, we'll be able to go so many days longer, and this will make it work. I'm just hearing chickens are going to be killing each other if we don't keep our Methionine.

I don't -- as a nutritionist, I hope you keep trying, but I'm not really optimistic on any of these for you. So, granted I'm a ruminant nutritionist, not a poultry, but I still know nutrition.

Are you going to reach the point where if it -- I mean, we're just going to have to live with a lower performance level, production level?

MR. MARTINELLI: Yes. And I guess I want to go back. I mean, you're completely right. I mean, this is much more your realm than mine. Closing the gap. So, I mean, if we can get these alternatives in the system,
and we can close the gap, then if we get results that are close, yes, we can live with that. But right now you're talking about a wide gap that creates bird health issues, creates environmental issues.

The thinking would be if we could get some of these alternatives in place and get the gap to where at least we're not dealing with bird health issues, we're not dealing with environmental issues. You're maybe dealing with a loss of production, but you have to just manage your way through that.

CHAIR DELGADO: Hugh, followed by Tracy.

DR. KARREMAN: Just taking that into account, let's say in a few years you're using the alternatives, and gee whiz, you still need a little bit of methionine even for a reduced level of production, which is our problem right now, is just trying to keep production. I'd like to ask the Program, is it ever possible to say okay, synthetic
methionine, which is only for poultry, we're not allowing it for pet food, or fish, or nothing else. It's just poultry. If that can be at a smidge, a fraction of what you're doing now, if that would be allowable. Can we say that, because it is a vitamin or essential nutrient, but it's only for poultry. I was wondering, could we have an annotation on that? Let's say come up in three years or two years, whatever, if this happens again, or maybe work on that now. Just say you can have it at whatever, like 15 percent of the level you have it now, so that you are forced to use some other inputs and have a diverse diet.

CHAIR DELGADO: So you're proposing a scaled down -

DR. KARREMAN: Not a total phase-out, necessarily. I'm just saying is that an option of bringing it down, stepping it down so then the alternatives have an incentive to step up. That's what we're dealing with, fish oil, fish meal from the symposium. We were
talking about a phase-out, so then the people
with the new products for fish oil, fish meal
will have stimulus to go up, because they know
you're coming down. Is that legal, being an
essential nutrient, well, because you're
supposed to balance the rations, vitamins,
minerals, and all that.

CHAIR DELGADO: Can a member of the
Program address that point?

DR. KARREMAN: An annotation to
have a certain amount, no more.

MR. POOLER: This is Bob Pooler,
NOP. We're going to have to take a look at
that and get back to you on it.

CHAIR DELGADO: Okay. Thank you.

But that's an option that probably the
Committee should consider. Kevin.

MEMBER ENGELBERT: There's a
nutritional supplement company in Pennsylvania
that I'm sure you're familiar with that offers
a poultry nutri-balance or supplement without
methionine. Can you give any opinion on that?
MR. PIERCE: Yes. Kevin, I'm not familiar with -- I'm familiar with the company I think you're talking about, but I'm not familiar with that product, but we can include that in the Methionine Task Force information.

MR. SMELTER: That product was developed by Dr. Jack Robinette to -- was a colleague of mine going back to 1980 when I started in the feed industry. Jack had a great understanding of all species, one of the few nutritionists, I think, who could excel in all those fields, and he's up there in his elder age right now, but he's still providing information to specific companies.

The nutri-balancer comes two ways. It comes with Methionine, and without methionine. And Jeff is not here from that company to speak for it, but originally his company, Fortrell, provided feed supplements to the "natural grower" before the organic program existed. When organics came, they modified some of their pre-mixes.
The pre-mix with methionine is chosen by people who wish to use it in their birds, some of them wish to use the one without methionine. Some of those are natural growers who will use some other ingredients that the organic program is not allowed to use, so Fortrell has always had the natural people, many of whom use fish, some might even use meat and bone. Meat and bone hasn't been mentioned, but historically in the 40s and 50s that was the main carrier of methionine into these poultry rations, was tankage, whey, things that we call slaughter byproducts, which are not allowed in organic production today. So they do have both, and their pre-mix without methionine would just be the necessary vitamins and trace minerals, macro and micro minerals that the bird would need. So there would be a difference in how the birds would be able to survive and perform.

MEMBER ENGELBERT: They make the claim that they have replaced the methionine
with acceptable ingredients, one of which is kelp meal. Do you know what the methionine levels of that ration might be? And have you, or any of your growers used this product to compare the results?

MR. SMELTER: Well, as one of their chief competitors, I've looked at it very closely, and they would use that product to grow all types of poultry, with some minor modifications. For instance, for layers, they would bring in some added calcium from limestone or oyster shell to supplement that out. I'm sorry. Oh, the kelp meal.

I know that Jeff has experimented with recommending his organic growers to use fish meal and crab meal, which is allowed under organic rules, as long as the preservative is okay. And he gets good results, and he has -- in those recommendations with no methionine, he'll use have a fish and a crab recommendation. Kelp is a great natural vitamin and trace mineral
source, but not a source of methionine, of any
significance, other than the tiny amount of
sea life, animal life that might be in it,
which is very negligible, and not really
claimed.

CHAIR DELGADO: I understand that
Richard Matthews has a statement that might
add to the previous question that you had.

MR. SMELTER: My name is Steven
Smelter.

MR. MATTHEWS: Richard Matthews.
Hugh, I'm going to go out on a limb, and
remind the board that in Section 205.602 for
sodium nitrate, that there already is a cap on
the amount of sodium nitrate that can be used
to meet the nitrogen needs, so why not in
livestock production, as well? So if you
wanted to say that synthetic methionine is
capped at a certain level, you can surely
propose that.

CHAIR DELGADO: Thank you.

MR. MATTHEWS: Granted, I'm talking
-- you know, it's already been done for a
natural which is restricted, but there's no
reason why you can't also restrict the
synthetic that you allow.

CHAIR DELGADO: Thank you for that
comment. Gerry, you wanted to comment on
that.

MEMBER DAVIS: That's a major
difference. That's a prohibited natural
that's restricted to that amount. It's not
synthetic.

CHAIR DELGADO: Hugh.

DR. KARREMAN: It's still on the
list.

MEMBER DAVIS: It's a similar
precedent, but it's synthetic versus natural.

DR. KARREMAN: Yes, but we're also
talking living creatures.

CHAIR DELGADO: Very well. So,
again, this is an option that the Committee
might consider, and explore that further.

Yes, Dan. You can a comment.
MEMBER GIACOMINI: Kind of another question. Well, first of all, let me say as far as the things -- I think the biggest help that I would see is in the fermentation products, because that's where you're going to have the best chance of concentrating your methionine. But has there been any work done on finding an economical organically approvable hydrolysis procedure and isolation technique to isolate some of the methionine out of some existing protein sources?

MR. MARTINELLI: No. I don't know of any, let's put it that way.

CHAIR DELGADO: Follow-up question?

MEMBER GIACOMINI: No. I understand it might be an idea.

CHAIR DELGADO: Okay. Thank you. Tracy.

MEMBER MIEDEMA: I just wanted to switch gears a little bit and go back to the petitions that we have before us, which deal specifically with the changing of this
expiration date, which the Livestock Committee seemed to have made pretty strong recommendation on. And a lot of what we were dealing with was the date, and that we were looking at two-year extension.

One of the things that you mentioned earlier today was that two years was arrived at sort of loosely based on it was three, plus two, it's loosely tied to a sunset-type period, and I'm just wondering, since this is our only time to discuss this and tomorrow we just vote. Right? We're trying to confine our discussion to today.

CHAIR DELGADO: Right.

MEMBER MIEDEMA: If two years seems like enough, given the amount of work that's in the hopper right now, and where we're going to be at in two years. And whether we're going to go through this whole exercise just to say add one more year, when we could potentially just make it three.

CHAIR DELGADO: Okay. Hugh, if you
can answer that question, I really would like
to wrap this up and move on to the next topic.
So we'll have Hugh, followed by Joe.

DR. KARREMAN: Certainly, that's
possible. You've got to remember that the
Livestock Committee unanimously voted to not
take the petitioners recommendation or their
petition at all, meaning methionine would be
out this October.

MEMBER MIEDEMA: Okay.

DR. KARREMAN: We certainly do not
want to kill an industry, so we came up with
the two years, kind of like what you said with
these alternatives, and what's in the hopper
and all that. We could make it three years,
possibly, but I want to make sure that -- I
won't be on the board next time when this
happens, but that it won't happen again, that
another three years is needed. And, so, maybe
we can do something with a restricted amount,
a small amount of synthetic methionine,
possibly, to stimulate the growth of some of
these other alternatives into the diet, to get
some variety in the diet, as well, from the
natural sources of proteins and whatnot.
Anyway, it's possible for three years.
By the way, quick thing, Livestock
Committee meeting tonight at some point.
CHAIR DELGADO: We'll make that
announcement. And just as a reminder, there's
always -- prior to voting, there's a period of
comment on that specific item. And you'll
have more opportunities to comment on that.
MEMBER SMILLIE: I was simply going
to say the same thing. It seems two won't do,
meth free in three.
CHAIR DELGADO: That's it? Well,
any more questions? Thank you very much to
the group, and we'll continue on to the next
speaker.
MS. FRANCIS: The next speaker had
to leave to catch a flight, unfortunately, and
he has handouts, which I will pass around,
which are collated and everything. So I'm
assuming the next speaker is still here.

CHAIR DELGADO: And that will be Greg Herbruck. Is that correct?

MS. FRANCIS: Eric Gingerich is after -

CHAIR DELGADO: Okay. So we are moving on. Greg is gone. Right, Valerie?

Greg is the one who left. Next up -

MS. FRANCIS: Greg left.

CHAIR DELGADO: Next up will be Eric Gingerich.

MR. GINGERICH: That's right. Eric Gingerich from the University of Pennsylvania. I'm a veterinarian, and I have a handout that you will all get eventually.

I've been in the industry about 30 years as a poultry veterinarian. I work in the diagnostic lab portion at New Bolton Center. We work with a lot of the Lancaster County and surrounding area poultry producers, organic, conventional, everything. So I'm looking at these chickens, I do field
investigations, trying to figure out what's going on with some of these flocks. And I've seen some problems in the -- even present problems with organic flocks.

I have about a list of nine different things that I think could impact poultry health, assuming that we have no good alternative to synthetic methionine to add to these rations. The first one is poor feathering in egg layers. This is definitely a big problem, even with conventional cage-free birds, that once they lose their feathers they lose a protective cover to protect them from scratches, and things like that. These wounds allow bacteria into the system. We get E. coli infections quite often.

Also, once they lose their feathers, they become very nervous and more cannibalistic, and we get a lot of peck out mortality. Even with present day organic flocks, we've had some pretty high mortality rates, especially in open-type housing from...
peck outs, even with synthetic methionine in
the rations.

Another thing, poor feathering in
broilers is another thing that without the
synthetic methionine, we anticipate that we'd
have poor feathering problems there, also.
Broilers also need those feathers for
prevention of skin scratches, to prevent
gangrenous dermatitis, and E. coli infections,
as well.

Without synthetic methionine, the
rations are going to have a lot of excess
protein due to added soybean meal to raise the
methionine level trying to get near the
requirements, and this extra nitrogen is going
to go into the feces. And this extra nitrogen
is going to increase our ammonia levels in the
houses, and this will impact the respiratory
tract negatively. It reduces the ability of
the respiratory tract to rid itself of
bacteria. We're going to see more bacterial
infections.
Also, birds are very sensitive, especially brown egg layers are very sensitive to ammonia. They get corneal ulcers. We've even had some -- this winter we had some pretty significant losses of birds due to corneal ulcers from high ammonia in brown egg pullets.

Talk about decreased growth rate with lower methionine rations. This, in a veterinarian's eyes, you're going to have these birds out in the field longer, broilers and turkeys, by the way, going to have them out in the field longer so that exposes them to more disease risk. The longer they're out in the field, the more risk they have.

Kidney problems could be an issue also with the excess nitrogen that birds have to excrete. This puts a big stress on the kidneys, and we anticipate possibly more visceral gout problems, urolythiasis problems in poultry, especially layers due to the increased amount of soybean meal that's going
to be used. This increases the potassium level of the diet, and this potassium is very prone to cause wet droppings. And these wet droppings, wet litter in chickens is a very bad thing. It increased pathogen load, it increases the bacterial level of the litter, it increases the ammonia release from the litter, so it's got a lot of negatives to it.

Also, increased heat stress is a possibility with increased nitrogen crude protein in these rations, because of the heat, the metabolism is going to be increased. During real hot weather, we're going to have some probably more heat stress, and mortality due to heat-related problems.

Pododermatitis, which is ulcers on the bottom of the feet of birds, this is -- some research has been done that shows a significant increase in turkeys, where you use higher levels of soybean meal, higher crude protein levels. They didn't really say exactly what it was due to, if it was the wet litter
issue with potassium or what, but there was a big increase in foot problems.

Lastly, coccidiosis may be increased. The severity of coccidiosis, some research has been done that equated inadequate methionine to increased severity of coccidiosis.

So, in summary, I think without a good alternative to synthetic methionine, I think we're going to have some -- see more birds in the lab due to some of these health issues. Any questions?

DR. GOLDSTEIN: Right. There's a handout. I don't know if you've received it yet. If not, it will be coming around. And it will go more in depth into what I wanted to say. If I only have five minutes, there's only certain things I can deal with.
CHAIR DELGADO: Dr. Goldstein, can you just state your name, and your affiliation, please.

DR. GOLDSTEIN: Right. Walter Goldstein, Research Director, Michael Fields Agricultural Institute, East Troy, Wisconsin.

CHAIR DELGADO: Thank you.

DR. GOLDSTEIN: Okay. If we can look at the screen over there, I have a few slides for you. First off, I want to point out that the work that we're doing is actually a team effort that involves our institute, Iowa State University Serial Testing Lab, USDA ARS, especially the Corn Breeding Group at Ames, Iowa, Practical Farmers of Iowa, University of Minnesota, Lamberton, we're all doing research. We're doing it also together with Organic Valley and Methionine Task Force, so it's a nice team effort.

Looking at the actual methionine content, we've heard some discussion about what needs to be in a ration. What I'd like
to point out here is that we have three
different types of corn here. This data is on
the basis of total dry matter, and you can see
normal corn, this is average of 1,903 samples
from the Iowa State Grain Testing Lab. And we
have 28 samples of our hard kernel methionine
corn, and 16 samples of our soft kernel
methionine corn. And you can see that there
are some profound differences. We have a
higher protein content. The methionine
content is about half again more. Also, the
total sulfur amino acid content, which counts
for chickens, is higher. And the lysine
content is higher. In fact, it's almost twice
as high for our soft kernel corn as it is for
normal corn. Lysine is also very important
amino acid for balancing the ration for
chickens.

And you can see that's an average
of 28 samples, and 16 samples. These samples
are expensive. For a company to do these
analyses, it costs them $150 a sample. We
feel very excited that we've made a new breakthrough in testing of methionine and lysine with a near infrared spectroscopy. We've developed a new calibration that's broken the inherent correlation between protein and methionine and between protein and lysine. We've made a big breakthrough. And with this technology, it's going to be possible to measure methionine very cheaply, and quickly. And that's going to be an important ingredient in terms of bringing the high methionine corn forward as an alternative for organic producers. The grain handlers are going to be able to need to test the corn, and to see whether it's going to be meeting their specifications in terms of methionine. The next slide, please.

Okay. Here shows some yields. These are yields from last year, from Wisconsin, from Iowa, and from Minnesota with the Lamberton Station. And you can see that what we're looking at is three different
groups, and we're looking at the yields of commercial hybrid checks, mostly three checks, and our best three high methionine hybrids. And if you look at that, you'll see that with the hard kernel late group that we're producing yields that are 90 percent of that of the commercial hybrids. These are Blue River hybrids. With our hard kernel early, it's 80 percent of the same yield as the commercial hybrids, for the soft kernel it's 70 percent. Soft kernel has the best nutritional value, probably because of its high lysine content, but we're sitting here with our best hybrids, we're somewhere between 70 and 90 percent of the yields, depending on the hybrid. So what we're doing is mostly going forward in terms of seed production with the hard kernel late time. Next slide, please.

We've done feeding trials with broilers. I should say that Organic Valley has done, Nick Levendoski and his group of
farmers, a broiler feeding trial with Cornish cross cockerels, small experiment. Birds fed out from when they were chicks. This experiment was simply to replace normal corn plus synthetic methionine in a normal diet with our corn, with our high methionine corn. The gain was essentially the same. We also had a third treatment, which was potato extract, high methionine potato extract. It did not perform. We had higher mortality, and the birds did not grow as well.

The birds that received the high methionine corn, and the birds that received the normal corn plus synthetic methionine had essentially the same rate of gain. Feed to gain ratio was the same, but for the potato extract it was higher. It wasn't as efficient forage.

Do you want me to continue with this? I can wrap it up in say three more minutes? There's a layer trial.

CHAIR DELGADO: Just provide a
quick wrap-up sentence, please. And then we'll open up for questions. Can you wrap-up your comments, Doctor?

DR. GOLDSTEIN: I wanted to show you a layer trial, which I think is very pertinent to -- a 44-week layer trial. It would take me about another minute on that. And then I wanted to say where we are at in terms of our seed production.

CHAIR DELGADO: Let's go on to questions. Joe.

MEMBER SMILLIE: Dr. Goldstein, could you tell us about a layer trial, and where you're at with your seed projections?

DR. GOLDSTEIN: Okay. Next slide, please.

CHAIR DELGADO: Thank you, Joe.

DR. GOLDSTEIN: Feeding trial was a trial carried out by the University of Minnesota together with Organic Valley and ourselves. It took place with Bovan Brown pullets, six replicated pens per treatment.
We had the same setup with normal corn, plus synthetic methionine, versus our corn in the context of a normal diet. The birds were fed out from when they were chicks, and the gain feed consumption was essentially the same. Egg production was 2 to 5 percent less per pen for the high methionine corn. However, there were some other differences.

The birds that received the high methionine corn were more enthusiastic about their feed. They loved it. It had to be controlled, because the birds liked it so much that they would go into frenzies about it. By the end of the trial, half of the pens with the controlled feed had been progressively disqualified because the hens were eating their own eggs. This is for the controlled diet, not for the high methionine corn, where there was no problem on that. This is a switch on the cannibalism issue.

Anyway, this interest in the high methionine corn was also seen in the broiler
trial, and so that's what I have to report at this point. Forty-four weeks, small flock, essentially no differences in performance.

CHAIR DELGADO: Okay.

DR. GOLDSTEIN: Or feathering, for that matter.

CHAIR DELGADO: Very good. Any other questions? Gerry.

MEMBER DAVIS: Can you spell out the progress of your seed increase program, and particularly, I wanted to know, looking at the chart from the Task Force that they put up earlier on your plans, they had it laid out quarterly. By the fourth quarter of '09, I'm kind of curious to see what kind of volume that represents, versus the percent in the organic feed marketplace for the need that is, what would be needed?

DR. GOLDSTEIN: Well, I think the point is, is that we can make projections, and it's important also to realize that real life doesn't always follow through on them. But in
projections, and this handout, when you have
a chance to look at it, on page 6, we've given
projections of production for the two top
varieties that we're bringing back from Hawaii
this year, and which we're multiplying with
the help of the Methionine Task Force. They
paid for the seed, everything is going
forward.

And on that, you'll see that on
page 6 under 2010, we project that 3.1 million
bushels of corn could be produced at rather
conservative production assumptions for the
organic poultry industry by the end of 2010.
That is if everything goes right. And it has
been estimated that there is a total demand of
8 million bushels per acre.

MEMBER DAVIS: For organic.

DR. GOLDSTEIN: Organic poultry
over the whole nation. So that could be
accelerated by producing seed during the
winter in Chile in order to give a leg-up, or
the three-year -- the idea of extending the
two years to a three-year would give us a little bit more leeway in case things just don't go as well as we want.

There's a number of things that we haven't resolved fully. As I explained earlier, we're going as fast forward as we can, and everything is looking positive, so far. But there are -- some time will help us.

MEMBER DAVIS: So does the chart, the information contained in this explain that these numbers are based on winter time production in Chile and things like that?

DR. GOLDSTEIN: No. These are without wintertime production in Chile.

MEMBER DAVIS: These are without.

DR. GOLDSTEIN: Yes, that's -- the last wintertime production would have been this last winter. And now we're going forward from now.

MEMBER DAVIS: So these numbers are, if you did not do that, take those -

DR. GOLDSTEIN: That's right.
MEMBER DAVIS: -- extraordinary measures of getting essentially two seed crops a year.

DR. GOLDSTEIN: That's correct.

That's correct.

CHAIR DELGADO: Any other questions? Steve.

MEMBER DeMURI: With the current pressure on with corn production right now, do you anticipate you'll have any problems getting growers to grow this lower yielding corn for the organic poultry industry?

DR. GOLDSTEIN: Yes, that's a very good question. I do anticipate we will have problems. I do anticipate, because farmers are going to be trying something new, and because what's not in place now is a price incentive system which is clear. We need to have outreach, we need to have a clear set of contracts, and that all needs to be developed.

CHAIR DELGADO: Any other questions? Dan, followed by Jennifer.
MEMBER GIACOMINI: When we're looking at something like corn, and we're trying to deal with something like methionine, where we're talking about something basically plus or minus, a 10 percent protein level, we can improve methionine, but we're still talking about small amounts, unless we do something to that corn to process it to concentrate the methionine and the protein. Is your company looking at any processing possibilities to make this a little more utilizable, and work into the ration?

DR. GOLDSTEIN: Could you go to the next slide, please. Sorry. The next one after that. I'd like to emphasize that actually I don't think that's necessary, not for broilers and layers, at least that's not what our results are showing, that it's necessary to concentrate the feed.

Cromwell in '68 and Chee in '73 did trials with the same floury to corn that we have with layers and broilers. They had the
same results. It's possible, I believe, to feed corn with organic, not necessarily natural, organic corn, and to be able to get adequate production levels. I think that's what the life has been showing us, so I'm not sure that that assumption is actually true in reality.

MEMBER GIACOMINI: Okay.

CHAIR DELGADO: Okay. Jennifer is not asking a question. Anybody else? Okay. Well, thank you very much.

DR. GOLDSTEIN: Sure.

CHAIR DELGADO: Appreciate your comments.

DR. GOLDSTEIN: Yes.

CHAIR DELGADO: Next up is Brian Baker as proxy for Dave DeCou, and after that is Katherine DiMatteo.

MR. BAKER: Thank you, Mr. Chair, members of the NOSB, members of the NOP. I appreciate this second opportunity to comment, and I will try to get straight to the point.
OMRI appreciates the recognition of our work on the database, if you could back up to that slide.

We conducted a survey of accredited certifiers to find out how they were verifying commercial availability, and we found, as many of you are aware, that none of them are following the NOSB's recommendations. They're using supplier letter seed catalogues as their main references.

OMRI comes in behind producer logs, around half of the certifiers are using it. We wanted to know how to improve that, and we also asked what's out there. Anyone want to guess what the number one crop that certifiers said that they were saying their producers had a hard time finding organic seed?

PARTICIPANT: Corn.

PARTICIPANT: Okra.

MR. BAKER: You got it, yes. And there's a reason alfalfa -- alfalfa is the answer. You want to go to the next slide,
please. Alfalfa, a lot of people don't realize that alfalfa is really sold into two markets, and we think of hay, and the run up in demand for hay because of the increased dairy production, but there's also a vegetable market. And seed for sprouting is not allowed to be exempt, so alfalfa spout producers have still be able to find organic seed, but they've had to pay quite a bit of money to keep that going.

And we found out this past spring, we've been very pleased to say, and surprised, actually, that we're getting as many hits on our seed database as we were getting on our products list. And the thing that -- we've also noticed that we're getting a lot of hits on corn, and a lot of concern over the ability to get uncontaminated -- get corn seed that's not GMO contaminated.

Briefly, we've talked to individuals at FIBL, Soil Association, the Danish Ministry of Agriculture in the
development of our database and there are
limitations to adopting the European model
that would require changes in the way seeds
are regulated in the United States. And, so,
yes, the European Registry has certain
advantages, but that's a very different mind
set that they have, and how seed is regulated,
and what varieties are out there for farmers
to grow, so I caution against mandating a
European-style approach, without an
understanding of how that's connected to how
seeds are regulated in Europe. Switching over
to the other commercial availability issue,
the allowance of agricultural ingredients in
organic processing and handling creates some
interesting challenges in inspection and
labeling. Under OFPA, items that contain less
than 70 percent organic ingredients are exempt
from certification. And under 7 CFR
205.101(c)(3), that exemption is carried
forward in the regulation.

Now guess whose door people knock
on when they want to get their non-organic agricultural ingredients certified for use in organic production? Okay. So the ACAs don't want them. We're aware that not only colors, but also anti-foaming agents, flavors, fruit coatings, these things are coming to us, and they're formulated with items on 605A and B, items on 606, and organic agricultural ingredients, less than 70 percent organic agricultural ingredients.

We're getting mixed messages from subscribing certifiers in the industry about what we're supposed to do to gather, verify, and communicate information on these products that are clearly ineligible for organic certification. Specifically, how are people supposed to know the organic content of these non-organic ingredients, or should they just assume none of it's organic?

We also have to deal with the fact that organic claims and the labeling of such intermediate BtoB products are covered under
305 and 310. And the vendors want to keep this specific information proprietary. They don't want their customers to know it. They don't want certifiers to know it. They don't even want us to know it, but we'll get it. And then we don't know what to do with it, so we need guidance. We need help.

That's something where we're asking for your assistance, and we're also asking that the information -- that the increased funding for data collection be used to estimate the market for organic seed and non-organic agricultural ingredients, and I'd be willing to answer questions on tartaric acid and methionine.

CHAIR DELGADO: Okay. Any questions? Katrina.

SECRETARY HEINZE: I want to make sure I understood that list bit right.

MR. BAKER: I was trying to get it out in less than five minutes.

SECRETARY HEINZE: I know. You're
getting questions about the non-organic materials being used in products labeled as made with, so ones that are below 95 percent and above 70?

MR. BAKER: No. We're getting formulated products that are combinations of non-organic agricultural ingredients on 606, non-organic non-synthetic ingredients on 605A, non-organic synthetic ingredients on 605B, and organic agricultural ingredients that are combined in formulations that are, in turn, used in organic products that have over 95 percent organic content, and they want to sell these formulated packages to organic processors or packers. I mean, fruit coatings, what do you do with fruit coatings? You've got five ingredients in a fruit coating, and it's a black box. The company that formulates it doesn't want the packing house to know the specific ingredients or the percentages. And the fruit packer wants to sell their fruit as organic. Heck, they'd
like to sell it as 100 percent organic, but it's not 100 percent organic if it has a non-
organic coating that includes shellac and an organic vegetable oil. And I don't want to
give the whole formulation away.

SECRETARY HEINZE: Thank you for clarifying.

CHAIR DELGADO: Okay. Joe.

MEMBER SMILLIE: Has OMRI been working with the other seed databases that we've heard about?

MR. BAKER: Yes, we have. We've worked with the Organic Seed Alliance, and are very complementary to their's. We've talked extensively with Cricket Rakita, and Save our Seeds at the Organic Seed Conference. We were on a panel together. We think that there need to be multiple portals, and we don't want to see a single database. We want to see a diversity out there. I mean, our community thrives on diversity.

CHAIR DELGADO: Dan.
MEMBER GIACOMINI: Can you add anything of historical memory to the Tartaric Acid, A-B. If we're looking to make a technical correction, and we're going to make a request, I want to make sure that -- I want to increase the chance that we're getting it right. And, also, then knowing what we're voting.

MR. BAKER: Yes. Thank you for asking. I was one of the advisors to the National Organic Standards Board at the November 1995 meeting in Austin, Texas, where that was discussed. I pulled up the Minutes and what notes I could find, and the -- my recollection, having been there, was that the industry felt strongly that they needed to have all available sources of Tartaric Acid, all sources of Tartaric Acid available to them, including those made from synthetic sources. There was no distinction between the L and other isomers of Malic Acid as being the source.
That was a split vote to allow the synthetic from all sources, but you have to remember two things. One is that at that time, the NOSB was operating under the assumption of organic preference. If organic was available, you had to use it. If it wasn't available, you had to use the natural. If the natural wasn't available, only then could you use the synthetic, and so you had this assumption that orders of preference would be in the rule, and it would enforceable.

That fell out in 2000, five years after that recommendation was made. The second thing was that there was an assumption that the sunset process would take care of a lot of these substances that were controversial, and where there were split decisions. And that as the organic industry grew, these sources would become available, and the sunset process would take them off.

CHAIR DELGADO: Kevin.
MEMBER ENGELBERT: Hi, Brian.

Would you repeat again what your objective is with this, for example, the coating you gave and trying to call a product that's been used, have these 605s, 606s all put together. What exactly, again, do you want from the Board in that regard?

MR. BAKER: I think the most important thing is making sure that people have the information that they need in order to make decisions as to whether a given ingredient will meet the organic standards. So if it has a 606 item, it is very difficult for us to understand how the user of that ingredient will be able to assess commercial availability if that item is not conveyed to the processor, or the certifier. And that we think that 305 and 310 need to recognize that items that are agricultural and non-organic, and on 606, need to appear on the label. And I don't know if we can go so far as to say that the percentages of organic and non-
organic ingredients need to be declared. But, obviously, if you assume that the organic agricultural ingredients in this formulated product don't count as organic, then that's a conservative approach that insures compliance. Does that make sense, or is it -- yes. People need to know what they're getting.

CHAIR DELGADO: Any other questions? Julie.

MEMBER WEISMAN: I just want to go through this one more time to make sure. I want to phrase it a different way. So what you're saying is that there -- certain 606 items are making their way to processors, but their presence in the formulations that the processors are buying is currently hidden by the manufacturers.

MR. BAKER: Right. It's considered proprietary by the manufacturer, and they want -- and the ability of OMRI to require them to disclose that information to the processor and to the certifier of that processor is being
challenged.

MEMBER WEISMAN: Can I continue?

CHAIR DELGADO: Follow-up, yes.

MEMBER WEISMAN: So that because

the product that's being sold to the processor

is not being sold as organic, it is not being

subjected to any scrutiny.

MR. BAKER: Plant is not inspected.

MEMBER WEISMAN: And the person who

holds the certificate for the organic product

that it's going into, has no idea that there's

an ingredient in there where there's a burden

to source it organically.

MR. BAKER: That's correct.

MEMBER WEISMAN: Okay. I got it

now.

CHAIR DELGADO: Okay. Dan, then

Gerry.

MEMBER GIACOMINI: I'm going to

jump around, I guess, a little. We'll jump

around a little bit, I guess, here. I want to

go back on Tartaric Acid. In your review of
products, can you give us any insight into
what you see as A form, B form, or anything
along those lines?

MR. BAKER: Well, yes. I was a big
fan of order of preference. I mean, if it's
available organic, then it should be used from
organic sources. The annotation that was
proposed in '95 required that it come from
grapes, the 605A version come from grapes.
Now, I've been in plenty of organic vineyards,
and I know a little bit about how Tartaric
Acid is made, so I'm told there's organic
Tartaric Acid on the market. But, again,
we're put in a position where there's
something that's on 605A as being non-
agricultural when it comes from grapes.

MEMBER GIACOMINI: But of the A
versus B form that we do have in the rule now,
what are you seeing in products that you're
reviewing?

MR. BAKER: We're seeing both. And
it's not just cost-driven, it's quality-
driven, and there are certain technical and
functional requirements, but it's more often
the non-synthetic form that is the higher
quality, what we've been seeing. And, again,
I have to defer, in part, to our Advisory
Council Members. They've done more of that
work than I have.

CHAIR DELGADO: Gerry. Any other
questions? All right. Thank you very much,
Brian.

MR. BAKER: Thank you.

CHAIR DELGADO: Next is Katherine
DiMatteo, and then after her we'll have David
Bailey.

MS. DiMATTEO: Hello. Katherine
DiMatteo, Senior Associate, Wolf, DiMatteo &
Associates. And I'm giving up my Wolf,
DiMatteo & Associates time to read a letter
from one of our clients, Blue River Hybrids.

"Dear NOSB Members: Thank you for
the opportunity comment today. In addition to
the comments that Blue River submitted through
regulations.gov, on the recommendation on commercial availability of organic seed, I would like to add a personal experience to demonstrate how the current lack of enforcement of the NOP requirement to use organic seed impacts an organic business.

Within the past month, Blue River Hybrids has had 481 bags of organic corn seed returned from our dealer in the upper Midwest. The value of this returned seed is $62,193. The seed was from three hybrids, all of which were capable of good performance in the area, and the seed was shipped in a timely way, ready for delivery to organic farmers to plant this season.

Why was the seed returned? Because the organic farmers in the area told our organic dealer, who is also an organic farmer, that they would be allowed by their certifiers to plant conventional seed. This seed was being reserved for use by these customers, and because of the lateness of this decision, Blue
River lost the opportunity to sell this seed to other farmers. Had this decision been made in February, we would have sold the seed to other organic farmers wanting seed for these hybrids.

I understand that accredited certifiers, the NOSB, and perhaps even the NOP, do not want to impose undue burden on organic farmers who may already struggle to make a living farming, as well as complying with the NOP rules, and the paperwork requirements of certification. But organic seed is grown by organic farmers, and their livelihood and mine are just as precarious, and the requirements of NOP just as burdensome.

The NOSB recommendation that you are amending has been in place since 2005. In that time, the organic seed industry has grown, and the availability and the use of organic seed has increased, but the prevalent attitude among farmers and certifiers
continues to be that using organic seed is the exception, rather than the rule.

I believe there is more that can be done to verify that farmers seek available sources and use organic seed, and that certifiers enforce the use of organic seed as required by the NOP rule.

Better guidance about how to determine commercial availability and equivalent varieties is needed in your recommendation. Clear and coherent explanations of why an organic variety is not sufficient, must be provided by the farmer, and kept on record by the certifier.

The accredited certifiers should be held accountable for their decisions on the availability and use of organic seed during the audit by the National Organic Program. And, as a resource, a National List of available seed must be developed under the supervision of the USDA, National Organic Program, similar to the organic feed grain
producers and handlers list which is currently available on the NOP website.

As the largest certified organic field corn seed supplier in the United States, the implementation of effective protocols is of vital importance to our company, and to the integrity and growth of the organic industry. Thank you very much. Maury Johnson, Director of Production and Sales."

CHAIR DELGADO: Okay. Thank you.

Any questions? Joe.

MEMBER SMILLIE: Do you have personally any comments to make on the recommendation on seed availability, commercial availability?

MS. DiMATTEO: I think that there's a number of things about the recommendation -- the amendment doesn't go far enough to really make -- produce any incentives, or to really create any more information that's already been around since 2005. Like Maury said in his letter, the current recommendation has
been around, and we're amending it -- and
you're amending it in ways -- you're making
progress. I think that there's just more to
be done. And I don't like the idea of in a
recommendation mandating a non-governmental
organization as the source of where
information is going to be provided. And I
think that that can cause a lot of problems,
both for the people providing the information,
and for people accessing the information. And
I most definitely think for the certifiers,
and for the National Organic Program to do
that kind of thing.

I would hope that with the
additional money that NOP has, that maybe some
of this information can be available. And
they've done it once, as Maury has pointed out
in his letter, by having the feed grain
producers and handlers database on their site.
So perhaps that can be another way to at least
provide a resource for people looking for
seed.
And we've discussed it both as Wolf, DiMatteo & Associates, and with our client, Blue River Hybrids, about whether to ask you if you could have different protocols, or more emphasis on commodity seeds, like corn and soybeans, which are readily available in different forms and varieties that can be used in organic farms, versus the problem with the vegetable seeds.

I realize there's different levels of ability to be able to comply with this organic seed requirement, but we never could come up with an idea of what to suggest, so we haven't posed that. That just would add one more kind of imbalance to the whole system. So, basically, I haven't looked at what's being done in the EU. I know that there's some problems with their database system, but I also think that it has provided some incentive to use more organic seed, and for seed suppliers to go ahead and develop new varieties so that they can get posted on those
databases, and show that they're available.

CHAIR DELGADO: Thank you. Any other questions? Well, thank you very much.

MS. DiMATTEO: Thank you.

CHAIR DELGADO: At this point, we're going to take a quick 5-minute break. We have nine more speakers, and I know several of the Committees have to do some work and homework, so I'll ask the Board Members to stay close, and we'll start in five minutes.

Next up after our break will be David Bailey.

(Whereupon, the above-entitled matter went off the record at 5:37 p.m. and resumed at 5:46 p.m.)

CHAIR DELGADO: And I'm glad to hear that someone recognizes what we're talking about. Thank you so much, Mr. David Bailey.

MR. BAILEY: Good afternoon, Mr. Chairman. Thank you, and fellow members of the Board, and members of the NOP, at least those are still here. My name is David
Bailey. I am here representing Small Planet Foods, which is the organic division of General Mills. And I'm here to speak about the okra petition, which has my name on it.

We did submit that to add it to Section 205.606 of the National List. Most of my points that I'm going to hit right now were mentioned earlier in previous discussions, so bear with me as I just kind of hit them again.

First, critical. I want to repeat that our petition is not for okra in a blanket sense. Somehow, and I don't know how, the IQF, the Individually Quick Frozen annotation or whatever you want to call it was dropped, and I think that's caused a lot of the uproar and whispering I'm hearing. So I don't know what you need to do to make sure that that gets on before you bullet, but I just wanted to point that out, and why? Because that distinction between the fresh and frozen is critical for a petition.

We have never denied the existence
that there's organic fresh okra out there. The basis for our petition is that for over a year now we've been looking for it. We've been looking for frozen okra. We have an application which we want to use it. The frustration is not shared -- I mean, it's shared by us. We've been looking quite hard for it, too. And we would have found it, obviously, we would not have filed the petition.

We haven't been able to find it at a reliable processor. And one of the big issues, obviously, again, hit on earlier is perish-ability. The application which we want to use it makes it impossible for us to harvest fresh okra, transport it to our plant, because it doesn't travel well, as was, again, said earlier. And the window of production that we would have to make the product would be so small, if it would even exist at all, very difficult to do.

I also want to stress that we want
to make sure a source is obviously steady and reliable. And we are committed, again, we're committed to buying an Instant Quick Frozen okra as soon as one is available.

We have a sourcing group that's been working on this, like I said, for over a year. Their efforts are continuous. At the time we submitted the petition, none of the processors we contacted had seen nor heard of organic frozen okra. Since that time, I can contribute that we have seen some leads emerge, and I call them leads only because upon further digging, none of those have panned out, unfortunately, so we press on with this petition.

Often what we're getting back from processors regarding their -- either their reluctance or their inability to meet a request to freeze their organic okra, is a combination of a few factors. And, again, most of these have been brought up a short time ago in discussion.
Okra fields are not harvested in one clean shot. The pods have to be picked over a series of days as they ripen, so in that case, the volume that you need has to be amassed over a period of time. Again, the fresh okra is highly perishable. So point three is that freezers need a significant volume of products in order to make a minimum run happen. And to do that, just to get that minimum amount they're going to need a fairly large amount of acreage of organic okra to amass that volume quickly enough to avoid spoilage of the okra.

Consequently, right now our volume needs do not justify what they would need to make a minimum run. That's what they're telling us. So, again, I want to reiterate that we are committed to buying it as soon as it's available. Again, as soon as a reliable source is available. And I just want to thank you for the opportunity to address this with you.
CHAIR DELGADO: Before we move on, so we do have to make that clarification on the petition, as the petitioner has clarified to -- requested to add IQF into that petition. Is that correct?

MEMBER WEISMAN: Yes. It is my intent. That was an oversight. It is my intention when the motion is made tomorrow to include that. Is there anything procedurally that I would need to do before that?

CHAIR DELGADO: No. When you make the motion, as you stated, you will clarify that.

MEMBER WEISMAN: Okay.

CHAIR DELGADO: And it's on the record that the petitioner requested that.

MS. FRANCIS: You just said that you don't need to modify it, but actually in your Committee, you need to have a -- are you just looking at it as a typo, or is this --
are you going to motioning on the Committee
level before the Board vote? If it's going to
come to you -

CHAIR DELGADO: It will come to the
Board with IQF added to it, and you are
absolutely right. It will have to be handled
at the Committee level to make that change.

MEMBER WEISMAN: Okay. Well, HC
wants to get into the queue for a Committee
meeting tonight.

CHAIR DELGADO: Very good. Okay.
And we'll start with -- we'll continue. Thank
you for that, and we'll continue with Joe.
Jeff.

VICE CHAIR MOYER: I don't know
much about what you're going to be using the
okra for, or how that all works out, but we've
heard several people talking from southern
locations that say they have the okra, or
certainly could step up and produce okra. And
they do have access to freezer plants. Have
you checked in those regions, or what is -
MR. BAILEY: Personally, I haven't.

If they have access to a freezer, we're all ears. I'd love for them to step up and give me a card.

VICE CHAIR MOYER: Okay. Thank you.

CHAIR DELGADO: Any other questions? Joe.

MEMBER SMILLIE: Could you walk us through how -- you're saying that you are in the market to buy frozen IQF okra. But you're also -- your infrastructure and your capabilities is, you would be able to contract growers to grow that for -- are you asking the IQF processor to not only freeze the okra, but also find it, locate it, and manage it, or are you more involved than that in the process?

MR. BAILEY: We can be more involved in the process. The potential is there.

MEMBER SMILLIE: So if a group came to you and said this IQF freezer guy will do
this job for us. You would contract with the growers, or would you say hey, we'll buy the frozen, but you've got to do all the contracting and the ag work?

MR. BAILEY: I should clarify. We probably could help him. Okra is not one of our ag department specialties that's in our division. I'm sorry. I'm going to ask you to repeat the second part of your question.

MEMBER SMILLIE: Well, the fact of another HC meeting today has actively floored me, but I'm going out to eat first. But I guess the question was how involved will you be in the process? Are you just saying we want to buy frozen IQF okra, or are you saying that if there's a freezer in a group, you're willing to step in and contract that acreage, or do you demand that the IQF facility do that?

MR. BAILEY: At this point, we are demanding the IQF facility do that.

MEMBER SMILLIE: I've got another
question. We're only talking about 5 percent, so your product is going to have 5 percent or less, probably less, because there may be citric acid or something else in the product that needs that 5 percent, too. So the product you're making, is 5 percent enough to utilize the wonderful talents of this wonderful vegetable?

MR. BAILEY: The mucilaginous properties?

MEMBER SMILLIE: There you go.

MR. BAILEY: Yes, it is.

MEMBER SMILLIE: Okay.

CHAIR DELGADO: Jeff. Any other questions? I lost track. Okay. Thank you very much.

MR. BAILEY: Thank you.

CHAIR DELGADO: We move on to Kim Deitz, and followed by Grace Gershuny.

MS. DEITZ: Start you day with me, and end with it. How's that? If you could put 10 minutes on, I'm going to real quickly
do a Marty and change hats in the middle of my presentation.

CHAIR DELGADO: Kim, do you have a -

MS. DEITZ: I'm up, and Grace is right behind me, so we're going to actually -

CHAIR DELGADO: You're going to team up?

MS. DEITZ: We're Co-Chairs for the Multi Site, so I'm going to roll right into that.

CHAIR DELGADO: Excellent. Okay.

MS. DEITZ: Okay. Ready?

SECRETARY HEINZE: I'll try to do a better job than I did with Marty. Do you want to know when you have one minute left out of the ten?

MS. DEITZ: No. I'll just roll right through.

SECRETARY HEINZE: Okay.

CHAIR DELGADO: Great.

MS. DEITZ: Okay. I always like to
give personal comment from Kim Deitz, not on
behalf of Smuckers, or OTA, or anybody else
towards the end of a meeting on what I see
from a historical perspective with regards to
materials, so I hope this helps you.

There was some discussion earlier
about deferred materials, withdrawn petitions,
petitions, in general, so a deferred material,
either the NOSB or petitioner can request the
material be deferred for gathering more
information. Once the information is brought
back to the Board, then you review the
material and vote on it.

A withdrawn petition is most likely
a petitioner requesting the withdrawal. For
example, when we had Harvey, we got inundated
with petitions in light of Harvey not going
the way that it did. Those petitions should
be archived so that if we ever need them
again, we should never shred any documents.
That came up, what do we do with withdrawn
petitions? Should we shred them? I think
those just need to be archived, because some of them actually have TAP reports with them, as well.

And then, as usual, I get up here and I sit in the audience, and I get all agitated about the petition process. And I just want you to remember to follow the process, and I say that every meeting. It's in all of my Minute notes. Follow the process, especially for removing a material from the National List, or changing an annotation. You have it written down. There's Federal Register documents that tell you what to do, and what you need, and what the public needs, so please follow those processes.

While I appreciate and support organic alternatives out there, they need to demonstrate that they are in the form, quality, and quantity that the industry needs before they're just taken off the list, because it could be a business hardship.
606 materials, do you need a TAP review? That should be a case-by-case basis, and you are going to have to determine whether nor not you have enough information for that, whether you need it, or whether you don't. That's just my personal opinion, and we can talk later on that, if you want.

Tartaric Acid. Tartaric Acid, folks, is a sunset material. If you really don't have any way to change the annotation right now, to change it from the National List, to delete it from 605A or B, or anything, so if somebody wanted to change the Tartaric Acid right now, it would have to be a petition to remove it, a petition to move it, or petition to change the annotation. You're reviewing it under sunset, so unless you had somebody come forward and give you a reason why Tartaric Acid should be taken off the National List, you have to vote on what you've got, and that's public comment. So, again, there's specific reasons, and specific
things that are needed to remove a petition, or to remove a material during sunset.

Methionine, I was on the Board when we reviewed Methionine the first time. And I encourage you, we, at that time, gave them that window of opportunity to come forward as a Task Force, and to bring us data. I think they're doing a great job. I think they're almost there, they're just not quite there. So take that into consideration. If it's two years, or three years, give them what they need so that we finally have the answer to that, and don't hurt the industry in the meantime.

Okay. Other hat. Rolling into Multi-site Certification or Group Certification. Grace Gershuny and I Co-Chaired that group, another wild group, 29 people on this Committee, and all very, very opinionated and very strong voiced in their ideals, so we're going to split up the thing. Grace is going to go first and talk to you
about the OTA recommendation, and then I will
follow it up on the questions.

MS. GERSHUNY: Okay. We have a
summary overview. You should all have
received both the recommendations from the OTA
Group Certification Task Force, and much more
recently we submitted some responses to the
questions, the additional questions posed by
the CAC Committee. So I will just start out
by acknowledging the fact that Tracy was,
indeed, on just about all, if not all of the
calls that we had, and we had many. And that
the document that you folks have created does,
indeed, have a great deal of commonality with
our recommendations by some strange
coincidence. But there are a couple of things
that are different, and I just wanted to
mention the fact that our recommendations did
not call for a rule change, and did not call
for any distinction between initial and
subsequent inspections of multi-site
operations.
We did not in any case call for any reduction of 100 percent annual inspections of all production units. And we went to great lengths to identify ways in which a production unit made up of a whole bunch of sub-units would be inspected by sampling of the sub-units, so that not every sub-unit would be inspected every year.

So first requirement for a group would be that it's organized as a single legal entity. The certification is for the group, not for individual members. This is, therefore, not anything like a pass for any of those members who would otherwise become independently certified. In most cases, they would not be independently certified. They would not be in the organic market at all. The only way they're in the organic market is as segments or portions of this group entity.

All sites facilities and production units as called for in the current rule would be inspected annually. All production units
operate under a single organic system plan,
not just all the sub-units in a given
production unit, but all production units in
the group operate under a single organic
system plan.

Criteria for production unit that
we identified so that how you would identify
how many -- whether a given set of sub-units
really can qualify as one production unit, is
that there would be a maximum number, we
suggest 200, but that could be adjusted
depending on the type of operations, similar
geography, and access by the certifying agent,
similar type of crop and harvest season,
common harvest collection point marketing,
common internal control staff and office
oversight. And the handling facility part is
very important.

Our recommendation says that any
site that includes a handling facility, and
particularly if that handling facility
processes product from more than one producer,
that handling facility must be inspected annually, and must be considered a single production unit. And this is really with reference to things like the washing, packing, drying, coffee, berry processing, and so forth.

We did a great deal of work on internal control system requirements. We identified need for personnel training and qualifications, items that minimize conflict of interest. And I wanted to also mention that the Committee's recommendation had some good provisions for that, including protection for whistle blowers to not be penalized.

Okay. The five minutes.

CHAIR DELGADO: You have one minute left.

MS. GERSHUNY: Okay. We had some other requirements, including what the annual inspection should look like. And, in particular, the two-step process for sampling of sub-units based on risk analysis first, and
in higher risk units always inspected. And then a random sample of the lower risk units. And I'm going to let -- hopefully another minute.

MS. DEITZ: Okay. In summary with the questions, we did give you a paper on the pending question issues. We really didn't have a lot of time to go into that, but we did our best based on the paper and the group. We had one call. We tried to address some of those, and I'll run through those real quick.

Our recommendations are based only on producer groups, additional sectors should be considered separately. And you can read those, or ask me to read them, or ask me anything else.

CHAIR DELGADO: Any questions from the Board?

MEMBER SMILLIE: Can you please just finish that.

MS. DEITZ: Okay.

MEMBER SMILLIE: I'm tired of
playing games. Just finish the -

MS. DEITZ: Okay. Additional sectors should be considered separately,
including criteria for inclusion and inspection protocols. So, in other words,
retailers and handlers. Any site that includes a handling facility must be inspected annually. Samples for external inspection selection through two-step process of risk analysis and combined with random sample of low risk sub-units, as Grace just said. Ability to detect non-compliances not effected, assuming adequate oversight of certifying agencies by NOP.

With the consumers, consumers will accept group certification if integrity of the process is assured. International issues should be factored into the risk analysis, but not be discriminatory toward domestic or foreign operations. And internal control system staff does not function as a proxy for third-party inspectors provided in our
recommendation.

CHAIR DELGADO: Okay. Any other questions from the Board? Dan, followed by Katrina.

MEMBER GIACOMINI: On your statements regarding Tartaric Acid, we realize that it's sunset, and that it's dealing with them as they are listed.

MS. DEITZ: Right.

MEMBER GIACOMINI: But in the process of evaluating it, the Committee came up, found that there was a difference in the recommendation to the way it's listed. The discussion that we're having on what that annotation is, and the Program looking at that to evaluate what the technical correction would be is, in a way, what we're looking at for the next five years, because that would be done without an NOP review. Number one.

Number two is that it seems to me a potentially valid consideration. I'm not sure that I totally agree with it, but I can
see the point, is that if, as Brian stated, that this was put on the list during a time where the assumption was made of preference, and preference no longer exists, that one of the requirements that the substance were necessary because of the unavailability of wholly non-synthetic alternatives, has changed slightly.

MS. DEITZ: Okay. We are during sunset, though. And with regards to Tartaric Acid, I wrote an original technical correction to this when the proposed rule came out, so I have it in my archives at my desk, so I will definitely forward that to you. It got left off the National List, and then I recommended that it get put back on. And I'm not sure whether it was on A or B, but I'll send that to you, Dan. And I do have some other information, so I'll dig that up for you. But that's not going to happen at this meeting, because I wasn't aware that you needed that. Order of preference is nowhere in
the rule, and order of preference is for everything, so Tartaric Acid shouldn't be singled out just because it's an order of preference in 1995. And we all, hopefully, run our businesses in order of preference. I know that we do, so that's my comment with that. And I also know that there's different functionalities for synthetic Tartaric Acid, and non-synthetic forms in the processing plants, in the formulation. So they are needed from both, and as well with this -- I guess there's a new petition out there for the 606.

MR. POOLER: This is Bob Pooler, NOP. Tartaric Acid was added to the National List along with Agar-agar and Carrageenan in 2003 as a technical correction, because it was left off the list.

CHAIR DELGADO: Thank you.
Katrina.

SECRETARY HEINZE: Yes, that's correct. And that's reflected in our current recommendation, so you don't have to go find your records.

MS. DEITZ: Okay.

SECRETARY HEINZE: Because you did a great job, and I found them.

MS. DEITZ: Okay.

SECRETARY HEINZE: And they are in the recommendation.

MS. DEITZ: All right. Okay.

SECRETARY HEINZE: The reason we've asked for the technical correction is in the 1995 transcripts, when the original Board voted on these items, they had the annotations. But in the Federal Register notices that went with the addition in 2003, those annotations were not included.

MS. DEITZ: I guess I'm just confused if we're adding annotations and changing them during sunset, and that's
typically not what we've done.

SECRETARY HEINZE: Right.

MS. DEITZ: But now they're at the petition process, so -

SECRETARY HEINZE: And so our recommendation does not include them.

MS. DEITZ: Yes.

SECRETARY HEINZE: We're just asking the Program to look at that, and go through that history.

MS. DEITZ: Yes.

SECRETARY HEINZE: Yes. Our recommendation is without them, because we know we can't do that.

MS. DEITZ: Okay.

CHAIR DELGADO: Any other questions? Well, thank you both, and congratulations for being able to manage 29 members of your group. That is quite a challenge.

MS. DEITZ: It's very interesting.

I thought the NOSB work was hard. Well,
believe me -- thanks.

CHAIR DELGADO: Up next is Nicole

Dehne from Vermont Organic.

MS. DEHNE: So hello, members of

the Board, and NOP staff. Thank you for the

opportunity to speak tonight. I know it's

kind of late, and I apologize if my stomach

growls into the mic, and I mean no threat by

that. My name is Nicole Dehne, and I

coordinate the certification program for

Vermont Organic Farmers, which is part of the

NOF of Vermont.

I'm speaking on behalf of over 500

certified producers, and there are several

points that I wanted to make this evening.

But first I wanted to start out by thanking

the Board for all the hard work in creating

all these recommendations and guidance

documents for this meeting, and to tell you

that it's much appreciated.

So I thought I would start with

adding new materials. In general, VOF agrees
with NOSB and the Materials Working Group, which also deserves thanks for their hard work, but there's definitely ambiguity in regards to the finding ag, non-ag, synthetic, and non-synthetic. And we appreciate that the NOSB is working on providing clarity for these issues, as it's clearly needed, as we saw in the presentation today how convoluted they can get. But it seems that everybody wants a simple option, and since we're all saying what our favorite options are, I believe that the simplest option is Option E, which hasn't really been discussed much, which is adding a definition of agricultural system as a land-based system that cultivates soil, producing crops, livestock, or poultry.

So this option doesn't stretch the meaning of agricultural, and I think it's what consumers expect of an organic product. And then yeast and other micro organisms can then stay in 205.605, but can be added with an annotation that requires the use of an organic
substrate, much like how yeast exists right now in the National List with prohibition of petrochemical substrate and the sulfite waste liquor.

However, what's most essential, especially with all of these ambiguities, is to insure that all materials added to the National List receive a TAP review, as is required by OFPA. Just so you all know what exactly you're dealing with. And no matter what option is chosen, it seems to me that items without standards or NOSB recommendations on standards shouldn't be considered organic, because there hasn't been adequate discussion about what the details of what goes into making them organic are.

I also wanted to touch on animal welfare standards. With the public interest in animal welfare and treatment, as this continues to grow, and as new labels in this area are being developed, I feel like it's time for the organic industry to strengthen
our commitment to humane animal husbandry. And the organic label should really represent humane animal treatment for the consumer. And it's VOF's belief that the organic standards current address animal welfare issues, and have laid the background for humane practices in animal care. So it's our recommendation that a task force be developed to create additional guidances, for example, veterinary procedures, production systems and facilities, and wide range of other livestock-related welfare concerns.

As far as multi-site operations, despite the VOF not certifying multi-site operations, that's my disclaimer, VOF feels that there should be limitations on who is eligible for multi-site status. So grower group certification has been historically used for farmers in developing countries who have limited financial resources, and who are working together as a cooperative or group.

As the CACC Board pointed out in
their guidance report, a limiting factor to
the growth of the organic industry is the
supply of raw materials, but not necessarily
the processing of those raw materials. Thus,
it was because of the limited resources and
needed raw materials that this exemption, of
sorts, was granted to grower groups. And, in
contrast, retailers are not required to be
certified under the rule. If a retailer
chooses to get certified, it's an entirely
voluntary practice. So our thought is why
grant retailers this exemption when it's not
coming from a place of need.
Retailers are choosing to get
certified to assure their consumers that they
have implemented best management practices, to
insure the organic integrity of the organic
products they carry. And if they want to
assure their customers of their practices, why
not adopt the higher standard of having each
individual store go through the certification
process? And if this process seems too
rigorous, then the retailer can always choose not to get certified, as it's not required under the rule.

So, for commercial availability, I also wanted to comment on the NOSB's guidance document on the commercial availability of organic seed. And as we've talked about, there's definitely a delicate balance between supporting the organic seed industry, and supporting growers, without over-burdening them. And I know everyone is sensitive to that. And our growers believe that the organic seed industry is still in the growth and development phase, and that the supply and demand will push the organic seed companies to develop seeds on their own.

While a national database of organic seed could be useful for growers as an educational resource, it's not necessarily going to be useful for enforcement.

CHAIR DELGADO: All right.

Questions? Hugh.
DR. KARREMAN: Thank you, Nicole.

I'm glad you brought up the animal husbandry issue. That is on our work plan, and I was just wondering what you would think of - not to get into real specifics, we can work on that later - but veterinarians sometimes have to dispense not fully approved by FDA type medicines, in other words, alternative medicines, and they need to have a valid client/patient relationship to do that. And I've been wondering, and I wonder what your thought would be on this, about perhaps having some kind of requirement in order to maintain that valid client/patient relationship with organic farmers to perhaps have the vet on the farm at least twice a year, even if the farmer doesn't need the vet for a sick cow, but to make sure everything is going well for the welfare of the animals, records check, all that kind of stuff. Would that be within what you're thinking?

MS. DEHNE: Yes. I do think that
that would give the consumers a certain -- it would assure consumers that somebody is kind of looking out as far as animal husbandry. But we also have the inspection process that happens on an annual basis. And our inspectors are also looking for animal health, and welfare issues, so I don't know if we necessarily need that extra -- I feel like it would sound like another type of inspection. Or maybe a recommendation, instead of a requirement.

DR. KARREMAN: Well, but truly to maintain a legal relationship with that farm, there has to be -- I mean, that's under FDA Center for Veterinary Medicine rules and everything. And I think that could use some bolstering. I've got to admit, self-centered veterinarian here, but this is across the U.S. I mean, I know how to deal with organic farmers, but a lot of the other vets don't, and it would be good if they were staying in contact with the farmers.
1. CHAIR DELGADO:  Any other
2. questions? Okay. Thank you very much
3. MEMBER ENGELBERT: One quick
4. question.
5. CHAIR DELGADO: I'm sorry. Kevin.
6. MEMBER ENGELBERT: What's the
7. status in Vermont with your dairy farms, have
8. you seen a loss of farms, or farms going back
9. to conventional production because of this
10. pasture situation? Just where is Vermont at,
11. basically?
12. MS. DEHNE: We have a lot of
13. farmers who are seriously concerned about
14. their future because they don't know what is
15. going to happen with the pasture issue. As
16. far as -- we hadn't until this year had any
17. farms that had dropped out of the organic
18. program and gone back to conventional. And I
19. can't say that's necessarily all the pasture
20. issue, there's definitely some loss of hope in
21. the organic regs, I think is one level, but a
22. huge part of it is financial. So we've had a
few farms that have gone back to conventional,
and some that have just gone out of business.

CHAIR DELGADO: Question. Dan?

MEMBER GIACOMINI: I've got to follow-up on that. Is that as much feed cost, or is -

MS. DEHNE: Oh, yes.

MEMBER GIACOMINI: Okay. So it's not just the pasture issue.

MS. DEHNE: No.

MEMBER GIACOMINI: Feed cost.

MS. DEHNE: And I hope I just said that. Yes.

MEMBER GIACOMINI: Okay.

CHAIR DELGADO: Any other questions. Okay. Thank you, Nicole.

MS. DEHNE: Sure.

CHAIR DELGADO: Coming up is Sam Welsch, followed by Sue Baird. Sam is not here? Let's move on then to Sue Baird, and she will be followed by Miles Macavoy.

MS. BAIRD: Hi, I'm Sue Baird. I'm
with QAI, and I want to address several issues today. But my first issue I wanted to address, multi-site organic certification. We served on the OTA Grower Group Task Force, although I admit the last few times I've been out and traveling, didn't do as well. But we agree with the recommendation for implementing the Grower Group certification. We strongly agree that Group Certification should be made available for small growers who otherwise may not be able to afford organic certification on the individual basis.

Additionally, U.S. desires their products and many times we can't produce them here within our borders, and they would not be available for us to use without this method of organic certification.

Try to address some of the questions you asked, who are small farmers? And that's a tough one, I've heard that discussed back and forth both on the OTA and on the ACA. USDA NOP defines small farmers,
or they did define small farmers in the NOP preamble, and they said it was one with 25 acres and a gross income of $30,000. Since that's already been defined in the preamble, perhaps that's one that we all could live with.

I don't think it's practical to limit a small farmer to one that has less than $5,000 gross income as some have suggested. Those farmers are exempted from certification, and our goal is not to exempt more, but to bring a lot more farmers into organic certification.

Does Grower Group internal control systems improve organic oversight? Yes. Just as HACCP improves food safety, so does having persons that are familiar with local customs and operations improve the organic certification process. Someone who's familiar with the operation, and with those customs knows where to look for flaws and weaknesses. Do those internal control officers replace
third-party certification agent inspectors?
No. No. Just as a QA Department does not
take the place of FSIS or FDA, but serves as
an extension to assist those government
auditors to enforce food safety audits, so
does an internal control system serve as an
extra set of eyes to protect organic
integrity.

Are some mistakes made with
internal control multi-site organic
operations? Yes. Just as there are mistakes
made on individual farms by individual
farmers, but we all strive, and they make
continuous improvements in their organic
system plans to become more effective, just as
I've seen many individual farmers make great
improvements over time in their own individual
inspections, and their own individual
operations.

Even though some mistakes have been
made, QAI urges NOP to not throw out the baby
with the basket. Marty stole my words, I
already had that down. That's here. Let's just better develop stronger criteria for certifying this important constituent of the organic certification.

QAI acknowledges the reasoning of the organic task force, when it stated, let's just work on grower groups cooperatives for the present. We will address the need for further discussion of other multi-site groups at a later date. We understand that logic. We don't want to see and lose our small grower group cooperatives that have been formed all over the world. And NOP did threaten to totally eliminate grower certification. Everyone reacted with fear, but QAI urges NOSB and NOP to not forget that many retail store chains have been certified from the beginning, the last five years, six years under this system with accredited certifying agents.

These retail store corporations have spent thousands of dollars to develop comprehensive internal control systems under
which they implement their organic certificates. They have spent years developing their corporate images and their reputations around being certified organic. They are proud of their organic certification, and they take it very seriously. Consumers will be the losers if these retail stores surrender their exhibited certificates. Please continue to address multi-site certification to allow these businesses to operate as certified entities under their organic system plans.

Commercial availability, we support this recommendation, except please, please think about 5B and D. We think that's too labor-intensive for certifying agents and producers. I think that you'll see -- I started looking at that requirement. It may be another full-time employee at my office.

DL-Methionine, we support you to the Livestock Commission's second proposal to extend the use of DL-Methionine until October
1, 2010, or maybe even better if that's what you all think. Please allow us time. Okay.

Thank you.

CHAIR DELGADO: Questions from the Board? Okay. Thank you very much.

MS. BAIRD: Thank you.

CHAIR DELGADO: Next up is Miles Macavoy, followed by Katherine DiMatteo. I think she already went. Do we have Miles? No Miles. Alexis Bandenmeyer. I think we'll be able to finish sooner than we thought, folks.

(Off the record comments.)

CHAIR DELGADO: Okay. So Sebastian Belle. Sebastian has agreed to talk to the Committee only.

SECRETARY HEINZE: Give us a sec.

CHAIR DELGADO: Yes.

(Off the record comments.)

CHAIR DELGADO: Okay. So let's call Sebastian Belle, and that will be it for today. So no pressure, Sebastian.

MR. BELLE: Thank you very much.
Batting clean-up, that seems to be my role in life. My name is Sebastian Belle. I represent the Maine Aquaculture Association. We are the oldest state aquaculture association in the country. We represent both fin fish and shellfish growers, and yes, I plead guilty. One of my members is a father and two brothers who own a salmon farm, so I'm the Evil Empire Incarnate here.

I've been in this business for about 30 years, and I want to start by just saying that I have a tremendous amount of respect and thanks for the work that you folks do, and also recognize the hard work that the Livestock Committee under Dr. Karreman's leadership is doing. I realize it's often hard to wade through these issues, and particularly for new issues that we bring to the table, it's probably even more complicated, and at times more controversial than some of the other stuff.

I am a member of the Aquaculture
Working Group or Task Force under George Lockwood's leadership, and I also want to commend him for his leadership, and just strongly support the comments that he made earlier today, as well as the written comments that were submitted. And just indicate that we on the Working Group are really ready and willing to help the Livestock Committee in any way we can as you begin to go back and grapple with a number of the issues that you clearly have got to go back and rework on. And we're willing to do that in a constructive and non-invasive fashion, I think is the politically appropriate way to put that.

I also want to thank the NOP Program folks for their clarification earlier today on the use of fish meal and fish oil from wild sources. I think that was very helpful, and really helps, I think, some of the proposals that have been made by the Working Group, perhaps see the light of day. It's not, I think, a coincidence that the
minority report on the Livestock Committee was written by a nutritionist, and the point I want to leave you with today is that fish meal and fish oil, and particularly fish oil, is really problematic from a -- particularly a marine fin fish point of view. Animals that are being grown in marine environments.

The tilapia and catfish, which are the species that will probably make it through here under the current proposals, if you take byproducts from those organic fish and use them to generate fish meal or fish oil, they are not going to satisfy some of the basic amino acid profiles and lipid requirements for marine fin fish, and that's the conundrum we have. And, so, I respect that we're trying to increase organic production, and use those as feed ingredients, some of the byproducts from those fish. I think that's a great idea. We support that. But physiologically, we've got a problem. You're talking about going from a fresh water eco system and the species there
to a salt water eco system and species, and there are some fundamental differences, particularly during the start feeding phase for marine fin fish.

And what that means is, when a marine fin fish hatches from the egg, it has some internal source of nutrition, and it lives on that for some period of time. And then it has to begin to feed on exogenous sources of food. That is the highest mortality phase in marine fin fish, and we are very early on in the development of feeds for marine fin fish, because we don't know a lot of the nutritional requirements for those species. And, so, fish meal and fish oil are used in those species as kind of a safety factor in the diets, so they're put in there because that's what those animals begin to feed on in the wild. And they kind of are a fudge factor, if you will, and I use that with some trepidation because I'm not a nutritionist, but they're kind of a fudge
factor in the formulated feeds to insure that
you're not getting nutritional pathologies at
the very early start feeding phase of those
species.

I also want to make a point that
the allowing of private certified label
products and their use as ingredients in fish
feeds I think is very problematic. It sounds
like that may have been resolved, but the
point is, I have members that grow fish that
have never used antibiotics on their sites,
ever, in the entire history of that farm. And
they would be prohibited from reaching organic
certifications; and yet, people who were
feeding feeds with feed ingredients from
Europe in which they're allowed to use two,
and sometimes three times prior to harvest
antibiotics, those would be allowed, so that's
problematic, I think, from our point of view.

Thank you. Long day.

CHAIR DELGADO: Questions? Hugh,
followed by Dan.
DR. KARREMAN: Two questions, I guess. What kind of fish are those folks growing up in Maine that aren't using the antibiotics?

MR. BELLE: Salmon.

DR. KARREMAN: Okay. And as far as the fish oil being very, very important in the early growth on the exogenous feeding, when they just start out, we've heard that tilapia and catfish and shrimp don't have quite the right essential oil, or fish oils that are needed. When the fish are becoming more adult-like, would the tilapia-derived fish oil be okay for them, versus let's say the little guys that really need the strong stuff?

MR. BELLE: Honest answer, we don't really know.

DR. KARREMAN: What's your best educated guess?

MR. BELLE: I just -- I don't feel like I'm in a position to really answer that, Hugh. I think that -- we just don't know,
honestly.

DR. KARREMAN: Okay.

CHAIR DELGADO: Dan. And before we do that, I just want to announce that we have one more speaker after Sebastian, so please continue. What is your question?

MEMBER GIACOMINI: To Hugh's point, I believe the recommendation from the Aquaculture Working Group is the 12 and 12 on average over the production cycle, so that would be compensated and adjusted through that time frame.

One of the numbers that I'm having a hard time getting a hold of, Sebastian, and maybe you can help me, is - and partly, it's because of the nature, or the difference in the nature of our beast that we're familiar with. There are certainly standards, typical book values for fish meal, all that. But the fish meal that you would be looking to be utilizing, granted you can't feed salmon to salmon, but the fish meal that you would be
looking to utilize in your salmon farms, the number that I'm interested in finding out, and I've asked a couple of people and they don't know, or they're having too hard a time finding it, what is the lipid level on that? So not on book value fish meal, but on the fish meal that you're going to be feeding, what's the residual lipid level in that fish meal? Because one of the reasons I'm asking that is because we're starting to hear comments, we had one of the commenters in our packet address this total lipid content in the diet. I'd like to have a little better idea of where we stand on that when we are looking to combine the two.

MR. BELLE: I don't know the answer to that off the top of my head, but I'd be glad to go back to some of our nutritionists in the work group and get that number for you. I think that's a very fair questions.

MEMBER GIACOMINI: Thank you.

MR. BELLE: Okay.
CHAIR DELGADO:  Jennifer.

MEMBER HALL:  Thank you, Sebastian,

for being here.  Kind of given some of the new
information that we got earlier today, I have
a question for the Program.  We've been
operating lately under a couple of
assumptions, one being that wild source for
meal and oil was not something that we could
consider.  And, so, I've also, at least I
have, and we've discussed it in Committee,
that we've been operating under the assumption
that -- we have been told that all of the
aquaculture recommendation needs to be
submitted at once versus a piecemeal approach,
that a piecemeal approach is not something
that would be considered.  And I guess I want
to verify that assumption, because I continue
to hear more and more that in the piscivorus
requirements, that the nutrition values are
not well known at this time.  And, so, in the
interest of wanting to move some elements
forward where there is a greater knowledge and
security about what's happening there, could
the whole basket versus none be reconsidered?

CHAIR DELGADO: Can someone from
the Program comment on that?

MR. BRADLEY: Yes. Barbara will
have to comment on that from the Program
standpoint, because that would be a long-term
work plan management issue with the Board.

CHAIR DELGADO: Okay. We'll leave
that question open. Yes, you want to follow-
up?

MEMBER GIACOMINI: Just a little
clarifying, so we make sure that the answer
comes back to the right question. I believe
at the last meeting Barbara said that because
of fiscal issues, that the Program was
essentially sitting on the document that we
had already made a recommendation on, and
passed on to you, and was going to wait on
rule making until all of the aquaculture
issues had been passed to you. And so what
we're looking at now is whether, with the
additional funding, and the additional manpower resources, will that move up in the agenda, and could we possibly be seeing aquaculture regulations for what we've already passed without fish meal, fish oil, net pens, by valves, and those things being fully resolved?

MR. BRADLEY: As I recall, what Barbara said was that there's a lot of regulatory work ahead of aquaculture in the mill right now, and that we would get to it as soon as we can. If we can acquire additional resources, that will certainly help, but it wasn't a matter of we're going to wait on this until you get the whole thing done. Continue with your work, we'll continue with our's, and we'll begin working on that as soon as we can.

CHAIR DELGADO: Okay. Any follow-up questions? Hugh.

DR. KARREMAN: Well, I guess that means that shrimp, and tilapia, and catfish are in the mill. Yes, that's what we passed
last spring. Right. But you guys, we can hope, are going to be working on that before we might get the other parts in. That's what you're saying right now.

MR. BRADLEY: What we're saying right now is that we have pasture in front of us, and we have origin of livestock, and I'm sure aquaculture will be the next thing coming in. We also have sunset items that have to be done, so it's a workload thing, and we don't have resources added to the staff yet that can really take that burden off. We're not in a position to say that yet. It takes a bit of time to get people hired and then trained in a reg writing mode.

CHAIR DELGADO: Just to follow-up, as far as we're concerned, the Program has received all the materials, recommendations that have been approved. Correct? Related to aquaculture. Is that correct?

MR. BRADLEY: Yes.

CHAIR DELGADO: Okay. Thank you.
Any other questions? Thank you very much.

Now at this time, our very last speaker will be Dave Carter. And after that, we'll be done.

MR. CARTER: All right. I'm Dave Carter. It's late, you're tired, I'll be quick. I was asked to come up and just give a comment on the record. Grace Marroquin wanted me to come up and just address one of the issues that was identified by the Materials Working Group, and that was if you made the change on agricultural products and had designation of organic yeast, what would be the impact in some of the livestock feed, issues with the yeast, and then other microbial ingredients.

So in visiting with some of the folks who use livestock feed regimens, yeast is really what you would call an alternative ingredient. It's not really a mandatory ingredient. It's not like Methionine. Most of the feeders and the folks that I talk with
don't even use yeast at this point, so it's an alternative ingredient. If you were to have it designated as organic and put it into feed rations at the level that it's put in there, it would be about 9 cents a day per animal on beef, and so it just becomes a simple equation of over a 90-day feeding period does the animal put on X number of pounds to pay for that ingredient?

So in terms of some of the other microbial ingredients that are going in there that would then come under this definition, some of the things like the probiotics that are not now currently considered organic. They're not because they're growing them on yeast substrate, and it's not organic, and so I talked to probiotic producers, said yes, if we got this done, we would definitely move forward with that. So I just want to kind of lay that out there in terms of that.

Now, while I'm here, there's two other things, and I have to say number one is,
I've been working with folks on the Fenbendizole petition. I appreciate the work that was done on that, agree with what Rick Matthews said, just remember I think as one ingredient comes on there, I think it's time to get the other one off of there. I think that will be good.

And then, finally, the Pet Food Task Force gave you a very, very good report a while back, and before it gathers too much dust, it would be very good to see that move forward, because as I walked around Expo West, there are more organic seals popping up on pet food every single day, and it's really time to get the fence around that, and get that under control. So thank you.

CHAIR DELGADO: Okay. Thank you.

Questions? Dan.

MEMBER GIACOMINI: I completely agree with you that the yeast issue is in very small amounts, and it's not nutritional. That is the very reason why it makes a difference
in livestock. It is in as a digestive aid, not all yeast is yeast when it comes to the value as a digestive aid. Regarding species of action in the ruminant regarding the livability of getting it to the animal and through the feed system. That is part of the reason.

The second thing is, if your people are paying 9 cents, they ought to look around. The typical price on yeast is about 5-1/2 on most Tim Graham products.

MR. CARTER: Yes. No, I'm thinking organic. I'm going up the scale in terms of that, so if they can save some money. Actually, the best solution to everything is buy some buffalo, put them out on grass and forget about it.

CHAIR DELGADO: Okay. Katrina.
SECRETARY HEINZE: I just want your affiliation for the notes.
MR. CARTER: What's that?
SECRETARY HEINZE: Your
MR. CARTER: Oh, my affiliation. Actually, I'm representing myself. I'm with the National Bison Association, Crystal Springs Consulting, and Pet Promise.

CHAIR DELGADO: Okay. Any other questions? Julie.

MEMBER WEISMAN: I just wanted to address Dave on the issue of the pet food recommendation, and make sure that it known that we've already had two Handling Committee calls since the publication deadline for this meeting closed, including one that Emily Brown Rosen and the Chair of the Task Force, Nancy Cook, had been on. We have more in the pipeline as soon as this meeting ends, so that's -- it's definitely in gear now.

MR. CARTER: Thank you.

CHAIR DELGADO: Any other comments? Questions? Julie, thank you very much. That was very timely, and I'm really happy to hear that you're working so well with that. This
concludes --

MEMBER: I was going to make a
motion for adjournment.

CHAIR DELGADO: No need for that.

MEMBER: Can't adjourn the whole
meeting.

CHAIR DELGADO: This concludes Day
Two of our meeting. Yes?

MEMBER: Just so not everyone
scatters, Livestock Committee does have to
have a meeting tonight. How about dinner in
the restaurant here, or later at 8:00. Let's
just talk afterwards.

CHAIR DELGADO: Okay. Yes, please.

We have--I think the crowds will also have
those-- so we are officially -- yes?

(Off mic comment.)

CHAIR DELGADO: No Handling
meeting. Okay. We're in recess until
tomorrow at 8:00.

(Whereupon, the proceedings went
off the record at 6:45 p.m.)

CHAIRMAN DELGADO: The meeting will come to order. Good morning, ladies and gentlemen, members of the board.

This is day three of our meeting, and the first item on the agenda for today is to continue with public comment. We have 10 presenters today.

And I would like to call at this moment Ms. Lynn Coody followed by Emily Brown-Rosen.

Okay, Emily, if you would be kind enough to state your name and your affiliation.

PUBLIC COMMENT (CONTINUED)

MS. COODY: Okay, thank you.

My name is Lynn Coody, and for the record Coody is spelled C-o-o-d-y. And today I'm speaking for the Wild Farm Alliance, which is a nonprofit organization located in California.
And it is on a topic that you have not heard about yet in this meeting which is biodiversity. So remember, this is from Wild Farm Alliance.

We are coming back to the National Organic Standards Board on the issue of biodiversity conservation, which is part of the national organic program rule, a topic that the board had full agreement on in 2005.

At that time NOSB unanimously approved additions of field-tested biodiversity questions into its model organic farm plan. This plan now available through ATRA is a voluntary guidance document used by many certifiers during the inspection processes.

The endorsement of these questions by the NOSB was in a bigger sense the agreement by the board that biodiversity and natural resources are an integral part of the NOP.

The NOP's audit review and
compliance check list, which is entitled ARC 1025A is a document that guides audits of NOP accredited certification agents.

This document does not currently contain a requirement for verification that certification agents are implementing the natural resources standard in the rule which is Section 205-200. This standard states, production practices implemented in accordance with this subpart must maintain or improve the natural resources of the operation including soil and water quality.

Additional sections of the rule further define natural resources to include wetlands, woodlands and wildlife – in other words, not just farmland.

Other sections explain that producers must initiate practices to support biodiversity; in other words, be active about it.

And another provision requires a producer to incorporate biodiversity
conservation practices in his or her organic farm plan.

When considered together the various provisions point to the need for assessment systems that include review of the impacts of an organic farm's practices on natural environments in the vicinity of the farm.

In order the remedy the omission of this, of the NOP - NOP's omission on their check list, we have requested twice that the NOP amend the check list to include natural resources and biodiversity in three specific sections. And that's all that information was given in my written testimony, so you don't have to hear all that stuff right now.

With the funding from Organic Farming Research Foundation and assistance from a broad-based technical advisory committee, the Wild Farm Alliance published two guides for farmers and certification agencies describing practices and actions
farmers can take to conserve biodiversity.

In 2006 these guides were mailed to all organic farmers and certifier in the nation. Since the NOSB made this recommendation and the biodiversity guides were produced, the Rodale Institute now provides electronic versions of ATRA's farm plans for its transition to organics course and the Independent Organic Inspectors Association uses the updated farm plan along with WFA's biodiversity conservation certifier guide in their advanced inspector training sessions.

And recently Wild Farm Alliance has published another guidance document that is design – you should have copies of this now - that is designed to assist farmers and certifiers in identify noncompliances related to biodiversity, and to suggest positive approaches for complying with the standards related to this topic.

Currently certifier who inspect
about half of the organic farmers in the country are either now addressing biodiversity or say they would like to look into it more once they get some staff time.

However, some of the certifiers who are already implementing NOP's standards for biodiversity conservation have expressed concerns to WFA related to the fact that NOP's accreditation system is not currently holding all NOP-accredited certification agencies accountable for enforcing the biodiversity standards.

With the NOP's revision of the ARC's check list used to audit certification agencies as described above, both the letter and the intent of the NOP regulations will be implemented and organic certifiers will compete on an equitable basis.

Wild Farm Alliance encourages the NOSB to make a recommendation to the NOP that they incorporate the natural resources and biodiversity sections into the ARC check list.
1025A. By making this amendment NOP will ensure the consumers are getting what they pay for - I'm on my last sentence - pay for, organic products that only - that not only say they are environmentally friendly but also have the accreditation system to back it up.

CHAIRMAN DELGADO: Okay, thank you. Questions from the board?

MEMBER ENGELBERT: I agree with everything you said, but I just want to make sure you and your organization is aware, there is a cost for the farmer for that, to do all those things, and it's very difficult to extract that cost and put a figure on it and have it covered by the marketplace. But I agree with what you are saying.

MS. COODY: Well, hopefully, if you take a look at this booklet that we wrote, you'll see that the first page, the first chart gives a summary of what we consider to be the major nonconformances. However, the rest of the entire book is positive things
that farmers can do. And in many cases when we - really in most cases we see that farmers are already doing a lot of this compliance. It's only in a few cases that difficulties are occurring. In most organic farms, it's amazing.

CHAIRMAN DELGADO: Follow up?

MEMBER ENGELBERT: Yes, I agree, and we are doing that. We provide a very good diet for all the wild animals that are on our farm. I'm serious; they eat very well. We have hunters coming to us all the time because we have such a huge population of wildlife on our farm.

MS. COODY: I hope you have orange vests for your cows.

CHAIRMAN DELGADO: We have a question from Joe, and then one from Berry.

MEMBER SMILLIE: You want us to make a recommendation on this?

MS. COODY: See, this is a topic that hasn't come up very much. So it's hard
to know how to actually approach this.

But since we have already written
three letters to ARC and they had promised to
talk to NOP about it, and NOP did talk to them
about it, it's just been going back and forth
about what should happen.

MEMBER SMILLIE: Well, wouldn't the
crops committee put it on their work plan?
Would that be the correct direction?

CHAIRMAN DELGADO: I was just
thinking of that.

Jeff, you had a comment, and I
would also like to ask Jerry to comment as
well.

VICE CHAIR MOYER: I would suggest
that it would probably be a joint crop CAC
document.

MS. COODY: It isn't an
accreditation issue.

VICE CHAIR MOYER: Since it has to
do with accreditation and inspection.

MEMBER SMILLIE: I don't know, too
many joints.

CHAIRMAN DELGADO: Gerry agrees with that comment, Joe, I think.

VICE CHAIR MOYER: I think it's something we could discuss putting on our work plan.

MEMBER SMILLIE: That's today though, right?

CHAIRMAN DELGADO: Yes. Today we'll be discussing it.

MEMBER SMILLIE: Okay, I'll talk to you guys later.

CHAIRMAN DELGADO: And we'll have some time during lunch for that.

Are you satisfied with that response, Joe?

Okay, we have Barry followed by Hugh. You had a question?

MEMBER FLANN: Thank you, Joe. What would I do without Joe sitting next to me?

I just want to comment that I think this is an excellent piece of work, and I'm
delighted to see it.

Being a newcomer I don't have the slightest idea how we can implement it, but I'm certainly behind it, and I thank you for your work.

MS. COODY: Well, thank you.

CHAIRMAN DELGADO: Hugh?

MEMBER KARREMAN: It's interesting, Barry, you say that, because I remember back in 2005 I said about the exact same thing, this is a great idea. And it's kind of a fuzzy memory to me at this point. I'm glad you bring it up again.

And all I can say is that I think it would be helpful to also have like ag support people like extension and whatnot be aware of this maybe through the e-Extension website that is happening now.

Because I know whenever AI give talks to either farmer groups or veterinary groups, but I always talk about like stream bank fencing, that brings a lot of wild life
right back. It really does. And that's a
good erosion control and whatnot.

So I don't think the onus has to
just be on the certifier inspector farmer.
You've got to bring in more people and be more
biodiverse with your inputs of people.

MS. COODY: You are absolutely
right, and we are on that track already. We
have been working with the e-organic folks.
In fact Jim Riddle was one of the people on
the advisory committee.

So we have suggested that this be
on their website or a link to it already, and
this is available on Wild Farm Alliance's
website, so any farmer can access it - any
farmer with a computer can access it at any
time.

So they do a terrific job of trying
to get it out to as many people as possible.
But I totally agree with you, and I think it's
great if - you know, they have done trainings,
and a lot of the certifiers their inspector
training on this already. But there's lots of
folks out there, increasingly all the time,
that are knowing about it.

So I appreciated your support then
and I appreciate it again now. Thanks.

CHAIRMAN DELGADO: Any other
questions from the board?

Thank you very much.

Next is Emily Brown-Rosen followed
by Leslie Zuck

MS. BROWN-ROSEN: Thank you. My
name is Emily Brown-Rosen, and I work for
Pennsylvania Certified Organic.

I'd like to thank you again for the
opportunity today. In opening I just want to
say one thing, it may seem like a lot of us
are up here complaining or having problems or
pointing out all this work you have to do, and
we were having this discussion on our
certifier listserv, and one of our European
colleagues pointed out to us that what are you
guys complaining about? We don't have anybody
we can ask any questions of in Europe? There is nobody to go to.

So we are really blessed with this whole setup, and it's really a great setup. So forgive us for sounding kind of demanding, but we really got to keep that in mind.

Okay, a few points about the TAP reviews. It's been said that the board can serve as its own technical advisory panel, and I would like to point out the OFPA language, 6518-K3 which says, the board shall convene technical advisory panels to provide scientific evaluation of the materials considered for inclusion on the national list.

Such panels may include experts in agronomy, entomology, health sciences, and other relevant disciplines. Okay, that's one.

And then at 6518-L3 it says, quote, the board shall submit to the secretary along with the proposed national list or any proposed amendments to such list the results of the board's evaluation and the evaluation...
of the technical advisory panel, all substances considered for inclusion on the national list.

Now maybe it is possible for the NOSB to serve as its own TAP and take both roles. It's written up in the OFPA, but to me it sounds like there is a requirement to have TAPS, and a requirement that these are a different body with a different recommendation.

And I do not believe the intent of Congress, and it certainly does not meet the expectation of the organic community that we do not have to have reviews.

Many of us in the organic community have worked very diligently the last few years to obtain funding in appropriations for 2008, and in the farm bill, we're looking forward to that. And a product of that funding should be good, sound, scientific support for this group. You do a lot of hard work, and you deserve support, technical support, to
evaluate these complex issues on hundreds of
different topics that you can't possibly have
expertise in all of them.

So I think you have the authority
to refuse to evaluate materials, when you do
not have technical support or a TAP when it's
needed, and you should preserve that
authority.

Secondly, synthetic and
nonsynthetic clarification. A lot of people
have brought up the need to go back to this
document, revisit it. And we do have a
problem - one of the reasons we feel this is
needed is, we have a problem with a certain
number of materials that are not on the
national list that are currently being allowed
in organic food.

And this is due to certain
interpretations made in older decisions by the
program. For example sodium and potassium
lactate are antimicrobials used in processed
meat products, and they are ingredients that
are required to appear on the label of organic
say deli sliced meat. We see it out there all
the time. We've been requested to allow our
processors to use this. It's not on the
national list.

Neither potassium nor sodium lactate is on the national list. These are
two discrete chemical compounds with separate
CAS numbers.

The physicians substance database
says these are not prohibited, but it doesn't
give any reason.

Now the reason is that in an
earlier round there was an opinion in a letter
from NOP that this substance is allowed
because it was formed from two substances
where one is on the national list and one is
considered consistent with the national list.

But under this reasoning dozens of
food additives can be justified based on
substances on the national list that are
combined together. Forming a chemical
reaction and a new compound.

    We don't think this is consistent
with OFPA or with the board's authority that
they are the ones who can recommend all
synthetic substances allowed in food handling.

    So - but if we move forward on this
it's kind of hard to know how to petition to
take a substance off the list when it's not on
the list. So we can file complaints; there
can be lawsuits. But we'd rather not do that.
I mean that would be harmful for everybody,
and I think we can resolve this much more
simply.

    So if we move forward on your
synthetic framework, which was actually
reproposed back to you from the program in
2006, it clearly defines what's chemical
reaction and the need for individual CAS
numbers. And I think that would just really
clean things up, and we could move forward.

    So that's my compelling reasons.

Very quickly, the other loophole
area is accessory nutrients. You've heard testimony, people don't like the fact that these have been allowed. It's been a compliance decision, and you felt like you couldn't do anything.

Again, we can't petition to take something off that's not on, but you should go back and revisit that 1995 document on accessory nutrients, written before the rule, not consistent with the rule, and it should be rescinded.

Any questions? I had a few more points, but.

CHAIRMAN DELGADO: Questions from the board? Can?

MEMBER GIACOMINI: Thank you, Emily.

Just two things, on the synthetic and non-synthetic I believe that is part of the next step or maybe a subsequent step of the materials working group is to be looking at synthetic as we look at that whole entire thing.
And regarding your other issue of those items, one of the things I'm going to undertake as my job is that included in the request for any technical reviews will be an evaluation of what can be made with that substance when combined with other things that are on the national list.

I don't know how much more we can do with that right now, but that is part of an evaluation that I don't think was made, but we can at least evaluate it in new things that are coming before us.

MS. BROWN-ROSEN: Then you are going to need a lot of technical support to look at all the combinations of things that are on the list. Good.

One little response is that the materials working group, we need to go ahead. I think it would be very useful to have a way to post comments on ongoing issues like synthetic-nonsynthetic, like hydroponics that are asking for questions, in intervals between
meetings.

Like right now we can't post any comments until 30 days before when you have the thing open on regulations dot gov. So if there is a way to set up something on NOSB's website, it really helps to dialogue, to see other people's comments, and weigh them, and have more time to think about some of these long-term issues.

CHAIRMAN DELGADO: We had a question from Jerry followed by Kevin.

MEMBER DAVIS: Emily, could you send us more details on those materials that you see as - you made an example of the potassium lactate and so on, if there are some more items.

MS. BROWN-ROSEN: Actually, the board had a lot of correspondence on that subject. We can dig it all up and send it back to you.

MEMBER DAVIS: If everyone has that, that's great.
MS. BROWN-ROSEN: Okay.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: Yes, Emily, you said you had two more short points?

MS. BROWN-ROSEN: Yes, well, I just mentioned the one about between meetings. Then the last one was the petition substance database. We appreciate the new website, but it is not manageable right now. You have to click on the 26 different letters. You can't search. And there are some errors in there. It just needs updating where it says things are prohibited that are actually not prohibited, and then we have those points where it says prohibited, but it doesn't say why. So it's really difficult to use, and we hope it can be remediated.

CHAIRMAN DELGADO: Hugh?

MEMBER KARREMAN: Hi, Emily. Since you're a materials girl, I thought I'd ask you, I was wondering, I know that with the official release of the new Federal Register
release on December 12 of last year, that allows medicines in the livestock realm that previously weren't delineated.

What have you been doing, or what would you suggest, regarding 205.603(f) in respect to excipients that are now fortunately allowed in the regulations but they are more narrowly defined toward FDA regulations. And what are you doing about the excipients in USDA licensed biologics and vaccines? How are you looking at that as a certifier?

Because they are encouraged by 205(a)(6).

MS. BROWN-ROSEN: Right. My understanding is, we got clarification at the January certifier training in Kentucky that if it's a biologic or a vaccine that's USDA APHIS approved, then automatically all the excipients in there are considered approved. It's just a different regulatory scheme. It's not FDA ruling over those; it's USDA. So that was the intention, to cover those two.
So if it's a registered biologic, we do not question the excipients, because they have already been looked at.

MEMBER KARREMAN: Has that been written down yet, that you can refer to that?

MS. BROWN-ROSEN: No, actually we're waiting for the notes from the training. I believe NOP promised us after all of them were completed.

MEMBER KARREMAN: And that will be addressed at that point in black and white? Okay.

MS. BROWN-ROSEN: Well, they are also putting things on the AQSS, but I haven't seen that one yet.

MEMBER KARREMAN: Good. Also another question, regarding 205.603(d)(2) and (d)(3) under trace minerals and vitamins. There has been some problems with using trace minerals and vitamins, medically, injection for sick organic livestock because technically that's as a feed supplement or additive or
something like that; it's not technically allowed for injection. It's not referred to that way.

So what would you suggest should be done on that?

MS. BROWN-ROSEN: Well, we - and I think most certifiers do allow injectable vitamins as a valid health care material. It's really not specifically spelled out in the National List, and that would be helpful to that have additional use specified. I think there is discussion under health care about appropriate vitamins and minerals being required for health, so that is sort of our reasoning.

But it would be better to have a petition on injectable or medical use of vitamins and minerals, and maybe there needs to be some annotation, but we've all been too busy to do that I guess.

We have been applying the excipients' policy to those vitamins that are
used medically. And some vitamins do not meet that. So we have certain forms that are allowed and certain that aren't. So we are just investigating those and evaluating them on a case-by-case basis.

MEMBER KARREMAN: One last question if I may?

CHAIRMAN DELGADO: Yes. Any other from the board? Proceed.

MEMBER KARREMAN: Same realm. On 205.603(a)(23)(i)(I) regarding Xylozine being only used at an emergency situations, sometimes - well, these are real life - you know, we've had these discussions. Sometimes a farmer will buy in some cows or whatever that have horns and they need to have them taken off. And that is certainly not an emergency, but Xylozine is absolutely used to sedate the animal and for analgesia and whatnot along with lidocaine.

But it says under 23(I)(I) that it can only be used in an emergency, and that's
not really an emergency.

Do you have any suggestions for that so that people aren't caught up with minor noncompliances or written up?

MS. BROWN-ROSEN: So far as I know it hasn't come up yet specifically, or that I've come across my desk in our operations. I'm sure it will. That is a good question.

I would tend to look at it that horns in a large animal is a dangerous situation. It could be an emergency for the farmer. I might think of it that way. But I don't know if we need to re-address that annotation.

MEMBER KARREMAN: Well, that's a specific thing, the horns. But it might be castration or whatever.

MS. BROWN-ROSEN: That is a more routine thing, yes, right. So that is the only anaesthetic that would be suitable for that, you think?

MEMBER KARREMAN: Well, to sedate
them and get near them and work them.

MS. BROWN-ROSEN: Well, too bad you didn't change that when you recommended it.

MEMBER KARREMAN: It slipped by.

MS. BROWN-ROSEN: Well, maybe it has to get brought back up then.

MEMBER KARREMAN: Okay, thanks.

CHAIRMAN DELGADO: Any other question from the board?

Thank you, Emily.

MS. BROWN-ROSEN: You are welcome.

CHAIRMAN DELGADO: Next is Leslie Zuck followed by Kelly Shea.

MS. ZUCK: I'm glad Emily got all the hard questions.

I'm Leslie Zuck, z-u-c-k. And I'll first comment as chair of the Accredited Certifiers Association, the ACA met last night, and we had a good discussion on how our organization can most effectively assist the NOSB and NOP in your decision-making process.

And we are really impressed with
the work of the materials working group and
their presentation to the board, and ACA
decided that we could form some working groups
within our organization. And we made a pretty
long laundry list of topics which I will share
with you since you share your work plan with
us.

And that list is: grower groups;
origin of livestock; poultry living
conditions; animal welfare issues; materials
issues; private labeling; and some of the
missing standards - we call them missing
standards - and those would be honey or
apuaculture, mushrooms, and greenhouse
products.

And we will be responding to the
crops committee's questionnaire on
hydroponics, so we'll get back you on those.
We didn't really have enough time, because I
think we just kind of saw it a few days ago,
so we will respond to that.

And we do encourage the board
members and the national organic program staff
to contact Pat Kane with the ACA if you want
information or research assistance on topics
you're working on. And Pat will be sure to
get it out to our member certifiers to help
you out if you need our help.

There was one comment we'd like to
make on the commercial availability of seed,
and that is that we wholeheartedly agree with
the committee that it is important to support
the use of traditionally bred seed, but we
suggest that the data collection needed to
support your recommendation would best be done
by experts, which is not us. Such as the
Economic Research Service and other agencies
that have the means, expertise, and authority
to collect and collate that data for that
purpose.

I'm also commenting as executive
director of Pennsylvania Certified Organic,
PCO's concern that some certified organic
poultry operations are being permitted to
continuously confine poultry based on a veterinarian's recommendation that the bird's health, safety or well-being could be jeopardized if they are given outdoor access.

PCO certifies more than 100 poultry operations, and those include layers, broilers and turkey producers. You heard from quite a few of them yesterday I believe. And those producers produce more than 600,000 broilers; 800,000 layers; and 10,000 organic - all those - turkeys annually. And every one of those birds is required to have outdoor access during the season. They cannot be continuously confined.

And actually those numbers would be a lot higher in Pennsylvania if we as a certifier were not being so strict about outdoor access, because we actually have had large producers leave our program in favor of certification programs that allow continuous confinement.

So we have had those letters
presented to us as a justification for continuously confining poultry due to the risk of avian influenza being transmitted to domestic poultry from wild bird populations.

We got those letters. We did additional research to assess the risk, and we have shared that research with other certifiers; we are happy to share it with anyone. And we developed a process on temporary confinement due to the risk of high-path avian influenza - that's the HFN-1 strain, I think. And that was back in 2006.

We have seen no elevated risk since then, and we strongly disagree that there is justification for permitting continuous confinement.

In their 2005 letter to certifiers, the National Organic Program refers us to the APHIS guidance on protecting poultry from disease outbreaks. And even the APHIS guidance doesn't requirement confinement. It does give it as one option, but it
additionally allows restricting outside access by maintaining outdoor enclosures covered with solid roofs, wire mesh, netted sides, keeping your outdoor enclosures covered with wire mesh or netting in lower risk areas where solid roofing would not be required.

So there are alternatives to completely confining the birds, and that's on the USDA website, so that is there for anyone to look at.

So I'll conclude by saying that all certifiers in order to do our job effectively could benefit from more guidance on poultry living conditions, including indoor and outdoor space requirements, type of outdoor access, type of enclosures for outdoor access.

And we'd ask that the NOSB put this on your work plan. You have a recommendation out there from a number of years ago; you might want to get that out and dust it off and review it, and help us with this urgent problem that we have.
CHAIRMAN DELGADO: Hugh followed by Joe.

MEMBER KARREMAN: Thanks, Leslie.

We had, when Mike Lacey was on the board we were discussing the AI, high path AI issue. And it kind of came and went because that threat at that time came and went. But I think maybe informally we were discussing, but I could ask you, would you think it would be good is the NOSB were to have a policy or guidance that only during an AI outbreak and only when a Department of Agriculture, or state Department of Agriculture, Delaware, Maryland, Pennsylvania, whatever, declares an emergency, that animals can be kept inside until the emergency is done.

Would that be a good thing to have stated?

MS. ZUCK: Some type of policy would be excellent. PCO does have a policy that sort of reflects what you did state there, and it says, conditions warranting temporary
confinement. Our policy says that we will not wait until a local infection occurs. But we consider allowing the request if there is a documented occurrence in migratory birds in North America, or if state or federal authorities require birds to be kept inside.

During this time Pennsylvania Department of Agriculture had a workshop on it, invited everyone to come down there. And they were not requiring poultry, any poultry, conventional or otherwise, to be kept inside. So we thought it was really not responsible for us as an organic certifier to require or allow poultry to be kept inside.

And that basically there is a list of things that you would consider, so there are – there already are in place the Centers for Disease Control maintains a current alert posting website. FAO has one that every two weeks they put a map up on their website that shows where all the outbreaks are. And now they are all in Asia and other places, but
there have not been any here. At that time there hadn't been any in the Western hemisphere. And there are organizations monitoring that that we would defer to rather than us as a certifier to assess the risk. We don't need to do that; we could go to these agencies to do that.

MEMBER KARREMAN: Just to follow that, I think that if you are a certification agency and you are getting kind of dinged by people going away from you since you are actually reflecting the will and intent of the regulations for public health are, that's not right. You guys are obviously thinking about this. Pennsylvania is a big egg producing state and whatnot, and you have obviously done your homework, and you have people going away from your certification agency. That is not right.

MS. ZUCK: I think the regulation could use a little more teeth. It does say that the rules permit temporary confinement
under 205.239(b) based on conditions under which the animals' health, safety or well-being could be jeopardized. I mean that is pretty general. Leave them outside, they could be jeopardized. They could be eaten by a coyote. Lots of things could happen to them if you leave them outside, so it's not really that difficult to find somebody to write a letter to justify confinement. So I think we need additional guidelines under poultry.

MEMBER KARREMAN: But under 239(b) it doesn't say that if a veterinarian writes a letter that that then excuses that, does it?

MS. ZUCK: It would be justification that a certifier could responsibly use for justification. I'm not faulting the certifiers who are permitting this. I just feel they don't have enough tools with which to make their decision. And they need the support of the board and the program when they make strict decisions like we're making to do that. Because the producers are pretty
adamant about - we had them saying, do you want to be responsible for the first case of avian influenza being in an organic flock in Pennsylvania? You wouldn't want that, would you?

So as a certifier you're like, okay, well, maybe this sounds reasonable, yes. So that's kind of the things that we are up against. And they are your client, and you want to help them, and you don't want them to have problems with their production; it's a big issue. And we are completely sympathetic to their concerns. They've got a lot of birds to take care of.

MEMBER SMILLIE: Joe followed by Kevin. My line of questioning was exactly where Hugh went, and Leslie, I think you have answered it perfectly.

It's the problem Leslie has pointed out. Your very last point is the key point. Basically the regulation like we've seen in other parts of the regulation, the regulation
is not clear. And what she's cited is exactly what your clients and their lawyers will cite to you.

We have a responsible state veterinary who says they are in danger if they are going out in X situation. AI is just one of them. AI was like a good training course for permanent temporary confinement rule.

And that's what's happening. That's the reality we have to face. And Leslie's answer is a good answer, and that's the way certification agents should be pursuing it, but when faced with companies and their lawyers, saying, here is what the regulation says, and this is what we are going to hold you as a certification agent to, it's tough. So basically we would need support in further definition of the regulation as it now sits, not the spirit of the law, because the spirit of the law has no weight in court. It's the regulation that has the weight, and Leslie perfectly described the situation that
we face with that.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: It's obviously troubling to hear that you lose farms to another certifier. It's very similar to what's going on in some instances with the seed situation.

Other than coming before the board and stating that problem, are there any other actions that you do or that you take or that we could take?

MS. ZUCK: Like I said in this case I don't really fault the certifier. I feel like if we had additional guidance that would help us be a little more comfortable in our decision to require that. I'm not sure what the answer is, but I'd just like to work together with the board and with the program to try to solve this problem and I think if we - I don't know what the solution is.

CHAIRMAN DELGADO: Follow up?

MEMBER ENGELBERT: I guess what I
meant we'd want is, do you call the other
certifier and say, what are you doing?

    MS. ZUCK: Well, they've called us,
and they know that we've made that decision,
and we've shared this information with them,
but they still were really uncomfortable with
not having necessarily the support in the rule
as Joe states that is going to allow them to
really stand up to that.

    CHAIRMAN DELGADO: Comment from the
program?

    MR. MATTHEWS: Richard Matthews.

    I couldn't disagree more,
especially with the comments from Joe.

    All right, here is the issue.
205.238(a), producer must establish and
maintain preventive livestock health care
practices including, one, selection of species
and types of livestock with regard to
suitability for site specific conditions and
resistance to prevalent disease and parasites.

    Paragraph three: establishment of
appropriate housing, pasture conditions and sanitation practices to minimize the occurrence and spread of diseases and parasites.

Section 205.239, livestock living conditions: (a) the producer of an organic livestock operation must establish and maintain livestock living conditions which accommodate the health and natural behavior of animals including access to the outdoors.

I don't care what some lawyer is saying, the rules are clear. The birds are supposed to be outside, and I would also hold that if 95 certifying agents said, no, we are going to enforce the regulations, the birds would be outdoors.

The problem is that some certifying agents are not enforcing the regs, and therefore you have shopping.

Now the issue is, can we go on a porch? Well years ago, when I was the program manager, the board came up with a
recommendation that we turned into a policy statement. We were sued over that policy statement; we won. I emphasize, we won. Okay?

Now, you have chicken producers who have porches; not many, but you do have some. Now, that same provision is in the APHIS guidelines. You can put them out on a porch. So bottom line is, the regs are sufficient. The board has already had a recommendation. We developed a policy. It's time for certifying agents to enforce.

MS. ZUCK: I wasn't at the national - or the NOP training in Chicago, but I understand there was some discussion on temporary confinement, I don't know what it was called, continuous temporary confinement, or extended long-term temporary confinement. I wasn't there for that discussion but from what I understood that was supported by the rule and the program. And I'm a little unclear about how that would not conflict with
what Richard just said.

CHAIRMAN DELGADO: Question from Hugh.

MEMBER KARREMAN: Just a kind of a question of Richard I guess. Under 239(a)(1) with access to the outdoors, that's one of those nebulous terms. Are the chickens, if you have 16,000 in a house and you have got these doors that are one foot high and one foot wide and you've got three of them along one side and three along the other side, and maybe there are 100 birds out on a porch, and you've got 16,000 birds in the house, how often access? Like, you're saying the birds should be outside; I agree. I think a lot of us here in the organic community would agree with that. But it's still kind of like one of those nebulous terms like access to pasture - I hate to bring that up.

MR. MATTHEWS: Well, you know, we can debate back and forth on the issues, but the bottom line is, the reg says, the birds
have to go outside, and if you've got an area that is too small to allow the birds out, then you haven't met the requirements.

And this issue of what constitutes temporary, well, if the farmer has never created the space in which the bird would go out into, then they are clearly not meeting the requirement of providing access. It's a demonstration of a total unwillingness to provide the access in the event there isn't a threat.

So okay, so you want to keep them in when the geese are migrating over, because you think you have a real serious problem and the vet says there is a real serious problem. But my question is: is the access there at other times? And I think if you go out there you are going to find out the access it not there. They haven't prepared for the day that they can meet the requirement of putting the birds outside as they are required.

MEMBER KARREMAN: Just a quick
follow up. I guess then what I'd like to interpret that as is access for all the birds at one time, not just a fraction of them. That's I think what I'm - access to the outdoors for like cattle it would be like the whole herd goes out and grazes. Well, with poultry that might not be the case, not that I want them grazing necessarily, but just that a fraction are going out those very small doors out to the porches, and yet the massive amount of them are still in the house, and they can't all go out at once.

So are you saying that perhaps we need to clarify that a little bit? It's access to the outdoors for all of them at any time?

MR. MATTHEWS: Further clarification by the board would not be a bad thing. But all I'm saying is that we've got regulations that are already out there, and the problem is certifying agents, some of them, are not enforcing those requirements. And a
certifying agent who certifies somebody who
has no space for outside access, which a lot
of them have gone ahead and certified
operations without that space, they are in
violation of the regulations.

Temporary is just that - temporary.

And if a certifying agent certifies somebody
for production of poultry products and that
operation has no facilities for outside
access, that is a willful violation and
certifying agents should not be certifying
that.

Get the birds outdoors; that's what
the regs require.

CHAIRMAN DELGADO: Thank you for
that comment.

I just want to remind the members
of the board, we do have a schedule and I do
want to stick to it.

MEMBER SMILLIE: Just a
clarification, Richard, we are absolutely
totally in agreement, that's clear. Access to
the outdoors has to be there.

Temporary confinement is another complicated, more complicated issue. But we are absolutely clear that access to the outdoors has to be part of the whole OSP in plan that, has to be in place, the birds have to be able to get outdoors.

What the tricky part is is defining what can be allowed for temporary confinement. And just going back to the porches deal, that was the signal about what outdoors means that was not the interpretation of the organic world at that time that porches were outdoors, but that was the program's interpretation. And as you say you won in court on that issue. So porches were outdoors; that's clear too.

CHAIRMAN DELGADO: Any more questions, comments, the program? No? Thank you very much, Leslie.

We move on now to Kelly Shea followed by Susan Bassi.

I must clarify that Kelly does have
a proxy for Nancy Chapman, is that the case?

MS. SHEA: Yes. Just five, and probably less.

Good morning and congratulations to all of your West Coasters for holding on.

I'm Kelly Shea with Whiteway Foods, and I'm here today on behalf of the Soy Foods Association of North America, known as SANA. I have remarks from the Soy Foods Association on the reaffirmation of calcium sulfate and gluconodeltalactone as approved ingredients in organic.

SANA represents the interests of small and large soy food manufacturers, soy processes, ingredient suppliers, soybean farmers and other industry stakeholders.

SANA would like to thank the United States Department of Agriculture, Agricultural Marketing Service and the National Organic Standards Board for the relisting of calcium sulfate and gluconodeltalactone, GDL, as non-agricultural, non-organic substance
ingredients allowed in process products labeled organic.

These two substances are very important ingredients in the manufacturing process for organic tofu. Calcium sulfate used in tofu manufacturing for centuries is a coagulant that yields specific textural qualities of tofu that cannot be duplicated by any other coagulant.

This domestically produced naturally mined earth mineral also provides a natural source of calcium for consumers who eat tofu.

Gluconodeltalactone, GDL, is also a tofu coagulant prepared by direct crystallization from the aquacious solution of gluconic acid, which is produced by the oxidation of D-glucose.

When GDL is used along with other coagulants such as calcium chloride, calcium sulfate or magnesium chloride, these salts act together to coagulate soy milk and give it the
real silken smooth type of tofu.

SANA appreciates the opportunity for its member companies and other stakeholders to comment on the classification of these important ingredients, and SANA wishes to thank the NOSB handling committee for its thoughtful consideration and reaffirmation of the November 2007 recommendation for relisting calcium sulfate and GDL on the approved list of ingredients for organic products, as no risks to the environment, human or animal health as a result of the use or manufacture for these ingredients were found.

Again on behalf of SANA I thank the NOSB for its continued support of the organic industry, and careful consideration of the needs of soy food manufacturers.

Thank you.

CHAIRMAN DELGADO: Questions from the board.

Dan.
MEMBER GIA COMINI: Thank you, Kelly. Not a question, but maybe this is more directed toward Valerie.

Maybe in the future we could at least wait until after the first break to talking about coagulants. It's just a little too early right now.

CHAIRMAN DELGADO: Any other questions?

MS. SHEA: May I go on the record as saying that you are a goofball, Mr. Giacomini? Thank you.

MEMBER GIA COMINI: Thank you, Kelly.

CHAIRMAN DELGADO: Thank you.

Up next is Susan Bassi followed by Jim Pierce.

MS. BASSI: Good morning. My name is Susan Bassi, and I'm representing Agricoat out of Soledad, California. And we are a seed coating and enhancement company.

I'm here today to speak to you on a
number of seed-related issues that you have facing the board at this meeting.

Our company was established in 2002, and was created to offer seed products and services for organic production.

The majority of our products are NOP-compliant, and our California facility is duly certified as a processor-handler.

Agricoat also offers WSDA certificates for seed coating products applied to conventional seed and used in organic operations.

I'm here today to address a number of issues, but I want to begin with the issue before you on the justification for a new organic binder to support lettuce coating.

First I'd like to clarify a few terms that are routinely used in the seed industry, but may be less familiar to members of the organic community and the board.

Seed pelleting is also called coating. It is a process whereby mechanical
buildup of dry materials is used to increase the size and shape of a seed. Not all seed species are pelleted. Mainly high value vegetable seeds such as onion, lettuce, carrot and radicchio are pelleted or coated.

The decision to pallet is usually dependent on the seed size, shape and cost to the seed to be pelleted.

The binder: the binder is a material used to hold the ingredients together or intact, while allowing water and nutrient uptake such that seed germination is not negatively impacted.

Priming is a specialized process used to break photo or thermal dormancy of seed, and it is typically used on lettuce, onion and endive species. The process is cost-prohibitive for many other species.

When seed is primed it may be pelleted, but it is not necessary. In fact many growers have moved to raw planters, such that prime seed is often planted without a
coating.

Speaking specifically to the petition for adding Dextrin to the national list as a seed binder, it should be noted that our company along with a number of other companies are producing seed coating for organic production without the need for such an addition.

As to the issue of viability, it would be fair to state that initially pelleted products for organic production do not equate the performance of their conventional counterparts. It's a little fat in the beginning.

However, our company and others continue to work with NOP-compliant materials and processes such that today our products perform as well as other conventional counterparts.

In fact some of our growers hold a single inventory of products that can be used in either organic or conventional product, and
reduce costs associated with carrying dual inventories.

As to the data reported in the petition before you, the report demonstrates only that the binding product tested internally by one company vary in performance with their own priming process.

The data does not report any information on similar products currently available for organic production.

We set a dangerous precedent when we consider adding materials or making changes to NOP rules to benefit a single company rather than an entire industry.

Now I'd like to address some issues on organic seed which we are not producers of organic seed but we do process and handle a lot of materials that go into organic production, and so we work with a number of clients from producers to growers, so I just have a little input to give you on that issue, since I know it's important to the board.
I've listened to several thoughtful questions from board members on Tuesday related to paperwork, supply and demand, and the other issues that may create barriers to advancing the production and use of organic seed. And I thought a simple story from an organic seed producer might provide some valuable insight.

The producer recently shipped a dealer, supplied a dealer with organic corn seed in advance of spring planting orders and based on early estimates.

A grower who had previously and successfully used the organic seed found out just prior to planting that he would be allowed to use conventional seed in his production based on the seed exception allowance, and was granted such exception by his certifier.

Over $62,000 of seed then missed an important planting window, and it was too late to sell the seed to another grower, so the
seed was returned and did not make it into organic production.

As long as there is an exception it will be used, and there will be no impetus for change.

In conclusion we are at a good starting point for further discussion on seed technology and availability for organic production. As you move forward in your policies that impact seeds and use in organic production, I encourage you to set policies that are realistic and knowledge-based, that are clearly defined and communicated throughout the industry, and that are enforced through a clear and consistent message from certifiers to their clients.

Thank you.

CHAIRMAN DELGADO: Questions from the board.

None? Thank you very much.

Next is Jim Pierce, following by Karen Wilcox.
MR. PIERCE: Good morning. Nice to see you guys so engaged with public comment, it really is.

I've got my fish farmer hat on now, not Oregon Tilth, not Organic Valley. I'm a trout farmer. And I've been asked to read a comment by Dick Martin of Martin International Corporation, a Massachusetts corporation exporting and importing fresh and frozen seafood. And if there is a few minutes, I'm going to try to get some aquaculture comments from my own observations at this meeting. And if there is really a chance, I'll tell you about Grandma's chickens.

Okay, so from Martin International, I strongly -- Martin International supports the Livestock Committee minority position as follows.

I strongly support the original aquaculture working group's interim final report approved on March 7, specifically 205. 252 aquaculture feed. These considerations
and proposals offer practical solutions for the complex issue regarding the aquaculture, the organic culture of carnivorous aquatic organisms.

The modifications, the limitations proposed in the committee's report, which proscribe the use of fish meal and fish oil derived from foreign certified farmed aquatic animals is not a viable alternative from both the supply base and economic perspective. Jim agrees.

Simply put, there is not enough cultured aquatic species leave alone organic species that would qualify under the proposal by the livestock committee to generate sufficient fish meal and oil on a commercial scale.

Secondly, the production of organic species to create a basis for fish meal and organic -- and fish oil utilized by feed for another organic carnivorous species would create unbearable cost that would be
prohibitive on a commercial scale and unaffordable by a consumer.

Please be careful that what looks like a standard is not an insurmountable barrier. That is what this gentleman is saying.

As organic is a process claim, the current practice of the OU model utilizes a resource that is already produced. The fish are already being caught and utilized in human food production. The resource exists, and the required infrastructure is in place.

As organic is a process claim, so too should the process by which aquatic feed is produced and processed for use in cultured organic aquatic organisms.

To date all rules created have been restricted to terrestrial models which should not be bent to fit the aquatic model. A new approach is needed to allow for the unique issues that confront the NOSB in defining rules for aquatic species.
The diligence and perseverance of the NOSB in this effort should be recognized and commended as extraordinary. Yet a workable model on a practical and economic scale must be the outcome. Otherwise a non-workable model is yet another waste of energy on a human scale that does not benefit the consumer, the environment, or the industry.

End of Dick's comments.

It appears from the discussion yesterday that a door is open on the re-allowance of the use of wild-caught fish in aquaculture feeds. I think that is a good thing. I think you need to dredge up those five paragraphs that the aquaculture working group outlined. I believe that's that section 252 that they referred to, either as an expiration date which they recommended, or a step down which has also been tossed around.

Either one, I think, is going to be breaking new ground, but I think is compatible with a system of organic production; is a
system of continuous improvement.

The other thing I'd like to see is you to return to utilizing this aquaculture working group. Their efforts have been tremendous. They are willing to keep working with you. I believe that door has also been reopened. But plug them back in. I think they've seen with this materials group a model of presenting options rather than language, that they are ready to follow and give you some tools in order to turn the corner on this very difficult issue.

The other thing for both you and the program is, please, please move forward with the approval of standards that are already in the docket that appear to be workable and turn into rules. That would be the vegetarian fish and the gentle organic shrimp.

It will not only supply some feed resources, which, again, I don't agree that using food for fish food is going to be
economically viable, but it's a start. But more importantly, it will establish a presence with the USDA certified aquaculture products. That is important; that's very important.

Regarding Grandma's chickens, I sat here yesterday wishing you would ask me that question. Fifty years ago 50 to 60 percent of the U.S. population was farmers, and they raised 100 or 200 or so chickens at a time. But remember, Herbert Hoover promised a chicken in every pot because chicken was expensive. You know what people ate 50 or 60 years ago, poor people? They ate lobster and oyster stew; it's true, look it up. Chicken was a luxury. If you could get a chicken on a Sunday that was a big deal.

The other thing that Grandma did was she fed her chickens meat, beef, pork, whatever; table scraps, that's what they were eating. And they were also eating a lot of fish --

So this is a new paradigm. I think
I agree with Dan Giacomini that two years may be prolonging the agony, but I'm not sure it's enough. And I bring those comments to you because from the very beginning of the methionine discussion I've been involved with it.

So closing on behalf of the Milwaukee Organic Okra Growers and Bratwurst Gumbo Association, I thank you for your time.

(Laughter.)

CHAIRMAN DELGADO: Questions from the board?

Thank you.

Caren Wilcox followed by Alexis Baden-Mayer.

MS. WILCOX: Good morning, everybody.

This will be very brief. I am Caren Wilcox, and I am the outgoing executive director of the Organic Trade Association, and that's why I decided to speak to you today.

I wanted to thank you all for your
service and also for your interaction with OTA, which I think has been very productive over the last couple of years and, I should add, very transparent.

And I hoped to come today to say that the Farm Bill had passed. As you probably all know, we had a technological glitch yesterday in the Congress. And I'm not going to make a prediction about when it will pass, but hopefully it will.

And I would like to say that we at OTA and with many other people here in this room pressed very hard in the Farm Bill to have an increase of domestic production of organic in the United States. It's very, very important to us, we believe, in this market to increase our domestic supply.

We acknowledge of course that a great deal of product is coming in from overseas. We don't know how much, but we do know it is coming in. But we think it's very important for our consumers to understand that...
we are trying to increase domestic production.

    And we acknowledge that that is
going to put some pressure potentially on NOP
because there will be a lot more people
probably in this audience and pressing for new
interesting developments in organic and
potentially put some more pressure on all of
you.

    But we did press very hard also in
the bill to get new resources for NOP, so that
they will be able to maintain really strong
programs for the -- to maintain the standards
which are also incredibly important to the
whole consumer community and therefore to all
of us.

    So thank you very much. It's been
a pleasure to work with all of you.

    CHAIRMAN DELGADO: And thank you,
Caren, for your wonderful historic
achievements.

    Questions from the board?

    Thank you, Caren. Please, Joe.
MEMBER SMILLIE: I just want to thank OTA for making your services available for the working groups that have really assisted our process. We really think that that's the role of the trade association and that you have just done a fabulous job with supporting both -- the two that I can think of, the materials working group and the group certification, just as two examples of two groups that have had a profound influence on our thinking here.

MS. WILCOX: Well, we are very glad to be able to do that, and we have a great staff to do that backup.

CHAIRMAN DELGADO: Well said, Joe. Thank you.

Any other questions?

We'll proceed then to Alexis Baden-Mayer.

Bonnie Wideman.

Bonnie. She's coming. After her we have Foster, John Foster.
MS. WIDEMAN: Salutations, board and program. I'm Bonnie Wideman, and I'm director of Midwest Organic Services Association, MOSA. We serve around 1,100 clients, more than 900 farms, fewer than 200 handlers. Thank you for your work and the opportunity to comment.

In the organic handling arena, MOSA would like to have further clarification in two areas talked about at the NOP trainings: private labeling and flavors. We certify a number of food co-ops in the Midwest as retailers. These co-ops and their members were as incredulous as we at MOSA were to hear that their competitors, the big retail chains, were being certified as grower groups. Please stop this erosion of consumer confidence in organic and proceed with work with grower groups as originally intended.

It is, on the other hand, very gratifying to see before the NOSB the petition for the allowance of cheese wax for sealing the plugs in shiitake logs. For it is an
indication of the program's willingness to
listen to the needs of the little guy.

Most shitake production takes place
in plastic bags, not in logs, which is a whole
environment enveloped by synthetic
hydrocarbons, not just a plug. Please grant
this petition as it is needed by the small
but vibrant sector.

We also support Fenbenzadole as an
alternative to Ivermectin and the extension of
methionine both in time and by amount. Also,
speaking of birds, we would like clarification
if porches are outdoor access or if they are
temporary outdoor access, as was the
impression at the NOP training.

In regard to commercial
availability guidance regarding the sourcing
of organic seed, the measures proposed would
put an undue strain on both us and our
farmers. Our situation is very different from
what we hear described in different parts of
the country. Our vegetable operations are
much smaller in size, yet they grow a wider variety of crops, and they do provide us with full variety information and organic seed search documentation.

My staff estimates as high as 80 percent organic seed use in our vegetable operations. On the other hand we can say that only about 50 percent of the corn and beans used by our farmers is organic. And grasses and alfalfa are in short supply, and we would like to see better quality alfalfa in particular.

But we do see that the organic seeds use does keep increasing, and we feel this is due to our efforts to have our farmers search more for organic seed. We feel though that what they need is more awareness of where to buy organic seed, and we also need to encourage them to place their orders earlier.

A national database of organic seed would help us more than our farmers. We have confidence in what we are doing in requiring
organic seed search, and we would appreciate it if our systems weren't strained by new requirements. But, rather, if there is a way to support certifiers who are having challenges in this area we think it would be a better way to proceed.

My final comments have to do with dairy replacements. We have been assured that we will be getting what we need in relationship to pasture. When I use the word "we," in this case I'm referring to the over 450 dairy farms that we certify.

Our average herd size is 40 to 50. Our farmers raise their own replacements, and they raise most of their own feed. We would call them sustainable, yet sustaining them will be the responsibility of the NOP with the clarification of the replacements issue.

What do we need? We need a dairy replacements rule that is simply last third. At MOSA we see fewer dairies coming into organic, and we are seeing frustration grow
with our existing farmers as they face climate changes, rising expenses, and a challenge to the milk pay price. Please recognize this and take measures to bring change by stopping continual transition of dairy replacements.

CHAIRMAN DELGADO: Questions from the board? Julie?

MEMBER WEISMAN: Yes, Bonnie, it wasn't the most focused on part of your talk, but I was wondering if you could clarify a little bit -- if you could explain a little bit more about what in the area of flavors you want -- you would -- MOSA would find helpful and certifiers in general would find more helpful.

MS. WIDEMAN: We would find it helpful if we had a means of verifying the composition of flavors, which is so complicated, by using affidavits.

MEMBER WEISMAN: Thank you.

I wish that the -- I don't know if anyone from FEMA is still in the room, from
the Flavor and Extract Manufacturers Association is still in the room, but I thank you for putting it in the record.

MS. WIDEMAN: You're welcome.

CHAIRMAN DELGADO: Any other questions from the board?

Julie, would you like to call someone from FEMA?

CHAIRMAN DELGADO: Okay, thank you very much.

Moving on to John Foster, and after that we have Susie Bowman.

MR. FOSTER: Hi, I'm John Foster. I'm the senior manager of organic integrity for Earthbound Farms. I apologize for reading. There is no other way for me to stay on time or on track for that matter.

Thank you each for your hard work and dedication to the organic community and industry. It's no small feat. And also the
staff of NOP; also no small feat.

The discussion around commercial availability is a real conundrum for me as it pertains to seed in this case. We, Earthbound Farms, grows our own crops on around 200 acres in Carmel Valley, California. We are also a pretty large packer and shipper of a lot of organic produce, spring mix, leaf lettuce, et cetera. We contract with around 150 farms and ranches. Those range from five to 680 acres each throughout Western U.S., Canada, and Mexico.

My comments are also pretty heavily informed, having been an organic inspector for a number of years and a certifier in many capacities for about 15 years. I've seen either in person or reviewed organic system plans of a couple of thousand operations, the smallest quarter-acre backyard gardens to the largest manufacturers in the country. That's my perspective.

Our growers use a tremendous amount
of seed, many, many thousands of pounds every year. And in general they do a good job of trying to find organic seed before using non-organic seed. My conundrum is that it's also my job to really facilitate organic integrity and advance it for all of our growers small and large, and elevating whenever possible the practices our growers use in their work.

It's also my job to look out for smaller growers who aren't growing on a scale to allow them to do what I'm doing here. They are really pretty busy growing the food that allows most of us in the room to make a living. I really appreciate that. It's my job to help them be sustainable as a business so that they continue to be organic farmers.

To be very clear, the larger growers we work with will not have a problem complying with any of the recommendations. It will be very easy for them because they have the staff, they have infrastructure to do that.
It's the growers growing 20, 60, 120 different varieties of vegetables, flowers, herbs, often through most of the months of the year, that will need to characterize, search for, assess, trial, compare, contrast, and document them all. That's in the recommendation, all those mandates are in the recommendation.

The irony to me is that the work associated with the application of this recommendation will fall most heavily on the most diversified farms, generally speaking those are smaller farms. And the irony is that those are the farms closest to the ideal that many of us in the room, and certainly many consumers picture, when they think about organic farms. Those are the farms that they are thinking about. So to put that burden on them, I think it weighs on them unequally, and that's odd to me.

Specifically Part D of the third recommendation will create this unequal and
undue burden in my opinion. If the main problem is that growers are using claims of lack of commercial availability to veil wishes to pay less for non-organic seed, then I would suggest providing tools to certifiers to deal with that. That is a very specific issue, and I have heard that reflected in other comments.

205.103 specifies that records must be adapted to each particular business for a reason. And USDA through accreditation has granted certifiers the ability to assess compliance for a reason. We prefer more vigorous auditing and testing of certifiers' ability to do their job in assessing compliance with these of commercial availability provisions.

Generally speaking certifiers should and most often do have tools and talent to make the calls about applying clauses and guidance regarding commercial availability. They look at each farm on its own merits and weaknesses. I'm asking to let certifiers
continue to use their experience and good judgment to determine what is needed for each operation, particularly taking into account uniqueness, character, conditions found on each farm.

Guide them when they ask for it, or when they need it -- not always the same thing. And I think 3(d) is a fine prescription, but I think it's for the wrong ailment.

Thank you for hearing these comments from not only Earthbound Farms, but following in Jim's footsteps, from the Pacific Northwest Growers Alliance for the promotion of organic okra and really good salmon.

(Laughter.)

CHAIRMAN DELGADO: Questions from the board?

Gerry.

MEMBER DAVIS: John, what is Earthbound's experience been on trying to stimulate more organic seed being available?
I've heard some things spoken that you've tried some things and have had some failures, and I was kind of interested if you would share on that.

MR. FOSTER: Sure. The answer is it depends on the situation. In general our experience has been that the larger growers who have capacity -- infrastructure, land base, staff, financial resources -- to do real good experiments and get the attention of seed suppliers who have really good seed, fresh seed, good quality, have better luck, everything else being equal, have better luck finding varieties in an organic form.

I'm not sure that they are any better at trialing or researching than a smaller grower, but I think they have more capacity to allow access to resources to get the results they are looking for. That's true for larger growers. Moreover, the larger growers have the ability to do their own breeding onsite for site-specific conditions,
again, because they have the capacity to do so. And in those cases they've been able to breed -- spinach comes to mind as one that has been most heavily worked on by our growers. They have found five or six varieties that are proprietary varieties that do exceptionally well, and they are all organic. They are contracting their own organic seed grow out to do that.

Smaller growers, I would say the results are more variable. Sometimes they ask the right question at the right time at the right conference, and you get exactly what you need, but other times, I've seen a lot of growers struggle, very genuinely trying their best, and you know, sitting at the kitchen table with those farmers, their kitchen table and their office and their research facility all in one, you know they're trying really hard. They are looking at seed catalogs. They just don't have the -- I don't think they have the access to as many resources. So
their results are equally variable.

CHAIRMAN DELGADO: Joe?

MEMBER SMILLIE: I appreciate your comments, John, as usual, excellent. I'd like to hear your thoughts on how you would see a database and whether that would be useful and how you would advise us to proceed in our recommendation for a database.

MR. FOSTER: I think if I had the clearest picture I'd probably just do it because there would be a lot of people asking for it. My sense is that all of the motion that several organizations are working toward is probably -- I don't mean to be glib -- it's probably the most appropriate because it's a real organic process.

I don't know that a system could be imposed that would be any better. It's not quite open source, but it's approaching that here. I don't know that you could get a better system than one that takes time. I would suggest it's better to do it right than
right now. I mean I understand the pressure to get it done sooner rather than later, but a bad system or a system that is ineffective or removes confidence in the system is not -- should not be allowed here. I think it's too important.

MEMBER SMILLIE: So in other words, not trying to force one organization to just do it and give them the power to have the control of the database, more open, pollinated with a number of databases out there?

MR. FOSTER: I wouldn't preclude the idea of having one organization do it. But to date I haven't seen one that is able and willing. Both of those have to happen to do that.

I think it's coming, and it's events like this, it's having this agenda item, that does a lot. Because after this meeting everyone in this room is going to go back to their constituency, whoever that is, and say, they are really serious about this.
We need to be moving along. I do that for all of my folks, and everyone else in this room gets it. It's going to happen.

    Pushing it too hard, or pushing it in a way that disproportionately affects growers who are least able to flex to absorb it I think needs more work. Basically this is a plug for my ongoing certifier peer review thing that I always hit on whenever I get a chance. This is more of the same.

CHAIRMAN DELGADO: Thank you. Any other questions from the board?

    Thank you, John. Moving on to Susie Bowman.

MS. BOWMAN: Hello, everybody. And thank you once again for listening to me. I've missed you all in the last year that I haven't been at meetings.

    I'm Sissy Bowman, CEO of Indiana Certified Organic. We're located in Indiana obviously, and I'm going to keep this really short so we can stay on time. I was going to
read this. I have public input from an Amish man from Hillsboro, Wisconsin, who is our internal control person for a 79-member grower group.

And I do have it written here so I'll turn it in. It's a little bit lengthy, but the gist of it is, put the grower back in grower group. That's what it was intended to be. Handler certification is a different type of certification. We do need to have standards and clarification on grower groups, but we're really mixing things up when we try to broaden that scope.

With proper internal controls grower groups can be very well run. I do advocate inspecting all of them. We do that. And maintaining a very close communication with these groups to make sure that we do know what's going on.

He has a lot more to say about it and says it very well. And then the other thing I want to say is, just say yes to cheese
CHAIRMAN DELGADO: Questions from the board.

Joe?

MEMBER SMILLIE: Yes, it's your certification agency that has the growers that are using the infamous term, cheese wax?

MS. BOWMAN: My client is petitioner.

MEMBER SMILLIE: Oh, your client is petitioner? I didn't get quite enough information on that. Maybe I missed a comment on that.

But my understanding of the issue is that it's used as a plug, it's used basically as a prophylactic to prevent -- could you just go by it, through it again. It's not a processing aid.

MS. BOWMAN: No, it's not. Holes are drilled into the logs. The spawn is put in there, and it's used as a moisture barrier and to hold the spawn there. It doesn't
become part of the product.

And I would liken it to using a plastic pot to hold soil together so you can put a plant in it. And again in other non-log based production of mushrooms there are basically wood chips that are held together in a plastic bag, and that is allowed. So the cheese wax is there for the purpose of holding it together so it can grow and maintaining the moisture there so it can get started.

MEMBER SMILLIE: So it's almost like mulch, a plastic mulch for growers.

MS. BOWMAN: Right.

MEMBER SMILLIE: And this doesn't become part of the log later?

MS. BOWMAN: No, it comes out.

MEMBER SMILLIE: It comes out?

MS. BOWMAN: It comes out. It's not taken up by the mushroom in any way, shape or form. And as far as, yes, I think plastic mulch is far worse actually than this is.

CHAIRMAN DELGADO: Any other
questions? Dan?

MEMBER GIACOMINI: Just, after it comes out, it just falls out on the ground and stays there?

MS. BOWMAN: It's biodegradable.

MEMBER GIACOMINI: It is?

MS. BOWMAN: Yes. That's what I'm told. I've read the petition. It's quite lengthy.

MEMBER GIACOMINI: I know.

MS. BOWMAN: And it's also allowed -- organic cheese is dipped in cheese wax. It's allowed to be used for that purpose.

MEMBER GIACOMINI: Yes, but when we cut it off cheese we don't throw it out on the ground.

MS. BOWMAN: It's disposed of somewhere.

MEMBER GIACOMINI: But it's not just out in the woods. It goes to a landfill; it goes somewhere.

MS. BOWMAN: If you would want to
annotate it to say how it has to be removed --

MEMBER GIACOMINI: No, I'm just wanting clarification on whether -- just asking whether it was biodegradable or not.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: I can address this now or later, but I might as well address it now. In the petition, which was an excellent petition full of great information, very unbiased, there is biodegradability information in the petition, and it is biodegradable. But maybe we should have spoken more about this during discussion yesterday. But this is by far the friendliest option, viable option, that these small growers have, and they have been using this for over 20 years now and producing the best mushrooms in the marketplace.

We don't produce that way. And I'll full admit that. We are large growers. We put our logs in plastic bags. The other options the outdoor growers have, and I have
seen this, are styrofoam plugs, which is a far less -- or they can put their whole outside log in a plastic bag. And this is by far the most environmentally friendly option.

CHAIRMAN DELGADO: Any other questions?

Thank you very much.

MS. BOWMAN: Thank you.

CHAIRMAN DELGADO: Calling Alexis Baden-Mayer, if she is here. And we have a 30-second request -- I'm sorry?

Calling again, Alexis Baden-Mayer.

Please approach.

MS. BADEN-MAYER: I'm Alexis Baden-Mayer; I'm with the Organic Consumers Association. I was typing out my notes on the train, my first train was cancelled, so sorry to be late.

So thank you to the members of the National Organic Standards Board and the representatives of the USDA National Organic Program, and to everyone in the room. It's
really exciting for me to be together with all of you. We are here representing an organic movement that is so needed right now in this time of crisis we are facing, an energy crisis, a food crisis, a climate crisis. The organic movement has the potential to solve all these problems, and we're leading the way.

So thank you for being part of that with me.

Okay, so another thing that is very special about the NOSB and the USDA National Organic Program is this democratic process. You won't find any other policy setting mechanism at the federal level that works like this. So it's kind of like a townhall meeting, and I'm a citizen, and I can just come and participate, and you all are citizens. And you set policy, the USDA looks at the policy and takes all of this input and adopts really good policies. I wish that every part of the federal government worked that way.

So I want to congratulate you all
on the budget increases and say a few words about how you might spend that money. Of course enforcement is a very good area. We support the petitions of the Cornucopia Institute in both dairy and hexane derived additives in infant formula; TAP reviews to help the NSB do their work, that is another good issue, good place to spend money; and I hope you also spend a little bit of your money on promoting yourself within USDA and to Congress. That's what federal agencies do once they get some power and some money, they use that power and money to promote themselves and get more of that.

And organic really is the solution to so many things, so I hope you let everybody at the USDA know what a great example this is for conservation and food safety, and encourage other programs to adopt pieces of the organic program.

All right, now I would just like to list the things that are the biggest threats
that we see to consumer confidence in the
organic industry in general. The first thing,
the NOSB, you guys, it's sort of out of your
control, but the rules for pasture and origin
of livestock. The delay in those rules has
been very damaging, and if those rules are
weak and are substandard to the best examples
out there, that is going to be very damaging
as well.

The other issue is lack of
enforcement of the word organic in the
personal care industry. OCA is spending a lot
of time working on this issue. We are taking
it to court in California. Companies are
using the word organic. They are not
certified organic, and some of their products
even have petroleum-based formulations that
contain carcinogens like 1,4-dioxane. So this
is real bad for the organic movement. You
wouldn't want -- like if this were happening
in food, you wouldn't let it happen because
it's so bad. But we can't let it happen in
personal care either.

And then back to issues that are before the NOSB, the certification of fish farming is probably one that is going to be -- it's very thorny. I know you are not dealing with the whole thing right now. But I kind of wish you would just look at it the way you did hydroponics. It's like, hydroponics, not organic. Farmed fish, not organic. And compare it to what else is out there. We have Alaskan wild salmon; is organic going to be more enticing to the consumer than that? If not, it's probably not a good idea to put something out there that's labeled organic that's not the very best example of food produced in compliance with or in union with a healthy ecosystem. And I guess I'll just stop there. I'll add more written comments to provide detail.

CHAIRMAN DELGADO: Okay, thank you.

Any comments, questions from the board?
Thank you very much.

That concludes the section -- Joe, please.

MEMBER SMILLIE: I'm glad you brought up the personal care issue. I just attended a meeting in New York on personal care, and it is a big issue. Certainly the USDA and NOP has got their hands full, but that word is out there in the personal care industry, and it is grossly, grossly misused. I'm not talking about minor noncompliance. As she said there is some major. And I think sooner or later we are going to have to deal with it as a board, and we should start to look at that issue.

Of course the NOP is probably aware of it, too, and as the lawsuits start flying, it'll be part of our deal, I'm sure, sooner or later to start to take a look at how we are going to approach that because my understanding, and this is what I said at the meeting, and I would love correction if I am
wrong, but USDA governs the use of the word, organic. The USDA NOP at this time is not enforcing the use of that word in the personal care industry, but I think the USDA reserves the right to enforce the use of the word organic in the personal care, health and beauty arena.

If I could get a comment from you if that is possible.

CHAIRMAN DELGADO: Comment, feedback from program?

MS. ROBINSON: Joe, we have issued a statement with regard to certification of non-food items in August of 2005, I believe, the sort of infamous scope statement.

And that is essentially about the only statement that the program has issued up to this point, and that is that if products are wholly comprised of agricultural ingredients they are eligible for certification, and if they meet the standards they may be certified, and then they may be
labeled according to the NOP regulations.

But we do not have standards for personal care products, as you know. So that's about the best that we can do at this point in time. We've had discussions with the Office of Management and Budget, and they asked us are you going to take on Revlon. This was back when we had six people in the office, and we said no. We had one million dollars in the budget. We now have the grand whopping total of $2.65 million in the budget.

Now, I ask you guys this all the time. What do you want us to work on? Aquaculture standards, fish standards, or cosmetics or pet food or pasture or what?

MEMBER SMILLIE: Well, of course; all of the above.

(Laughter.)

MS. ROBINSON: I understand. But that's why we issued the scope statement. At least -- but there are limits to the program's resources.
CHAIRMAN DELGADO: Any other questions from the board?

Well, thank you very much. We have one more presenter. He has promised to take less than a minute. The Chair will allow that. Please proceed.

MR. MESH: I wrote it down, so I don't have to deal with a computer because I feel like yesterday I was discombobulated because of the computer.

So Martin Mesh. I wanted to make sure because I'm not even sure that I said it yesterday, our position was to allow fish meal and fish oil from rendered fish facilities to be utilized as a supplement in the stair-step production method. It has been proposed prior by the aquaculture working group. Or utilize the statutory authority to make wild caught fish renderings and organic livestock feed in an effort to help establish an organic aquaculture industry that will have environmental benefits in that once they
I understand it, consumers I believe will embrace.

I wanted to touch on Katrina and my response to Tracy yesterday about grower groups. My hope has been to be sensitive to the landscape and environment while seeking solution to the grower group dilemma. I have and continue to advocate for separation between grower group certification and the proposed expansion aimed at other sectors like retailers and handlers.

I get concerned when I think about Katrina's comments, although she showed sensitivity to the current dilemma, when she talks about how General Mills utilizes an internal control system in a multibillion dollar company's food safety program, and we start to take that language and where the bar is set, and apply the same thing to group certification, and then expect certifiers to be able to verify that some of the world's poorest farmers, some illiterate, comply with
the standards.

And I fear that we are headed down a road of regulatory compliance burden that will drown producers and possibly certifiers. We say that there can be no scale bias, yet commercial availability is inherently just that in reverse manner as an unintended consequence.

I again request that we focus on solving grower group certification for those most at risk of being left out of the organic marketplace in a manner that actually works not only for consumers, consultants, and companies, but for the organic farmers themselves, those who this type of verification was originally created for.

I find it troubling that the Wisconsin bratwurst and okra growers, farmers and growers, ran out of time and now that I have, too. But I probably support their position on okra.

And then I have to close by saying,
John's comments were articulate, on target, and workable, and he is much more articulate than me, but he hit the nail right on the head. And I hope you guys really heard those comments as far as putting seed burden, you know, stuff on farmers, and the farmers that are least able to comply with an increasing record-keeping burden from the grower perspective.

Thanks for the time.

CHAIRMAN DELGADO: Questions from the board?

Thank you, Marty.

That concludes the section on public comment. I do appreciate everybody's constructive and productive input. I'm sure the members of the board have taken that into account, and I hope that will be reflected during the voting session which is about to start.

And having said that, we'll give the opportunity for the policy and development
MEMBER FLANN: Thank you.

As I reported yesterday, the policy and development committee has two sets of recommendations. The first is three changes in the policy development manual. I will just summarize those changes and then make a motion, and then that will be followed by a summary of the recommendations on the new member guide.

There are three recommendations for changes in the policy development manual. The first was under the mission statement to add "or deletion from" which would then read, "review petition materials for inclusion and/or deletion from the national list of approved and prohibited substances."

The second recommendation is one of strengthening language on communications and on page six of the mission statement essentially it says "communicate with organic
community including contacting public meetings and soliciting taking public comments and provide timely information." "Timely" is a new word. And then adding, "making full use of communication channels."

The third recommendation is instructions on withdrawal of petitions. The vote of the committee was four yes, no zero, abstention zero, and zero absent. Mr. Chairman, I'd like to make a motion that these changes be adopted.

CHAIRMAN DELGADO: Is there a second?

It is moved and seconded to introduce -- accept the changes recommended by the policy committee and incorporate those into the policies and procedures manual.

Discussion? Hugh followed by Dan.

MEMBER KARREMAN: Yesterday, actually maybe, Dan, you want to make it, I was going to refer to Dan's statement yesterday about maybe clarifying what our true
intent was regarding making full use of communication channels is basically making use of all manner of transmission of information. I don't know, Dan, maybe you have something better on that.

CHAIRMAN DELGADO: Dan?

MEMBER GIACOMINI: Thank you. You sort of handled the preamble of what I was going to say, so I'll just move in. I would move to amend the second part of section two to read, "making reasonable use of all communication channels."

CHAIRMAN DELGADO: Barry, do you accept that?

MEMBER FLANN: I accept that.

CHAIRMAN DELGADO: So it is a friendly amendment and it is --

MS. HEINZE: Can you repeat it so I can get it written down?

MEMBER GIACOMINI: Making reasonable use of all communication channels.

CHAIRMAN DELGADO: It is moved and
seconded, to amend the motion to -- let me make that -- to change the last sentence of the second proposal to read, making use of all reasonable use of communication channel, of all communication channels.

Discussion. Kevin?

MEMBER ENGELBERT: Yes, Dan, could you give an example of what you consider reasonable or unreasonable use, and why you think that is a necessary addition?

MEMBER GIACOMINI: I don't know that I can give you an example of reasonable. I can give you an example of the expectations that I can see the public could find in reading that statement two or three years to five years from now, and the burden that it would place on future members.

I think that the burden that that could place in their expectations, in their minds, is a huge burden on already very overworked people.

CHAIRMAN DELGADO: Jeff?
VICE CHAIR MOYER: Dan, I question your use of the word, "all." That's a very encompassing word, and does that put an undue burden on either the board or the program?

MEMBER GIACOMINI: Well, that was to match the use of the word, "full."

VICE CHAIR MOYER: I understand that. In my opinion using the word, "all," sounds like you've got to do it all.

MEMBER GIACOMINI: Full use of communication channels is all of everything.

VICE CHAIR MOYER: My suggestion would be that we keep the word, "reasonable use," take the word, "all," out of communication channels.

MEMBER GIACOMINI: If you want to make that motion that's fine with me.

CHAIRMAN DELGADO: Is that a motion?

VICE CHAIR MOYER: That is my friendly amendment.

CHAIRMAN DELGADO: There is a secondary motion to amend the primary motion.
The previous motion to amend, do you accept that?

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: That is accepted. And as it stands now, I'm not going to move with the voting on that, the motion to amend states as follows: to replace the last sentence on the proposed change to read, "making reasonable use of communication channels," is that correct?

VICE CHAIR MOYER: That is correct.

CHAIRMAN DELGADO: Striking out the word, "all," and that's been accepted by the proponent of the amendment.

We have Hugh followed by Tina.

MEMBER KARREMAN: Yes, the true intent is what we were talking about if I recall that day was making reasonable use of additional and electronic communication channels, available, traditional and electronic communication. That's what our intent was; I think everyone knows that. But
it was to make sure that traditional, like regular mail, that we get, and we read paper, everyone can get that, as well as electronic. It doesn't say we have to tell everybody on Earth; it's just that we don't want to just go to only electronic. That is the main thing we wanted to make sure.

CHAIRMAN DELGADO: We have Tina followed by Dan.

MEMBER ELLOR: Can I maybe temper this to take into account the intent, and maybe suggest another issue.

Maybe because if you take "all" out then you take out the variety of communications which we are trying to get at. Making reasonable use of a variety of communication channels.

And I know from my perspective, our certifier sends things out by mail and computer, because we have a lot of Amish farmers who don't have access to computers, so if we add a variety of communication channels,
maybe we can keep the original intent without being too absolute.

Can I suggest that as a friendly amendment?

CHAIRMAN DELGADO: It is amended, originally proposed by Dan. If that is how you want to proceed.

MEMBER ELLOR: If that is okay.

CHAIRMAN DELGADO: Well, we have to ask the proponent of the amendment. So I would like to ask do you agree with that?

MEMBER GIACOMINI: Could you restate that please?

MEMBER ELLOR: "Making reasonable use of a variety of communication channels." That way it's not -- not that we have to send out carrier pigeons, but we use a variety of communication channels.

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: That is approved, and so now the motion to amend reads, "making reasonable use of a variety of communication
MEMBER KARREMAN: I'll second that.

CHAIRMAN DELGADO: It's been accepted, so no need to second that.

Very well, we'll proceed with the amended motion. And we are at the point of accepting the amendment for the motion to -- amendment to the motion to accept changes one through three, and we are amending the last sentence, point two, of the motion.

MS. HEINZE: I had written down that we ask Barry if we accepted Dan's, so is Dan's a friendly amendment?

CHAIRMAN DELGADO: It was a friendly amendment. But we still have to --

CHAIRMAN DELGADO: We still have to go back and vote on that.

MEMBER ELLOR: Okay.

CHAIRMAN DELGADO: So we will vote on that amendment.

Yes.
MEMBER GIACOMINI: I would just, getting back to Kevin's question, I can just see in the original language of this, getting back to the example I used yesterday, of someone reading that and picking up the phone and calling the member and say, we want you to come to our meeting. Where is your meeting? Well, it's three hours away. I'm sorry I don't have time. Well it says in your bylaws -- it says in your procedure manual that you have to. And I'd just -- I just think the wording is pushing things a little too far.

CHAIRMAN DELGADO: Thanks for the clarification.

We will go on with the voting for the amendment to restate the last sentence of the second point of the motion.

We will start on the far right with Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN DELGADO: And I'll put the question again. The question is on the motion
to amend the last sentence on point two of the motion proposed by the policy and procedures manual as stated on the document dated April 3rd, 2008, to read: "making reasonable use of a variety of communication channels."

And we'll start with the vote with Dr. Karreman.

MEMBER KARREMAN: Yes.

CHAIRMAN DELGADO: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN DELGADO: Jennifer?

MEMBER ENGELBERT: Yes.

CHAIRMAN DELGADO: Steve?

MEMBER HALL: Yes.

CHAIRMAN DELGADO: Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Yes.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Yes.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: Yes.
CHAIRMAN DELGADO: Tina is not present.
Tracy?
MEMBER MIEDEMA: Yes.
CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: Yes.
CHAIRMAN DELGADO: Barry?
MEMBER MIEDEMA: Yes.
CHAIRMAN DELGADO: And the chair says yes.
Now we can proceed then to the discussion on the original motion.
MEMBER GIACOMINI: Mr. Chairman, could you announce the vote for the record please?
CHAIRMAN DELGADO: Thanks for the -- the vote is as follows.
Thirteen yeses, one absent -- two absent, sorry, and the motion to amend is approved.
Moving on then to the original motion which is to accept the changes to the policy and procedures manual, I would like to continue with the discussion and ask the members of the board if there are any other questions. And are you ready for the question?

The question is on the motion to accept the changes as listed by -- summarized and listed by the chair of the policy and procedures manual, including the last change that we discussed.

And we are ready go to vote. We'll start with Kevin?

MEMBER ENGELBERT: Yes.
CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: Yes.
CHAIRMAN DELGADO: Steve.
MEMBER DeMURI: Yes.
CHAIRMAN DELGADO: Julie?
MEMBER WEISMAN: Yes.
CHAIRMAN DELGADO: Dan?
MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Yes.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Yes.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: Yes.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: And Barry?

MEMBER FLANN: Yes.

CHAIRMAN DELGADO: And the chair says yes.

Hugh and the chair says yes.

And the total is 14 yes, 1 absent, and the motion is approved.

Back to you, Barry.

MEMBER FLANN: The second set of
recommendations involves changes to the new member guide. The first recommendation is an addition to chapter five, section B, and it's a descriptive paragraph on linking the final NOSB recommendation table.

And the second recommendation is on suggested best practices, and it gives a list of common technical sources. And the vote of the committee was four in favor, zero nos, zero absent.

CHAIRMAN DELGADO: Very well. Would you like to make a motion?

MEMBER FLANN: I move that these two recommendations of the policy development committee be accepted.

CHAIRMAN DELGADO: Is there a second?

MEMBER KARREMAN: Point of order.

CHAIRMAN DELGADO: Point of order.

MEMBER KARREMAN: The second recommendation wasn't actually read into the record.
CHAIRMAN DELGADO: Good point. Barry, would you please read the second recommendation which is the last paragraph on the statement.

MEMBER FLANN: It says, include a new section of chapter five listing common technical sources used by NOSB members. The proposed section would be located immediately after Section E, and would include the following.

And then there is a list of the common sources.

CHAIRMAN DELGADO: Thank you for that.

Is there a second to the motion?

MEMBER HALL: Second.

CHAIRMAN DELGADO: It is moved and seconded to accept the updates to the new member guide as summarized by the chair of the policy committee.

And we are open to discussion, questions, on the part of the board.
Are we ready for the question?

The question is on the motion to accept updates to the new member guide, as summarized by the chair of the policy committee on the April 3rd document.

And we will start with voting, and this time it will fall to Jennifer.

MEMBER HALL: Yes.
CHAIRMAN DELGADO: Steve.
MEMBER DeMURI: Yes.
CHAIRMAN DELGADO: Julie.
MEMBER WEISMAN: Yes.
CHAIRMAN DELGADO: Dan.
MEMBER GIACOMINI: Yes.
CHAIRMAN DELGADO: Katrina.
MS. HEINZE: Yes.
CHAIRMAN DELGADO: Jeff.
VICE CHAIR MOYER: Yes.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: Yes.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: Yes.
CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: Yes.

CHAIRMAN DELGADO: And Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN DELGADO: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN DELGADO: And the chair votes yes. And correct me if I'm wrong, Madame Secretary, we have yes totals, one absent, and the motion is agreed to.

That -- is that all, Mr. Chairman?

MEMBER FLANN: That's all.

CHAIRMAN DELGADO: Very good, thank you very much. That concludes with the section for the policy development committee.

We are due for a well deserved break at this time, and we are running, according to my estimates, 13 minutes late,
but I think we'll be able to catch up.

So we'll take a 10-minute break.

We will see you here at 10 minutes after the hour.

Thank you.

(Whereupon, the above-entitled matter went off the record at 9:58 a.m. and resumed at 10:21 a.m.)

CHAIRMAN DELGADO: We are back now, and we'll continue with the crops committee.

Does the secretary want to make a comment?

MS. HEINZE: Just a brief comment. I had a request for voting sheets for the rest of the board so those are being passed around in case you would like one.

You will note that there is one line that is a voting item from last November that I neglected to delete, so when you see that don't panic.

CHAIRMAN DELGADO: Very good.

Continuing on with the chair of the
crops committee, Mr. Davis.

JOINT CROPS & COMPLIANCE, ACCREDITATION AND CERTIFICATION COMMITTEE

MEMBER DAVIS: Thank you, Mr. Chair.

The first topic that we are going to cover, again, is the joint crops and compliance accreditation and certification committee, further guidance on commercial availability of organic seed.

We appreciate the many many different public comment inputs from both or several points of view I guess I should say. We had hoped to present some of these new ideas that we added on to the previous guidance as a way of vetting those ideas and getting response from the community.

And we have decided to take those suggestions under advisement, and to defer this item until the fall meeting, and to fully give full credit and credence to the comments that we received.

And Joe Smillie is going to explain
more of that.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: Right.

I just want to summarize the last comment we had when John Foster said that everybody is the room was taking notice of this issue. We've opened the discussion, and that achieves a lot of our purpose. I mean that's what really the main drive of this recommendation has been to bring attention to this area and on all fronts, on everybody's front.

So I think that part of our aim has been achieved already. We will come up with a recommendation for the next meeting in November, and what we'll do is become a kind of an approach of recalculating the distribution fo the burden.

So what we'll do is, we'll go back and look at our calculation of the distribution of the burden and try and make sure that the burden is fairly distributed in
I think we will also rethink and refine our approach to the database which is the other key issue. We have a lot of good input, and we'll look for a bit more on that.

So basically just to anticipate just getting back on our work plan, and getting more engaged in those two areas.

CHAIRMAN DELGADO: Thank you both. I appreciate that you are taking into consideration public comment, and you are right, it is part of the process to do so, and if there is a need to make any changes, to proceed with that.

We are looking forward also to the final version, and the next meeting in the fall.

Any questions from the board for the two chairs?

None? If that's the case, let's move on to the specific topics of the crops committee, and that involves petition
MEMBER DAVIS: For the petition materials, I'd like to start with cheesewax and go alphabetically.

CHAIRMAN DELGADO: Very good.

MEMBER DAVIS: Again, the committee originally voted six yes, zero no to approve this material and put it on the national list, which is that motion is to include microcrystalline cheesewax with specific cast numbers which have been amended since yesterday's presentation, because it was noted that one item was incorrect. And the new one is cast the third one in the line, there, has been corrected from yesterday's presentation.

So including those cast numbers, and add that material on the national list, 205.601, as a production aid in log-grown mushroom culture made without the cheesewax, made without either ethylene copolymer or synthetic colors.

And the CAS numbers again reflect
what our true intent of which materials might be included in various cheesewax products.

These are the only ones that - any cheesewax product used for this purpose could only include these three CAS numbers in their ingredients.

We also received public comment on some of the responses in the documentation section on the evaluation criteria, and several of the - some things have been removed from yesterday. On category one, question one, the answer - the response to that - the answer is still the same, no. We removed a point that was talking about petroleum and whether it's naturally or chemically changed or not, and thought it was not appropriate.

We did not intend as the committee - it was meant as background information, the previous comments that were made, not as a statement about petroleum coming from the committee.

And also category two, similar
statements were removed. I'd like to read that one.

What it reads now is - previously we had said - answered the question yes and no, so we have changed the answer to question one to now say, just yes. The substance is formulated or manufactured by a chemical process.

Petroleum wax is derived from crude oil. The cracking process of crude oil refining is considered synthetic. That's an addition.

Also the part about the ethylene propylene copolymers is still there; that was from the original.

The other addition is also - the last sentence, the formulation of cheesewax listed in petition do not contain this component or any colors but do contain BHT which is a synthetic antioxidant preservative.

The other change is category two, question three. There were some statements in
the documentation section that we removed that were from the petition, again, referring to
the petitioner's thoughts on petroleum and what it is, and we didn't mean to have it show that the committee agreed with their statements; it was not necessary, so we removed it on the documentation section on question three.

The answer now is just no, is the substance created by naturally occurring biological processes. We didn't feel like the statement was really necessary to document that answer.

And that's the last of the changes that we made as a committee. We revoted on this last night, and it still does not change the vote. It's still six yes, zero no.

And I'd like to open it up for any questions or discussion.

CHAIRMAN DELGADO: Would you like to propose a motion?

MEMBER DAVIS: The motion would be
to include this material in the national list as stated in our recommendation.

    MEMBER GIACOMINI: I'll second that motion.

    CHAIRMAN DELGADO: It is moved and seconded to include microcrystalline cheesewax CAS number 6474242380090308 and 8002742 on the national list, section 2005 - 205.6010, as production aid in log-grown mushroom culture made without either ethylene/propylene, copolymer or synthetic colors.

    Discussion? Joe.

    MEMBER SMILLIE: Yes, once again I wasn't part of the committee so I don't have the full range of information that you had. That's a given.

    This is described as a plug. Is it solid when it's put on, or is it sprayed on as a liquid?

    CHAIRMAN DELGADO: Tina.

    MEMBER ELLOR: I can address that.

    It's melted down and painted on.
MEMBER SMILLIE: Painted on?

MEMBER ELLOR: Just over the inoculation point.

CHAIRMAN DELGADO: Any other questions.

MEMBER ELLOR: It does actually work just as a barrier to moisture.

MEMBER SMILLIE: Does it penetrate I guess is the question?

MEMBER ELLOR: No. It's on the outside of the bark. It touches the spawn. But it's a temporary protection from moisture loss.

MEMBER SMILLIE: If I could just have another question.

VICE CHAIR MOYER: I was going to say, it does penetrate enough to adhere to the bark; it doesn't soak into it. But it does - it has to penetrate it a slight amount so it can adhere to it.

MEMBER ELLOR: Yes, when you paint wax on anything.
MEMBER SMILLIE: I guess the second question is more general. With the use of this material, is there a significant difference between organic shitake production this way, and conventional shitake production? Just in general.

MEMBER ELLOR: Yes, there would be. There is a whole laundry list of things people do to prevent insects and slugs and other infestations.

CHAIRMAN DELGADO: Any other questions? Dan.

MEMBER GIACOMINI: With all due respect to Tina and her expertise and the fact that she was looking - she's in the industry. Her company does not do it in this way, and she is reviewing a petition essentially from a competitor.

I really respect everything that you have put together on this, and I fully accept that in the new format as a viable path. I'm just a little uncomfortable that we
Chairman Delgado: Question? Follow up? Tina.

Member Ellor: And I fully understand that. The petition was extensive, and very technical. What I appreciate about it is that these guys didn't try to hide anything. It was - there was no obfuscation. They spelled it all out. They had extensive and really good information. But I certainly can sympathize with that, because it was a very technical petition.

Chairman Delgado: Hugh?

Member Karreman: I mean just generally if we have expertise on the board to interpret reviews we should make full use of that, and I think it's wonderful Tina did that, and I'll try to do that when it comes to medicine and stuff. I think we all should do that in our own areas; that's why we're on the
CHAIRMAN DELGADO: Any other comments?

Gerry.

MEMBER DAVIS: Commenting on that issue, we felt that the detail in the petition was great, and combine that with having a mushroom expert on the committee, we felt that this was something that could perform the – as the program would say, we are the technical advisory panel I guess.

CHAIRMAN DELGADO: Kevin followed by Jeff.

MEMBER ENGELBERT: And we found nothing in our other research to contradict anything that was in the petitioner. Like Tina said, it was thorough and no holds barred.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Yes, I just wanted to add to what Gerry said as well. The petition clearly spelled out all the
alternative products that could be used and what the pros and cons of those were, so it gave us an opportunity to weigh that against this material. And we've heard nothing that would indicate that there is anything else out there from either public comment or written comment that would indicate that petitioner had left something out deliberately or accidentally.

CHAIRMAN DELGADO: Any other questions, comments? Tina?

MEMBER ELLOR: I don't know if this is the appropriate time to do this, but should I recuse myself from this vote?

CHAIRMAN DELGADO: I was about to ask that. If there are no other comments on the part of the board members? Well, then the next question for my part would be if there is any conflict of interest that any of you would like to declare at this point.

Tina.

MEMBER ELLOR: I'm a mushroom geek.
I'm married to a mushroom grower, and I live in the mushroom capital of the world. We don't use this technology at all, so I don't feel like there is a conflict.

CHAIRMAN DELGADO: Any comments from the board members?

Sorry, we have Joe followed by Hugh. Yes.

MEMBER SMILLIE: No, I have no comment.

CHAIRMAN DELGADO: No comment? Hugh.

MEMBER KARREMAN: I think Dan pointed out that Tina is a competitor to this, and you know I just - and she is saying it's okay to go, so I don't see any reason for her to recuse herself.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: The only possible reason might be if you move to this type of production in the future, Tina.

MEMBER ELLOR: And there is really
probably very little possibility of that. But you know what? Just for safety sake I will recuse myself.

CHAIRMAN DELGADO: You will recuse yourself? Thank you for that.

Joe?

MEMBER SMILLIE: Well, I'll make a specific statement and a general statement.

We are a certification agent. We certify hundreds, possibly thousands of people, many of whom, some of whom certainly will use many, almost all of the materials that we are going to discuss today.

So as a general statement I do not feel that I have a conflict of interest in voting on cheesewax. I don't even - I don't know, but I don't think we certify any of these operations.

However, no matter which material is brought up, we will be certifying someone who uses these materials. I don't feel we have a conflict of interest whatsoever, but in
the past there has been some discussion about whether the certification agent has a conflict of interest in voting for the use of these materials.

So I would just put it to this board, I do not feel I have a conflict of interest, but I would ask the board.

CHAIRMAN DELGADO: Board members, do you feel there is a conflict of interest?

(Chorus of Nos.)

CHAIRMAN DELGADO: And the chair coincides.

Any other conflict to declare? Are you ready for the question?

The question that's on the motion to include microcrystalline cheesewax, CAS number 6474242380090308, and 8002742 as listed, to be listed on the national list Section 205.6010, as stated previously before.

And I'll start with the voting with Steve.

MEMBER DeMURI: Yes.
CHAIRMAN DELGADO: Julie.
MEMBER WEISMAN: Yes.
CHAIRMAN DELGADO: Dan.
MEMBER GIACOMINI: Abstain.
CHAIRMAN DELGADO: Katrina.
MS. HEINZE: Yes.
CHAIRMAN DELGADO: Jeff.
VICE CHAIR MOYER: Yes.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: Yes.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: Recused.
CHAIRMAN DELGADO: Tracy.
MEMBER MIEDEMA: Yes.
CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: Yes.
CHAIRMAN DELGADO: Barry.
MEMBER FLANN: Yes.
CHAIRMAN DELGADO: Hugh.
MEMBER KARREMAN: Yes.
CHAIRMAN DELGADO: Kevin.
MEMBER ENDELBERT: Yes.
CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: Yes.

CHAIRMAN DELGADO: And the chair says, yes.

I've asked both our secretary to keep track of the numbers to make sure that I don't get things confused. And the verdict is?

VICE CHAIR MOYER: We have 12 yeses, we have one recusal, and we have one abstention and one absent.

CHAIRMAN DELGADO: The motion is agreed to.

Mr. Davis, back to you.

MS. HEINZE: That would be 11 yeses.

CHAIRMAN DELGADO: We have one again - let's make sure we coincide that.

MS. HEINZE: There's 14 of you.

CHAIRMAN DELGADO: There is 14 of us. We have one absent. Two abstain.

VICE CHAIR MOYER: So we have one recusal, one abstention, one absent, and 12
yeses.

MS. HEINZE: I stand corrected.

MEMBER DAVIS: The next material will be dextrin, and the petition, it was petitioned for dextrin to be used as a binder in seed coatings with placement on the national list to apply to 601(n) as seed preparations.

Now I'll wait for Valerie to put up - there is one very small change to the document since yesterday, two places. Under Section B there, at the first page, Section B, where it says, substance fails criteria category, the comments, the words organic compliant binders have been put in there. Originally it said nonsynthetic starches, and we have chosen a more descriptive and a little broader term in calling them binders, because we with the secrecy around these seed coatings that the seed companies protect with their lives it was not proper to say for sure they are starches; we don't know that for sure.
So we just went to the generic term, binders, instead.

And that is also that same sentence is reflected in category two, question seven, so we changed it there also to say organic compliant binders rather than nonsynthetic starches.

And that's the only change. The committee revoted on that this morning, and the vote actually changes because there were six of us present, so the committee vote now stands at zero yes, six no, zero absent.

CHAIRMAN DELGADO: Would you like to make a motion?

MEMBER DAVIS: I move that we vote on this on whether to grant this petition or not. I'm unfamiliar with the wording I should use.

CHAIRMAN DELGADO: Why don't you read the petition as it is in the - so you move to -

MEMBER DAVIS: The motion is to
accept dextrin to be used as a binder in seed coatings with placement on the national list, section 205.601(n) as seed preparations.

CHAIRMAN DELGADO: Is there a second?

MEMBER ENGELBERT: I'll second.

CHAIRMAN DELGADO: It is moved and seconded to add dextrin to be used as a binder in seed coatings with placement on the national list, Section 205.601(n) as seed preparations.

Discussion? Questions from the board?

Hearing none, are there any conflicts of interest to declare?

None. Are you ready for the question?

Julie?

MEMBER WEISMAN: No.

CHAIRMAN DELGADO: I'm asking if you have any comments? You have no comments.

I'll put the question. The
question is on the motion to accept dextrin to
be used as a binder in seed coatings with
placement on the national list, Section
205.601(n) as seed preparation.

And we will start with the vote,
and this time, Julie.

MEMBER WEISMAN: No.
CHAIRMAN DELGADO: Dan.
MEMBER GIACOMINI: No.
CHAIRMAN DELGADO: Katrina.
MS. HEINZE: No.
CHAIRMAN DELGADO: Jeff.
VICE CHAIR MOYER: No.
CHAIRMAN DELGADO: Gerry?
MEMBER DAVIS: No.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: No.
CHAIRMAN DELGADO: Tracy.
MEMBER MIEDEMA: No.
CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: No.
CHAIRMAN DELGADO: Barry.
MEMBER FLANN: No.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: No.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: No.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: No.

CHAIRMAN DELGADO: And the chair says no.

Sorry, Steve.

MEMBER DeMURI: No.

CHAIRMAN DELGADO: I have to change my symbols.

In the meantime, Mr. Vice Chair, can you please tell us?

VICE CHAIR MOYER: The vote is 14 nos, one absent.

CHAIRMAN DELGADO: The motion to list dextrin to be used as a binder in seed coatings and listed in Section 205.601(n) is not approved, is lost.

Back to you, Mr. Davis.
MEMBER DAVIS: Our last petition material is tetracycline, specifically oxy-tetracycline hydrochloride. There has been written comment and verbal comment from the petition requesting to change the motion, change the request or petition. So we have changed the wording from yesterday's presentation. We have dropped the reference to, for use in peaches and nectarines, by their request, the petitioner's request, and have changed it to "petitioner is to add tetracycline, oxy-tetracycline, hydrochloride for fire blight control only on the national list 205.601(I)," I believe -- is that "I" or "j"? It's "I", okay.

I wanted to read the -- can you move that up a bit so I can see it?

The committee originally voted as we explained yesterday to - voted no, and - but there has been additional wording added to clarify some of the - our position and some of the - and also reflecting changing the peaches
and nectarine part of it. So I'll read those.

  The substance still fails category two and three. The material only marginally satisfies criteria number one. It fails criteria number two, since other organically compliant disease control options exist. Herein apple growers exporting to Europe, where antibiotics are not allowed, are already achieving some measure of fire blight control without the material.

  It also fails criteria number three on compatibility with public perception that antibiotics are not used in organic production, and on consistency within the NOP regulations that do not allow antibiotic use in any other section of the rule.

  The committee views this incompatibility and inconsistency with organic farming principles as potentially damaging to the reputation of the organic label overall.

  It is the intention of the committee to recommend allowing tetracycline
and streptomycin to sunset for the national list in October of 2012. Adding this form of tetracycline to the list at this time would be counterproductive to that goal by extending this date even later than that October - the 2012 date.

As part of the petitioner's written comment to remove the peaches and nectarine crops from their petition, they also stated that they were willing to accept rather than adding their particular form of this material, to the list for a full five years they were willing to accept that it be coincided with the existing tetracycline calcium form that is already on the list that will sunset in 2012. They stated that they are willing to let their material be added and coincided with that expiration date.

The original TAP that was done for the oxy-tetracycline calcium material that is already on the list does cover oxy-tetracycline hydrochlorite in it. It touches
on it, explains it as a related compound, explains that the EPA considers - regulates them the same, considers them as similar compounds, and so we noted that, and that's why we felt that a new TAP was not needed for this material.

And I'm saying this in response to several public comments that said, you know, a TAP was necessary for this particular material, because it has a separate CAS number. We just wanted to point out that the original TAP for the calcium form of the material does include the hydrochloride in several references.

But the committee agreed this morning in discussing this new development from the petitioner, their written statement, because of the complexity of the issue and the situation we felt it would be improper to proceed forward with a vote on this material until we can take it back to review this new information, mainly regarding their change in
what their petition is.

It was significant enough in what they are proposing that we want to review it as new information, and we are going to defer this material to the fall meeting.

CHAIRMAN DELGADO: Very good. Any questions from the board? Joe.

MEMBER SMILLIE: That's good. I think that that is a wise decision. I don't know, do we have the power - once we grant it, doesn't it get the full five years? Do we have the ability to say, we can add this to our current material?

CHAIRMAN DELGADO: Yes, we do have the authority to add a notation specifying the expiration dates and the intent like expressed before.

Hugh?

MEMBER KARREMAN: I agree, it's very good that you are going to defer this. And I would say, it really leaves us in a quandary. But to avoid the extension of sunsetting
time, maybe the committee should consider the listing of the oxy-tetracycline calcium and remove that calcium part of that, so it's just oxy-tetracycline so this petitioner is not so you can get to where he wants to be to just be included in the sunset time of the existing oxy-tetracycline calcium, but if you take the calcium word out of that, then you know it would still sunset in three years or whatever it was since -

MEMBER DAVIS: I think that probably would require a petition though to make that correction on the calcium form, if I understand the regulations correctly.

CHAIRMAN DELGADO: We have comments from Katrina.

MS. HEINZE: I agree with Hugh, and was going to build on that to encourage you to perhaps get some perspective from the program on what our options within the regulation might be -

MEMBER DAVIS: For what aspect of
this?

MS. HEINZE: All the aspects. I am troubled by having a listing that is a competitive disadvantage for a company, but yet do not want to do something that ends up extending the use of the antibiotics. I think it is complicated enough that maybe getting some help on how we could accomplish those two goals, which today seems seemingly at odds, might be helpful.

MEMBER DAVIS: Right, and believe me, we did consult with the program staff extensively over the last 24 hours about this, in response to the new developments. But we felt it was inappropriate to vote on this until we sort this out a little better.

MS. HEINZE: I agree. It will take everyone some more time to think about it.

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: And I concur. It's a wise idea to defer that if the time is needed to think about it.
Back to you again, Mr. Davis, you still have items which sunset?

MEMBER DAVIS: The next materials item is the reaffirmation of the sunset 2008 materials. Excuse me a minute.

As explained yesterday this is to reaffirm that we analyzed the public comment that came in after the vote at the November 2007 NOSB meeting. And we analyzed that information, and felt that it did not change the status of the vote on any of these materials.

So I move that we accept this recommendation.

CHAIRMAN DELGADO: Can you just state that more clearly? You are moving to accept this document as proof of reaffirmation of the voting; is that the case?

MEMBER DAVIS: That is the case.

CHAIRMAN DELGADO: Okay, do we have a second?

VICE CHAIR MOYER: I'll second that
motion.

CHAIRMAN DELGADO: It is moved and seconded to accept a document presented by the chair of the crops committee as reaffirmation of the decisions taken in the fall meeting of 2007 with regards to the materials listed in the document.

Discussion?

MEMBER KARREMAN: I guess I wasn't keeping up on these particular materials, I apologize. But why is there a reaffirmation of something?

MEMBER DAVIS: Because of an ANPR that was announced and public comment period that was put out by the program concerning these materials. I don't fully understand how it came in after the meeting, so I can't really explain that.

CHAIRMAN DELGADO: We have - Julie, can you clarify the point?

MEMBER WEISMAN: Yes, because we have handling materials that are in the same
situation. There was an inconsistency in how the sunset of these materials were originally publicized, and so at the time that we came to the meeting people - there was no public comment because they had not been publicized in the way the community is used to looking for them.

And for good order's sake although we did get public comments at the meeting on all of these materials, but for good order's sake - an ANPR that was put out in the more consistent format was published in the Federal Register, I think in late December, and the comment period closed in January.

So it was important to reaffirm the votes at the fall meeting in light of public comment that was received subsequently, and certainly in your case, and we'll get to mine later, the handling later, in the case of the crops material there was no public comment that contradicted or was anything contrary to what the board had already decided.
CHAIRMAN DELGADO: Right. And thank you Julie for explaining that. I didn't feel like I could articulate that; you did a much better job. Thank you.

Hugh, you have a follow up question?

Kevin?

MEMBER ENGELBERT: Yes, you'd be going through these items one by one, Gerry?

MEMBER DAVIS: To list, to state them? No, perhaps I should read them all as a group for the public record.

The motion is to reaffirm that the public comment received after the original November, 2007 vote on these materials, did nothing to change -

CHAIRMAN DELGADO: Excuse me, you are just clarifying your motion? You just made one. Please, read those materials. You already read the motion. Point of order, please.

MS. HEINZE: I believe my
understanding is - someone more expert than I will have to clarify - that if we change - right, we can't change the wording of the motion, right?

So -

CHAIRMAN DELGADO: Let's go -

MS. HEINZE: And I don't actually have the wording of the original motion.

(Laughter.)

CHAIRMAN DELGADO: That's a good point.

MS. HEINZE: So my recommendation would be that we take a sec to think about what the wording should be. Then he could offer a friendly change if his second accepts it; then we're fine, we can proceed. But let's make sure we get the wording right, and if you could go very slowly so I can type it, thank you.

CHAIRMAN DELGADO: You hit the nail on the head. We do need to amend that motion, and I believe that is coming now, Mr. Davis.
There is clarification from our parliamentarian, in-house parliamentarian.

MEMBER GIACOMINI: Yes, just a question to the program. Since this is sort of a facilitation of your paperwork, do you want each individual item in the motion, or just a reference to the items that were petitioned and voted on at meeting X, or sunsetted, voted for sunset on meeting X?

CHAIRMAN DELGADO: Kevin, go ahead.

MEMBER ENGELBERT: And the reason being is that these items were anonymously approved at the last meeting, so we need to know if that needs to be clarified with votes now, or whether we can still just blanketly do this procedure without listing each of these individually and doing a revote is basically what we are trying to figure out.

CHAIRMAN DELGADO: Just to clarify, this is a reaffirmation. The committee is coming back to us saying that the public comment did not warrant any substantial
1 changes, so there shouldn't be any changes to
2 the ultimate vote. And that is what the whole
3 purpose of this is.
4
5 The program has a comment, though?
6
7 Do we need - the question was, do we need to
8 itemize the list of -
9
10 MR. MATTHEWS: No. What you are
11 simply doing is that you are saying, as Gerald
12 has already said, is that in light of
13 additional comments that came in we have
14 determined that there is no change to the
15 voting from last November, and the voting
16 stands.
17
18 CHAIRMAN DELGADO: And just to make
19 it clear, we'll ask the chair to restate that
20 motion and I know we are suspending some of
21 the traditional rules. I apologize to the
22 parliamentarian. But we need clarification,
23 and if you list the names then we'll have the
24 second accept that motion.
25
26 MEMBER DAVIS: The motion is to
27 reaffirm that in light of public comment
received after the November, 2007 sunset voting on these five materials, that the public comment does not warrant any changes in the original vote from the November, 2007.

CHAIRMAN DELGADO: And can you list the materials, please?

MEMBER DAVIS: The materials are copper sulfate; ozone gas; peracetic acid; EPA list three inerts for us in passive pheromone dispensers; and calcium chloride.

CHAIRMAN DELGADO: And it was seconded by -

VICE CHAIR MOYER: I'll second that motion.

CHAIRMAN DELGADO: You second? It is moved and seconded to reaffirm the votes for copper sulfate - I'm not going to read it as stated.

MS. HEINZE: It is to reaffirm that in light of public comment received after November 7, November of 2007 voting on these five materials public comment does not warrant
- and I lost it after that - a review of the votes.

    CHAIRMAN DELGADO: Does not warrant a review of the votes; is that right? A change in the votes?

    MS. HEINZE: Now we all know how fast I type, so when you do your motions bear that in mind, please.

    CHAIRMAN DELGADO: So in summarizing once again, it's reaffirmation for these five materials as previously mentioned by the chair, and confirmed by the secretary.

Questions? Discussion on the part of the board?

    Ready for the question?

    Mr. Matthews.

    MR. MATTHEWS: I have good news. This won't happen again next time, because the 2011 ANPR is already out and the comments have already been received, so we won't have this confusion the next go round.

    CHAIRMAN DELGADO: That is in the
record.

I'll put the question. The question is on the motion to accept the reaffirmation as stated by the chair for the materials, and I won't read the whole motion, I'll just mentioned the materials: copper sulfate; ozone gas; peracetic acid; EPA listed inerts, calcium chloride would be listed and sections 205.601, and for the case of calcium chloride, 205.602, and the vote is not changed.

And I'll start by taking the vote from Dan.

MEMBER GIACOMINI: Yes.
CHAIRMAN DELGADO: Katrina.
MS. HEINZE: Yes.
CHAIRMAN DELGADO: Jeff.
VICE CHAIR MOYER: Yes.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: Yes.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: Yes.
CHAIRMAN DELGADO: Tracy.
MEMBER MIEDEMA: Yes.
CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: Yes.
CHAIRMAN DELGADO: Barry.
MEMBER FLANN: More than a yes or no, I was not a member at the time of the original vote, and I abstained in committee, so I planned to abstain on this vote, but the way the motion is worded it leaves me a little bit in doubt.

But I'll abstain.

CHAIRMAN DELGADO: Yes, it is the proper way. You abstain. Kevin - Hugh, sorry.

MEMBER KARREMAN: Yes.
CHAIRMAN DELGADO: Kevin.
MEMBER ENGELBERT: Yes.
CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: Yes.
CHAIRMAN DELGADO: Steve.
MEMBER DeMURI: Yes.
CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: And the chair says yes.

Mr. Vice Chair.

VICE CHAIR MOYER: We have 13 yeses, one abstention, and one absent.

CHAIRMAN DELGADO: The motion is approved. And we are back to you, Mr. Davis.

JOINT CROPS & LIVESTOCK COMMITTEE

MEMBER DAVIS: The next item is a joint crops and livestock committee item on aquatic plants.

MEMBER WEISMAN: Rigo, could you address my question I brought up to you?

CHAIRMAN DELGADO: The question you brought up?

MEMBER WEISMAN: Regarding the committee deferring on tetracycline.

CHAIRMAN DELGADO: Clarification on deferrals, we do not need to vote on whether to defer a material. It is considered, the
question still, at the committee level and it is committee, so we do not need to vote on it. It has not been brought forward to the board.

Any other questions in that respect? Okay, you may proceed, Mr. Davis.

MEMBER DAVIS: With that presentation will be the crops vice chair, Jeff Moyer.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Thank you, Mr. Davis.

In regards to the aquatic aquaculture - I mean aquatic plants, in organic aquaculture, our proposal is to move forward with the document as read. I'm hoping I don't have to read it in its entirety. It is quite lengthy.

But the title is, recommendation to provide clarity to the issue of farmed aquatic plants in organic aquaculture, April 4th, 2008, with intention to provide clarity.

Again in summation, we are saying
that farmed aquatic plants need to follow all
the rules and regulations in the rule Section
205.200 up to and including 205.207, with the
exceptions as listed here, and I'll make note
to those.

In Section A, aquatic plants may be
grown in closed containment, organic systems
provided. We listed one, two, three and four
specific areas as we talked about it
yesterday.

Under item four we have two other
classifications, mainly talking about water
discharge standards.

Item five talks about manure made
from terrestrial animals and the composting
process.

And then Section B talks about
aquatic plants grown in open water systems.
One word change that we might want to consider
as a board, and it would have to be made as an
amendment I believe, from the floor yesterday
the comment came I believe that what we should
do is change the wording that says that, comma, manure from terrestrial animals, to include manure or compost. That was mentioned from the floor.

Other than that after further discussion the committee's recommendation stands as presented yesterday.

CHAIRMAN DELGADO: Are you making a motion? And if so are you actually including that change?

VICE CHAIR MOYER: I turn it back over to the chair to make that motion.

MEMBER DAVIS: I would offer a friendly amendment.

CHAIRMAN DELGADO: You have to state a motion first. You can motion to accept this document with the changes that he proposed.

MEMBER DAVIS: Okay, I move that we accept this document with the one change being that in Section 5B, and number one, that manure or compost from terrestrial - wow, I'm stuck.
MEMBER GIACOMINI: In any form, I am comfortable with the language in the document. We have it in the historical record, in the transcript of this meeting. The full intent is manure and composted manure. Does anyone in the program imagine that that would cause a problem in the future, that somebody will be putting compost in the ocean? No comment?

CHAIRMAN DELGADO: No comment. So you are saying you would be comfortable if we do not mess with - so back to you, Gerry. Perhaps you want to abstain from including that change?

MEMBER DAVIS: Yes, I'll abstain.

CHAIRMAN DELGADO: Very good. So we have a comment from Tina?

MEMBER ELLOR: I would actually like to see that change, and I am willing to motion that.

CHAIRMAN DELGADO: In that case you will have a motion to amend, and we should go back to the chair to state the motion. We do
not have a motion yet. That's what I'm looking for.

MEMBER ELLOR: Okay.

CHAIRMAN DELGADO: So Gerry?

MEMBER DAVIS: Gene has helped me clarify a good way to do it.

The sentence, I move that the document be voted on as it stands with one change that in that section five - no it's not section five, excuse me, it's Section B, item number one, excuse me, the sentence should read that manure or composted manure from terrestrial animals in any form may not be used to fertilize open water aquatic plants.

CHAIRMAN DELGADO: is there a second?

VICE CHAIR MOYER: I will second that motion.

CHAIRMAN DELGADO: It is moved and seconded to set the recommendation on farm aquatic plants in organic aquaculture as summarized by the chair. The document is a
result of a Joint Crops & Livestock Committees
and it is dated April 4, 2008.

Questions from the board. Julie?

MEMBER WEISMAN: I would like to
hear Tina's concerns that led her to want that
compost added.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: I spend a lot of time
going around to school children talking about
mushrooms and mushroom compost, and they say,
don't those things grow on poop. I think that
manure and compost are different, and some
people do interpret it that way. So I'd
rather have them both listed there.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: I have no
disagreements with the document the way it is.

But I really am very uncomfortable with the B
section, because it seems to imply - it
implies to me that the only thing preventing
you from doing aquatic plants in the open
water in organic systems other than the rule
as it now says is this well worded point.

I think there are many other points. I don't think it's an inclusive document of all the conditions that should be there and beyond the regulation that we are currently working with.

And I believe that there are ocean organic aquatic systems that need a lot more guidance than simply you can't put manure in.

And again the examples I used yesterday aren't covered in this. Nori farming is a reality. I'm sure there are others that I'm not as familiar with.

But it's just not inclusive enough, and thereby it could imply that all you got to do is follow the reg as it exists, which is a terrestrial reg, and follow that rule and you are good to go. And I believe that there are a lot of other factors.

We have addressed those factors in the wild harvest section of the rule. The mapping, contamination, the - and so for wild
harvested aquatic plants I think we've got an adequate reg.

For organic aquaculture systems for aquatic plants I don't believe this is adequate. There is nothing wrong with it, but I don't think it's adequate, and hence it can lead to a misconception that that's all there is, and that's my - that's why I'm uncomfortable with this document.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Yes, I think the committee understands and sympathizes with your concerns, because they were concerns that were voiced at the committee.

At this particular time we are considering this document a living dynamic document which can be amended and added to in the future as particular issues come to bear.

We were trying to address most specifically issues related to closed containment systems because those are at the forefront of what seems to be happening aside
from the few cases you mentioned.

The committee also felt fairly strongly that the sections 200 through 207 of the terrestrial code was a good start from which to build on, and we were mainly addressing the newer issues which in a - even in the containment system which in an open water system really are not an issue.

I do think there are other things that we could possibly consider down the road as those issues come up, and we are prepared to do that.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: With regard to Joe's concern, since this is I believe the only section of the recommendation that even makes any reference to open water aquatic systems, would it address Joe's what I think are very valid concerns, which is basically there is a whole standard for open water that has not been clarified.

Could this recommendation be
restated to apply to aquatic plants in closed containment organic aquaculture? And then leave this last B off?

CHAIRMAN DELGADO: You do have the option to amend, place a motion to amend by striking. But we want to hear from Jeff.

VICE CHAIR MOYER: As part of the committee that pulled that together, I would be reluctant to strike it completely mainly from the fact that it detracts from the position that we recognize this as a situation that either is occurring or could occur, and that we want to document here specifically at least for the manure and compost to say that that is not allowed in open water.

Open water could entail possibly rivers; it's not necessarily just oceans, but somewhere where water is moving continuously through the system, we want to make sure that nobody feels that they are allowed to apply manure or compost. This is really, when you read the document carefully, it's mainly about
manure and compost throughout the process, and it would be handled differently in the open water. We do not want any open water applications, or perception that we are thinking it could allow that in open waters.

CHAIRMAN DELGADO: Is that clear? Julie?

MEMBER WEISMAN: Okay, so alternate to what I said could we add some language to be that acknowledges that there is not a complete standard written yet, but that such a standard has to include this language, something like that.

CHAIRMAN DELGADO: Would you like to make a motion for that?

MEMBER WEISMAN: I need help with the wording.

CHAIRMAN DELGADO: Dan might come in for help.

MEMBER GIACOMINI: Well, I just would like to go back to what Jeff just said. This is a recommendation. It goes on the
program's docket for work. It's unlikely that it will reach the top of that pile on someone's desk before we have a chance to deal with that next issue.

And is it necessary, since it's not a complete section, is it necessary to put it in? Because it doesn't become regulation until they put it into the reg.

CHAIRMAN DELGADO: Joe, followed by Julie.

MEMBER SMILLIE: I recognize that reality, and I would think that if you can buy me off by putting it on your work plan to further develop the open water portions of this.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: And I would be more comfortable if there was some way to make clear that this statement should not be interpreted as an allowance or an acknowledgment that - I guess I would like to hear from my fellow board members whether they
feel that this statement, they feel that this statement the way it exists now could be misinterpreted as the - what - the only criteria that has to be met by ocean water aquiculture.

CHAIRMAN DELGADO: Okay, any comments to Julie? In that respect, Kevin?

MEMBER ENGELBERT: The concerns that were raised were ones that I had in committee, but was convinced that we could go forward. But as I think more, I'm not sure but what we should simply drop B, or state that there are further rules for open water aquatic plants forthcoming.

I'm still - becoming more and more uncomfortable with this listing now.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: But if you read up, it's not the only stipulation. There are still all of the 205.200 - 00205.207, so you know, all of that is included as well, right?

CHAIRMAN DELGADO: Jeff?
VICE CHAIR MOYER: Yes, that's correct, Tina. We drug all of the terrestrial requirements, everyone of them in their entirety, into this document, but we wanted to make certain that there is a distinction between closed containment systems and open water systems in their ability to use compost and manure as a fertilizer substance, because that is allowed in the terrestrial system.

And we wanted to clarify that, and distinguish those areas, mainly because these aquatic plant production systems are moving forward. We do not want them to use - dissolve mineral fertilizers. I mean compost is the best way to fertilize these ponds, and we want to give those folks as quickly as possible the opportunity to do that.

Now I have no idea, we haven't discussed with the program, how fast this rulemaking, or this recommendation will surface to the top of their respective piles, but we didn't want to be holding back the
ability for people to fertilize ponds using composted terrestrial manures, and at the same
time we wanted to make sure that if they did use those composted terrestrial manures, that through the harvesting process it did not give them the ability, much like what happens with some of the conventional operations, it gives them the opportunity to flush their systems into the existing waterway.

So we are trying to head off at the pass some environmental issues that could take place rather shortly. Open water systems are different, and so manure is the big issue that we are dealing with in this particular regulation. There are no other real things that - in an effort to buy off Joe, we will go back and look at those other things.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: So is it the fact that I just was not aware that these concerns are addressed in other parts of the rule as Katrina mentioned, is that what I'm hearing?
I mean, I'm sorry, Tina.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: I personally believe that that is correct, that those things are covered. If you look at even the containment systems there are - may be other issues that come up in the future that aren't covered in this document. But we think we have covered our bases, because they are covered in the terrestrial system.

CHAIRMAN DELGADO: Any other questions? Kevin?

MEMBER ENGELBERT: For the board's benefit, let me read 205.207, which is included in this recommendation, wild crop harvesting practice standard.

A, wild crop that is intended to be sold, labeled, or represented as organic must be harvested from a designated area that has had no prohibited substances set forth in 205.105 applied to it for a period of three years immediately preceding the harvesting of
the wild crop.

B, a wild crop must be harvested in a manner that ensures that such harvesting or gathering will not be destructive to the environment, and will sustain the growth and production of the wild crop.

So we think that covers it.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: It's section 200 through 207, not just 207.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: Again, I'm satisfied if we continue to work on them, I really am. And I think we can get a task force together - that's the wrong word - a working group together to help us with this with some experts and put some language in place.

207 is specific to wild crops; that's what it says, and that's what it means, wild crops. We are not talking about wild crops.
CHAIRMAN DELGADO: Any other questions? Jeff?

VICE CHAIR MOYER: The point we're making, if you look at the statement we made under 205.258 we said that you have to include all of those rules into a farm system as well. I mean I think that's the way we intended this to read.

So even though it refers to wild crops here we are dragging that into the aquatic rule as well, and those stipulations would through that statement then apply to all of the farmed aquatic species as well, whether they are open water or closed containment, which would mean ponds, raceways, streams, rivers - we tried to cover every body of water we could.

CHAIRMAN DELGADO: Any other questions? Gerry?

MEMBER DAVIS: Joe, on the problem phrase that you were struggling with, would it help in your mind if it were worded
differently, such as manure or composted manure from terrestrial animals may not be used to fertilize open water aquatic plants, and leave out that part where it starts with, aquatic plants may be grown in open water organic systems provided that. Does that make it seem less like we've left out all the other parts, and all we are addressing is the manure and composted manure?

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: It does. I think that from that particular point of view, it does help.

MEMBER DAVIS: It becomes less - you take away the title, then it just deals with manure and compost. Again, I'm more than happy as long as we pursue this topic and add some more detail to it.

CHAIRMAN DELGADO: Gerry, do you want to make a motion?

MEMBER DAVIS: Yes, I'd like to - is
that a motion or an amendment?

CHAIRMAN DELGADO: You would have to make a motion to amend.

MS. HEINZE: Wait, wait.

CHAIRMAN DELGADO: We have a correction here. Are you ready?

MS. HEINZE: Yes.

MEMBER DAVIS: I would like to move that we amend the wording in section B1 - actually that we would strike the line that is titled item B, aquatic plants may be grown in open water organic systems provided that, we would strike all of that, and the new line delineated as number B would read: Manure from terrestrial animals - excuse me, manure or composted manure from terrestrial animals may not be used to fertilize open water aquatic plants.

CHAIRMAN DELGADO: Okay, you made the original motion, and we would like to hear from the second, do you agree with that?

VICE CHAIR MOYER: I do not accept
that motion.

CHAIRMAN DELGADO: Okay, we need a second to that amendment.

MEMBER GIACOMINI: Before a second, Gerald, would you consider on that motion renaming that double I rather than B?

VICE CHAIR MOYER: That won't work.

That will not work.

CHAIRMAN DELGADO: Let's wait for a report from Gerry, and then we will proceed with clarifications.

The motion is stated.

MEMBER DAVIS: The motion is to change the wording to read for item B to be, manure or composted manure from terrestrial animals may not be used to fertilize open water aquatic plants.

CHAIRMAN DELGADO: That's your motion.

Do we have a second for that?

MEMBER FLANN: I'll second.

CHAIRMAN DELGADO: There is a
second. Okay, it is moved and seconded to amend by striking point B of the recommendation on farmed aquatic plants in organic aquaculture and replace that with, manure or composted manure from terrestrial animals may not be used to fertilize open water aquatic plants.

That will replace point B.

Discussion? Jeff, followed by Dan and then Julie.

VICE CHAIR MOYER: Yes, the reason I wouldn't accept that motion, if you look at what Point A is, it specifically talks about plants grown in closed containment system. And if you get rid of B, then you no longer have a separate category for open water systems which is a category that I feel we need to retain.

We also need to retain it in the format that it is. If you want to change the sentence so that it opens the door for possibilities of more numbers to come under
there, I'm all in favor of that. That door remains open as well for closed containment systems.

Again, this document was designed or written to discuss manure and compost applications in these systems. And if there are other pieces of information that need to be included in the exceptions as listed in either closed containment systems or open water systems I would like to see provisions left open for that to be done.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: Clarification of Gerry's motion. As Rigo read it, I'm not sure how Katrina typed it, did you intend to delete "in any form"?

MEMBER DAVIS: Yes.

MEMBER GIACOMINI: You deleted "in any form."

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: Katrina?

MS. HEINZE: I don't believe in your
original motion you deleted "in any form."

CHAIRMAN DELGADO: The amendment.

MS. HEINZE: Yes, way back at the beginning. Didn't we just add composted manure? I don't think we deleted "in any form."

CHAIRMAN DELGADO: In the motion that he's making now.

MS. HEINZE: Right, so my question is, are we rewording it now to get rid of "in any form?" Or was that the intention?

CHAIRMAN DELGADO: The open question, he just did it, that is the intention. But thank you for that clarification.

Julie.

MEMBER WEISMAN: To Jeff's concerns, if instead of striking B, we added some additional wording at the beginning. What I'm thinking of is, to the extent that aquatic plants may be grown in open water organic systems, and then strike "provided that."
Strike the "that" in - or, then manure, et cetera, et cetera, et cetera.

CHAIRMAN DELGADO: Hang on to that thought. We are discussing this motion to amend, and we might come back to your suggestion.

Barry.

MEMBER FLANN: A point of clarification, since I seconded it. I thought the motion to amend was to place that language as a new B. I didn't know we were eliminating B.

CHAIRMAN DELGADO: That is correct.

MEMBER FLANN: So I was a little confused by Jeff's comment. Because I certainly think that B ought to be retained to separate it from A.

CHAIRMAN DELGADO: That is correct.

Just to clarify the motion was to amend by striking the language that we have on point B at the moment and replace that with manure and composted manure and continue throughout that
That would become B, and one would disappear. That will be the clarification.

Jeff.

VICE CHAIR MOYER: But essentially through that language change you have eliminated the whole concept of open water systems. And if you look at A, we specifically discuss closed containment systems. And then when you jump to B, you change the language to an entirely - you talking about manure, it makes absolutely no sense that way, and you lose the whole train of thought, in my opinion, regarding open water systems versus closed systems which are the two predominant systems that at least this committee was aware of and that we were discussing in terms of bodies of water.

They were either closed so that they were managed specifically by humans for the production of food. You have complete control over what comes in and what goes out,
and that's why we said you have to have berms around them and other things. We specifically put that in on the closed containment system.

On an open water system, you have very little control about stream bank, river frontage if you had some kind of plants growing in a river, we wanted to make sure that you included that as well.

And by making the change that is now being suggested or being discussed you lose all of that language, and I don't support that.

CHAIRMAN DELGADO: Comments? Dan.

MEMBER GIACOMINI: We're talking about Gerald's amendment, and on that issue I agree with Jeff's point. But I agree with the direction that Julie is trying to make with her amendment. So I oppose Gerald's and I will support the presentation of Julie's amendment at the completion of that.

CHAIRMAN DELGADO: Very good. And my understanding is that it is a completely
different motion from what we are considering at the moment, so we will study that after we call the question.

Are we ready for the previous question?

VICE CHAIR MOYER: Can you - you can have an unfriendly amendment to an amendment, can you not? Or a friendly amendment to an amendment?

MEMBER GIACOMINI: It's too radical.

VICE CHAIR MOYER: It's too radical?

CHAIRMAN DELGADO: Yes, completely different.

Any other questions?

Let's proceed with voting. The question is on the motion to amend by striking the language in point B, and replace that with manure or composted manure from terrestrial animals may not be used to fertilize open water aquatic plants.

And we'll take the vote starting with Katrina.
MS. HEINZE: No.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: No.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: No.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: No.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: No.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: No.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: Abstain.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: No.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: No.

CHAIRMAN DELGADO: Julie.
MEMBER WEISMAN: No.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: No.

CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: Eleven nos, two yeses, and one abstention and one absent.

CHAIRMAN DELGADO: The motion to amend by striking is lost.

We go back to appending motion, Julie.

MEMBER WEISMAN: I move that we amend the recommendation on farmed aquatic plants and organic agriculture, dated April 4th, 2008, by adding after letter B the words, to the extent that, striking the word that from the end of that phrase.

And striking the "that" that appears before the number one.

So I will read how the two sentences would appear.

B, to the extent that aquatic
plants may be grown in open water organic systems, and manure and composted manure from terrestrial animals in any form may not be used to fertilize open water aquatic plants.

MEMBER FLANN: Second.

CHAIRMAN DELGADO: Right. It is moved and seconded to amend by including the words "to the extent that" on point B, first part of the sentence; strike "that" after the word provided for the same point B. Strike "provided that", stand corrected.

So that - and there it is - that sentence will read: To the extent that aquatic plants may be grown in open water organic systems provided - strike - and it will - and on point B1 the word "that" is struck.

Discussion? Jeff.

VICE CHAIR MOYER: I like it.

(Laughter.)

CHAIRMAN DELGADO: Other questions?

Joe? No.

MEMBER SMILLIE: I was just going to
call the question.

CHAIRMAN DELGADO: Joe, second, Julie. Are we ready for the question?

The question is on the motion to amend by adding the words "to the extent that" to sentence point B.

MEMBER ELLOR: Point of order.

CHAIRMAN DELGADO: Point of order.

MEMBER ELLOR: Isn't this a friendly amendment?

CHAIRMAN DELGADO: I forgot. No, it's not a friendly amendment, because - it was -

(Off-mike comments.)

CHAIRMAN DELGADO: Right, it was a friendly amendment; we did not need a second. I stand corrected. We have one. We can proceed.

I'll put the question once again. The question is on the motion to insert the words, "to the extent that" before the start of sentence on point B, and striking out the
words, "provided that," point B will lead to
the extent that aquatic plants may be grown in
open water organic systems and strike the
word, that, from point B1.

Ready to vote, and we'll start with
Jeff.

VICE CHAIR MOYER: Yes.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: Yes.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: Yes.
CHAIRMAN DELGADO: Tracy.
MEMBER MIEDEMA: Yes.
CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: Yes.
CHAIRMAN DELGADO: Barry.
MEMBER FLANN: Yes.
CHAIRMAN DELGADO: Hugh.
MEMBER KARREMAN: Yes.
CHAIRMAN DELGADO: Kevin.
MEMBER ENGELBERT: Yes.
CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: Yes.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: Yes.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Yes.

CHAIRMAN DELGADO: And the chair says yes.

MEMBER ELLOR: I just have - I'm confused. I am not a parliamentarian. Do we have to vote on friendly amendments?

CHAIRMAN DELGADO: Yes, we do.

MEMBER ELLOR: We do? Okay.

VICE CHAIR MOYER: The vote was 14 yes, one abstention - I'm sorry, one absent.

CHAIRMAN DELGADO: The motion is approved. And we move now to the - back to the discussion on the actual recommendation on farmed aquatic plants in organic agriculture.
Are there any questions prior to the vote?

Ready for the question. The question is on the motion to accept the recommendation of farmed aquatic plants in organic agriculture as stated with the changes, and with the date, April 4th, 2008, and with today's - and including today's amendments.

We will start our vote with Gerry.

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: Yes.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: Yes.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: Yes.
CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: Yes.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: Yes.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Yes.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Yes.

CHAIRMAN DELGADO: And the chair votes yes.

VICE CHAIR MOYER: The vote is 14 yes, one absent.

CHAIRMAN DELGADO: The motion is agreed to.

Does that conclude your presentation for both crops and livestock committee?

Good, we can move on then to the
livestock committee, and Dr. Karreman.

LIVESTOCK COMMITTEE

MEMBER KARREMAN: Okay, thanks, Rigo.

The livestock committee was considered a petition for the inclusion of Fenbendazole on the national list at 205.603A18, parasiticides. And the - we didn't receive any unfavorable comments. And we are recommending that the inclusion of Fenbendazole on the national list at 205.603 parasiticides with the annotation as shown in C and the proposed annotation will help meet the criteria in A.

It is, I'll read the annotation: only to be used on written diagnosis of clinical infestation by a veterinarian. Prohibited in slaughter stock, allowed in emergency treatment for dairy and breeder stock when organic system plan approved preventive management does not prevent infestation.
Milk or milk products from a treated animal cannot be labeled as provided for in subpart D of this part for 90 days following treatment.

In breeder stock, treatment cannot occur during the last third of gestation if the progeny will be sold as organic, and must not be used during the lactation period of breeding stock.

So we - oh, we had a committee meeting last night, a short one, to discuss some things. And one of the things was that at the program Richard Matthews wanted the proposed annotation to precede - or no, he thought it was redundant I believe to a degree, and place it higher up on the list of 205.603.

We decided to not change our annotation at all, and recommend it as petitioned, as shown, as posted, as publicly commented on, and allow the program to do what it feels is needed for the annotation for the
intent of the annotation and deal with it as they get it.

CHAIRMAN DELGADO: Would you like to make a motion?

MEMBER KARREMAN: Yes, I would make a motion that the master organic standards board include Fenbendazole on the national list at 205.603 item A18 parasiticides.

MEMBER ENGELBERT: I'll second.

CHAIRMAN DELGADO: It is moved and seconded to include Fenbendazole in the national list section 205.603 parasiticides, with - I should clarify, with the amendment that has been read by the chair, is that correct? With the annotation, I'm sorry. Okay, discussion. Kevin.

MEMBER ENGELBERT: Just for the board members' knowledge, we saw no harm in having that annotation remain with - in its position that we are recommending. It's a very critical issue, and a lot of times farmers in their haste will simply go and look
up a material. And we didn't see any harm in keeping that annotation right with it. But the program can adjust as they deem necessary.

CHAIRMAN DELGADO: Any other questions? Julie?

MEMBER WEISMAN: Just because I'm not sure if - if we pass - if we pass a material with an annotation can the program - and actually I'm looking across the room, I don't know who can answer the question right now, but I'm curious, is there a precedent for that?

CHAIRMAN DELGADO: That the program what?

MEMBER WEISMAN: Will - well, I know that they can remove or alter annotations, but they can't add anything to the heading of the section in the rule without - they can?

CHAIRMAN DELGADO: No, they can't. They are supposed to interpret, and nobody is there - they are supposed to interpret our intent with the proposals.
Sorry, Hugh, you had a comment?

MEMBER KARREMAN: Yes, if they want to alter an annotation they certainly can do that with the medicines that were released on December 12th, 2007. That certainly occurred.

I don't think it hindered what the board's intent was for those medicines. I don't think they would do that with this, because there is precedent already with Ivermectin. So anyway.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: I think there's a number of ways they could handle this, Julie. There's - this is the identical, except for the slight addition of veterinarian script, is the identical annotation with Ivermectin. They - it may be that they may put the annotation on the parasiticides, and put this as A and B. Or they may in working with us we may find on our work plan an input from the program to deal with this reorganization item.

CHAIRMAN DELGADO: Any other
questions? Gerry.

MEMBER DAVIS: Hugh, what is from your point of view the intended way of dropping Ivermectin from the list after this one is officially on?

MEMBER KARREMAN: Well, the official way would be to have a petition from the public. It could be anyone. And I would ask that that petition wait until actually Fenbendazole is in the Federal Register, because we don't know how long that may take.

But the full intent - and I will be off the board by the time probably Fenbendazole comes in, and I would personally petition Ivermectin to come off at that point.

But anyone can do that.

MEMBER DAVIS: That was my - would you expect that someone will do that?

MEMBER KARREMAN: Oh yes.

MEMBER DAVIS: They're motivated to do it?

MEMBER KARREMAN: Absolutely.
CHAIRMAN DELGADO: Dan?

MEMBER GIACOMINI: And that's the same depending on how the program proceeds with Moxidectin.

The intent of the committee I believe is to have only one on there. We just want the right one.

CHAIRMAN DELGADO: Any other questions? Are you ready for the question? The question is on the motion to include Fenbendazole on the national list Section 205.603, with the annotation that has been read.

We'll start the voting with Tina.

MEMBER ELLOR: Yes.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: Yes.

MEMBER KARREMAN: Hugh.
CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: Yes.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: Yes.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: Yes.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Yes.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Yes.

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: And the chair says yes.

VICE CHAIR MOYER: The vote is 14 yeses, one absent.

CHAIRMAN DELGADO: The motion is agreed to.

Let's move on then to the next
material, Mr. Chairman.

MEMBER KARREMAN: Okay, the next material is the - you will see there are two methionine recommendations that the committee came up with.

The first one of course is the action the petitioner's request, which is, the petition was for removal of the annotation date of October 1st, 2008, for synthetic methionine on the national list.

And we felt that the substance failed criteria in category two and three, and in our comments there the committee wrote, rations that supply adequate naturally occurring methionine appear to exist, especially if poultry have true access to the outdoors.

Management practices are preferred to off-farm inputs in organic agriculture. Synthetic methionine is used primarily to increase growth rates in production, not only to maintain health.
And so the petitioner's request to remove the annotation date of October 1st, 2008, failed by a vote of five opposed to that and none in favor, and two were absent.

And the reason for the rejection at the committee level was exactly the same as the reason it failed category two and three.

So I guess we need to actually vote on that recommendation as it stands.

We do have a second one after we vote or have discussion.

CHAIRMAN DELGADO: That is correct.

So would you like to make a motion?

MEMBER KARREMAN: Oh, I'm sorry, yes.

The motion would be to remove the annotation date of October 1st, 2008, for synthetic methionine on the national list.

MEMBER ELLOR: Second.

CHAIRMAN DELGADO: It is moved and seconded to remove the annotation, the date of October 1st, 2008 for synthetic methionine on
the national list Section 205.603.

Discussion.

MEMBER GIACOMINI: I support the motion. I think we heard enough comment that would raise in question the - some of the language we are putting in on B, and if the language in B were completely true we would have a very hard time justifying the next motion coming back up of putting it on.

I think the statement of rations that supply adequate natural protein, naturally occurring methionine appear to exist would greatly deviate from the testimony that we have heard.

There is a lot of work to go in that direction, but the reason we are putting methionine and keeping it on, or voting to keep it on the list or considering that, is because of the testimony that says it's not.

MEMBER KARREMAN: That's the next recommendation.

MEMBER GIACOMINI: But I'm saying
that when you - like I say I support the motion but when we rework this document, when we go to submit this document the justification that we are putting in B I do not believe is accurate and would need to be a little reworked.

MEMBER KARREMAN: That can be done. Would you have a suggestion right now? Is any part of B accurate?

CHAIRMAN DELGADO: You don't have to do it now. Just take the comments. These are materials that you presented as backup for your motion and recommendations.

Kevin.

MEMBER ENGELBERT: You said you support the motion, Dan. The motion is to remove the annotation date so that it stays on the list.

MEMBER GIACOMINI: No, I support the recommendation from the committee. I just want the document to be correct.

MEMBER ENGELBERT: I just wanted to
be clear.

MEMBER GIACOMINI: Thank you.

CHAIRMAN DELGADO: Any other questions?

From the director.

MS. FRANCIS: I just wanted to offer to Dan that you can write additional narrative. But this was your committee recommendation at the time. You're not modifying this in your narrative or your final, you can address that.

CHAIRMAN DELGADO: Thank you for that clarification.

Any other questions? Hugh.

MEMBER KARREMAN: Just be very clear about how voting goes on this recommendation, what a vote means.

CHAIRMAN DELGADO: Okay, ready for the question?

Before that I would like to ask if there is any conflict of interest on the part of the board members, conflicts of interest to
declare?

(No response.)

CHAIRMAN DELGADO: Hearing none -
yes? Tina.

MEMBER ELLOR: Hugh, would you mind
just going over what the votes mean.

CHAIRMAN DELGADO: I will do that.

Any other questions in that
respect?

MEMBER ENGELBERT: As a livestock
producer there may be a conflict of interest.
I don't see one, but I guess I'll put that up
for the board's discretion.

CHAIRMAN DELGADO: Concerns from the
board?

MEMBER MIEDEMA: No.

CHAIRMAN DELGADO: None whatsoever,
Good. Okay, any other questions on the
conflict of interest, clarification on the
voting?

Ready for the question. The
question is on the petition to remove the
annotation date of October 1st, 2008, for synthetic methionine on the national list Section 205.603. I must clarify that the committee voted no. It was rejected and the question now is for us to decide.

Your vote for yes will be to remove the annotation. A vote of no will be to reject the petition.

Is that clear?

We'll start with the vote, and it's Tracy's turn.

MEMBER MIEDEMA: No.
CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: No.
CHAIRMAN DELGADO: Barry.
MEMBER FLANN: No.
CHAIRMAN DELGADO: Hugh
MEMBER KARREMAN: No.
CHAIRMAN DELGADO: Kevin.
MEMBER ENGELBERT: No.
CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: No.
CHAIRMAN DELGADO: Steve.
MEMBER DeMURI: No.
CHAIRMAN DELGADO: Julie.
MEMBER WEISMAN: No.
CHAIRMAN DELGADO: Dan.
MEMBER GIACOMINI: No.
CHAIRMAN DELGADO: Katrina.
MS. HEINZE: No.
CHAIRMAN DELGADO: Jeff.
VICE CHAIR MOYER: No.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: No.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: No.
CHAIRMAN DELGADO: And the chair says no.

VICE CHAIR MOYER: Mr. Chairman, that is 14 nos, one absent.

CHAIRMAN DELGADO: Okay. The motion to remove the annotation of October 1st, 2008, for synthetic methionine as stated on the national list, Section 205.603 is lost.
Back to you Dr. Karreman.

MEMBER KARREMAN: All right, so that means right now that - right now methionine will be coming off October 1st, 2008.

CHAIRMAN DELGADO: That is correct.

MEMBER KARREMAN: That is what that means, just so the board knows that, okay.

However, the livestock committee right away saw that that is not a practical plan at all and we then came forth with the next recommendation we'll be voting on that the - let's see, how do I state this - sorry - well, that the committee recommends that the annotation for synthetic methionine on the national list be October 1st, 2010.

That's pretty much straight up the recommendation.

CHAIRMAN DELGADO: Can you state that once more.

MEMBER KARREMAN: Okay. The livestock committee - I make a motion that the - okay, the livestock committee - I want to
make a motion that the expiration date for synthetic methionine be October 1st, 2010.

CHAIRMAN DELGADO: Second?

MEMBER ENGELBERT: I'll second.

CHAIRMAN DELGADO: It is moved and seconded to add an expiration date of October 1st, 2010, for synthetic methionine as listed on Section 205.603.

Discussion? Joe?

MEMBER SMILLIE: Yes, I'm not sure if it's friendly, I don't think it's radical, but I'd like to offer a motion to amend it to a three-year or make it 2011.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: What are my choices? Yes or no?

CHAIRMAN DELGADO: Do you agree with that amendment? Do you accept that?

MEMBER KARREMAN: No, I do not agree to that.

CHAIRMAN DELGADO: Okay, so it is not a friendly amendment. Do you want to
proceed with a motion to extend.

MEMBER SMILLIE: I would like to move that we adopt it with - same motion but adopt it for 2011.

CHAIRMAN DELGADO: A second?

VOICE: I'll second.

CHAIRMAN DELGADO: There's a second.

It is moved and seconded to amend the motion to extend the date to 2011.

Discussion on that motion to amend?

Hugh?

MEMBER KARREMAN: I think the reason we - we talked about this last night in our committee meeting, two or three years. And we feel as a committee, and I think it was a unanimous vote if I remember correctly, that a two-year expiration date from October, 2010, really gives a strong signal to the poultry industry that the National Organic Standards Board is very firm in wanting to stimulate alternatives to synthetic methionine to come into practice.
We felt that a three-year date - there's been a third three-year extension or whatever expiration on methionine - well, let me back up a second.

On the two year, they also presented a very nice 24-month plan of their testing and what not. Granted, all the results may not be tabulated at that point or anything. But with some of the public comment regarding the high methionine corn and the Neptune Industry's insects, and the fermentation based methionine, natural methionine, we felt that it would get more stimulus to have that come in line.

Now, the other - have the alternatives come in line - one other reason we didn't go for a three-year is because the composition of this board will have changed dramatically enough that we want a lot of the same people on this board to see how their progress is coming in two years instead of having a whole lot of more new people on the
board in three years seeing it as a fresh problem.

I hate to say it that way, but we took that into account.

Now we also are - we would - we are also thinking about possibly as I mentioned yesterday a potential cap on perhaps perpetual synthetic methionine to be allowed for poultry but at a much reduced rate to help stimulate the natural alternatives that are being worked on.

That is not for this recommendation, but that played into our two-year expiration date versus the three.

Does that all help you?

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Yes, Joe, I just kind of wanted to second what Hugh was saying, make sure it was clear that the makeup of the livestock committee wants to track this over time, because there is some feeling among certain committee members that we may never
get away from some allowed limit of synthetic methionine.

But we didn't want it to continue too far down the road before we make that decision, and so we felt by giving ourselves two years there would not be this reeducation of whatever new committee members may be seated at that time on what that was, and we don't want to keep perpetuating the system where we continually give expiration dates of three years, two years, five years, or whatever it may be, and add confusion to a system.

So by tracking this over the next two years this committee felt like they'd have a much better opinion given the industry of us on where that project and program was heading and how we may vote at that time or present a petition at that time.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: As a member of the livestock committee I completely agree
with Hugh and Jeff on this.

This is part of the - along with some of the materials that they presented that I'm willing to go on this as having been the writer of the minority opinion. And I think it's this kind of a statement that lets this industry know really how short of a leash they are on this in the minds of the livestock committee.

We - I know personally I do not expect another recommendation for methionine to come out with some pretty good caps on use, and it's not part of the motion or anything else but I really expect some timely updates at all future meetings between now and the expiration date of this recommendation to be hearing from the poultry group on how this is progressing.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: Who that's currently on the livestock committee will be here in two years? Most of you?
CHAIRMAN DELGADO: Joe, followed by Kevin.

MEMBER SMILLIE: I respect the wisdom of the livestock committee and seek to withdraw my motion.

CHAIRMAN DELGADO: The second was Steve?

MEMBER DeMURI: I accept that.

CHAIRMAN DELGADO: You accept? Okay, the motion is withdraw, and we are back to the original question. He has accepted - the second has accepted the withdrawal of the motion.

So we are back to the original motion which is the year 2010. We have Kevin to comment.

MEMBER ENGELBERT: Mission accomplished. I don't need to comment.

CHAIRMAN DELGADO: Mission accomplished? Katrina?

MS. HEINZE: This is actually for
the methionine working group.

You committed yesterday to come back and give us reports at every one of our meetings. And certainly you have heard today how much we expect that.

After the conversation yesterday about my mother's chickens --

(Laughter.)

-- which I've got lots of nice hallway chatter about, so thank you, I know you said something yesterday that I'd like to challenge you on. You said that as processors it's up to us to know what the consumers expect, not you.

And I would challenge that. Your consumers are your customers. And you probably should know and do know what they expect.

I would like to see when you come back six months from now what you think outdoor access should look like; don't wait for us to tell you. Have that be part of your
solution on methionine. Tell us what your consumers expect for that, because I think it can be part of the solution. So I'm looking forward to hearing what you have to say on that.

CHAIRMAN DELGADO: Okay, that was a proactive call.

Dan, if you can stay focused on the pending question I would appreciate it.

Any other questions related to the motion?

Hearing none, are we ready for the question?

Joe? Okay, you're getting ready to vote. I'll put the question.

The question is on the motion to add an expiration date of October 1st, 2010 for synthetic methionine as listed in Section 205.603.

And we'll start the vote with Joe.

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: Barry.
MEMBER FLANN: Yes.
CHAIRMAN DELGADO: Hugh.
MEMBER KARREMAN: Yes.
CHAIRMAN DELGADO: Kevin.
MEMBER ENGELBERT: Yes.
CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: Yes.
CHAIRMAN DELGADO: Steve.
MEMBER DeMURI: Yes.
CHAIRMAN DELGADO: Julie.
MEMBER WEISMAN: Yes.
CHAIRMAN DELGADO: Dan.
MEMBER GIACOMINI: Yes.
CHAIRMAN DELGADO: Katrina.
MS. HEINZE: Yes.
CHAIRMAN DELGADO: Jeff.
VICE CHAIR MOYER: Yes.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: Yes.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: Yes.
CHAIRMAN DELGADO: Tracy.
MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: And the chair says yes.

VICE CHAIR MOYER: Mr. Chairman, the vote is 14 yeses and one absent.

CHAIRMAN DELGADO: The motion is agreed to.

Back to Dr. Karreman, are you done with petition materials?

MEMBER KARREMAN: I think we are done for now.

CHAIRMAN DELGADO: Very good. At this point we are scheduled to have a lunch break, a well deserved one. I appreciate your hard work, unless there is a correction?

We will resume here at exactly 1:00 o'clock, and I will ask the board members to be prompt.

(Whereupon, the above entitled matter went off the record at 12:09 p.m. and resumed at 1:11 p.m.)

CHAIRMAN DELGADO: All right, we are
ready to resume our meeting. Thank you.

So continuing with our agenda, we are back to Dr. Karreman to discuss aquaculture.

MEMBER KARREMAN: Aquaculture, well, we have had a recommendation which is posted on the screen, and I don't have it on my laptop right here.

So our recommendation to be honest, we are -- because of public comment and what the program has said about wild caught being a possible item that's in play, we will be deferring any action on this item, and we will be working diligently with the aquaculture working group over the next bunch of months to come up with a new recommendation.

There was a lot of public comment wondering about the foreign certified type deal that we thought was our only kind of possible attempt at getting it started. But the wild caught is certainly something that we want to look into. And perhaps a phase down
on that, step down over whatever, 10 year
time, that's somewhat mentioned, I think, in
the minority report.

So if it's okay with the board we
will defer on that action item unfortunately
until we have a better recommendation.

CHAIRMAN DELGADO: Just to clarify
that's an item still committed to Livestock
Committee, and if that is your direction it is
acceptable.

MEMBER KARREMAN: Thank you.

CHAIRMAN DELGADO: Any questions
from the board members?

Hearing none, Joe.

MEMBER SMILLIE: Well, just adding
to that, I think that was a little unfortunate
that that all happened, and that we need to
always follow the line that whatever we think
is the best way to do it is the way we should
do it, and if the program has trouble with
that I'm sure they'll tell us.

But getting too much information
sometimes at the beginning can be a bit of a problem.

CHAIRMAN DELGADO: Any other questions? Hugh?

MEMBER KARREMAN: What do you mean by getting too much information?

MEMBER SMILLIE: Well, getting indications that the way we're headed won't be acceptable, you know, we should head the way - - always head the way we think is the right way to head.

MEMBER KARREMAN: And if I may just add in, I think we have discussed this. I had quite a lot of phone calls with the AWG, and among the Livestock Committee. And we are very aware of a lot of the issues.

And it's going to still take some real work, but I think we are kind of like riding the wave on it, and we'll be able to blend in some of the new information we got at this meeting.

CHAIRMAN DELGADO: Very good. Jeff.
VICE CHAIR MOYER: Just a comment in reference to what Joe said.

I think the Livestock Committee, while it took in all accounts of information, there were many people on the committee that still feel that we were and are heading in the right direction. So I don't want to wish the committee to be portrayed as not having done what you said.

There is new information coming to us. We are going to reevaluate that against what we have currently on the table as a proposal.

CHAIRMAN DELGADO: Jeff, are you done?

VICE CHAIR MOYER: I am.

CHAIRMAN DELGADO: Point of order, please, let's concentrate on this.

Jeff is done. Someone else? Hugh? Do you want to respond to that?

MEMBER KARREMAN: I guess I just -- well, I just want to also talk -- can I talk
about net pens for a minute?

CHAIRMAN DELGADO: Are there any questions related to fish meal?

MEMBER KARREMAN: Fish meal and fish oil?

CHAIRMAN DELGADO: Fish feed. None. Okay. Then we can move on to the next topic.

MEMBER KARREMAN: Okay, and then it was only posted as a discussion item for the meeting, not an action item, on the net pens. But, again, we are going to work with the aquaculture working group, George and Sebastian are sitting out there, and they are very involved with this.

Regarding net pens as well as bivalves and molluscs, and we hope to have their input and have some alternatives given to us to choose from so we can juggle and balance things as we sit here on the board that we need to do.

Well, anyway -- oh, and the net pens, the items specifically were on siting of
net pens, one of the items, as well as the 
nutrient management, manure buildup potential 
was a second big item. And there might be 
more, but they are the two main ones that I 
think were stickers from when it came up 
before.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Just to add to 
that, Hugh, there were a few other items. We 
had disease management. We had escapes. And 
those were the other two that make that up.

MEMBER KARREMAN: Thanks.

MEMBER GIACOMINI: Not questions but 
just sort of one more follow up. The major 
features of the bivalve document are the 
things that we are working on in the net pens 
document. And it -- we are hoping that we 
will be able to come together with those two 
items in a document at the next meeting and it 
won't be always one more meeting.

CHAIRMAN DELGADO: Hugh?
MEMBER KARREMAN: And one other thing that we need to verify as a board I guess as we go ahead is -- and I'm not sure if we got that already from the program here or not, if it's on a transcript, but whether or not, or whether they will move forward with what we already have passed to get the aquaculture industry already going for the catfish and the tilapia and the shrimp that are already possible to be organically aquacultured.

We hope as a committee, and perhaps as a board, that the program will start that and not wait until the whole package is done. That's our hope.

CHAIRMAN DELGADO: Any questions?

Okay, on that note.

MEMBER KARREMAN: That's it.

CHAIRMAN DELGADO: Does that conclude your presentation?

Thank you very much. At that point then we can move on to the Handling Committee,
and Ms. Weisman.

HANDLING COMMITTEE

MEMBER WEISMAN: I believe what we are scheduled to do is lead off with the petition materials, all of which are 606 items. And although we presented them in groups yesterday having to do with the petitioner, I don't see a reason why we can't just go through them in the alphabetical order that they are on our agendas for the purposes of voting, and I think it will make it less confusing for us to keep track of, so we'll do it that way.

CHAIRMAN DELGADO: Very good. Just to clarify, the part of the petition materials, 205.605, two are listed in the agenda, and those have been deferred.

MEMBER WEISMAN: You're right, okay, so we do have to speak to those.

CHAIRMAN DELGADO: Sodium chlorite acidified was one of them.

MEMBER WEISMAN: Right, okay, there
were -- yes, there were two petitioned items that were on the agenda for this meeting. I actually -- I'm not in the part of the agenda that has them listed so if I make a mistake somebody correct me.

But they were sodium chlorite acidified, and we could not move forward with that. It was a late entry, and the TAP could not be completed and received in time that we felt was necessary for us to evaluate this petition. So that is deferred to the fall meeting.

And also calcium from seaweed also had some complicated issues that we felt we needed additional time to consider and get more information about.

CHAIRMAN DELGADO: Very good.

Any questions on those materials? Dan?

MEMBER GIACOMINI: Not to dispute what Julie said, but I don't want it perceived that the board or the committee saw sodium
chlorite as a late addition to us. It was just in the timeframe of the meeting and the availability of the technical review that it was not able to be completed before we were needing to make a recommendation for this meeting.

CHAIRMAN DELGADO: Very good. Any other comments?

Okay. Back to you, Ms. Weisman.

MEMBER WEISMAN: Okay. So on that note I think that we are now clear to move ahead to the petition materials for Section 205.606. The first material that we are looking at is listed as alcohol, cooking wines, specifically marsala cooking wine.

This is an item as everyone heard yesterday, it was presented, a lot of detail was given about how it's used, about the efforts that the petitioner is going through to elicit organic forms of this material to be produced. We were satisfied that it is not commercially available as organic and that
it's needed for the use that the petitioner wants it and that it's appropriate for listing. We voted at the committee level unanimously for listing. So --

CHAIRMAN DELGADO: Would you like to make a motion?

MEMBER WEISMAN: Yes, I move that --

for the inclusion of fortified cooking wine, marsala, on the national list, Section 205.606.

MEMBER MIEDEMA: Second.

CHAIRMAN DELGADO: It is moved and second for the inclusion of fortified cooking wine, marsala, on the national list, Section 205.606.

Debate? Questions? Are we ready for the question?

The question is on the motion to include fortified cooking wine, marsala, on the national list, Section 205.606.

And we will start with -- in fact before we proceed with voting I would like to
call the board members to see if there is any
potential conflict of interest to declare?

Hearing none, I will -- yes.

MS. HEINZE: This is our Handling
Committee ritual. I work for a large handling
company who may or may not use some of the
materials that are before us.

With one exception, which would be
okra, I don't think that that poses a conflict
of interest. Clearly on okra I will be
recusing myself.

CHAIRMAN DELGADO: Very good.

Board members, any concerns,
questions, regarding potential conflict of
interest on the part of Katrina?

MEMBER GIACOMINI: On this one and
the next one in my household we do do a lot of
-- have wine with our cooking, and sometimes
we do put it in the food.

CHAIRMAN DELGADO: Are you bragging
or stating a conflict of interest? Going back
to Katrina, there is no reason to state
potential conflict of interest at this point.

I haven't heard any from any other member.

So we will proceed. I will restate, put the question forward. And it is for the inclusion of -- the motion to include fortified cooking wine, marsala, on the national list, Section 205.606, and we'll start the vote with Barry.

MEMBER FLANN: Yes.

CHAIRMAN DELGADO: Hugh?

MEMBER KARREMAN: Yes.

CHAIRMAN DELGADO: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN DELGADO: Jennifer?

MEMBER HALL: Yes.

CHAIRMAN DELGADO: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN DELGADO: Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: Katrina?
MS. HEINZE: Yes.

CHAIRMAN DELGADO: Jeff?

VICE CHAIR MOYER: Yes.

CHAIRMAN DELGADO: Gerry?

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN DELGADO: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: And the chair votes yes.

VICE CHAIR MOYER: Mr. Chairman, the vote is 14 yes, 1 absent.

CHAIRMAN DELGADO: The motion is agreed to. We can proceed to the next material.

MEMBER WEISMAN: Okay, the next material is fortified cooking wine, sherry. It is the same petitioner, and the same wealth of information was provided in that petition.
We felt that it met all of the applicable criteria, and it -- this material also was voted unanimously by the Handling Committee to list.

So I move for the inclusion of fortified cooking wine, sherry, on Section 205.606 of the national list.

MEMBER MIEDEMA: Second.

CHAIRMAN DELGADO: It is moved and seconded to include fortified cooking wine, sherry, on the national list, Section 205.606.

Questions? Hearing none, are there any conflicts of interest to declare?

All right, ready for the question.

The question is on the motion to include fortified cooking wine, sherry, on the national list, Section 205.606, and we'll start our vote with Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN DELGADO: Kevin?

MEMBER ENGELBERT: Yes.

CHAIRMAN DELGADO: Jennifer?
MEMBER HALL: Yes.

CHAIRMAN DELGADO: Steve?

MEMBER DeMURI: Yes.

CHAIRMAN DELGADO: Julie?

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: Dan?

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: Katrina?

MS. HEINZE: Yes.

CHAIRMAN DELGADO: Jeff?

VICE CHAIR MOYER: Yes.

CHAIRMAN DELGADO: Gerry?

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: Tina?

MEMBER ELLOR: Yes.

CHAIRMAN DELGADO: Tracy?

MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe?

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: Barry?

MEMBER FLANN: Yes.

CHAIRMAN DELGADO: And the chair
votes yes.

VICE CHAIR MOYER: Mr. Chairman, the vote is 14 yes, one absent.

CHAIRMAN DELGADO: The motion is agreed to.

We can move forward.

MEMBER WEISMAN: Okay. The next item is one of -- I'm losing track of exactly how many there were. I think there were 14 materials that were all petitioned by the same petitioner.

So I'll kind of go through the general idea once, and then I will just present pertinent details that may apply to only certain ones as they come up and my fellow Handling Committee members can feel free to point out if I'm omitting something important.

This next material is Camu Camu powdered extract. And it is an extract that was made from juicing and straining berries of the Camu Camu bush, which only grows in
Brazil. It's concentrated, and then spray dried onto organic kasava starch.

And the problem -- the criteria that this -- the important criteria that this material failed was in the area of commercial supply, and like most of the other materials that were petitioned by this petitioner, there was found to be organic forms of Camu Camu, and the petition, although they said in a boilerplate statement that they have a procurement department that is continuously searching for organic forms of the materials that they need, there was no acknowledgment of the existence of this material which was readily discoverable by those on the Handling Committee that were evaluating it.

So we did not feel that this petition could move forward because it doesn't even acknowledge the existence of an organic form, and so it failed 5-0 with one abstention at the Handling Committee level.

So in keeping a consistent form,
not to confuse everyone, the motion is for inclusion of non-organically produced -- is for the inclusion of Camu Camu powdered extract on Section 205.606 of the national list.

CHAIRMAN DELGADO: You move, the second?

MEMBER DAVIS: Second.

CHAIRMAN DELGADO: It is moved and seconded for the inclusion of non-organically produced Camu Camu extract on the national list, Section 205.606.

Discussion? Dan, followed by Gerry.

MEMBER GIACOMINI: Well, Gerry, maybe I'll be feeding it right back to you. You did additional work, fairly extensive, it sounds like, on this substance, calling the groups in Brazil. Could you sort of -- you had something where you found that it was available, but I thought you said something about not available by this group or
Could you clarify that again? We have a little bit -- we have a bunch of petitions by this group. And they're all -- we would like a more complete better petition from all of them. But it seems like we may have a little more information on this one than the others.

MEMBER DAVIS: Right, and you're right, I was going to bring up those points. As Julie mentioned this was from -- the petition is from a petitioner that sent in a lot of petitions, and the remainder of them used kind of a boilerplate method of saying our procurement department is seeking supplies of this and can't find any dah dah dah like that.

On this one they did not actually say that. Yes, on this -- this is the only one that I saw that they did not. They stated that there was no, and never has been any organically available -- organically produced
Camu Camu berry extract.

    In checking on that with the Brazilian certification agency that I check with, their first response by email was, well, yes, we do have Camu Camu berry extract -- well, he said Camu Camu berry certified as organic. Upon further checking and actually speaking with someone there, they checked into it further, and what they described was, we have a fruit juice drink that contains Camu Camu berry that I was led to believe it was fresh processed; it was not a dried and powdered extract like the petitioner described. It was included in their juice mix, but not derived from extract necessarily.

    And the certifying agent went on to say that he did checking and there is -- his statement was, there is currently no Camu Camu berry powdered extract available for export that he knows of in working with his group of certification. So I don't think this one is as clearcut as some of the others, and it
deserves a little closer consideration.

CHAIRMAN DELGADO: Questions?

Katrina?

MS. HEINZE: It's worth noting that this is a wild harvest material. The rest are not. So that's one of the differences and what does make this one a little more complicated than the others.

CHAIRMAN DELGADO: Any other questions?

Kevin?

MEMBER ENGELBERT: Has this changed the committee's position then? Have you revoted, or are you sticking with your original recommendation?

MEMBER DAVIS: My own personal vote? Is that appropriate?

CHAIRMAN DELGADO: It is appropriate if you are asking directly --

MEMBER ENGELBERT: No, I was asking the committee in general, whether you re-address the issue as a committee.
MEMBER WEISMAN: We did not meet following yesterday's presentation to address this issue, although I'm hearing it a little differently than I have heard it up until now, me, personally. But no, in answer to Kevin's question, we did not meet to revote this material since it was presented yesterday.

CHAIRMAN DELGADO: The question is, are you expecting to change the recommendation, the motion; is that correct, Kevin?

MEMBER WEISMAN: The motion's the same.

MEMBER ENGELBERT: The motion's the same. I just wondered whether they had re-addressed it and left their motion the same.

CHAIRMAN DELGADO: Okay, thank you for that then.

MEMBER WEISMAN: I have a clarifying question from a procedural point of view. Is it -- every member of the Handling Committee has the option, if they want, of voting
differently now than we did, okay, so I'm wondering then therefore is Kevin asking the members of the Handling Committee individually, do they feel differently about it now than they did before?

MEMBER ENGELBERT: Yes, I will ask that question then. What is the opinion?

CHAIRMAN DELGADO: Katrina?

MS. HEINZE: I am not changing my vote. But the reason for my statement is, I want to make sure that this material is clear for those folks who are not on the Handling Committee because given how many materials we have I know it's very confusing. So I just wanted to make sure that folks were aware that this one was a little different in the event that that affected your vote.

CHAIRMAN DELGADO: Other members of the Handling Committee? Steve?

MEMBER DeMURI: I do realize that this ingredient is a little different than the others that they petitioned. But the evidence
still wasn't compelling enough for me to change my vote. So I still vote no.

CHAIRMAN DELGADO: Joe?

MEMBER SMILLIE: Same for me. I think Gerry did more research than the committee presented in their petition. So I have not changed my vote.

MEMBER WEISMAN: Yes, and I'll just for the record, I will also add my voice that I think that the problem was not even acknowledging -- that the evidence that they presented in their petition wasn't compelling; it was -- the burden was on us to go out and ferret it out. And Gerry went to actually very great lengths to do that.

CHAIRMAN DELGADO: Okay, any other questions? Gerry?

MEMBER DAVIS: And this topic, this discussion we're having right now, was brought up right before we voted. And the conclusion of the committee, the general consensus seemed to be that we had to search this out. The
petitioner themselves did not really do due diligence to expose these things, so that they didn't address the issue properly, and that's why they still voted. So I want to point out, that was all covered; this is not a new development.

CHAIRMAN DELGADO: Okay, Tracy? Jeff?

VICE CHAIR MOYER: I was just going to ask the committee, and I assume that I already know the answer, the petitioner was made aware of the fact that your intention, or your suggestion and recommendation was to not put this on the list, and they were not here in front of us to make any other comment and have not submitted any other written comment; is that correct?

MEMBER WEISMAN: That's correct, but I will -- this question was asked yesterday, and I am going to ask Valerie Francis again to clarify what the -- once we hand in our recommendation, what steps the program then
CHAIRMAN DELGADO: Valerie?

MS. FRANCIS: Actually Bob, who
handles this part, I let him know that you
made your recommendation, that it's time to
inform the petitioner.

CHAIRMAN DELGADO: Bob, would you
please comment?

MR. POOLER: This is Bob Pooler of
the National Organic Program. Each petitioner
was notified that their petition was going to
be considered at this meeting. And they were
sent a notice, and the information in the
notice indicated where the recommendation was,
and they were invited to comment on it.

That was sent to every petitioner
that is being considered here today, including
-- the person's name was, I believe, Mr.
Hartwright. And Mr. Hartwright received both
an email and a letter and a fax.

CHAIRMAN DELGADO: And that was done
with the appropriate amount of time, I
suppose, as the recommendation was posted publicly, correct?

MR. POOLER: Actually when the recommendation was forwarded to me, the letters were sent out, and I believe this occurred prior to the Federal Register notice.

CHAIRMAN DELGADO: Thank you. Jeff?

VICE CHAIR MOYER: Thank you, Bob, thank you, Julie. I think for me that clarifies things very well.

CHAIRMAN DELGADO: Any other questions? Kevin?

MEMBER ENGELBERT: Just one. The committee, and especially Gerry, is to be commended for finding out additional information beyond what was petitioned, and I guess I understand why you kept your reasonings for not changing your vote the same, but not perfectly.

Would anybody like to delve a little bit more into the reasoning of that?

CHAIRMAN DELGADO: Would you like to
respond to that, Gerry? Or Katrina, are you
adding something?

MEMBER DAVIS: No, I'd rather not.

CHAIRMAN DELGADO: Katrina?

MS. HEINZE: I will speak for me as opposed to everyone on the Handling Committee.

We did the research so we could understand the material better, and certainly we found some evidence that would support the petitioner. I guess the concern I have is, we talked to one person. We certainly didn't do an exhaustive market search. And so there may very well be some available that we did not discover in Gerry's search, and that was a concern I had.

CHAIRMAN DELGADO: Thank you.

Any other questions? Dan.

MEMBER GIACOMINI: Is there -- in your research -- I'm hearing wild crop in the rainforest in Brazil, of which --

MEMBER DAVIS: Amazon in general.

MEMBER GIACOMINI: In the Amazon,
and absolutely no known organic crop. You found a juice, organic juice with juice in it.

MEMBER DAVIS: An organic juice that contains as a small fraction this material, but no reference to the powdered extract that could be something that could be exported.

MEMBER GIACOMINI: Right. I almost feel like this substance is being penalized for the inadequacy of the volume of the petition submitted by this submitter. I mean I don't see where we would have found -- where in the research where could we put together the possibility that there wouldn't be a potential commercial unavailability.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: All that I was able to find in doing an Internet search asking for Camu Camu berry extract, there were only references to nonorganic. There was no -- not even from small distributors. Usually you can find small quantities of stuff that claims organic, but for this I found none. And
that's why I took Joe's suggestion to call IBD in Brazil and give that a try. I emailed them first, but that was kind of flawed in the way that worked, so I wanted to call in the number to get a better response.

And the problem with that was, I called the day before we had to vote on it, and there was some additional information. But the general consensus of the committee was that this really doesn't change the fact that the petitioner themselves did not explain their case themselves. They just threw out a blanket statement and didn't really delve into any of this information that they could have done themselves.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: I also want to respond to Dan's remark. I don't think the petitioner is not being penalized because of the small quantity of material.

MEMBER GIACOMINI: No, this substance --
MEMBER WEISMAN: Oh, of the petition.

MEMBER GIACOMINI: -- is being penalized for the volume of the other petitions by this petitioner.

MEMBER WEISMAN: Right, and what I want to say about that is that it is true that we have looked at many materials before, and I am the first one to make the case that yes this material -- yes, we all know that this is grown organically but it is not being processed into the form or there are barriers to trade, none is getting exported.

I would say if the first step had been completed to the satisfaction of this committee, that's where we would be, and then I would feel very differently about it. But the first step wasn't done.

CHAIRMAN DELGADO: Any other questions? Tracy?

MEMBER MIEDEMA: This question applies to this substance and then all of
them. Julie, can you make sure I understand -- and I know the understanding, the burden of proof of whether or not a supply is potentially fragile, commercially available and if it's fragile, that burden is on the petitioner. And the burden is not on the committee. In a simple Google search and a few phone calls we find an organic version that the petitioner failed to even point out then we can reasonably say they have not met their burden of proof or carried their burden of proof.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: I would agree with that.

CHAIRMAN DELGADO: Joe?

MEMBER SMILLIE: And, again, it can be re-petitioned with a better petition, and in fact that was our action to the petitioners. We said, hey, give us -- we are not against what you are saying; you just didn't prove your case at all really. And in
what little time we had we got a lot more
information than you presented us.

So re-petition. And I would have
thought with that list that they would have
done that. They haven't done it yet, but they
still have the opportunity to do so.

CHAIRMAN DELGADO: Any other
questions?

Okay, are we ready for the
question?

The question is on the motion to
include nonorganically produced Camu Camu
extract on the national list Section 205.606.

We will start our voting with
Kevin.

MEMBER ENGELBERT: No.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: No.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: No.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: No.
CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: No.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: No.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: No.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: No.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: No.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: No.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: Bear with me a second, please, Mr. Chairman.
CHAIRMAN DELGADO: Yes.

VICE CHAIR MOYER: I have 11 nos, 3 yeses, one absent, Mr. Chairman.

CHAIRMAN DELGADO: The motion is agreed to, and we can move on to the next material.

MS. HEINZE: No, the motion failed.

CHAIRMAN DELGADO: Sorry, the motion failed; I apologize for that. And I'll just restate that.

The motion to include nonorganically produced Camu Camu extract on the national list section 205.606 is lost.

Let's move on to the next material.

MEMBER WEISMAN: The next item is caramel color. This material as Joe presented yesterday, we got a pretty far way in the evaluation of this material feeling like it was very -- a lot of information about the use of caramel, about -- let's see, it was actually petitioned by a manufacturer who is also a manufacturer of conventional caramel
color who basically was telling us that they can't make all forms organically that they are able to make conventionally, and that there was a call in the industry for a variety of forms. Not all caramels are created equal, or not all caramel colors are created equal.

And to make a long story short the committee stopped short when it arrived at the information that the problem with making the additional forms of caramel color that they already make conventionally was that it was cost prohibitive. And cost is not a criteria that is acceptable as a reason for finding something not commercially available. And so for that reason this material failed at committee level unanimously six to nothing.

CHAIRMAN DELGADO: Okay, would you like to make a motion?

MEMBER GIACOMINI: The motion is for the inclusion of caramel color on the national list Section 205.606.

CHAIRMAN DELGADO: Is there a
MEMBER ELLOR: Second.

CHAIRMAN DELGADO: Tina seconds. It is moved and seconded to include caramel color on the national list, Section 205.606.

Questions from the board. Jennifer?

Okay, we are ready for the question. The question is on the motion to include caramel color on the national list, Section 205.606, and we'll start our voting with Jennifer.

MEMBER HALL: No.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: No.

CHAIRMAN DELGADO: Julie?

MEMBER WEISMAN: No.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: No.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: No.

CHAIRMAN DELGADO: Jeff?
VICE CHAIR MOYER: No.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: No.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: No.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: No.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: No.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: No.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: No.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: No.

CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: Mr. Chairman, we have 14 nos and one absent.

CHAIRMAN DELGADO: The motion to include caramel color on the national list, Section 205.606 is lost.
We can move on to the next material.

MEMBER GIACOMINI: Okay, the next material is Chinese thistle root, otherwise known as Atractylodes Rhizome, powdered extract. And this is a material in which the petitioner failed -- did not -- failed to acknowledge the existence of the fact that organic Chinese thistle daisy is being cultivated.

We don't know if it's being extracted and powdered, but it is certainly being grown, and this was not mentioned at all in the petition. They did not address the existence of the organic form, and so for this reason it failed unanimously at the committee level.

CHAIRMAN DELGADO: Would you like to state a motion?

MEMBER GIACOMINI: I move that Chinese thistle root powdered extract be included on section 205.606 of the national
list.

CHAIRMAN DELGADO: Is there a second?

MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It is moved and seconded to include Chinese thistle root extract on the national list, Section 205.606.

Are there any questions? Ready for the question?

The question is on the motion to include Chinese thistle root extract on the national list, Section 205.606, and we'll start our vote with Steve.

MEMBER DeMURI: No.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: No.

CHAIRMAN DELGADO: Dan.

MEMBER GIGACOMINI: No.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: No.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: No.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: No.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: No.
CHAIRMAN DELGADO: Tracy.
MEMBER MIEDEMA: No.
CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: No.
CHAIRMAN DELGADO: Barry.
MEMBER FLANN: No.
CHAIRMAN DELGADO: Hugh.
MEMBER KARREMAN: No.
CHAIRMAN DELGADO: Kevin.
MEMBER ENGELBERT: No.
CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: No.
CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: Mr. Chairman, the vote is 14 nos, one absent.

CHAIRMAN DELGADO: The motion to include Chinese thistle root extract on the
national list is lost.

We can proceed to the next material.

MEMBER WEISMAN: The next material is Codonopsis Root, powdered extract. Again, this is a petition in which organic forms of - - organic Codonopsis was found by the committee to be cultivated and grown in certified organic form, and no mention of this was made in the petition. And it failed unanimously at the committee level.

CHAIRMAN DELGADO: Would you like to make a motion?

MEMBER WEISMAN: I keep forgetting. You would think I'd figure that out by now.

I move that Codonopsis Root powdered extract be included on Section 205.606 of the national list.

CHAIRMAN DELGADO: Is there a second?

MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It is moved and
seconded to include Codonopsis Root powdered extract on the national list, Section 205.606.

Debate?

Ready for the question? The question is on the motion to include Codonopsis Root powdered extract on the national list, Section 205.606, and we'll start our vote with Julie.

MEMBER WEISMAN: No.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: No.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: No.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: No.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: No.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: No.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: No.

CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: No.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: No.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: No.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: No.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: No.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: No.

CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: Mr. Chairman, the vote is 14 nos, one absent.

CHAIRMAN DELGADO: The motion to include Codonopsis Root powdered extract on the national list Section 205.606 is lost.

And we can proceed with the next material.

MEMBER WEISMAN: Ginger root powdered extract is the next material. Not
only is ginger root being cultivated widely organically, but the Handling Committee found very easily that it is being extracted. I cannot verify that it is available -- and I believe actually that it is in powdered form as well, as organic. And the petitioner made no mention of the existence of these organic forms of ginger root. And so it failed unanimously for that reason.

So I would like to make a motion at this time for the inclusion of ginger root powdered extract on Section 205.606 of the national list.

CHAIRMAN DELGADO: Is there a second?

MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It is moved and seconded to include ginger root powdered extract on the national list, Section 205.606.

Questions from the board?

Debate? Ready for the question?

The question is on the motion to
include ginger root powdered extract on the national list, Section 205.606. And we'll start our vote with Dan.

MEMBER GIACOMINI: No.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: No.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: No.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: No.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: No.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: No.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: No.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: No.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: No.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: No.
CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: No.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: No.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: No.

CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: Mr. Chairman, the vote is 14 nos, one absent.

CHAIRMAN DELGADO: The motion to include ginger root powdered extract on the national list, Section 205.606 is lost.

We can proceed to the next material.

MEMBER WEISMAN: The next material in our book is Jujube Fruit powdered extract. I would like to make a note though. I think that on our -- just a procedural note, on our vote sheets that are a few items missing. This one and the one that -- yes, there's quite a few. There's three I see so far.
MS. HEINZE: Yes, I see that.

MEMBER WEISMAN: Yes, there are three. So we'll just -- hopefully everyone will adjust accordingly. Does the secretary need a minute?

CHAIRMAN DELGADO: We will give the secretary a minute to adjust our note-taking, as well as to the vice chair who is kind enough tracking voting for us.

Ms. HEINZE: You can proceed with your introduction.

CHAIRMAN DELGADO: Jeff?

VICE CHAIR MOYER: Yes.

CHAIRMAN DELGADO: We're ready.

MEMBER WEISMAN: All right. Jujube Fruit powdered extract is being petitioned for inclusion on 606, and it is a material for which the Handling Committee with little difficulty was able to locate certified organically cultivated forms which was not mentioned in the petition, and for this reason it failed 5-0 with one absent at the time the
vote was taken.

CHAIRMAN DELGADO: Motion please.

MEMBER WEISMAN: I move for the inclusion of Jujube Fruit powdered extract on Section 205.606 of the national list.

CHAIRMAN DELGADO: Is there a second?

MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It is moved and seconded to include Jujube Fruit powdered extract on the national list, Section 205.606.

MEMBER GIACOMINI: Just a question, Mr. Chairman.

Should we be asking for conflicts on each one, or do we just assume it was done at the beginning of the section?

CHAIRMAN DELGADO: I assume it was done at the beginning of the section, and I will be asking --

MEMBER GIACOMINI: Anyone can speak up as they need to?
CHAIRMAN DELGADO: I would ask that to be the case.

Any other questions?

Are we ready for the question? And since it was brought up, are there any conflicts of interest that you wish to declare at this point, members of the board?

Very well, the question is on the motion to include Jujube Fruit powdered extract on the national list, Section 205.606.

We will start our vote with Katrina.

MS. HEINZE: No.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: No.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: No.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: No.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: No.

CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: No.
CHAIRMAN DELGADO: Barry.
MEMBER FLANN: No.
CHAIRMAN DELGADO: Hugh.
MEMBER KARREMAN: No.
CHAIRMAN DELGADO: Kevin.
MEMBER EN格尔BERT: No.
CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: No.
CHAIRMAN DELGADO: Steve.
MEMBER DeMURI: No.
CHAIRMAN DELGADO: Julie.
MEMBER WEISMAN: No.
CHAIRMAN DELGADO: Dan.
MEMBER GIACOMINI: No.
CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: The vice chair says you guys vote fast.

(Laughter.)

VICE CHAIR MOYER: Mr. Chairman, the vote is 14 nos, one absent.
CHAIRMAN DELGADO: The motion to include Jujube Fruit powdered extract on the national list, Section 205.606 is lost.

We can proceed to the next material.

MEMBER WEISMAN: The next item that we will discuss is the petition for Ligusticum Root powdered extract.

As you can probably guess, it was a petition made by the same petitioner as the last petition, and the Handling Committee was able to ascertain that it is being cultivated organically.

And so this material failed 5-0, and one absent.

CHAIRMAN DELGADO: Can I have a motion?

MEMBER WEISMAN: At this time I move for the inclusion of Ligusticum Root powdered extra on the national list Section 205.606.

CHAIRMAN DELGADO: Is there a second?
MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It is moved and seconded to include Ligusticum Root powdered extract on the national list Section 205.606.

Questions? Debate?

We are ready for the question. The question is on the motion to include Ligusticum Root powdered extract on the national list Section 205.606. And very slowly we will start taking votes starting with Jeff.

VICE CHAIR MOYER: No.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: No.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: No.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: No.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: No.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: No.
CHAIRMAN DELGADO: Hugh.
MEMBER KARREMAN: No.
CHAIRMAN DELGADO: Kevin.
MEMBER ENGELBERT: Ready, Jeff?
No.

(Laughter.)
CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: No.
CHAIRMAN DELGADO: Steve.
MEMBER DeMURI: No.
CHAIRMAN DELGADO: Julie.
MEMBER WEISMAN: No.
CHAIRMAN DELGADO: Dan.
MEMBER GIACOMINI: No.
CHAIRMAN DELGADO: Katrina?
MS. HEINZE: No.
CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: Mr. Chairman, the vote is four nos, one absent.

MS. HEINZE: Four?

VICE CHAIR MOYER: Fourteen.
MS. HEINZE: We're really going too fast.

CHAIRMAN DELGADO: The motion to include Ligusticum Root powdered extract on the national list Section 205.606 is lost.

We can proceed to the next material.

MEMBER WEISMAN: The next material for consideration is oat bran concentrate, and we actually received a letter during public comment from the petitioner asking that the petition be withdrawn, and that the program in NOSB expend no further time and resources on the consideration of the petition.

I believe all that is required is for me to have read that into the record.

Is that true?

As the chairman of the handling committee I accept the petitioner's request to withdraw.

CHAIRMAN DELGADO: So the petition has been withdrawn for oat bran concentrate,
and we can proceed to the next material.

MEMBER WEISMAN: The next material up for consideration is okra.

And there are two matters. One is the handling committee voted last night. It was an oversight on our part to submit this without listing it as okra IQF. That's how it was petitioned. And it was error on our part for us to not have handed the recommendation on that way because that is how we considered it.

So I think that that - I believe that - that was an amendment. We voted, the committee voted, six nothing. It was unanimous, the vote was unanimous to change the listing on the recommendation to okra IQF.

CHAIRMAN DELGADO: Very good. And six was that -

MEMBER WEISMAN: Oh, I'm sorry, you're right. Okay, it was unanimous, but it was five zero with one recusal.

CHAIRMAN DELGADO: So we have five
yes?

MEMBER WEISMAN: Five yes, zero nos, one recusal.

MS. HEINZE: Who was the first and second?

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: We are ready for the motion.

MEMBER WEISMAN: Well, before I motion there was also - the petitioner spoke yesterday during public comment and requested permission to make something additional or to clarify a comment that he made during the discussion yesterday.

And I would like to grant - if it is within my authority - or I would like to ask you as chair if this permission can be granted?

CHAIRMAN DELGADO: It is granted. If the speaker will please approach the board. State your name and affiliation for the record.
MR. BAILEY: Sure, thank you.

Again, David Bailey for Small Planet Foods, General Mills.

And what I think I misspoke about yesterday, I was asked a question whether Small Planet Foods or General Mills worked with contracted growers or helped them, would a freezer be found in a general okra growing area? Would we help the contract growers?

At the time I didn't speak clearly on that.

I want to say, yes, we would, as the answer.

So that is my only clarification. We do have some experience in contract growing. We have a lot - it's not in okra, but our business. We do have that as one of our business models.

Thank you.

CHAIRMAN DELGADO: Any questions to the presenter? Please don't leave the board.

Julie? Tracy?
MEMBER MIEDEMA: With this flurry of organic okra growers we are hearing about and the potential to maybe, in the not too distant future, produce an IQF, would your organization petition to have it removed?

MR. BAILEY: Yes, I would either assist the freezer to do it or I'd do it myself.

MEMBER MIEDEMA: Thank you.

CHAIRMAN DELGADO: Gerry?

MEMBER DAVIS: Would it be appropriate to ask you if the product that the okra goes into actually carries the name gumbo in some fashion?

MR. BAILEY: It does.

CHAIRMAN DELGADO: Any other questions?

Thank you.

MR. BAILEY: Thank you.

CHAIRMAN DELGADO: Back to you, Ms. Weisman.

MEMBER WEISMAN: So this material
was found to meet the applicable criteria including that it is - that there is no commercial supply of organic okra in the individually quick frozen form. And as I mentioned it did pass by committee vote, five, zero nos, and one recusal.

So at this time I would like to make a motion for the inclusion of okra IQF on the national list Section 205.606.

MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It is moved and seconded to include okra IQF on the national list Section 205.606.

Questions?

MEMBER DeMURI: Before we vote, I need to recuse myself as well. General Mills is a formidable competitor of ours, and we would also like to use this ingredient in some of our products. So it's a double-edged sword for Campbell's.

CHAIRMAN DELGADO: Okay, now that we bring that up are there any conflicts of
interest to declare?

We have Katrina followed by Barry and Joe.

MS. HEINZE: It does bear saying, I think everyone knows it, I work for the petitioner, so I will be recusing myself.

CHAIRMAN DELGADO: You will be recusing yourself? Thank you. Barry.

MEMBER FLANN: I was just going to ask a question.

CHAIRMAN DELGADO: Before we proceed with questions, Joe, you had a question?

MEMBER SMILLIE: I just want to repeat my statement of this morning, which was, we may or may not certify many companies that may or may not use this, and I just want to put that out there again.

I don't think there is a conflict of interest.

CHAIRMAN DELGADO: Board members, do you think there is a conflict of interest?

MEMBER FLANN: No.
CHAIRMAN DELGADO: Very good, we'll proceed now to the questions, debate. We will start with Barry followed by Gerry.

MEMBER FLANN: I'm sorry, this is one that has me kind of confused, and it's probably because of my lack of understanding of the system.

But the availability of organically grown okra troubles me that it seems like it's just the methods now that are being made available or are being used is a reason to add okra to the list of substances.

And that seems to open up all kinds of doors in other situations. But, like I say, I'll have to admit I don't fully understand this issue, so I'm kind of troubled.

Of course I'm influenced by the committee's acceptance of it, but I'm personally troubled by it.

CHAIRMAN DELGADO: Julie, would you like to respond?
MEMBER WEISMAN: Well, I just first want to say that this petition as we just voted to amend it, is not a blanket acceptance of okra as an agricultural product in organic food. It's only for individually quick frozen okra to be used.

In other words, because of the way food products are processed and where they are processed and what kind of facilities are used, and because of the scale that is required in the existing - and the location of the existing IQF facilities, it is not possible for okra to be -- there is no organic okra currently available in a close enough proximity to existing IQF facilities for manufacturers of organic gumbo products sold to - at retail to make use of the - I'm losing my clarity, I'm sorry about that. Somebody help me.

MEMBER FLANN: But that is the very part of this whole thing that troubles me, and I don't really - I don't have a handle on it,
and that sort of troubles me that that is a manufacturing thing. And I just could see other situations where that is used as a reason not to use organic.

CHAIRMAN DELGADO: Okay, we have a question from Gerry, followed by Jeff and Steve and Tina.

Gerry.

MEMBER DAVIS: A statement merely personally. After thinking about this more, I originally voted yes at the committee level, most of these six items, in fact all of them so far, have been items that are part of, they have to be part of the 5 percent non-organic, but most of them are not the key ingredient that identifies the product as what it is, being the one that is non-organic.

So because of that, that gumbo is gumbo because it has okra in it, and this product is going to have non-organic okra in it, I can't vote to list it myself.

CHAIRMAN DELGADO: Jeff.
VICE CHAIR MOYER: Yes, Gerry, I was going to say the same thing. I agree with that. And then in the context of that, we just failed to list Ligusticum Root because we said that there was some organic Ligusticum Root somewhere in the world but not necessarily in this form, we don't know.

We certainly know that there is okra, and given the fact that okra is on the name of the product, I have a real difficulty with this material.

CHAIRMAN DELGADO: Okay, we have Steve followed by Tina and Dan.

MEMBER DeMURI: I just want to remind everybody, especially Barry, since you are new, that there is also a commercial availability burden on the manufacturer or user to satisfy their certifier that there is none available as well. So it's a two-step process.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: My issue with it, and
my question is this; once the okra is frozen, it's shelf stable for a certain amount of time, I'm assuming, and it could be accumulated. So if you can't get it all at one time, the possibility is that you could stockpile it until you have enough to do the production. And that it is okra, which is a fairly big commodity crop. I have a problem with it, and the same issue that Jeff and Gerry has, that it's in the name of the product.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: I would like first of all to go back a little bit on Barry's. If you look at the list of items we have already put on 606 there is a historical precedent for what we are looking at with this item.

We have peppers but only those processed in the chipotle form. We have galanga, but only the frozen form.

There are a couple - I won't say a
number, but some - where it was the uniqueness of the process and what it took to do that that is the thing that put the substance, the agricultural product, on the list.

In this situation I've gone back and forth a lot. I've thought no. I've thought I can go along yes, if it's IQF.

In rethinking it, it seems that a significant part of the IQF problem comes down to being a financial issue and the fact of small amounts each day to be frozen, and that is a short-term thing not even taking into account, like Tina said, we have rejected some items, simply because we know the existence of their organic crop. We have rejected an item that we could not even find any evidence that it could be - was ever grown in an organic form.

And I have a hard time going along with this one.

CHAIRMAN DELGADO: Do you want to respond to that one?
MEMBER WEISMAN: I want to respond to one point of that. And there was also a question that was raised by Jeff.

The petition, for instance, for Ligusticum that we just voted on was not rejected because we found organic raw agricultural product being grown. It was because the petition was insufficient in that it did not acknowledge the existence and address the fact that, well, maybe the raw crop is being grown but it's not being processed into the form that is needed for our use.

CHAIRMAN DELGADO: Joe, followed by Tracy.

MEMBER SMILLIE: Julie made the point that I was going to make. The comparison Jeff drew is inaccurate. So we've got that one down.

To Dan's point, and again, it's important, you know, everything - it's like time or money, right. So everything can be
financial. But in this case it's not so much the financial cost. It's the method of harvesting of okra, and the fact that you can't do it all at once; it's got to be picked off. So you've got to have a very large, large supply of it in order to pick it off.

   And then you have to have freezer capacity that is timed to do that. If you've been there, it's got to all arrive, they've got to run it all at once. Because as a certifier, I'm telling them they've got to do a clean-up before they run - before they run organic.

   So all of these start to go together. And the petition, and this is why we are held by the criteria on which we judge the petition. And the criteria is, is there a fragility of supply, or is it not available at all?

   In this case, the IQF okra is clearly not available. It's not. And the petitioner documented that.
Is there a fragility? Definitely, also. Can it be overcome in the future? Absolutely possible.

And so those are the criteria that we as a committee have to work with. We can't just say, oh. You have to look at the criteria and make your judgment, and I think that's what we did as a committee.

And there are two safeguards in this system of checks and balances. And those safeguards are, just because we put it on 606, that's not the final word. The certifier has to rule on commercial availability; and as soon as IQF facility or a group of farmers say we can make this available, they can petition to have it removed, and that petition is granted preference over any other petition.

So I think that we have safeguards in place for it, and if you go by the criteria, that's the way you have to vote, is based on the criteria that are presented for 606.
CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: Two points.

One is that early on we brought up this question of whether the 606 list either spurs or spurns the industry stepping up and producing an organic version.

And it's one of those deals where we can't predict the future, but sometimes we can peer into that crystal ball a little bit. And this seems to be a situation that could really spur a whole new demand for organic okra, organic IQF okra that was never there before, and provide a new market for these organic okra growers that currently don't have anyone to sell it to other than their corner market, because this company or whomever it is, is able to get in, the market starts rolling.

And let's not forget, the label is going to be crystal clear. It will not say organic okra in the ingredients panel. It will say okra, and any organization that opts
to do that, even if it's a quintessential gumbo product, does so at their peril.

And maybe their consumers will reject that notion and put a lot of pressure on them externally to find that.

And so I think if we are going to look into our crystal ball, this might be a spur organic demand situation by the addition of it to 606.

CHAIRMAN DELGADO: Any other questions?

The question is on the motion to include okra IQF on the national list, Section 205.606.

We did have a motion.

MEMBER SMILLIE: Yes, made by Julie, seconded by Joe.

CHAIRMAN DELGADO: Once that is clarified, we'll proceed with a vote. And we'll start with Gerry.
MEMBER DAVIS: No.

CHAIRMAN DELGADO: Gerry said?

MEMBER DAVIS: No.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: No.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: No.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: No.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: No.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: No.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: No.

CHAIRMAN DELGADO: Katrina is
abstaining, recusing.

    Jeff.

VICE CHAIR MOYER: No.

CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: I have eight nos, three yeses, one absent and two recusals.

    I stand corrected; it is nine nos, three yeses, one absent, and two recusals.

CHAIRMAN DELGADO: The motion to include okra IQF on the national list 205.606 is lost.

    We can proceed to the next material.

MEMBER WEISMAN: The next material for consideration is Pectin, low-methoxy, non-amidated, which currently is included in the listing for Pectin, low-methoxy, on 205.605(b).

    And the petitioner is asking for the non-amidated form of low-methoxy Pectin to be included on 606 of the national list where
high-methoxy Pectin also currently is located.

It is - was clear to the handling committee in reviewing the petition that this material which is basically isolated from - through mechanical means from apple pumice, which is a waste byproduct of the apple-pressing industry, and is used - it's critical for the production of jams and jellies and other dairy - other dairy products or anything that needs to be gelled. It is used to - for texture.

And it was seen - there certainly - none of this is available organically at this point, and in fact, when the petitioner was contacted, part of the reason for this petition is that they believe it is possible, that there is plenty of organic pumice available and that it would be possible to make this material organically but not unless it is recognized as an agricultural product on 606.

So this is a material that the
handling committee voted five yes, and one absent for inclusion on 606.

CHAIRMAN DELGADO: Would you like to make a motion?

MEMBER WEISMAN: At this time I would like to make a motion that Pectin, low-methoxy, non-amidated, be included on Section 205.606 of the national list.

CHAIRMAN DELGADO: Is there a second?

MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It's moved and seconded to include Pectin, low-methoxy, non-amidated, on the list on section 205.606.

Debate. Jeff.

VICE CHAIR MOYER: Thank you, Mr. Chairman.

Julie, I have a question about a comment you just made here. You said there were plenty of organic pumice does exist, but -

MEMBER WEISMAN: Pumice, not pectin.
VICE CHAIR MOYER: Right, but they can't make it into pectin?

MEMBER WEISMAN: They can, but it can't be certified organic unless it's recognized as an agricultural product.

VICE CHAIR MOYER: This is confusing to me.

CHAIRMAN DELGADO: Dan?

MEMBER GIACOMINI: The listing on 605 is essentially, although it's not stated that way, is a two-part listing. It's Pectin, low-methoxy. There is amidated, and there is non-amidated. The amidated makes it synthetic. This claim is that the non-amidation keeps it agricultural as an agriculturally processed product. They want it identified and listed as an agricultural product via the 606 mechanism so they can make it and identify it as an organic product.

Does that answer your question?

VICE CHAIR MOYER: It does not. It confuses me even more. You are inferring
that, by moving it, it becomes non-synthetic when it is already –

CHAIRMAN DELGADO: Julie, do you want to –

MEMBER WEISMAN: I think I’m going to make a stab at constructing some history on this. And I think this speaks to the issue of how non-organic materials, how the market creates a demand for ingredients that no one ever bothered to consider how to make organically before.

When the national list was created, two kinds of Pectin was requested to be included for use in organic production. And at the time, two kinds of Pectin were identified: high-methoxy and low-methoxy. And all known forms of low-methoxy Pectin at that time were amidated, were reacted with ammonia in a way that makes them synthetic. So for that reason low-methoxy Pectin is - you find that on 205.605(b) which are synthetics-allowed.
It was also recognized at that time that high-methoxy Pectin had not been treated with ammonia; was not amidated; and so that was considered to be non-synthetic.

Now there are details that I'm probably missing, as to why it was - right, and that's why it's on 606. That's why it's on 606.

What the petitioner has brought to light is that, now there is high-methoxy Pectin being made that is not being amidated.

CHAIRMAN DELGADO: Low-methoxy.

MEMBER WEISMAN: I'm sorry, it does get confusing. There's low-methoxy Pectin now available which is not being amidated. And since it is a material that comes from an agricultural process through processes that are - that do not make it synthetic, they are isolated physically, it is - continues - it's basically a portion of the apple pumice.

VICE CHAIR MOYER: I understand that, but I guess my question would be, if it
is organic apple pumice, and it is not synthetically treated, why isn't it just allowed as it is right now, without being on this list?

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Because it's not the pumice itself that is being used. It is being - I have to think about that.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: Is there much potential of running into the problem of - there is a lot of organic apple pumice, but there is no processing space, or it's too small of an item for a processor to make into organic low-methoxy non-amidated Pectin. Or we'll have the same situation. There is organic pumice available, and yet we can make it into low-methoxy non-amidated pumice, but it's too small; no one is going to do it because it is too much of an inconvenience. No one can shut down their line long enough to make a batch.
MEMBER WEISMAN: It was not something that was included in the petition, but it came up in subsequent conversation, because I had an opportunity at a trade show to ask a question, the petitioner was exhibiting. And the reason why this petition was being made was because they, in fact, not themselves, but I guess their supplier, they have already been in conversation with their supplier of Pectin, it's a jam manufacturer, who - and they are preparing to do just that, but they don't want to proceed unless the hurdle is cleared that this can in fact be - that this will be eligible for certification.

CHAIRMAN DELGADO: At this moment I would like to recognize a member of the public. Can you please approach the podium and state your name.

MS. SONNABEND: Zea Sonnabend, and I was the TAP contractor at the time that the Pectins were put on the list. So I wanted to just clarify a little bit about the history.
You have to realize that when the National List was first created we didn't have a rule yet. And so there weren't these neat 205.605, 205.606 like that. It was just, does it belong on the list? And is it synthetic or non-synthetic. And there wasn't the big emphasis that there is now on agricultural versus non-agricultural and the fine distinction.

So it was considered more important to look about whether something was synthetic or non-synthetic, and the agricultural listing was only used for the things that were really raw agricultural things.

And then it was unclear until Mr. Harvey clarified it that the ingredients that were not available in organic form as ingredients had to be put on the list in their own section.

So that being said, it was determined that high-methoxy Pectin had not - was non-synthetic because it had not gone
through a chemical change in the extraction, but low-methoxy pectin had been—in some cases it's been precipitated with ammonium salts and alcohol, which is what precipitated the low-methoxy-ness of it, and therefore it was put on the list.

I do think that this is one where you may need a little further study to make sure that this form of pectin—it may be agricultural, but it may be synthetic agricultural, in which case maybe where it is on the list is okay. And depending on how you go with agricultural in the future, then maybe commercial availability will apply to everything on the list, and it could be sourced in organic form even if it might have gone through a synthetic step.

Anyway, I think you should really look at this carefully in light of that past history.

CHAIRMAN DELGADO: Okay, thank you for that clarification.
Julie followed by Joe.

MEMBER WEISMAN: Under category two, question one, that's the question that asks, is the substance formulated or manufactured by a chemical process. And the petition did include a description of how this material is made.

They say that the pectin present in the cell wall structure of the apple pumice is extracted with acidified water that is filtered or strained to remove any remaining insoluble materials.

So they are mentioning extraction and filtration which are both allowed processes.

Now I guess we may want to ask the question, are there other materials that non-amidated low-methoxy Pectin might come from that we don't want to include.

And if that were the case, I would say that we should limit our listing from apple pumice only.
CHAIRMAN DELGADO: Okay, Joe.

MEMBER SMILLIE: Well, I don't know if this is helpful or not, and maybe Zea might know. But if the case is that these are allowable processes and organic apple pumice is readily available, why is no one petitioning to remove high-methoxy Pectin off 606?

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: You know I'm not the expert, and whatever I know about Pectin I learned from Kevin O'Rell who is not on the board anymore.

But my understanding is that there are -- different pectins are more forgiving than others, and I believe that the - I believe that the high-methoxy - the low-methoxy Pectins are more foolproof, and then the high-methoxy Pectins, you have to be - they are less forgiving. Like you could still end up with liquid in your jam if you don't do it exactly right.
CHAIRMAN DELGADO: Please wait to be recognized. Proceed.

MS. SONNABEND: Zea Sonnabend. My perception at the time, although it probably doesn't appear in the minutes, was that the high-methoxy Pectin was really not that useful in processing but it was put on the list because we'd rather have someone use the non-synthetic form if it would work in their situation. And almost everyone used the low-methoxy form.

CHAIRMAN DELGADO: Thank you.

Dan followed by Tina.

MEMBER GIACOMINI: Zea, could you please with your, the paperwork you have and whatever glasses you may need, does this process match the one that you found in your research as far as the making of the Pectin and the difference between the two?

CHAIRMAN DELGADO: Can you highlight it?

MS. SONNABEND: I forgot one point
in the last thing, which is that the lower methoxy Pectin works better with lower levels of sugar than high-methoxy, and that was decided to be desirable.

CHAIRMAN DELGADO: Okay, can you please identify yourself for the record.

MS. BROWN-ROSEN: I'm Emily Brown-Rosen with PCO. I happened to have a spreadsheet in my computer where I had looked at compiled information on these synthetics on the list. So I pulled out what I had dug up and also what was in the TAP reviews. And the thing is this old TAP review was not very good. So you have never really had a very good TAP review on these pectins. And I think they are - the manufacturing process, as it was originally considered, was not really - maybe Brian Baker maybe has more thoughts off the top of his head - but what I found was that TAP kind of - I didn't see - it lumped together high-methoxy, low-methoxy, and from reading up on it, my understanding is that
when you extract from rinds of citrus, apples, other fruits, with water or acid – here they are talking about extracting with acids, aqueous acid solutions, that was considered a processing agent that yielded the high-methoxy form, and that was considered by the board to be natural, not synthetic.

Then it was precipitated out with aluminum salts or alcohol. These were removed, and the board said high-methoxy, that's natural. Further, demethylation by acid or alkalitic to get to the low-methoxy Pectin.

And so that low-methoxy as a group was considered synthetic. It could be amidated or it could be not amidated.

And so my perception was they were lumped together.

But in my mind this is all – you know, there are a lot of ways to make pectin, and you don't really have a good TAP review, and I would just recommend getting a little
more detail on this, especially considering all the uncertainty about ag, non-ag and synthetic, non-synthetic at this point.

CHAIRMAN DELGADO: Dan, do you have a follow-up question?

MEMBER GIACOMINI: No, I think this one would be a good one to keep in mind as examples to run through when we are looking at the material working group.

CHAIRMAN DELGADO: Any other questions for the speaker? Julie?

Katrina.

MS. HEINZE: I'm wondering if this might be a material - and I don't know procedurally how to do this - that the committee might want to spend a little bit more time on.

So do I make a motion?

CHAIRMAN DELGADO: Well, right now the motion is with the chair of the committee. And we'll ask her to give us a decision.

You can definitely rescind the
motion, withdraw it, and request more time to consider, given the pending questions.

MEMBER WEISMAN: Although I am reluctant, because we received this petition quite some time ago, and it was deferred in the fray of considering 606 materials to replace colors that were falling off the list, and because it had a home, I'm reluctant to defer it further.

However, I recommend at this time that we defer consideration of this material.

CHAIRMAN DELGADO: Does the second concur?

MEMBER DeMURI: Yes, I do.

CHAIRMAN DELGADO: At this time we are suspending consideration of pectin, low-methoxy non-amidated.

And we'll continue on with the next material.

Back to you, Ms. Weisman.

MEMBER WEISMAN: The next material to be considered is Peony Root powdered
extract. It is also a material that was - which the committee felt did not provide - did not acknowledge the fact that - it did not include information that we found on our own, namely, that there is organic peony root - well, there is organic peony root, and they did not make mention of this in the petition.

And the vote on the handling committee was five against listing, one absent.

CHAIRMAN DELGADO: Okay, can I have a motion, please?

MEMBER WEISMAN: I move for the inclusion of peony root powdered extract on Section 205.606 of the national list.

MEMBER DeMURI: I'll second.

CHAIRMAN DELGADO: It is moved and seconded to include Peony Root powdered extract on the national list, Section 205.606.

Questions.

Ready for the question? The question is on the motion to include peony...
We will start the vote with Tina.

MEMBER ELLOR: No.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: No.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: No.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: No.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: No.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: No.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: No.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: No.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: No.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: No.
CHAIRMAN DELGADO: Katrina.

MS. HEINZE: No.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: We're slowing down. No.

(Laughter.)

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: No.

CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: Mr. Chairman, we have 14 nos, one absent.

CHAIRMAN DELGADO: The motion to include Peony Root powdered extract on the national list in Section 205.606 is lost.

We will proceed with the next material.

MEMBER WEISMAN: Polygala Root powdered extract, this is a material that was found by members of the handling committee to be sold in a liquid extract form, a point that was not acknowledged by the petitioner.
At this point I make a motion for the inclusion of Polygala Root powdered extract on Section 205.606 of the national list.

CHAIRMAN DELGADO: Is there a second?

MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It's moved and seconded to include Polygala Root powdered extract on the national list, Section 205.606. Debate? Any questions on the board?

Ready for the question. The question is on the motion to list Polygala Root powdered extract on the national list Section 205.606, and we'll start our vote with Tracy.

MEMBER MIEDEMA: No.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: No.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: No.
CHAIRMAN DELGADO: Hugh.
MEMBER KARREMAN: No.
CHAIRMAN DELGADO: Kevin.
MEMBER ENGELBERT: No.
CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: No.
CHAIRMAN DELGADO: Steve.
MEMBER DeMURI: No.
CHAIRMAN DELGADO: Julie.
MEMBER WEISMAN: No.
CHAIRMAN DELGADO: Dan.
MEMBER GIACOMINI: No.
CHAIRMAN DELGADO: Katrina.
MS. HEINZE: No.
CHAIRMAN DELGADO: Jeff.
VICE CHAIR MOYER: No.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: No.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: No.
CHAIRMAN DELGADO: Tracy - oh, the chair votes no.
VICE CHAIR MOYER: Mr. Chairman, the vote is 14 nos, one absent.

CHAIRMAN DELGADO: The motion to include Polygala Root powdered extract on the national list Section 205.606 is lost.

We can proceed with the next material.

MEMBER WEISMAN: Not to be confused with Polygala Root powdered extract, we are now considered Polygonum Root powdered extract. And again, we felt that the petition did not acknowledge the existence of information available readily of the existence - that this material was being at least cultivated organically.

And we had the vote - the vote for this were four no, one yes and one absent.

At this time I would like to make a motion for the inclusion of Polygonum Root powdered extract on Section 205.606 of the national list.

CHAIRMAN DELGADO: Do we have a
MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It's moved and seconded to included Polygonum Root powdered extract on the national list Section 205.606. Questions? Joe.

MEMBER SMILLIE: I'd like to hear from the member who voted yes.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: There was one. Okay, you know, actually, correct me if I'm wrong, it's coming back to me, there was no information available suggesting that it was being cultivated organically. And this was one of the - I think this was one of the early petitions that we looked at, so I voted yes because of that.

But subsequently, in the consideration of many other petitions that came after it, and it was basically I was having at that time the same question that Jeff had earlier, but the issue then became
for me was that the petitioner didn't - just used a boilerplate for 16 materials and didn't even - did not - before even - the petitioner had not been demonstrating an attempt, and so therefore, that was why I voted that way.

But I wouldn't vote that way now if I were reconsidering.

CHAIRMAN DELGADO: Any other questions?

Are we ready for the question? The question is on the motion to include Polygonum Root powdered extract on the national list, Section 205.606, and we'll start our vote with Joe.

MEMBER SMILLIE: No.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: No.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: No.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: No.

CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: No.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: No.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: No.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: No.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: No.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: No.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: No.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: No.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: No.

CHAIRMAN DELGADO: And the chair

votes no.

VICE CHAIR MOYER: Mr. Chairman, the
vote is four nos, one absent - 14 nos, one
absent, I apologize.
CHAIRMAN DELGADO: The motion to include Polygonum Root powdered extract on the national list Section 205.606 is lost, and it is quarter to 3:00.

I think we are ready for a break at this point, and it will be for 10 minutes. And I ask the board to be prompt. We will be back here at 3:00 o'clock, and I'll ask the board to be prompt.

(Whereupon, the above-entitled matter went off the record at 2:48 p.m. and resumed at 3:09 p.m.)

CHAIRMAN DELGADO: We're back in session, and back to you, Ms. Weisman.

MEMBER WEISMAN: Okay, the next material to be considered is Poria Fungus powdered extract.

This is another petition in which the petitioner made a blanket statement that they always look for organic sources of materials that they need without specifying any of them in particular, and so we did not
find this petition compelling, did not feel that they had adequately addressed the question of whether this material is in fact available as organic.

The committee voted four no, one was absent, and one abstained.

And I'm wondering if Katrina also has a record of who the abstention was, and I'm hoping it wasn't me.

(Laughter.)

CHAIRMAN DELGADO: Katrina, can you respond to that?

MS. HEINZE: We would have to look at the handling committee minutes. Would you like me to do that?

MEMBER WEISMAN: I think we can proceed if everyone is comfortable.

CHAIRMAN DELGADO: Let's proceed.

MEMBER WEISMAN: All right. So therefore I would like to move at this time for the listing of Poria Fungus powdered extract on Section 205.606 of the national
MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It is moved and seconded to include Poria Fungus powdered extract on the national list, Section 205.606.

Debate? Questions from the board?

Ready for the question. The question is on the motion to include Poria Fungus powdered extract on the national list Section 205.606, and we'll start taking our vote with Barry.

MEMBER FLANN: No.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: No.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: No.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: No.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: No.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: No.
CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: No.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: No.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: No.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: No.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: No.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: No.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: No.

CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: Mr. Chairman, the vote is 14 no, one absent.

CHAIRMAN DELGADO: The motion to include Poria Fungus powdered extract on the national list, Section 205.606 is lost.

And we can proceed to the next
MEMBER WEISMAN: The next material for consideration is Rehmannia Root powdered extract. You will not be surprised to know that it was petitioned by the same petitioner who petitioned many of the other root powdered extracts, and like its companions, this petition did not acknowledge the existence of organic Rehmannia root that was not difficult for members of the handling committee to locate, and for this reason it failed five no and one absent.

CHAIRMAN DELGADO: Do we have a motion?

MEMBER WEISMAN: I move that Rehmannia Root powdered extract be included on Section 205.606 of the national list.

MEMBER KARREMAN: Second.

CHAIRMAN DELGADO: Who was the second?

MEMBER DeMURI: Hugh.

CHAIRMAN DELGADO: Hugh was the
second.

It is moved and seconded to include Rehmannia Root powdered extract on the national list, Section 205.606.

Debate. Questions from the board?

Are you ready for the question, board members? The question is on the motion to include Rehmannia Root powdered extract on the national list Section 205.606.

And we'll start taking our vote with Hugh.

MEMBER KARREMAN: No.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: No.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: No.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: No.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: No.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: No.
CHAIRMAN DELGADO: Katrina.

MS. HEINZE: No.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: No.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: No.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: No.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: No.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: No.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: No.

CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: Mr. Chairman the vote is 14 no, one absent.

CHAIRMAN DELGADO: The motion to include Rehmannia Root powdered extract on the national list, Section 205.606 is lost.

We can proceed with the next
MEMBER WEISMAN: The next material that we are considering is seaweed, specifically Kombu, which is also known by the names Lamanaria Japonica, Lamanaria Japonica var ochotensis, Lamanaria angustata, laminaria angustata longissima. I hope I got those right.

CHAIRMAN DELGADO: Joe?

MEMBER SMILLIE: There is a possible clarification. And that was because of a public comment we received that agreed with the petitioner, had no problem with them, but just wanted to differentiate, even though those variety names are correct, there is a general category called Pacific Kombu, which they all meet, which is in the trade differentiated from Atlantic Kombu. So they would like - I don't think they requested per se, but I think in honoring that input if we can put seaweed, Pacific Kombu, in there, it's certainly a friendly -
CHAIRMAN DELGADO: It's a comment at this point. And it's taken by the chair. Okay, any comment response on your part, Julie?

MEMBER WEISMAN: Just procedural. Should I continue with the presentation and then at the end of that time I will make a motion?

CHAIRMAN DELGADO: And then you can make the motion with the suggestion, or as you have it, and then it can be moved to amend; it's up to you.

MEMBER WEISMAN: Okay.

CHAIRMAN DELGADO: So complete your presentation, make the motion, and we'll proceed from there.

MEMBER WEISMAN: All right, this material is wild-harvested, hot-water extracted, condensed, heat sterilized and filtered. We found it to meet the criteria in terms of impact on humans in the environment, compatibility, consistency.
It is also a material that is an essential ingredient in traditional Japanese cuisine for centuries, and it - although there are other organic certified sea vegetables, Kombu has characteristics that those other seaweeds and sea vegetables do not.

We - wild crop certification is pretty complicated, and so this was pretty clearly documented as not available currently. There was - the handling committee did contact other distributors of Kombu in the U.S. who confirmed the information the petitioner gives regarding the availability.

And so we voted at the committee level five yes, zero nos, and one absent for the listing of this material on 606.

What I'm going to do right now actually is motion the material the way the recommendation was originally made and then entertain any amendments so that we can have discussion, because that discussion didn't happen in committee because the public comment
came afterwards.

So at this time I would like to move that seaweed Kombu be included on Section 205.606 of the national list.

MEMBER SMILLIE: Second.

CHAIRMAN DELGADO: It is moved and seconded, and the second came from Joe.

It is moved and seconded to include seaweed Kombu on the list, Section 205.606.

Comments, Jeff followed by Hugh.

VICE CHAIR MOYER: Yes, the question that I have pertains to the actual forms in which we're listing this. And my concern is that, if I came up with an organic version of Kombu that was a different variety name they would not have to use it because they would say, even if it satisfied all the culinary requirements that are solicited by the purchasing agent, they could conceivably say, oh we don't have to use that. We can circumvent because it's not the exact variety name.
So in general when we listed these things like carrot extract, we didn't list specific carrot varieties. Here we are going to some really specific details, and I have some concerns over that.

CHAIRMAN DELGADO: The motion as it stands just to clarify is seaweed Kombu. The varieties are listed in the background papers.

VICE CHAIR MOYER: They are listed right on here.

CHAIRMAN DELGADO: But the intent of the chair was to list the varieties here, or just seaweed Kombu.

MEMBER WEISMAN: I actually would like to ask a question of my handling committee colleague, Joe Smillie.

What would be the down side of not having these specific varieties listed?

MEMBER SMILLIE: Well, as I understand it, this is very specific because this is what the petitioner considers to be the precise type of Kombu. Because Kombu,
like seaweed if you really want to get specific, that's a terrible word because it doesn't really reflect any kind of reality within that trade. There is seaweed even of itself isn't a really good term. It's a sea vegetable or something like that.

But anyhow if we listed just seaweed Pacific Kombu I think it would accomplish the task. This would be a real clarification, because what you said, Jeff, was suppose someone came up with a Kombu that wasn't one of these species, the odds are that then it wouldn't fit the culinary need; it would be Atlantic so-called Kombu.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: Actually, Jeff touches on what I want to point out, and it's a technicality. But if you are going to have a genus and species, genus is capitalized, species is not; and then you're going to go to a variety, what you can do is just have the genius and put, s-p-p for the species that
might fall under the laminaria. And then you are not going to only limit it to the variety ochotensis and longissima.

It's a technical thing, but you are getting at that, I think. So if they are all in the laminaria genus, just put laminara s-p-p dot, and that will cover other species like the Japonica and the angustata and maybe some other new one that is going to come in there, okay?

And actually you should do that on all the botanicals that you ever talk about, not just - you can't just call it carrot, you should actually have its Latin name.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: I have a question for Joe. Do you know whether the use of the word, Pacific, here is an ocean term or is it essentially a culinary term where it is part of the characteristics that they are doing?

MEMBER SMILLIE: I did talk with a number of manufacturers on this one, and
distributors. It's a generally recognized term. Kombu itself is a generally recognized term in the culinary trade.

Whereas if we said, as Hugh pointed out, laminaria, that's a bigger, that's bigger than Kombu. That includes what is commonly called Atlantic Kombu which the culinary people don't regard as real Kombu. It's a similar species but it doesn't have the same characteristics as what is called in Japanese culinary tradition Kombu.

MEMBER GIACOMINI: So wouldn't the use of the Pacific Kombu protect the industry -

MEMBER SMILLIE: Yes.

MEMBER GIACOMINI: - even a little more so than listing species of genus, I would think.

MEMBER SMILLIE: I would agree.

MEMBER GIACOMINI: And the argument that Jeff is looking at of whether they are coming up with something that is acceptable or
not without having the specific genus, we are
talking about a culinary category more than an
ocean.

MEMBER SMILLIE: And I think that
was the public comment we got, which is in
your binder - maybe we should refer to it;
I'll have to find it first. But that was the
public comment, that they wanted to be really
sure that uses of - if other lamanaria would
suffice, that people would have to purchase
that lamanaria, which was certified but didn't
meet their definition of Kombu.

And if you want, I'd have to find
that public comment if you want to go to that,
but that's what my friendly motion will be is
to drop the species names and simply insert
Pacific Kombu, which is more of a trade term.

CHAIRMAN DELGADO: We are looking
for that reference.

MEMBER SMILLIE: I have it. You
want me to read the whole thing? It won't
take long.
Okay, it's ready docket number blah blah blah, seafood Kombu. Please accept this comment regarding the addition of seaweeds Kombu to Section 606. It should clearly restrict it only to the species specifically designated as listed in the public notice. Thorvin Inc., doing business as Thorvin Kelp is the largest US-based distributor of certified organic kelp products with certified organic aquatic plant products available in commercial quantities in excess of 1,000 blah blah.

I am writing to inform you that abundant supplies of certified organic Lamanaria digitata are commercially available. Lamanaria digitata is commonly known as Atlantic Kombu, and can be substituted for Kombu that originates in the Pacific Ocean for a number of functions, current inventories, blah blah blah.

I want to affirm that the petitioner who requested the addition of Kombu
to the national list accurately recognized the availability of lamanaria digitata.

Therefore we respectfully request that the listing clearly limit the category to Pacific Kombu, which is the species listed as the petitioner requested.

CHAIRMAN DELGADO: Any questions? Kevin, followed by Dan.

MEMBER ENGELBERT: We have two questions. We have certified Thorvin Kelp. How is that possible without aquaculture aquatic standards. And if that is certified organic why can't the Kombu be certified.

MEMBER SMILLIE: The answer is, it's certified under the wild harvest regulation, and that particular kelpery or whatever was able to be certified. The ones in the Pacific were not.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: So it sounds like, if I heard what you were reading correctly, he wants both varieties - he wants
it listed as seaweed Pacific Kombu with the varieties -

MEMBER SMILLIE: That is correct.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: I guess I'm just curious, because if we list - I understand what he's saying now I think - and if we list them this way with these varieties, then in order to get these off the list you would have to come up with the exact varieties in organic form, as opposed to saying if, you know, I'm just wondering if they are trying to avoid using Atlantic Kombu that is certified organic. Because there is a - clearly, they state it themselves, that there is plenty of certified organic Kombu out there.

MEMBER SMILLIE: Right, but it doesn't fulfill the functions that Pacific Kombu fulfills. It fulfills other functions.

VICE CHAIR MOYER: I don't understand what those are.

MEMBER SMILLIE: Well, I don't know
either, quite frankly, feed or other - I don't know. But to use it - and I don't want to get specific - but it's a specific use within the Japanese culinary tradition. It's actually packaged in a well known brand of organic beans that uses Kombu, and this company is diligently finding organic ingredients every place they can.

So I figured, hey, if they can't find it, it ain't there. So we talked to them and they said, no, we'd love to be able to get it, and we've been pushing and pushing, but it simply can't be done at this time.

So what this - what my take on the petition is, what they're saying is, hey, don't just throw up Kombu there and then have someone come along and say, oops, I can't use your Kombu that's certified. I'll use conventional because it's on list 606.

They're saying, hey, protect our business, which doesn't want to be damaged by your incorrect listing, is my interpretation.
of that letter.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: I mean I think that between the petitioner's attempt to make it clear he doesn't want this listing to interfere with the Atlantic guy's business, and also the petitioner and the commenter who is involved in Atlantic Kombu is making very clear that I have organic certified Kombu of a different variety that is available and can be used for certain functions but not all of these functions.

So I think they are actually both kind of backing each other up and making sure that there will be markets for their products.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Well, then in that regard I sort of have things backwards. It is actually more important that we be as specific as possible.

MEMBER SMILLIE: Pacific-specific.

VICE CHAIR MOYER: I apologize for
dragging everybody through that, but it helped me.

CHAIRMAN DELGADO: Any other questions in that respect?

So the motion stands as seaweed Kombu. Do we have another question, comment on that respect?

Hugh?

MEMBER KARREMAN: Okay, so you're going to have the Lamanaria Japonica ochotensis, right? And you don't need the Lamanaria Japonica just before that.

CHAIRMAN DELGADO: Just to clarify, we do have Lamanaria Japonica as well as lamanaria angustata, and each of those are specific varieties.

MEMBER KARREMAN: If all you want are those two varieties shown, that's the only two you really need to list. You don't – because there are going to be other varieties of lamanaria Japonica there before the comma, potentially.
CHAIRMAN DELGADO: I'd like to list it as the petitioner presented it.

MEMBER KARREMAN: Which is what? What I'm looking at?

CHAIRMAN DELGADO: Both, both lamanaria Japonica and lamanaria Japonica ta da da da da.

MEMBER KARREMAN: Okay.

VICE CHAIR MOYER: Was that the Latin form?

MEMBER SMILLIE: That was ig-pay atin-lay.

(Laughter.)

CHAIRMAN DELGADO: Okay, going back, as I said - Dan, go ahead.

MEMBER GIACOMINI: I'll step out on a limb here, not being a handling person. I would move to amend the motion to add the word, Pacific, between seaweed and Kombu, and following Kombu, add the - I'm not even going to try saying it - the species listed as they are on the recommendation.
CHAIRMAN DELGADO: Julie, do you agree with that?

MEMBER WEISMAN: I accept the amendment.

CHAIRMAN DELGADO: So it is a friendly amendment.

Do you want to say something before I state the amendment?

It is moved to amend the motion to include the word, Pacific, after seaweed - no, because Julie was the original proponent of the motion. She has accepted the amendment, and we don't need a second. It's a friendly amendment.

(Off-mike comment.)

CHAIRMAN DELGADO: I'm sorry, you're right, you're absolutely right.

MEMBER KARREMAN: Thank you, I accept.

CHAIRMAN DELGADO: Thank you for that friendly parliamentary check. And I'll continue stating the motion to amend.
It is moved and seconded to amend by including the word, Pacific, after seaweed, and the motion will remain as seaweed Pacific Kombu followed by lamanaria Japonica, lamanaria Japonica variety ochotensis, lamanaria angustata and lamanaria angustata variety longissima.

Debate? Hugh?

MEMBER KARREMAN: Well, not a debate.

CHAIRMAN DELGADO: Questions.

MEMBER KARREMAN: You got the word, seaweed, in there. To me that's like the whole kitchen sink. So why don't you just have the Pacific Kombu and the rest of it - just take that seaweed out of there.

CHAIRMAN DELGADO: At the moment we do have a motion to accept the inclusion of the word Pacific in the original motion. So let's take care of that unless you can make an amendment to amend the amendment to drop the word, seaweed.
Clarification, we have one from the point of the director followed by our parliamentarian.

MS. FRANCIS: I would just prefer that you refer to how it's listed in the roll where we have a category of seaweed. I think we should be consistent. We have a category of seaweed.

MEMBER GIACOMINI: Seaweed as it's listed now is not separated off. V is wakame seaweed, it's not seaweed wakame.

MS. FRANCIS: Really? Okay.

CHAIRMAN DELGADO: We will have to regain control. Going back to Dan, the original, you had a comment.

MEMBER GIACOMINI: The amendment was accepted in a friendly form. It is then accepted. It is now the motion on the table.

CHAIRMAN DELGADO: It is the motion on the table?

MEMBER GIACOMINI: It is not to amend the motion; it is the motion as amended.
CHAIRMAN DELGADO: As amended. I stand corrected. So we do have a proposal from Hugh. Was that a motion on your part? Can you state it as a motion, please?

MEMBER KARREMAN: I will make the motion to take the word, seaweed out of there for - forget the motion. Just don't worry about it.

CHAIRMAN DELGADO: Okay, any other comments? Dan?

MEMBER GIACOMINI: I believe when we did the wakame, we did it as seaweed wakame, and it came - did we not? We did it as wakame seaweed?

CHAIRMAN DELGADO: Bob, can you state that for the record?

MR. POOLER: Bob Pooler, NOP. It's wakame seaweed that's listed in the regulations.

MEMBER GIACOMINI: We are trying to see what our recommendation was.

MR. POOLER: I think it was wakame
seaweed. I'd have to check on that.

CHAIRMAN DELGADO: So Dan, back to you, the concern is that the position of the seaweed -

MEMBER GIACOMINI: My thinking was that they had slightly modified in an insignificant form, and they could certainly do that again. If they are held not to, then we would want to make sure we are consistent.

CHAIRMAN DELGADO: Okay. Our director is showing signs of frustration. Do you want to make a statement?

Hugh?

MEMBER KARREMAN: On 606 you have it listed under 2(v) wakame seaweed, and in parentheses, Hondaria. So I would say that on this here it should say Pacific Kombu seaweed, and then in parentheses the Latin botanical names, because you have precedence here.

CHAIRMAN DELGADO: Joe, and the question from the chair to the members, would we be changing significantly the intent of the
petition?

MEMBER SMILLIE: I think it's a friendly amendment.

CHAIRMAN DELGADO: It's a friendly amendment. Julie?

MEMBER WEISMAN: I'm still looking for the wakame recommendation. I'm sorry. No, no, not for listing; how we recommended it.

But in the meantime, could you please repeat the friendly amendment.

CHAIRMAN DELGADO: The friendly amendment is as follows, to change the position of the word, seaweed, to follow after Kombu, so it would read Pacific Kombu seaweed.

MEMBER WEISMAN: Can I ask a question before I decide whether to accept or not?

CHAIRMAN DELGADO: Yes, absolutely.

MEMBER WEISMAN: Hugh, do you think it would be very different to call it Kombu seaweed Pacific?
CHAIRMAN DELGADO: Hugh?

MEMBER KARREMAN: Mr. Chairman, I could live with that, if you have the Latin names after it; that's what really counts.

CHAIRMAN DELGADO: Dan, and followed by Mr. Matthews.

MEMBER GIACOMINI: Unfortunately, what I have is the recommendation out of committee, not the completed recommendation from the board. But from the committee it was wakame enduria species.

CHAIRMAN DELGADO: No mention of seaweed?

MEMBER GIACOMINI: No mention of seaweed.

CHAIRMAN DELGADO: Mr. Matthews, can you bring some clarity to the matter?

MR. MATTHEWS: Well, I don't know.

I don't know that I'm going to bring a whole lot of clarity. But the importance is the genus, the species, and if you go down to variety; that's what's
important.

The reason for the scientific names is because the common names vary so greatly from one region to another. So the important thing is, do you have the right genus, species, and if necessary, variety.

The common name is not that important.

CHAIRMAN DELGADO: Very well; thank you for that.

Back to Julie, you had a comment?

MEMBER WEISMAN: No, in that case I would accept the friendly amendment.

CHAIRMAN DELGADO: A friendly amendment is accepted by the original proponent of the motion, and also, I understand from the second of that motion, Joe, is that correct?

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: Okay, so the motion now stands as Pacific Kombu seaweed followed by the specific genus, species and
varieties of the material.

Any other questions? You ready for the question?

The question is on the motion to list Pacific Kombu seaweed, lamanaria Japonica, lamanaria Japonica variety ochotensis, lamanaria angustata, lamanaria angustata variety longissima.

(Laughter.)

That's my pigeon Latin.

We'll start our vote with Kevin.

MEMBER ENGELBERT: Yes.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: Yes.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: Yes.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Yes.
CHAIRMAN DELGADO: Jeff.
VICE CHAIR MOYER: Yes.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: Yes.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: Yes.
CHAIRMAN DELGADO: Tracy.
MEMBER MIEDEMA: Yes.
CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: Yes.
CHAIRMAN DELGADO: Barry.
MEMBER FLANN: Yes.
CHAIRMAN DELGADO: Hugh.
MEMBER KARREMAN: Yes.
CHAIRMAN DELGADO: And the chair votes yes.

VICE CHAIR MOYER: Mr. Chairman, the vote is 14 yes, one absent.

CHAIRMAN DELGADO: The motion is agreed to.

We can move on to the next material.
MEMBER WEISMAN: The next material is tangerine peel powdered extract. It was not difficult to know, despite the fact it wasn't mentioned in the petition at all, that there is plenty of organic tangerine being grown.

And because this was not mentioned in the petition, this failed unanimously at the committee level for inclusion on the national list.

So with that I move for the inclusion of tangerine peel powdered extract on section 205.606 of the national list.

CHAIRMAN DELGADO: Is there a second?

MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It is moved and seconded to include tangerine peel powdered extract on the national list, Section 205.606. Discussion?

MEMBER KARREMAN: If I could just make a comment.
CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: From what you were saying, Julie, it has nothing to do with the way the vote is going to go, but if the petitioner didn't even bother to realize that there are a lot of organic tangerines out there, isn't there a lot of time and energy that everyone has put into this to get to this point. It could have been evaluated a lot earlier and just kind of kicked back or something.

Maybe that is out of order. But there are a lot of organic oranges, tangerines, apples.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Believe me, I am sitting here myself repeating the same thing over and over again, and it is a lot of time.

But I also think that the 606 process is fairly new, and entertaining petitions for it are new, and I don't think that petitioners necessarily realize what kind
of detail we are looking for.

So I think unfortunately it's an exercise that we have - it's the growing pains that we have to go through with a new category of materials that we are having to consider.

CHAIRMAN DELGADO: We have Joe followed by - yes, Steve.

MEMBER DeMURI: And I agree with that. But just because there are a lot of tangerines out there organically produced doesn't mean that they can be processed into the form that petitioner wants them. So we have to look at that aspect of it too.

If they had just petitioned for organic tangerines, then it probably wouldn't be a problem. Different story.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: And if they had acknowledged in their petitions the existence of organic tangerines, but the lack of anyone out there willing then to process them into the form that they need to use it, that would
have satisfied us. It would have satisfied us more. We might have still wanted more information. But that would have been much more satisfactory.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: Just a general comment.

All these petitioners from the - all these petitions from the same petitioner that have none of the homework done properly, even though 606 is new, I think what you may be getting at, could it have just been sent back and said, we are not going to address these; it's a lot of time to do this. And you need to do your homework before we do ours.

I think that is the general -

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Well, actually, this - the fact that we got all these separate petitions was exactly the result of sending - originally these were petitioned all on one petition as a category, with all of these
items listed on it.

And when we said, no, they have to be petitioned individually, as individual items, what they did was, they made 16 copies, and then they cut-and-pasted, and submitted it back to us that way.

So we had already sent them back, and this is what came back to us.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: I think I'd like to recognize the humanity in this whole process. We are getting better and more sophisticated and more familiar with this process.

I think it's the same thing with the program. I know in my communication with Bob, there is a different level of evaluation of what he's considering, completeness in this round, than there was in the first group we had where we just had - fifty or whatever. I'm sure he's learning from this of what - what is going to be needed on the 606, because
it's a learning process for them too, and I don't necessarily know that a package like this would necessarily get passed on to us in the same way a year from now. They're learning from it too.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Coupled with that is - we struggled with these. Do we send them back? Do we not send them back? What do we do?

The process of sending back creates quite a bit of work as well, and going back and forth. And we really struggled with the precedent that we would be sending. How do you decide which petitions you hand-hold the petitioner through and which you don't.

And we struggled, and I'm not sure we found the right answer on that. If we choose to send them back because it's not complete - we're still learning.

CHAIRMAN DELGADO: I would like to remind the board that we are concentrating on
a motion, and although it's a valid discussion on this point, we can always take that up after the voting.

Does the program wish to comment on the motion pending?

MS. ROBINSON: Just to say that, you know, in the past you generally concentrated obviously on synthetics, so you have good procedures for what has to be in a petition on synthetics, and now you are coming up against 606, you are coming up - you are evaluating agricultural materials.

And we can issue guidance - maybe what we need here is a better set of what kind of criteria, what kind of information needs to be put in the petition for the petitioners for submitting 606, because these are different - just the nature of them is different.

So but you know obviously that's something that we need to work on collaboratively. The board doesn't need to just go off and say, okay, here's what we
want. Because clearly you are dissatisfied with the information you've gotten. We would have been dissatisfied with that.

But you would have been dissatisfied if we had just said, out and out, petitions are no good, we're rejecting them.

So that's something that the board probably does need to begin thinking about and working on, otherwise everyone is wasting time as you said.

CHAIRMAN DELGADO: I can hear an action item from that point, and I like that for the work plan, though the chair agrees with me.

Kevin, do you have a question related to the motion, pending question?

Okay, pending question. Any other questions? Are you ready for the question?

The question is on the motion to include tangerine peel powdered extract on the national list Section 205.606, and we'll start taking our vote with Jennifer.
MEMBER HALL: No.
CHAIRMAN DELGADO: Steve.
MEMBER DeMURI: No.
CHAIRMAN DELGADO: Julie.
MEMBER WEISMAN: No.
CHAIRMAN DELGADO: Dan.
MEMBER GIACOMINI: No.
CHAIRMAN DELGADO: Katrina.
MS. HEINZE: No.
CHAIRMAN DELGADO: Jeff.
VICE CHAIR MOYER: No.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: No.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: No.
CHAIRMAN DELGADO: Tracy.
MEMBER MIEDEMA: No.
CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: No.
CHAIRMAN DELGADO: Barry.
MEMBER FLANN: No.
CHAIRMAN DELGADO: Hugh.
MEMBER KARREMAN: No.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: No.

CHAIRMAN DELGADO: And the chair votes no.

VICE CHAIR MOYER: Mr. Chairman, the vote is 14 no, one absent.

CHAIRMAN DELGADO: The motion to include tangerine peel powdered extract on the national list Section 205.606 is lost.

We can move on to the next material.

MEMBER WEISMAN: The next material being petitioned is Tragacanth gum. And it doesn't say it on the substance listing, but it does say in the annotation section it would be water-extracted only.

This would be in addition to an already existing section on 205.606, and that is the annotation for the entire section.

There is a little history here, and actually when the petition first came before
the handling committee, we were asked if perhaps it already is included in the section, and there are documents showing that when gums were originally – water-extracted gums were originally being discussed for 606 that Tragacanth gum was among the gums that were being discussed at the time, and perhaps it was an oversight that it didn't make it onto the final list.

We decided that for good order's sake it was important to have it be a petition, and not to have it added as a technical correction.

But in fact, Tragacanth gum is produced in an identical manner to other gums that are already listed.

In addition there is a significant problem in terms of region and trade that make it not available right now organically.

The main growing area for this material is Iran, and we are not allowed to import products from Iran right now.
Conventional forms of this material - well, conventional forms of this material were described are grown and manufactured in Turkey, and the Turkish organic sector is growing, and the petitioner is working very closely with their suppliers in Turkey to develop certified organic forms of the material.

The Tragacanth gum does have functions that are unique to the other gums on the list, and for that reason we found the evidence compelling.

And it was voted by the handling committee unanimously, six nothing, for inclusion on the list.

So at this time I would like to make a motion that Tragacanth gum, water-extracted, be added - included on Section 205.606(b) of the national list, which are water-extracted only gums.

MEMBER SMILLIE: Second.

CHAIRMAN DELGADO: It's moved and
seconded to include Tragacanth water-extracted on the national list, Section 205.606.

Questions from the board? Are we ready for the question?

The question is on the motion to include Tragacanth water-extracted on the national list, Section 205.606, and we'll start taking our vote with Steve.

MEMBER DeMURI: Yes.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Yes.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Yes.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: Yes.

CHAIRMAN DELGADO: Tracy.
MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: Yes.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: Yes.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: Yes.

CHAIRMAN DELGADO: And the chair votes yes.

VICE CHAIR MOYER: Mr. Chairman, the vote is 14 yes, one absent.

CHAIRMAN DELGADO: The motion is agreed to, and we can move on to the next material.

MEMBER WEISMAN: This actually is the last of the petitioned materials for us to deal with.

With have other - we have sunset
materials. But this is the last of the petitioned materials.

CHAIRMAN DELGADO: Let's proceed with the sunset materials then.

MEMBER WEISMAN: The - I have two - we made two separate recommendations to reaffirm the sunset votes that were made at the November, 2007 -- we discussed this earlier in the day with regard to crops. I don't feel necessarily like I have to repeat that background information.

But the summary is that in the comment period that closed after the November vote, there were no comments that were in disagreement with the vote that we had already made, and so therefore, the handling committee recommends reaffirming the board's vote in November to continue listing on Section 205.605(a) agar-agar, animal enzymes, calcium sulfate, Carrageenan, and Glucono Delta Lactone.

MEMBER HALL: Second.
CHAIRMAN DELGADO: It is moved and seconded to reaffirm the votes obtained on the meeting of 2007 of this board.

And they were to continue the listing of the materials agar-agar, animal enzymes, calcium sulfate, Carrageenan, Glucono Delta Lactone in Section 205.605(a).

Discussion. No questions?

The second was Jennifer.

Are you ready for the question? The question is on the motion to reaffirm the votes. Confirming the listing of agar-agar, animal enzymes, Calcium sulfate, Carrageenan, Glucono Delta Lactone.

And we will start the vote with Julie.

MEMBER WEISMAN: And I vote yes.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Yes.

CHAIRMAN DELGADO: Jeff.
VICE CHAIR MOYER: Yes.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: Yes.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: Yes.
CHAIRMAN DELGADO: Tracy.
MEMBER MIEDEMA: Yes.
CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: Yes.
CHAIRMAN DELGADO: Barry.
MEMBER FLANN: Abstain.
CHAIRMAN DELGADO: Hugh.
MEMBER KARREMAN: Yes.
CHAIRMAN DELGADO: Kevin.
MEMBER ENGELBERT: Yes.
CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: Yes.
CHAIRMAN DELGADO: Steve.
MEMBER DeMURI: Yes.
CHAIRMAN DELGADO: And the chair votes yes.

VICE CHAIR MOYER: Mr. Chairman, we
have 13 yeses, one abstention, and one absent.

CHAIRMAN DELGADO: The motion is agreed to, and we can proceed with the next list of materials.

MEMBER WEISMAN: We also - I'm just going to move right into the motion.

I move that - I move for the affirmation of the board's decision at the November, 2007 meeting for the relisting on Section 205.605(b) of cellulose.

CHAIRMAN DELGADO: Cellulose? Is there a second.

MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It's moved and seconded to reaffirm the votes from the November meeting concerning the listing of cellulose in Section 205.605(b).

Discussion? Questions?

Are you ready for the question? The question is on the motion to affirm the votes related to cellulose to be listed on Section - continue to be listed on Section
205.605(b).

We'll start taking our vote with Dan.

MEMBER GIACOMINI: Yes.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Yes.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Yes.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: Yes.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: Abstain.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: Yes.
CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: Yes.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: Yes.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: And the chair votes yes.

VICE CHAIR MOYER: Mr. Chairman, the vote is 13 yes, one abstention and one absent.

CHAIRMAN DELGADO: The motion is agreed to. We can proceed to the next material.

MEMBER WEISMAN: The last thing we have before us is the recommendation for the relisting of tartaric acid on Sections 205.605(a) and 205.605(b).

We have – we spoke in detail yesterday about the rather circuitous history of this material being listed on both sections of the list.

I would like to just further
clarify that the listing on 605(a) would be tartaric acid from grapes, and the listing on 605(b) will be tartaric acid from malic acid.

I think that these were - I'm going to ask for some guidance. We actually at the handling committee these were voted on separately for A and B. Is that - I wrote one paper, but do we need to vote on them separately?

CHAIRMAN DELGADO: Yes, we do. And do you want to include in your motion the specific source of the acid, grapes and malic acid; is that the intent of the committee, Julie?

MEMBER WEISMAN: No. It's not.

CHAIRMAN DELGADO: So it's just a comment and a clarification.

Dan, you had a clarifying comment?

MEMBER GIACOMINI: Being sunset, it's the review of the current existing listing. That is, without the specification annotation on it, in the research of doing
that, the committee found, came across this additional information, of which, as I understand it, they are requesting the program to review that information for a technical correction.

But the sunset itself is as it is currently listed.

CHAIRMAN DELGADO: Any questions on that? Jeff, and then we'll have a response from Joe.

VICE CHAIR MOYER: My question is for you, Dan. Can you be more specific on what you mean about the information for technical review?

MEMBER GIACOMINI: Technical correction, not technical review.

VICE CHAIR MOYER: Oh, I’m sorry, I thought you said technical review.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: It’s a question. Does that mean that we have to remove that language from this recommendation before we
vote on it?

In other words if it came to this meeting with the language, with the technical correction and the annotation made for grape, we can't really do that, can we?

CHAIRMAN DELGADO: No, we can't, because we are talking about sunset.

MEMBER WEISMAN: Right.

CHAIRMAN DELGADO: And the comment made on the part of Dan is correct.

MEMBER WEISMAN: Okay, I haven't made the motion yet, I don't believe.

CHAIRMAN DELGADO: You have not.

MEMBER WEISMAN: So can -- I make the motion with the amendment if I want, correct, to remove -

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: You can make a motion to list tartaric acid on 605(a) and that would cover it.

MEMBER WEISMAN: To relist?

MS. HEINZE: That's what I meant. I
got the second half right.

CHAIRMAN DELGADO: Very good. Is that clear, Julie?

MEMBER WEISMAN: So at this time I would like to make a motion to relist tartaric acid on Section 205.605(a) of the national list.

CHAIRMAN DELGADO: Is there a second?

MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It is moved and seconded to relist tartaric acid Section 205.605(a).

Discussion. No questions? Ready for the question?

The question is on the motion to relist tartaric acid on Section 205.605(a).

We'll start taking our vote with Katrina.

MS. HEINZE: Yes.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Yes.
CHAIRMAN DELGADO: Gerry.
MEMBER DAVIS: Yes.
CHAIRMAN DELGADO: Tina.
MEMBER ELLOR: Yes.
CHAIRMAN DELGADO: Tracy.
MEMBER MIEDEMA: Yes.
CHAIRMAN DELGADO: Joe.
MEMBER SMILLIE: Yes.
CHAIRMAN DELGADO: Barry.
MEMBER FLANN: Abstain.
CHAIRMAN DELGADO: Hugh.
MEMBER KARREMAN: Yes.
CHAIRMAN DELGADO: Kevin.
MEMBER ENGELBERT: Yes.
CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: Yes.
CHAIRMAN DELGADO: Steve.
MEMBER DeMURI: Yes.
CHAIRMAN DELGADO: Julie.
MEMBER WEISMAN: Yes.
CHAIRMAN DELGADO: Dan.
MEMBER GIACOMINI: Yes.
CHAIRMAN DELGADO: And the chair votes yes.

VICE CHAIR MOYER: Mr. Chairman, we have 13 yeses, one abstention, and one absent.

CHAIRMAN DELGADO: The motion is agreed to. We can move on to the next material.

MEMBER GIACOMINI: Point of order, Mr. Chairman?

CHAIRMAN DELGADO: Yes, Dan.

MEMBER GIACOMINI: Question to Barry: this is not a reaffirmation of old votes. This is new right now that has not been done before.

Are you abstaining for the same reason you did before, or do you just want to abstain on this motion?

MEMBER FLANN: I'm just abstaining on this motion.

MEMBER GIACOMINI: Okay, I just wanted to make sure it wasn't because of it had been up before, which it had not.
CHAIRMAN DELGADO: Any other questions?

We can proceed to the next material.

MEMBER WEISMAN: At this time I would like to move for the relisting of tartaric acid on Section 205.605(b) of the national list.

CHAIRMAN DELGADO: Is there a second.

MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It's moved and seconded to relist tartaric acid on Section 205.605(b).

Discussion? Dan, followed by Kevin.

MEMBER GIACOMINI: I -- on a couple of different levels, I find it troubling that we have this on the list under both A and B.

And that gives me trouble, and with the information that Brian provided in historical clarity I think there is
justification that there is some new information in the fact that the thought process of what is going on in the world of organic and regulations is different now than it was then.

However, there is - even though I feel that way and I would love to vote no on this, we did have I believe the plethora and overwhelming one comment in support and no comments opposed.

So based on the preponderance of the comments, I kind of feel that I am forced to - and staying with that, to support it.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: That was along my thought process exactly, and I'd like an explanation from somebody from the handling committee or somebody familiar with tartaric acid as to what the different properties are made from grape wine versus malic acid.

And even though there were no comments received, I'd still like a review of
why the handling committee believes it should remain on.

I understand the indications of the public comment, reasoning.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: You know the sunset process is a very limiting process. We are bound by having received evidence on the three points that there is a replacement available, or there is new evidence showing that it is harmful in a way that they did not know at the beginning.

We got no evidence, so therefore we are bound to relist is my understanding.

MEMBER ENGELBERT: I realize all that. I just want to entertain the possibility that maybe no one bothered to do that.

But I'd also still like an explanation of the differences in the properties, and why there is actually - why a synthetic version is needed.
CHAIRMAN DELGADO: Any responses to
- Julie?

MEMBER WEISMAN: I want to say that
I personally - I can't say that I know enough
about all the unique uses of all the different
forms of tartaric acid.

But we did hear comment during the
last three days confirming that they are
different qualities, and that they are used
for different purposes, and that although most
uses - it appears that most use of tartaric
acid is of the nonsynthetic variety, that
there are certain uses for which at this point
only the synthetic can be used.

And I apologize for not being able
to be more specific than that.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: I just want to I
guess further clarify, and I was going to
repeat, I think it was Kim that said there's a
difference in the processing between two
sources.
I would not even have a problem with this being on the list on B along with what's on A with the consideration that there is a difference in processing.

But it seems that the historical memory that we have is for an insistence that it not only be the L-malic acid which as listed on 605(a) is nonsynthetic if it had been listed as L-malic, where it only could have been made synthetically from the nonsynthetic source.

But it seems the historical memory we have was an insistence that it be from all forms of malate, which includes synthetic malate which is not allowed on the list because it's not on 605(b) which is synthesized from butane.

So it's not only the fact of it being on A, but the fact of it's being on B with both L-malate and DL-malate being allowed as it source.

And I wish the board then had done
otherwise.

CHAIRMAN DELGADO: Any other comments?

Okay. Are we ready for the question?

The question is on the motion to relist tartaric acid under Section 205.605(b), and we'll start taking our vote with Jeff.

VICE CHAIR MOYER: No.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: Yes.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: Abstain.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: No.

CHAIRMAN DELGADO: Kevin.
MEMBER ENGELBERT: No.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: No.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: Yes.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: Everything Kevin just said, but yes.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Yes.

CHAIRMAN DELGADO: And the chair votes yes.

VICE CHAIR MOYER: Okay. Mr. Chairman, I have 3 nos, 10 yeses, 1 abstention and 1 absent.

CHAIRMAN DELGADO: The ayes have it, and the motion is agreed to.

We can proceed to the next material.

MEMBER WEISMAN: That's all folks.
CHAIRMAN DELGADO: That's it, fantastic.

(Applause.)

CHAIRMAN DELGADO: Well, thank you very much, Julie. That's a fantastic amount of work, and we do have a member of the program wishing to approach the board.

Mr. Matthews.

MR. MATTHEWS: The point I want to make is that there was some discussion early on about how you would like to annotate the tartaric acid.

I would suggest that you might want to go ahead and consider making that recommendation to the program, and that we can go ahead and consider your recommendation. If you don't make the recommendation and it goes back exactly the way it is, I'm not saying we are going to agree with you. I'm just saying you could make a recommendation to us on that if you wanted to.

MS. HEINZE: Is that something we
can do here? Now? Or does it have to come out of committee?

MR. MATTHEWS: That's exactly why I came up. So you guys could make that recommendation. Julie has already talked about it as the way they wanted to originally make the recommendation, and then she got talked out of doing it.

The thing is that if you really really want to do that, go ahead and make your recommendation; we will take it under consideration.

CHAIRMAN DELGADO: Question, Julie.

MEMBER WEISMAN: I just want to ask, and the reason we are able to do that at this sunset is because we are basically asking for a - an annotation as a technical correction?

MR. MATTHEWS: The way I understood it was that you felt that the original recommendations on these materials took those things into consideration when they were done, and one was from the grapes, the other one was
from malic acid. That's what I thought I heard.

MS. FRANCIS: Can I offer?

CHAIRMAN DELGADO: We have a clarification from the director.

MS. FRANCIS: Just looking at the institutional history on this, that is the original recommendation was as you had made it as a committee, more recently, wanting those annotations added. They were added as a technical correction later, but those annotations were left off, and I don't know if that was - it doesn't really seem clear from the record whether that was intended to leave those annotations off in the first place.

MR. MATTHEWS: That is my whole point of coming forward and saying, if you want to make that recommendation we can go back and look at the record and make that clarification if we feel that it is warranted.

CHAIRMAN DELGADO: We have Katrina wanting to participate.
MS. HEINZE: I just wanted to make
clear for the board, in 1995 when the first
board voted on these materials, they voted on
them with the annotations there. But tartaric
acid has just been kind of a poor orphan
child. It got left off for awhile, then it
finally got relisted, and those annotations
just got lost.

So this is really going back to the
original intent when they were originally
listed.

MR. MATTHEWS: Yes, poor tartaric
acid. I will be the first to admit, tartaric
acid has had a colorful history.

CHAIRMAN DELGADO: Julie, back to
you.

MEMBER WEISMAN: I just want to say
that I am inclined - I am going to need some
help procedurally from everybody because I
don't want to get in trouble here. But I am
inclined to try and preserve the original
decision, that included the annotation.
I do want to make clear, though, because it gets discussed over and over and over again, sunset, I do not want to set a precedent where people think that annotations can be changed during sunset. I'm very concerned about how that is going to appear.

CHAIRMAN DELGADO: Excellent question. Katrina, do you want to address?

MS. HEINZE: A suggestion perhaps that you make a recommendation that we ask the program to review the annotation history of these and make any necessary technical corrections.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: If I did that do you think we would have to make any new - can you make suggestions about the procedure for asking for that?

CHAIRMAN DELGADO: I believe that a simple request on the part of the committee that's saying to the rest of the vote, and on to the program, would be enough, but I would
like to have the input on the part of the director.

Is that correct?

MS. FRANCIS: I think that you should make a clear motion as to what you want the program to do.

CHAIRMAN DELGADO: Okay. So the answer is, let's treat it as a motion with a specific recommendation. That is what the director is suggesting.

Dan, do you have any other input?

MEMBER GIACOMINI: I think maybe part of the concern is the structure and the public. This was part of an – it was an underlying part of the original recommendation which in a way was phrased that we are voting to sunset and in the research we have realized that this technical correction may be justified.

That has been before the public. That has been open for public comment; that was in the Federal Register. I don't think we
need to worry about that, merely asking the
NOP to consider technical corrections, to have
the annotations as appropriate for tartaric
acid would be appropriate.

CHAIRMAN DELGADO: So just a
clarification. We think that this will be a-
by the second paragraph if you will, with a
proposal to add those annotations outside of
sunset; is that correct?

MEMBER GIACOMINI: This would be an
totally separate recommendation to the sunset
recommendation.

MEMBER WEISMAN: I'd like to make -
if the board is ready I would like to make a
stab at that recommendation.

CHAIRMAN DELGADO: I would like to
also comment on the part of the board members
to see if there is any objection to that
procedure? We have not stated that in the
agenda, and I don't want to run into any
problems.

So is there any objection on the
part of the board members to proceed with this potential motion?

Okay, if that's the case, Julie, let's go on.

MEMBER WEISMAN: I move that the annotations that were included in the original board recommendations for the listing of tartaric acid on 605(a) and (b) be restored to their listing, to their current listing.

CHAIRMAN DELGADO: Can you just list those annotations please.

MEMBER WEISMAN: Yes, I'm sorry.

Okay, I move for restoring the annotation made from grape wine to the annotation - to the listing of tartaric acid on 605(a).

CHAIRMAN DELGADO: Can you move up that? And just for clarity, Julie, we will take it like we did before, Section A first and then Section B later.

MEMBER WEISMAN: Okay. I would like to make a motion for the restoration of the
annotation that was included by the original board recommendation for the listing of tartaric acid on 605(a) to include made from grape wine.

CHAIRMAN DELGADO: Is there a second?

MEMBER DeMURI: I'll second it.

CHAIRMAN DELGADO: It is moved and seconded to add the annotation, made from grape wine, to the listing on the - to tartaric acid as listed in Section 205.605(a), and this will be the original annotation.

Discussion? Gerry?

MEMBER DAVIS: Can you pull the screen down just a couple of lines?

Okay, it's made from grape wine, not from grapes, right?

CHAIRMAN DELGADO: The motion is made from grape wine.

MEMBER DAVIS: That's how it was?

MEMBER WEISMAN: That's how it was.

CHAIRMAN DELGADO: Dan.
MEMBER GIACOMINI: Just for clarification, Katrina has a copy of the original document. Could we just verify that it was specifically grape wine.

MS. FRANCIS: It's in the original transcripts for 1995 that way.

CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Valerie, do you have that transcript on your computer?

MS. FRANCIS: This is not my computer. It's on the Internet, and it can be looked up if somebody has access.

MS. HEINZE: Well, I was just thinking, it might make the board more comfortable if they could actually see it. That whole picture is worth a 1,000 words.

MS. FRANCIS: They could actually see it.

MS. HEINZE: I will bring it up on my computer as well.

CHAIRMAN DELGADO: The chair recognizes the member of the public. Please
introduce yourself.

MR. SIEGEL: Yes, I'm Richard Siegel, a lawyer from Washington, D.C., and I'm counsel to Marroquin Organic International.

When Ms. Grace Marroquin gave her comment on Monday, she referred to organic tartaric acid, and she said that it's organic grape juice extract, where the organic tartaric acid is coming from.

So if you used the word, wine, maybe you would be restricting the category unduly. Maybe you ought to just stick to grapes.

CHAIRMAN DELGADO: Julie, can you respond to that.

MR. SIEGEL: That's all I have to say.

MEMBER WEISMAN: Yes, if it is in fact - right now we are asking for a technical correction restoring an annotation as it previously existed, and I believe that is the
only choice we have right now, because we are not starting with new annotations; we are just asking to restore an old one.

CHAIRMAN DELGADO: Thank you.

Valerie, you had a point to make?

MS. FRANCIS: She made the point.

CHAIRMAN DELGADO: Okay. Have we found that?

MEMBER GIACOMINI: Yes, it does say grape wine.

CHAIRMAN DELGADO: It's been confirmed. So it's grape wine.

Any other questions on the board?

Any other questions?

Are we ready for the question?

MEMBER WEISMAN: I just want to see what Valerie typed from what I said. Because I think the motion should mention that this is being done as a technical correction.

CHAIRMAN DELGADO: Can you show us the way the motion will be printed?

MEMBER WEISMAN: Okay, I want to add
the words, after J.W. motions, that as a technical - okay.

I move - okay, here we go. I move that the NOP consider technical corrections to add the annotation to tartaric acid - sorry.

CHAIRMAN DELGADO: Well, wait a minute.

MEMBER WEISMAN: I move that as a technical correction the NOP restores the annotation included in the original listing of tartaric acid.

CHAIRMAN DELGADO: We have a motion pending already, Julie. Do you want to withdraw that motion and state a new one?

MEMBER WEISMAN: I'm sorry; it's getting late.

CHAIRMAN DELGADO: That's all right. Do you wish to make a clarification on the motion that you have already stated?

MEMBER WEISMAN: Yes, I wish to make a clarification.

CHAIRMAN DELGADO: What is your
concern?

MEMBER WEISMAN: I wish to clarify
that we are asking for this as a technical
correction.

CHAIRMAN DELGADO: Okay.

Any other questions? Discussion?

Are we ready for the question?

The question is on the motion to
add the annotation made from grape wines to
the listing for tartaric acid as found under
Section 205.605(a).

We'll start taking our vote with
Gerry.

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: Tina.

MEMBER ELLOR: Yes.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: Yes.
CHAIRMAN DELGADO: Hugh.
MEMBER KARREMAN: Yes.
CHAIRMAN DELGADO: Kevin.
MEMBER ENGELBERT: Yes.
CHAIRMAN DELGADO: Jennifer.
MEMBER HALL: Yes.
CHAIRMAN DELGADO: Steve.
MEMBER DeMURI: Yes.
CHAIRMAN DELGADO: Julie.
MEMBER WEISMAN: Yes.
CHAIRMAN DELGADO: Dan.
MEMBER GIACOMINI: Yes.
CHAIRMAN DELGADO: Katrina.
MS. HEINZE: Yes.
CHAIRMAN DELGADO: Jeff.
VICE CHAIR MOYER: Yes.
CHAIRMAN DELGADO: And the chair votes yes.
VICE CHAIR MOYER: Mr. Chairman, the vote is 14 yes, one absent.
CHAIRMAN DELGADO: The ayes have it, and the motion is agreed to.
We can proceed to the next motion, Julie.

MEMBER WEISMAN: I move that as a technical correction the NOP restore the annotation included in the original listing of tartaric acid made from malic acid to its listing on 605(b).

CHAIRMAN DELGADO: Is there a second?

MEMBER DeMURI: Second.

CHAIRMAN DELGADO: It is moved and seconded to ask the program to make the technical correction to add the annotation made from malic acid to tartaric acid as found in Section 205.605(b).

Discussion? Any questions from the board?

Are you ready for the question?

The question is on the motion to request the program to make the technical correction to the annotation made from malic acid to tartaric acid as listed under Section
205.605(b).

We'll start taking our vote with Tina.

MEMBER ELLOR: Yes.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: Yes.

CHAIRMAN DELGADO: Joe.

MEMBER SMILLIE: Yes.

CHAIRMAN DELGADO: Barry.

MEMBER FLANN: Yes.

CHAIRMAN DELGADO: Hugh.

MEMBER KARREMAN: Yes.

CHAIRMAN DELGADO: Kevin.

MEMBER ENGELBERT: Abstain.

CHAIRMAN DELGADO: Jennifer.

MEMBER HALL: Yes.

CHAIRMAN DELGADO: Steve.

MEMBER DeMURI: Yes.

CHAIRMAN DELGADO: Julie.

MEMBER WEISMAN: Yes.

CHAIRMAN DELGADO: Dan.

MEMBER GIACOMINI: Yes.
CHAIRMAN DELGADO: Katrina.

MS. HEINZE: Yes.

CHAIRMAN DELGADO: Jeff.

VICE CHAIR MOYER: Yes.

CHAIRMAN DELGADO: Gerry.

MEMBER DAVIS: Yes.

CHAIRMAN DELGADO: And the chair votes yes.

VICE CHAIR MOYER: Mr. Chairman, we have 13 yeses, one abstention, and one absent.

CHAIRMAN DELGADO: The ayes have it, and the motion is agreed to.

We can proceed with the next motion, Julie.

Are we done?

MEMBER WEISMAN: I don't think there is one.

CHAIRMAN DELGADO: I think we are done. Thank you very much for that excellent show of endurance.

Is there a question from the executive director? No? Very good.
Let's move on next to the next item on the agenda, and it is the committee work plans. We'll start doing those fairly quickly. We are running a little bit late behind schedule. So we will start with the lifestyle committee, Dr. Karreman.

**COMMITTEE WORK PLANS**

**MEMBER KARREMAN:** All right.

Of course we will be working on aquaculture, specifically the fish meal and fish oil recommendation that we deferred up on today, and the net pens with the questions we had, we still have on the table, and the bivalve molluscs, and is it appropriate to ask the program for any questions right now or not?

**CHAIRMAN DELGADO:** No, not at the moment.

**MEMBER KARREMAN:** Not at the moment, okay.

**CHAIRMAN DELGADO:** You can state them as work items in your work plan.
MEMBER KARREMAN: Will do.

Okay, and then previously on the work plan we have called a topic animal welfare, various issues that were species that were already being produced organically, and I think I would like to, in consultation with the chair of the board, change that term to animal husbandry. It seems to be a little more I don't know acceptable, politically correct - I hate being politically correct.

Anyway, and also I've been in touch with Temple Grandin who is a worldwide famous animal behaviorist and she and I talked at length about certain things in organics that might be able to be worked on as animal husbandry, so that is on the work plan.

And that's the two main things, and any materials that come up.

Well, under the animal husbandry, in poultry we want to look more specifically at the - to follow off of the natural behavior of the species and outdoor access, and that,
within poultry, and that might help with the methionine questions as well.

CHAIRMAN DELGADO: Okay. Any questions for the lifestyle committee?

Okay, we can move on then to the handling committee.

Julie?

MEMBER WEISMAN: Yes. On our work plan we will continue to work jointly with the materials committee on work towards what is now being called clarification of definitions on the national list, is that how we've been referring to it, which will of course include liaising with the materials working group. And I will continue to be on those calls.

Number - we also will - much higher on our list now is finalizing the pet food standards that were proposed by the Pet Foods Task Force. We have already been meeting as I had described earlier during public comment yesterday, and we will resume meeting now that this meeting is over and we will consult with...
the Pet Food Task Force, and with the Livestock Committee as we move towards a conclusion.

Third, is to continue to review petition materials. I believe what remains on our work plan now for 605 is calcium from seaweed, propionic acid, which I imagine now that there is some funding will see the TAP; sodium chlorite which we are also wanting to see a TAP on; yeast is still on the work plan, and we are— that is going to be contingent on clarifying the definition of non-ag, and then the status of the petition.

On 606 we have some deferred materials: Chlorella, an algae; Dumonticae, an algae; black pepper extract; buck hull powder. We have a new petitioned material, orange pulp, which we'll be considering. And from this meeting pectin low-methoxy nonamidated has been deferred.

In addition I think that we will need to work and— with the program to clarify
- to refine our 606 procedures.

I also have as a placeholder anyway materials for sunset review. But if I am correct, we do not have any materials coming up for sunset review again until the fall of 2011. But I do believe we have to get started on those, maybe not immediately, but within - I'll confer with Dan about the timeline, and I think it's a lot of materials.

CHAIRMAN DELGADO: Questions for the chair?

MEMBER WEISMAN: I'm not finished.

CHAIRMAN DELGADO: Oh, I'm sorry.

MEMBER WEISMAN: What is also still in my work plan lingering that was - is the issue of flavor guidance. I would like to confer with the program on that work plan item, and also the issue of food contact substances and fortification of food have been on our work plan for quite some time.

Now I'm done.

CHAIRMAN DELGADO: Okay. Questions?

Questions for Julie?
Okay, thank you, Julie.

Next to Dan, materials committee.

MEMBER GIACOMINI: Thank you, Mr. Chairman.

The materials committee on the work plan is the ongoing management of petitioned items. Included in that will be working with the program on seeing if there are any old board-deferred petitions that may have gone by the wayside that we need to pick up and finish.

The next one is continuing making sure that we stay on track, whether it's the time in the next six months or not, but staying on track with sunset items.

The clarifying issue that we need to resolve with that is working with the program on a change that was done in some of the formatting of the materials and exactly what materials are that we are going to be needing to look at to sunset at the appropriate time.
Number three is continuing work with the issue of the - I'll take Julie's new name for it - the clarification of definition of materials in cooperation with handling. And materials working group, and including in that with handling is a clarification on 606.

And also working with the policy committee in cooperation with the policy committee on material issues being considered for clarification and guidelines in the policy procedure manual.

CHAIRMAN DELGADO: Any questions for Dan?

Okay, just want to thank you both for the amount of work you've done, especially regarding the topic of materials. I know it's quite a difficult challenge for all of us, and I really admire the way you've been working with OTA.

Moving on to crops, Mr. Davis, what is the plan.

MEMBER DAVIS: Crops committee has
new and old materials to continue working on, 
defered material from this meeting, 
tetracycline, sort out the last details of 
that that came piling in at the last minute; 
sorbitol octanoate, I believe the TAP has been 
completed, and we are able to start on that, 
pretty close.

Pelargonic acid has been in our 
work plan, and I believe I'm hearing reports 
from the petitioner that they want to revise 
that.

Same situation with ammonium salts 
of fatty acid, which both of them are 
herbicides.

Several new materials for us to do 
sufficiency review and then start on would be 
isoparaffinic hydrocarbon, polycarboxlactone -

MEMBER GIACOMINI: Hold on, 
isoparaffinic what?

MEMBER DAVIS: Hydrocarbon.

MEMBER GIACOMINI: Thank you.

Polycarboxlactone, all one word. Ethylene
glycol, and tetramethyl - I don't know how to pronounce this word - d-e-c-y-n-e - dio, inert and pesticide formulations.

For other items, ongoing work with crops and CAC commercial availability of organic seed work; continue working on the soiless growing system subject; gathering information and working towards an eventual recommendation.

We are going to begin working on the mushroom standard, and also the commitment to at least study the biodiversity compliance assessment information that was provided by the Wild Farm Alliance; we will look at that and decide what and where to go with that.

CHAIRMAN DELGADO: Any questions? Steve?

MEMBER DeMURI: There was a lot of discussion about organic seed at this meeting. What do you guy see as your next steps in that process?

MEMBER DAVIS: Joe, do you want to
comment on that?

MEMBER SMILLIE: We're going to take a look at our - we're not going back to the drawing board. We think that we have the core of a good recommendation, and we are going to go back and look at it. And the two factors we've identified so far, there may be more.

And again we are going to have more for a joint meeting with both committees. It didn't quite work that way last time. We did our part and then passed it on. This time we are going to have joint meetings, and just hone right in on redistributing the burden, and making it valid and useful for everyone, and then looking at how we want to approach databases, how we want to let a thousand flowers bloom and guide the process and all that sort of thing.

So those are the two clear action items; there might be more. But we definitely will have a recommendation for the November meeting, and we'll try and get it out as early
as possible with lots of time for feedback.

CHAIRMAN DELGADO: Any other questions for crops?

Thank you, Gerry.

We'll move on then to Joe.

MEMBER SMILLIE: Well, number one on the list is continuing our work on the multisite certification; that's the primary job. We are hoping that we can get together as a committee and work something out so that we can get a recommendation ready for the November meeting.

That is certainly the target. We hope to meet that target. We've got some real challenges with that, and we are just hoping we can find the middle way on our committee. Because as you know the committee is pretty well split on it, and we're just going to explore ways that we can find to move it forward. That's about all I can say at this time. We've got a lot more feedback, but once again it's divided feedback also. That's
Number one.

Number two is, working directly with the crops committee on the commercial availability document. Certainly as representatives of the certifier community I would say the preponderance of comment on that document was from the certifier community. We work very closely with ACA and NASOP, to accomplish that task. And that will be my job, to liaison with those two already existing groups.

Then we are going to open up some new areas. We want to move forward with the biodiversity issue, as far as we see it, as far as enforcement certification issues of this very important part of the regulation is being enforced properly by certifiers, and we will work with the crops committee on that, hopefully jointly, again, so we've got two items for joint meetings so that we can schedule those and those will be useful.

And then I'm not sure, because I
haven't had a chance to talk to my committee,
and sometimes it's a little premature to say
what your work plan is when the group hasn't
gotten together, because there may be input
from other people.

But I'd like to take up, just pick
one issue that seems to affect the certifier
community. And we got also a response from
the NOP, that we are open to discussing it.
And that is the whole 100 percent claim that's
in the regulation that seems to be an issue
that is not fully vetted. So we are going to
jump into that and put that on our work plan.

So what used to be the sleepy CAC
committee is fully caffeinated and ready to
go.

(Laughter.)

CHAIRMAN DELGADO: Any questions for
Joe? Dan?

MEMBER GIACOMINI: I noticed your
first listing was multisite in the broad
sense, the global name. I don't think there
is much chance that there would ever be multisite if we didn't have multi-grower, and if we weren't multi-grower I would hate to lose it because of a resistance to the rest of multisite.

I would encourage you to consider the possibility of saving the baby before the house burns down.

MEMBER SMILLIE: You mean polishing the door knobs while the boat is sinking.

MEMBER GIACOMINI: Whichever, but if there is part of it that couldn't - that can move forward, I would encourage you to consider - just consider that.

CHAIRMAN DELGADO: Tracy.

MEMBER MIEDEMA: I would like to go ahead and respond. It would be great if you would join in some of our calls. It sounds like you have some very strong opinions. And it's easy to cave to loud voices, but right now we're still working on having a very firm legal underpinning for something that was on
extremely shaky ground. It's so shaky that the whole concept of a sampling protocol for certification was taken from grower groups, and it was taken from others who are also using that same method of certification.

So we're approaching this from a pragmatic standpoint and not an emotional standpoint.

CHAIRMAN DELGADO: Any other questions?

Joe? Something else?

MEMBER SMILLIE: We go as you know, you're chair, and some of the responsibilities and accountabilities of the chair. So what I'd like to do is to continue the process that we sort of started on halfway, and I would cordially invite you to attend the CAC meetings on a regular basis, because I believe that as chair you have shown good leadership, great impartiality, and I'd like to have you join our committee on a regular basis as we thrash through this incredibly difficult
issue.

CHAIRMAN DELGADO: That is an action item on my part, and I will definitely participate in your calls, looking forward. I know it's an incredibly difficult issue. It's an emotional issue too. We have to recognize that.

And as Dan said, there are opportunities. We can discuss those, to move forward. If not one item, all of the items they are considering. But definitely we will be participating in your conference calls.

Any other questions for Joe? No?

Let's move on then to the last of our committees, policy and development, with our newest member, Barry.

MEMBER FLANN: Sorry, Mr. Chairman, I had some important business.

The policy development committee has met by conference call and developed and proposed a work plan. Many of the items I'll go through here in a minute have been sort of
farmed out to us, so not all of them just came out of the committee's ideas. But let me just go through these. Maybe I can go down the list first, and then any questions that you have.

CHAIRMAN DELGADO: Yes.

MEMBER FLANN: Number one, procedures for handling public comments at NOSB meetings. To polish those. We have them now, but to improve on what we have if necessary.

Review the TAP procedures, and I'll say more about that.

Clarify the sunset procedures in the policy manual, and I myself found what was written in the policy manual very confusing as a new member. So I guess I kind of originated looking at that.

Preamble use in contact instructions for the manual, and that - I think we started thinking about that when we were thinking about a preamble to the
multisite paper and decided we didn't know when it really might be needed, or what a preamble consisted of.

CHAIRMAN DELGADO: Just to clarify, would it be a preamble for a motion, is that the intent?

MEMBER FLANN: A preamble for a policy paper or recommendation paper like the multisite paper that was written.

CHAIRMAN DELGADO: Okay.

MEMBER FLANN: Which it started out, we were calling I think - isn't that right, Jennifer - originally what we were preparing was called a preamble.

CHAIRMAN DELGADO: Excuse me, Valerie are you wanting to comment?

MS. FRANCIS: We didn't really get much further in our training along this thinking. We wanted to on Tuesday morning, but I think we have moved past just focusing on the preamble of a recommendation but the structure of a recommendation, including the
process for really approaching recommendations. Outside of materials recommendations, all the other recommendations.

CHAIRMAN DELGADO: We can refine that later with more clarification.

Please continue.

MEMBER FLANN: Number five is clarification and guidance on committee work plans.

Number six was new member guide update of website addresses and navigating the new NOP assisted, this to be in the new member guide.

Seven was NOSB member training needs to be included in new member guide; what is needed and what's expected and so forth.

Eight is election procedures for NOSB officers. And there were some questions raised that maybe the procedures - I don't know, help me out.

MEMBER KARREMAN: That's not fair
for you, because you haven't been through an
election within the board yet.

   But basically one of the policy
members was saying that perhaps the way we
conduct our elections for our own officers
here should be somewhat less maybe haphazard,
you know, just little pieces of paper going in
a cup. Just a little bit more respectful of
the people that are up for election.

CHAIRMAN DELGADO: More formal?

MEMBER FLANN: Okay, and then the
last one that we have on our work plan was a
technical corrections procedures and
priorities; how to deal with the need for
technical corrections.

   And I think obviously in the course
of this meeting there have been things that
have come up, probably assignments for the
policy committee. But they are not on the
list, and I want to talk to the whole
committee about it before doing anything.

MEMBER KARREMAN: Well, I think that
part of that last one is when the NOSB sends
up a recommendation, and then it eventually
gets into the Federal Register that if there
is some intent that wasn't translated as our
intent or maybe something was because of the
need for writing in the Federal Register a
certain way it didn't catch what we meant or
it omitted what we intended. There was some
policy to correct that, if possible sooner
rather than later, so that the certifiers
don't start wondering like what's up.

I don't know how else to put it,
but I'm just thinking like a few specific
things from the December 12th entry in the
Federal Register, and there are other times
too.

MEMBER FLANN: Anyway, to make sure
- I don't know - if there are any technical
corrections needed that we look at that and
deal with that as soon as possible in
something that has been published.

CHAIRMAN DELGADO: In something that
has been published already in the rule?

MEMBER FLANN: Yes.

CHAIRMAN DELGADO: And comparing the intent of what the board wanted with what's actually the result?

MEMBER FLANN: Yes.

CHAIRMAN DELGADO: Any questions?

First of all, does that conclude your presentation?

MEMBER FLANN: Yes.

CHAIRMAN DELGADO: Any questions for policy?

Okay, well, that concludes our presentation of work plans. So Mr. Vice Chair, do you want to -

VICE CHAIR MOYER: Are you going to adjourn the meeting?

CHAIRMAN DELGADO: Not quite. I still have some - we still have one more item, other business and closing remarks.

OTHER BUSINESS & CLOSING REMARKS

CHAIRMAN DELGADO: Just to remind
the chairs of the committees, we will be sending out the famous Excel spreadsheet that we use to keep track of our work plans. I'll be asking you to set priorities for all the items that you proposed so far, and we'll be addressing those as usual in our executive conference calls.

And emphasis on priorities. I know we have families and works to attend to, so please pay close attention to those, and we'll be able to define our target dates and our performance throughout the process.

And the other thing that I would also like to mention to the rest of the board members is, we have a calendar floating around to find availability for the full meeting. We are planning that, and as soon as we have everyone's dates, I know I'm the first one to not have answered Valerie's call, but once we have the final dates we will be able to define the target dates that we need for those motions, recommendations and discussion.
material. So that's key.

And that's on my part, I'd like to ask both of you, the secretary and the vice chair, to see if you have any other issues to consider as part of the other business items?

Jeff?

VICE CHAIR MOYER: Not really, Mr. Chairman. I just wanted to say before we adjourn this meeting that for reasons that you are probably all well aware of, I am very hesitant to speak on behalf of the entire board.

But in this case I will step out on a limb and say on behalf of the entire board, Rigo, I want to thank you, and I think the board wants to thank you, for running a very efficient, inclusive, and professional meeting. Thank you very much.

CHAIRMAN DELGADO: You are very welcome. Thank you.

(Applause.)

CHAIRMAN DELGADO: And I want to
take the opportunity to thank you, Jeff, and Katrina, for wonderful team that you have become, meeting practically every Monday, half an hour, with Valerie, to make sure that we are not dealing with any pop quizzes at the last minute. So I appreciate your time, devotion and dedication.

Also on the part of the board I am really happy with the level of commitment, professionalism and dedication that all of you have shown. Regardless of the issues, you are always willing to work and participate.

Yes, Joe.

MEMBER SMILLIE: I'm sorry if I missed something, but when that request for meeting dates which I haven't answered yet, and I really intend to, Val, did that talk about location at all?

CHAIRMAN DELGADO: No, it did.

MEMBER SMILLIE: You know, it's time we moved it out from Washington, D.C. I heard it loud and clear in all conversations. And I
think if the finances are there, which I am led to believe they are, that we should seriously considering moving the November meeting to the West Coast. I think it was promised to Seattle was it a year ago? Time flies when you're having fun, but I would like the NOSB to at least make that wish clear to the NOP, and if finance is willing, let's move her out of Washington for the next meeting.

CHAIRMAN DELGADO: That's an excellent suggestion. We will come up with a date first, and then as you suggested, we'll propose possibly several locations and see if the program has the budget to respond to our suggestions.

Any other comments?

As a last remark I want to say that this has been an extremely productive meeting. I'm really happy and impressed with the level of constructive participation that we had on the part of the public commenters, from the public in general.
So I hope you share with me the
happiness and emotion that I have for having
seen such a productive meeting today.

I want to wish you a happy return
to your homes, and the best for the rest of
the year. We will see you here in about six
months.

And I would like to call for a
motion to adjourn.

VICE CHAIR MOYER: I'll make that
motion.

MEMBER KARREMAN: And I'll second
it.

CHAIRMAN DELGADO: The meeting is
adjourned.

(Whereupon, at 5:01 p.m., the
proceeding in the above-entitled matter was
adjourned.)
UNITED STATES DEPARTMENT OF AGRICULTURE

NATIONAL ORGANIC STANDARDS BOARD

MEETING

MONDAY,
NOVEMBER 17, 2008

The board meeting was held at the Savoy Suites Hotel, 2505 Wisconsin Ave., NW, Washington, DC 20007, at 9:00 a.m., Rigoberto Delgado, Chairperson, presiding.

PRESENT:

RIGOBERTO I. DELGADO, Chair
JEFFREY W. MOYER, Vice Chair
GERALD DAVIS

STEVE DEMURI
KRISTINE ELLOR
KEVIN ENGELBERT
BARRY FLAMM
DANIEL G. GIACOMINI
JENNIFER M. HALL
BEA E. JAMES

HUBERT J. KARREMAN
TRACY MIEDEMA
JOSEPH SMILLIE
JULIE S. WEISMAN
STAFF PRESENT:

KATHERINE BENHAM  
VALERIE FRANCES  
ANDREW REGALADO  

BARBARA ROBINSON  
JUDITH RAGONESI  
MARK BRADLEY  
RICHARD MATTHEWS  
ROBERT POOLER  
SHANNON NALLY  
RUIHONG GUO  

VALERIE SCHMALE  
TAMMIE WILLBURN  
BABAK RASTGOUFARD  
ZAHA LOMAX  
SHAUNTA NEWBY

## Call to Order
Remarks: Rigoberto Delgado, Chairperson
- Approval of Agenda: 4
- Announcements: 7
- Introductions: 9
- NOSB Mission: n/a

## Secretary's Report
- By Bea James: 19
- Approval of May 2008 Meeting Transcripts and Meeting Summary as Official Actions and Voting Results for November 2007 and May 2008 as Official Record: 19

## National Organic Program Report
- By Barbara Robinson: 24

## NOSB Materials Review Process Update
- By Dan Giacomini: 54

## Public Comment on NOSB Action and Discussion Items
- 78

## Adjourn
CHAIRPERSON DELGADO: After that understanding break, we are officially calling the meeting of the National Organic Standards Board to order. And we have a quorum. Everybody is in its place, and at this moment I will like to get straight into business and entertain a motion to approve today's agenda. It is my understanding that all the board members have had a chance and time to review it. And if there's someone who would like to move to approve the agenda, I will entertain that.

VICE CHAIRPERSON MOYER: I make a motion that we accept the agenda as posted.

CHAIRPERSON DELGADO: It's been moved and seconded to approve the agenda as posted. And we'll take a vote. All those in favor say aye.

(Chorus of ayes.)

CHAIRPERSON DELGADO: Opposed?
(No response.)

CHAIRPERSON DELGADO: Hearing none, we have our agenda. Thank you for that.

The second point is my welcoming remarks. And first of all, I want to welcome all the board members, members of the Program, as well as members of the public, very familiar faces by now and new faces. All of you are welcome.

It feels as if it's been only a couple of weeks since our last meeting back in November of '07, but that, to me, means two things. We have been extremely busy, and time has gone by very quickly. I think that the main theme of these last four months, for us at least on the board, has been focused on our work plans and maintaining our priorities straight and also finding ways of improving our performance. I think we're doing better ways of communicating among each other over the phone, over the net; and we're also using better tracking tools to make sure that we are
tracking our priorities as they should.

Above all, I think all of these exercises have allowed us to focus more on the issues and be more productive in that sense. We've been providing responses and papers on a timely manner, as our Executive Director might highlight sometime. We've been effective in following our action items and identifying those action items. And also we've been extremely professional I think in discussing the issues and not letting our own biases sometimes get in the way.

Throughout the last 12 months, we've been able to produce up to 70 or even more than 70 recommendations, and we've clocked more than 200 hours of conference calls and time on the phone. That doesn't include the time that we're spending preparing and doesn't include the time of the public involvement in our work, and we appreciate that.

The public has also been extremely
responsive. This session alone we've had over
360 comments that all of us have read and
reviewed carefully. Last May, we had 86
participants coming up to the forum and
expressing their views. And this session
we're expecting 91. So it's, by all means, a
great response and also a great deal of input
from the public, and we're grateful for that.

In summary, I think that this
board is extremely productive and effective.
And as our Executive Director likes to have on
many occasions, I think we continue to be the
best in class, and all of us should be proud
of that, and we thank you for that.

Okay. Having said that, I would
like to pause a minute to recognize one of our
members of our committee. Valerie?

MS. FRANCES: Welcome, everyone.
And I just received this news today myself.
Probably not everybody knows her, but I'm sure
many of us do and worked with her for many
years. Diane Joy Goodman passed Friday
unexpectedly. I won't go into any details because I really don't know them, but I just want to say that she was a joy to know, and I always appreciated her good humor and insight and just love of life. And she just was in there doing all she could. And so I just want to acknowledge that, and if we could just take a moment of silence for her.

CHAIRPERSON DELGADO: We will observe a minute of silence in memory of Diane starting now.

(Whereupon, a moment of silence was observed.)

CHAIRPERSON DELGADO: Thank you. I'd also like to make an announcement. The secretary, Dr. Katrina Heinze also suffered an accident, a broken ankle, this past Friday and is not able to attend this meeting and sends her regrets and best wishes for all the members in our productive session. I'd also like to take the opportunity to send Katrina best wishes for a fast recovery and someone
take good notes and make sure that she's up to
speed in terms of what happens here.

Introductions of individual Board
members. Traditionally, we'll start on that
side with Hugh Karreman, please.

MR. KARREMAN: I am Hugh Karreman.

My background is in, originally, soil and
science conservation and that morphed into
being a veterinarian. And I'm a vet in
Lancaster County with a lot of organic dairy
farms and work with many organic dairy farms
across the country.

CHAIRPERSON DELGADO: Thank you.

Mr. Engelbert?

MR. ENGELBERT: Good morning. I'm
Kevin Engelbert. I hold one of the producer
seats on the Board. (Speaking off mic.)

MS. HALL: (Speaking off mic.)

Good morning. My name is Jennifer Hall. I
serve on the consumer slot on the board. I
live in Spokane, Washington, and I'm currently
in the process of . . .
MR. DEMURI: Good morning. My name is Steve Demuri. I live in California, and I hold one of the handler positions on the Board. I'm employed by Campbell Soup Company, and this is my, I'm going into my third year in January on the Board.

MS. WEISMAN: I'm Julie Weisman. I hold one of the, the other handler position on the Board. I am going into my last year on the Board. I can't believe I'm saying that. And my background actually is in social work with a focus on groups, so you can imagine how handy that comes in. For the last decade and a half, I've been involved in flavor ingredients and especially organic flavor ingredients, both commercially for other manufacturers and also private ones, as well. And I'm glad to be here.

MR. GIACOMINI: My name is Dan Giacomini. I'm from Middletown, California. If you don't have to go there, there's no reason why you would know where that is
because it's not on the road to anyplace. But I serve as a consumer seat on the Board. And being in the Bay area, which is probably one of the more liberal areas in the country, I always tell people that if you come from the rest of the country as a Democrat you go to San Francisco and you find yourself a conservative.

So it's a very active place. I contact and work with and try to communicate with a lot of consumers. I'm an organic consumer myself and my family is. And we try and stay, I try and stay in touch with as many of those, that group as I possibly can.

VICE CHAIRPERSON MOYER: My name is Jeff Moyer. I hold a producer position on the Board. I'm also currently the Vice Chair of the Board. I'm the Director of Farm Operations for the Rodale Institute in Kutztown, Pennsylvania, and I manage my own small farm on the side.

CHAIRPERSON DELGADO: Bea James?
MS. JAMES: My name is Bea James, and I hold the retail seat on the Board. I've worked in various aspects of retail from co-ops to mass market to independent grocery stores for over 20 years. And my favorite past time is baking, and I used to own my own pastry shop. And I only have a year left on the Board, and I'm going to get back to making chocolate stuff.

CHAIRPERSON DELGADO: I'd also like to clarify that, in the absence of our Secretary, the Vice Chair and the Chair agree to request Bea that she functions as the secretary for this session, and she has gracefully agreed to that. Thank you. Going on with Mr. Davis.

MR. DAVIS: My name is Gerald Davis. I hold a producer seat on the Board. I am a long-time organic farming agronomist and work for a large family-owned vegetable farm in California working with 40 different vegetable crops and fruit: blueberries,
strawberries, tomatoes, green house crops. It's a very diversified farm, and I'm happy to be here to share whatever I can with this Board and lend some assistance.

MS. ELLOR: I'm Tina Ellor. I hold an environmental slot on the Board. I am Technical Director of Phillips Mushroom Farms. And I'm happy to be here, and I'm happy to see so many familiar faces.

MS. MIEDEMA: My name is Tracy Miedema, and I'm also happy to see so many friends here this morning. This is the end of my second year on the Board, which means it's my fourth of ten meetings, and it is truly an honor and a privilege to meet so many intelligent and very interested people and do the best I can to help with all of the causes that we're working on.

My personal interest in food really stems from growing up and eating wild food in the rural Pacific northwest. I still live far out in the sticks in Oregon, and I
keep bees. And my professional interest is studying consumer behavior, and my graduate work focused on consumer behavior in the organic food industry. And I hold one of the three consumer rep seats.

MR. SMILLIE: I'm Joe Smillie. I hold the certifier seat on the Board, and I'm Chair of the Certification, Accreditation and Compliance Committee, which used to be a very quiet committee and now is pretty active. I was a college graduate that returned to the farm, much to the consternation of my family who fought for three years to get off the farm and send somebody to get a degree. I was a back-to-the-lander, an organic farmer, a consultant, and then got into the regulatory world thinking that the vision of organic needed regulations.

So now I'm basically functioning as a USDA bureaucrat and very interested in all of the issues and very interested as I watch the vision of organics change as it
becomes a regulation because, you know, 30
percent means 30 percent, not 29.8. And so
working with the regulations has been quite an
experience, and I'm looking forward to trying
to make sure that the regulations reflect the
vision of organics.

I'm also, I'm happy to say, proud
to be an American citizen and might even get
a flag one of these days. So glad to be in
D.C. As I woke up this morning on the eighth
floor the sun was rising over the Washington
Monument, and it's a whole new day and I'm
glad to be here.

CHAIRPERSON DELGADO: Lastly, our
newest member of the Board, Barry Flamm.

MR. FLAMM: My name is Barry
Flamm. This is my first year on the Board.
I'm serving as a Chair of the Policy
Committee, and I serve with Joe on the
Certification Committee and with Jerry on the
Crops Committee. It's been a very interesting
and exciting year so far, and I'm amazed about
how much work this Board does. I've been involved in a lot of boards in my career, and this one I think is pretty incredible.

My background is in forestry and natural resource conservation and my specialty now is biodiversity conservation, which is how I earn some money to keep going as an international consultant now. I usually work in Asia and Africa and so forth doing biodiversity conservation work.

I've been an organic farmer and organic orchardist, which I really love doing. I'm not engaged in that hands-on right at the moment, which I miss and am going to get back to. I appreciate, as Tracy said, this incredible group of people that come here to present their comments and also all their written comments. I'm amazed at the carefulness and thoughtfulness of all of it, so it's very special. Thank you.

CHAIRPERSON DELGADO: Next, the Executive Director, Valerie Frances. Will you
introduce yourself, please?

MS. FRANCES: Valerie Frances, the Executive Director. And if you are signed up for public comment and have something that you want distributed or want to give me PowerPoint presentations, just try to drag me down. The public comment schedule is out on the table as you're coming into the room. And when you're on deck, try to be up here or, actually, if you're on this side -- it's just a little bit awkward because, you know, so you can check it. If you've got something to distribute, try to get them to me ahead of time. So far, I really don't have any space to put anything, so I'll just do the best I can and I'm sure we all will.

CHAIRPERSON DELGADO: All right.

Thank you.

DR. ROBINSON: I'm Barbara Robinson, Deputy Administrator for Transportation and Marketing Programs and the Acting Director for the National Organic
Program. And let's start with you, Bob.

MR. POOLER: Bob Pooler, National Organics Program.

MR. REGALADO: Andrew Regalado, National Organic Program, Compliance and Enforcement.

MS. NALLY: Shannon Nally, National Organic Program.

MR. BRADLEY: Mark Bradley, NOP, Auditing, Accreditation, and Training.

MS. BENHAM: Katherine Benham, National Organic Program.

MR. MATTHEWS: Richard Matthews, Standards Development and Review.

MS. RAGONESI: Judith Ragonesi with the National Organic Program, and I work in Compliance.

CHAIRPERSON DELGADO: Can you repeat your name, please?

MS. RAGONESI: Judith Ragonesi.

CHAIRPERSON DELGADO: Thank you.

Anyone else?
VICE CHAIRPERSON MOYER: Mr. Chairman, hopefully the recorder could capture those names. If they want to stop and --

DR. ROBINSON: Oh, I'll introduce them when I do the NOP.

CHAIRPERSON DELGADO: Thank you.

DR. ROBINSON: Because we do have a number of new staff.

CHAIRPERSON DELGADO: Very good. Excellent. And, lastly, for benefit of our secretary, I'm a producer from West Texas, and you all will recognize my accent. I'm very proud of it. I'm a parent of two kids. The youngest of the family is 14 years old; and the second, the oldest boy, is 17. We grow different crops, and I have my family heavily involved in that, including my father and mother even on some occasions.

So that concludes introductions.

We are somewhat behind schedule, and we'll move right into the Secretary's report.

MS. JAMES: Okay. I'll do my best
to represent Katrina's hard work here. The Secretary's Report consists of the acceptance of some of the minutes, so I would like to move to accept the November 2007 voting results.

CHAIRPERSON DELGADO: Is there a second?

MR. KARREMAN: Second.

CHAIRPERSON DELGADO: Okay. It's moved and seconded to approve the November meeting voting results. The voting results of November 2007; is that correct?

MS. JAMES: Yes, correct.

CHAIRPERSON DELGADO: So the motion is to approve the voting results for the November 2007 meeting. So we have a motion now, and the motion is to approve the voting results for November 2007. Any discussion?

(No response.)

CHAIRPERSON DELGADO: No discussion. Ready for the question? The
motion is on the question of approving the
voting results for the November 2007 results,
and we'll take a voice vote. All those in
favor, say aye.

(Chorus of ayes.)

CHAIRPERSON DELGADO: All those
opposed say no.

(No response.)

CHAIRPERSON DELGADO: Okay. The
motion passes.

MS. JAMES: Okay. Next is a
motion to accept the May 2008 meeting
transcripts.

CHAIRPERSON DELGADO: Is there a
second?

MS. HALL: Second.

CHAIRPERSON DELGADO: Jennifer has
seconded. Okay. And the motion is to approve
the May 2008 minutes.

MS. JAMES: Transcripts.

CHAIRPERSON DELGADO: Transcripts.

Sorry. And ready for discussion?
CHAIRPERSON DELGADO: No discussion. Ready for the question. The question is on the motion to approve the May 2008 meeting transcripts. Again, we'll take a voice vote. All those in favor say aye.

(CHorus of ayes.)

CHAIRPERSON DELGADO: All those opposed?

(No response.)

CHAIRPERSON DELGADO: Okay. Hearing none, the motion is agreed to.

MS. JAMES: Okay. So a motion to accept the May 2008 meeting summary, as well as the voting results.

CHAIRPERSON DELGADO: Okay. Is there a second?

VICE CHAIRPERSON MOYER: I'll second that.

CHAIRPERSON DELGADO: Vice Chair seconded that. Okay. It is moved and seconded to approve the meeting summary and
results. Is there discussion?

(No response.)

CHAIRPERSON DELGADO: Ready for the question. The question is the motion to approve the meeting summary results. We'll take a voice vote. All those in favor say aye.

(Chorus of ayes.)

CHAIRPERSON DELGADO: All those opposed say no.

(No response.)

CHAIRPERSON DELGADO: Okay. The motion is agreed to, and I think that concludes the Secretary's Report; is that correct?

MS. JAMES: Yes.

CHAIRPERSON DELGADO: Okay, thank you very much. And now to the next point. We would like to invite Dr. Barbara Robinson to provide us a report on the Program. As Dr. Robinson makes her way up to the podium, I'd like to point out two young ladies on the
right of the room.

MS. JAMES: Mr. Chairman, I have a question. If we're not recording does that affect the transcript?

MS. BENHAM: It's recording. She has mics.

CHAIRPERSON DELGADO: The mics are working.

MS. BENHAM: She has separate mics at the table.

CHAIRPERSON DELGADO: I'll ask the audience to be extremely careful, and I'll ask Dr. Robinson to address the group without a microphone.

DR. ROBINSON: I'm afraid to talk now. In all these years, this is what it took? This is all it took. Who knew?

Okay. Let me be brief, so we can stay on schedule here. First of all, let me make sure I do introduce my staff correctly. Since we met in May, we have hired six additional staff, bringing us up to 15, which
is a much nicer number to say for the National Organic Program. We now have three branches and three branch chiefs. So in addition to Rick Matthews and Mark Bradley, who head up, respectfully, Standards Development and Accreditation and Auditing, we also have the pleasure of bringing on Ruihong Guo. Ruihong, would you please stand up? Thank you. Ruihong is Branch Chief for Compliance and Enforcement, our newest branch that we've added to the NOP. In Ruihong's staff, we have Valerie Schmale, Judith Ragonesi, Tammie Wilburn, Andrew Regalado.

Then we also have Babak Rastgoufard, who's on detail from the Office of the General Counsel who's working on Rick's staff. Shannon Nally, Shannon, you were on board I think in May, correct? But Shannon came from the Compliance and Analysis staff in the Agency, so Shannon used to work on appeals. So now we had to replace her and we have done so, we think, quite capably with
Zaha Lomax way back there. So we're very glad to have Zaha. She does not report directly to me. However, she does work on the Appeals Board of the NOP.

We also hired Shaunta Newby. Shaunta, where are you? Oh, she's the young lady that you see when you come and sign up for public comment. She is the new secretary for the NOP.

So we're pretty excited that we have a lot more people. Still not enough, in my opinion, but much better than in the past. And that's thanks to getting a little more money from Congress.

So, let's see, what else have we done this year, besides hire new people? Oh, well, we did publish the access to pasture regulation on October 24, largely thanks to Rick Matthews' very hard work over the past couple of years. That comment period opened on October 24th, and it continues until December 23rd at this time.
Materials update. Let me see. We have -- hang on. I'll tell you what we have published. The proposed and final rules have been published; Sunset 2008; the ANPR proposed and final rules have been published; the 2011 Sunset; we have the ANPR published; the November 2007 and May 2008 Board recommendations, we're working on the proposed rule. And the 606 final rule is being redrafted; I'm not too happy about that, but that's where it is.

On our budget, we are stuck with a continuing resolution for fiscal year '09. Right now, we have a continuing resolution that goes through March. That's what was signed by the President. I kind of expect that, you know, well, we don't really expect, we have no expectations at this point. I don't have any other information to give you.

We do have a small increase in the NOP budget in the '09 budget, but since we're on a continuing resolution, you know, we have
no expectations to see that unless the Congress, you know, does something otherwise. But given the state of the economy, we're not holding our breath on this.

ACA renewals, we are coming through that process. We have most of the 2007 done, and we're working on the 2008 ACAs that need to be renewed. We continually make updates on the web site. I think we're pretty much caught up with the domestic ACAs, and there's a few foreign ACAs that we still need to finish up on from 2007, and it's just a case of getting, you know, catching up with the AHRQ reports. So we're working on that.

Cost share. As you know, we did get quite a big bump in cost share appropriations from Congress, 22 million in the national program through the Farm Bill. And we did get the cooperative agreements out to the states. And then we are going to do some cost share re-invention. Rick is working with Ruihong's group, and we do have some
plans to improve how we work with the states on cost share and improve, you know, management of that program over the next couple of years.

And one last thing is NOP training for certifying agents. We are going to spend a significant amount of funding from the Program in this coming calendar year out of FY09, FY08/09 spending to really improve our training for certifying agents. In the past, we've only been able to do three training sites per year. We will continue to attend All Things Organic in the coming year, but I don't think that's enough. What I'd like to do is open up the NOP and make it available first to certifying agents but then to anybody who wants to know what does this regulation really mean and what does it mean to be compliant with this regulation. And the idea would be to make the NOP operable and open 24/7.

So we have contracted with the AMS
Training Institute, which is just an excellent resource available to us in AMS. And, in fact, I asked Mark for his input, and he's given us a template to use. I wanted to start with the LSP because I think that is the root of the regulation, but we'll get working on that over the holidays. But we did have, you know, a template that we could at least give the Training Institute to get started with to give them our sense of what we mean with labeling.

The idea would be to take every section of this regulation and break it down and then put it together in a CD-ROM type of format but also a way that we can reach every certifying agent first, because that is our first obligation of course, and then to make training mandatory for all certifying agents but then, of course, make it user friendly enough so that, beyond certifying agents, producers, handlers, and even consumers who want to know what does it mean to be compliant
and what does it mean to be organic will understand this.

And then, of course, it won't just be, well, here's the CD, go. There will actually be training seminars. There will be actual hands-on training. But then this will also be a way to reach people who can't get to a session. As I said, we're going to spend some significant amounts of funding with this, but we had to start somewhere and we had to start sometime. And I think now is the time to do it, as we're coming through the first round of certifying agent renewals and we can see, you know, we can get some feedback from the audit reports what is it we're seeing both from the certifying agents and the on-site inspections and what is it we need to be communicating back to folks.

One of those, just kind of my own personal reaction is that organic is a conscious and a conscientious decision. You know, you've heard me say that on Executive
Committee calls. And so the OSP is going to be a significant component of this. We want to see accurate check sheets. We helped support those at the beginning, so we'll go back and use those workbooks that were put together. We will probably talk with and we already have been talking with ATTRA about using their site as a place to host this once we're done, to host the training.

So we're just at the early stages of this. We'll make it as live and interactive as we can, and so we're kind of excited about this.

But, at any rate, I've gone on a little too long. But that concludes the NOP update, Mr. Chairman. Do you have any questions?

CHAIRPERSON DELGADO: Any other questions? Mr. Smillie?

MR. SMILLIE: I think it's really good news, Barbara. It starts to sound like the long-awaited quality manual.
DR. ROBINSON: Yes, except there will be many of them, Joe. There won't be one. There will be one for every section of the regulation.

MR. SMILLIE: Well, I think that's really good news because that's what we're looking for to create the consistency and the whole idea of the training. And getting all the certifiers with the same, you know, interpretation is going to take a long time. To work up the reg is going to take a long time. So I think this is going to be a great step.

The second thing I think is that the relationship between the agents of the USD and the USDA, we really need to work on that. And if it's going to be a 24/7 thing, I think that's going to start to solve a lot of problems and we create a two-way communication because I agree with you. A lot of times the NOP trainings in the past have been good, but, you know, some of the people who needed to be
there weren't there. So I think the mandatory aspect I think is a good aspect, as long as it's convenient. I know we've heard a lot from some of the state programs this year, and they're saying that, you know, it's too bad that there won't be trainings this year, but the real bottom line was their budget cuts wouldn't even allow them to go anyhow. And I think in this era of budget cuts we can't give excuses to certifiers not to be on line.

So the idea of eventually creating a 24/7 exchange and leveling of interpretations is just going to be a really excellent move. And I think I can speak for the Certifier Committee in saying that I think that we really look forward, as agents of the USDA which is our single solitary position, that we look forward to this kind of cooperation.

DR. ROBINSON: Well, thanks. And I think part of this, we're not going to wait and put the whole thing together, too. We're
going to pilot this out. For example, we'll get a piece of it done, and then we're going to send it out and say, well, you know, how does this look? Does it work? Are we communicating? You know, so trust me when I say, for example, we'll get the labeling one done and it will be kind of, okay, here's what we mean when we say you must do this, or if we're following the inspector around or the certifying agent around in a plant and we pause the tape, the camera or something, and say what did he just do or what's wrong with this label? You know, and then we ship this out, and they say, you know, okay, did everybody get it? Because there's no point in sending it out, of course, and everybody looks at it and says, well, either that was like at the fifth grade level or the five-year-old level and, you know, that wasn't helpful, or nobody would get it.

So we're going to do some test marketing here, too, because we want to do it
right, and also we need something that is
easily update-able as we make changes because
it's also got to be cost effective, too. It's
got to be something that when we put it
together and it goes on the web that we can
also update it as we issue new guidance. For
example, there will be one on the National

But I think you see the idea.

And, yes, part of this problem is access to
training. Quite frankly, not everybody goes,
or an agent will send one person, maybe not
even the person that needs it or something
like that; or the same person comes to all
three trainings or the same person comes year
after year after year.

But we're not getting the right
kind of, you know, training in my opinion or
in the Program's opinion or from the results
that we're seeing. Everybody needs to be able
to hear from the Program; and, likewise, the
Program needs to be talking to all of its
agents. And then the agents, of course, need to be able to talk to their inspectors. And there is no reason, in this age of transparency, there is no reason in the world why producers or processors couldn't look at this and say, "Okay, do I meet the performance standards? I want to know." Why not? If the certifying agent or the inspector is going to come out to this plant or this operation, "Am I in compliance?" Why not? And why shouldn't consumers be able to look at the labeling or something else and say, "So what does it mean?"

MR. SMILLIE: Just a short follow-up. Barbara, any word on the Canada/US equivalency talks?

DR. ROBINSON: Oh, yes. We are trying right now just to set up another meeting, a follow-up meeting. They've had some, since their election -- we sent them a document in mid-September to respond to some other questions that they had, and so last I
I heard we were trying to set up a meeting.
We're just waiting for them. We were going to have a meeting this week, as a matter of fact.
And then they had some, what I heard was they had some food safety issues that caused them to ask could they wait until next week. So we're just waiting for them to pick a date; that's all. And we're ready to go whenever they are.

CHAIRPERSON DELGADO: Hugh?

MR. KARREMAN: Thank you, Barbara, for releasing the pasture rule. I think I can speak for the Board on that or at least the five of us who were on the Board back when the guidance in February 2005 were put out. Remember that way back then, that meeting, you guys? And I thank you very much for a very comprehensive rule, and it is not on the agenda to discuss the pasture rule. It is beyond the NOSB at this point. Just so everyone knows, it's obviously NOP level, so we're not going to be discussing it. But I
guess if people have public comment, that's public comment and that's fine. But we have a lot of other issues on the table to get at. So I just want to say that.

And then just one other thing would be, please, I strongly urge you to extend the comment period for an extra three months beyond December 23rd for the organic community to -- 90 days beyond. In any event, extend the comment period, please, so that the organic community can digest it. It's a very comprehensive document. It's very well thought out, but it needs some work. And I know, at least for my farmers back in Pennsylvania, they are not on line, you know. They basically get updated via, you know, word of mouth or whatever. So please, please, please do that, okay?

DR. ROBINSON: That's not a problem, Hugh. We'll accept any requests and any comments that's submitted to us. So that's not a problem.
Now, I did forget one other thing, Mr. Chairman. Dave Shipman, who is the Associate Administrator for AMS, is going to come down to the Board meeting probably around 10:30, and I will be happy to introduce him. But he just wanted to meet the Board and just say a few words and welcome you all here. If you remember Ken Clayton, he retired, and so Dave has taken his position as Associate Administrator. Jim Link, who was the former Administrator for the Grain Inspection Packers and Stockyards Administration, has come over to be our Acting Administrator now that Lloyd Day has resigned and left the agency.

But, at any rate, Dave is going to come down around 10:30 or so, give or take. It depends on his schedule. So he'd like to come.

CHAIRPERSON DELGADO: Steve, you had a question.

MR. DEMURI: Actually, Bill asked my question.
CHAIRPERSON DELGADO: Okay. Any other questions? Bea?

MS. JAMES: I just want to make one comment regarding your announcements. I really want to applaud the NOP for looking at improving the training and opening it up to consumers, handlers, producers, anybody who's interested, because, one, the transparency, as you mentioned; and then, two, it just helps with education, which is always a challenge at consumer level.

DR. ROBINSON: We totally agree. Everybody should know about this.

CHAIRPERSON DELGADO: Any other questions? Tracy?

MS. MIEDEMA: When we produce recommendations here, I sometimes wonder and I think others wonder where they go. Sometimes, it's clear that they're in process and there's some sort of action, but if you wouldn't mind just commenting a bit on what the various paths are that these
recommendations take when they leave this room.

DR. ROBINSON: Sure, sure. Of course, your materials recommendations are number one. Those take priority over everything because that is the National List and that's just the number-one priority. Anything that, you know, that we have asked you for would probably be number two in terms of what we would work. So recommendations that you made where we've asked you for standards development, recommendations where we've asked you, you know, we need more collaboration, we need your input on this, we're not going to move forward on something unless you give us a recommendation, then, you know, once you give us the recommendation, we look it over.

Generally speaking, we will then go talk, if we have some concerns about whether or not it needs, whether we can issue guidance versus whether or not it requires a
regulatory change, we'll go consult with OGC, the lawyers, for legal sufficiency, and then we'll act on it. If it's a recommendation that you're making and it wasn't even we asked for and we've just got a lot of other work that we're working on, it may sit for a while. You know, it's something that you want to do but -- and, by that, I don't mean that it will just sit because we don't care. It depends on our level of interest. You may come up with something that, like, "Wow, we hadn't thought about that, but that's very interesting," and then we may get to work on it.

Again, the same path would occur, though, Tracy. We have to go talk to lawyers to see is this, you know, is the way they've written it or what they've written or what we want to do about it, is there legal sufficiency? Does it fall within the law, fall within the regs? And then what do we have to do? Do we have to write a regulation, or can we issue guidance? What would we do?
So recommendations that you make that really deal with governance of the Board, how you will conduct yourselves, those sorts of things, we don't really have much to do with that. That's really more the purview of the Board, and that's all right with us.

But bear in mind there is a limit to our resources and there is a lot that we're trying to do, as well. So, obviously, it can take some time to get to those.

CHAIRPERSON DELGADO: Dan?

MR. GIACOMINI: Barbara, as a follow-up to that question, is there a way for the Board and the industry to become aware of the situations of old recommendations, of whether they're rejected, shelved, ignored, being processed? Is there a way to find out what the -- and that goes forward, too. That's not just the old ones in the past. Is there a way for us to be able to find out what the status of things are?

DR. ROBINSON: Well, my
understanding was that, actually, that Valerie
was working on, you know, trying to put
together a matrix. We've talked about this.
She's working on it and trying to track down
all of the historical Board recommendations,
and she had discussed about a way to, first of
all, try to organize them, get them in some
kind of way that we could cross-reference them
and not just do them chronologically because
that doesn't really help that much. That's
one way to organize them, but then that's not
always the most useful way, certainly not as
the Program matures.

And then to figure out the best
ways to organize them, for myself, what I
don't want to see happen is that the Board
starts repeating recommendations and piling up
old ground that's already been done. On the
other hand, the Board may find old
recommendations and say, "Okay, work has been
done on this. Certainly the Program may know
that work has been done this," but the Board
may say, "Hmm, we could take an old recommendation and improve it. Now's the time. Maybe the Program wasn't ready for it, couldn't do anything about it, didn't have the resources, and now the time is right," or, "Maybe the problem has been solved," whatever, I don't know.

So there's got to be a better way to go back and do the seminal work and organize these things in a way that, you know, you can take a look at them. But Valerie has started to do that and, you know, basically cataloging them, cataloging them in a useful way. They're not a secret, in other words.

CHAIRPERSON DELGADO: Joe?

MR. SMILLIE: Barbara, could you elaborate on the 606 rule re-draft? As you know, our Handling Committee, it's a challenge. And I'm not sure, you just had a short little thing about --

DR. ROBINSON: I know. I'm not happy about this either. We should have had
this out. You've got something to say about this, Rick, where we are with it? Is it stuck in RGC or --

MR. SMILLIE: What's your current thinking?

MR. MATTHEWS: Well, the comments have all been reviewed, a doc has been drafted. The doc has been drafted. It's pretty long. All the comments have been reviewed. I was not very happy with it. It's about three-quarters rewritten. It's still with the Program. It's on the plate as one of the things to do. We did get nine rule-making actions done, but that's one of them we haven't gotten done.

DR. ROBINSON: But it was published as an interim final.

MR. MATTHEWS: Yes. I mean, right now, you've got a final rule out there. It's an interim final and --

DR. ROBINSON: It's not that you're inoperable but it's --
MR. MATTHEWS: And the only thing that you're going to see happen is that either the material is going to stay on, or it's going to get pulled back up. That's what's going to happen.

DR. ROBINSON: Oh, the suspense.

MR. SMILLIE: You know, reading the tea leaves here, yes, we've got some problems with the list, as you know. There's things in wrong places, and we're trying to attack it piecemeal, and we're finding inconsistencies as we go forward on 606. There's a lot of inconsistencies. There's some materials that belong on 606 or some place else. And as we muddle through our Ag/Non-Ag resolution, which, hopefully, we're going to bring to a close, it points to the fact that, now that we know what we're doing as a regulation, we need to go back and look at 605 and 606, my two favorites, and just say, okay, let's re-organize these and get it right. Because it's just extremely difficult.
to get it right now when there's the layering
inconsistencies with what we were given
originally. I won't mention any in
particular.

MR. MATTHEWS: Well, I could not
agree more that there are huge problems with
the National List in the way it's structured.
The 606, though, from an interim final rule to
a final rule, however, doesn't solve any of
those problems. So, I mean, it may have
sounded flip before, but the bottom line is
with the 606 rule either the material is going
to stay on or it will come off because of
comment. And, of course, those who want it
off want to see that thing out as soon as
possible. We want to see it out, too, but
we've got to get it right, and it will have to
work through the system. So if it's not right
leaving the branch, it's going to take a whole
lot longer to get it through the system.

But, no, Joe, you're right. The
National List has got huge problems with it,
and I can see no better project for this Board
to be working on than restructuring that
National List.

CHAIRPERSON DELGADO: Kevin?

MR. ENGELBERT: I would like to
defer until this subject -- if anybody has any
questions about this then I will wait --

DR. ROBINSON: He wants to defer
the subject until a later time.

MR. ENGELBERT: I want to defer my
comments until this subject is fully vetted.
If there are any other questions pertaining to
what we're talking about now I'd prefer they
go ahead.

CHAIRPERSON DELGADO: Any other
questions relating to the topic? No other
questions.

MR. ENGELBERT: No other
questions. Well, in deference to Hugh, I'll
be brief. But to keep things fair and
balanced, I wanted to post a comment about the
fact rule, also. Obviously, the community is
thrilled that it's out there, and the people
that I talk with and myself don't see any
really type of postponement or extended
comment period. It's obvious that the rule
that's written is very comprehensive; but, to
me, it simply clarified the existing rule.
And while it does need tweaking, I think the
organic community can come to a consensus in
that length of time. And the people that I
talk with, the farmers, would hate to see
anything to slow this process down and that
may end up postponing its implementation even
longer than we've already waited.

CHAIRPERSON DELGADO: Any other
comments or questions? Two people are buying
beers tonight. Yes, Bea?

MS. JAMES: I know on one of our
calls we talked about Richard leaving the
Program in January, and I wonder if there's
been any thought as to -- I know you're
irreplaceable -- who might step into that
position?
DR. ROBINSON: No.

MR. MATTHEWS: Anybody who wants it.

(Laughter.)

CHAIRPERSON DELGADO: Any other questions? I just have one more. I'd like to say that nobody likes pop quizzes, and I do like the concept that you're presenting about having online year-round training, especially for the producers. I know a lot of people that want to do the right things but don't have access to the right information, and I think this is going to be a wonderful channel to solve those problems.

My question, as always, is time line, when do you think you'll be able to roll this out?

DR. ROBINSON: Well, as you know, and I'll only say it to you guys, I only have one more year left. And, you know, this is, you know, I always said my first priority was getting out a pasture regulation, and this is
kind of my next pet project for the Program.

I believe in this very much. That's why I'm willing to commit resources to it. I believe that we really have to put this out to the community. So, you know, I'm willing to give up Thanksgiving and Christmas to work on the OSP, to script it out. I really think this is important.

I don't have a time line for you, except to say that I would like to have the whole thing done next year, all of it, the whole regulation, all of the modules done. Because it will be modules. It will be separate modules. But, you know, first things first, we'll roll it out as we get it done. The labeling one would be done very quickly, I would hope early spring. And then as soon as we get one done, I'm hopeful that the rest of them will come out quickly. It's always, you know, getting the first one done is the hardest. But, yes, next year, I would like to get it all done.
CHAIRPERSON DELGADO: Any last questions, comments, for Dr. Robinson? Well, I would like to thank you very much, as well as Richard, for all your work you've done. We're going to miss you and wish you the best of luck. Thanks again.

Moving on the next point, we have Dan Giacomini talking about materials and the review process.

MR. GIACOMINI: Thank you, Mr. Chairman. I think, Barbara, the assistant secretary you said was coming --

DR. ROBINSON: Deputy Administrator.

MR. GIACOMINI: -- Administrator.

If they're on a tight schedule, you can just interrupt me and I'll finish up after their greeting, if that works.

DR. ROBINSON: He's not going to come until, I think, after the break, Dan.

MR. GIACOMINI: Okay. If you've seen this material presentation before, I'm
constantly trying to make it more complete and
more thorough and not dragging it out too
long. I did decide to change the background.
It didn't look good on that. It looks much
better on my computer. It's a sunrise or a
sunset, and it's not a statement on anything
organic of which one that is. It's just a
background. But it doesn't look good, so I'll
change it.

I'll be running through the
National List and what the sections are within
it; the petition items, where they stand at
this point in time; the material review
process; the criteria for both the National
List and the Sunset Review; a brief statement
on the Materials Working Group; and some final
notes.

Regarding the sections of the
National List, which are in the 600 section of
the rule, Section 205. 601 and 602 are crops,
with 601 being synthetics that are allowed;
602 non-synthetics that are prohibited.
Next slide. Livestock, 603 and 604 for livestock. 603 synthetics that are allowed, and 604 non-synthetics that are prohibited.

Handling. The National List requires listing of both, so of everything that is utilized and allowed. So on 605, non-agricultural non-organic substances allowed as ingredients in or processed products labeled as organic or made with organic. Section A being non-synthetics allowed, and B being synthetics allowed.

606 is the non-organically-produced agricultural products allowed as ingredients in or on processed products labeled as organic. Listed non-organically-produced agricultural products may be used as ingredients in or on processed products labeled as organic only in accordance with any restrictions specified in this section, and only when the product is not commercially-available in organic form.
The current status of National List items that are in review at this meeting, at the Fall `08, we are dealing with recommendations for, in Section 601 for crops, tetracycline hydrochloride, sorbitol octanoate, pelargonic acid, and ammonium salts of fatty acids. Section 603 for livestock-- there's currently no petition materials reviewed at this meeting. 605 is calcium from seaweed and an expanded use for ethylene. We have two algae, which are listed as a 605 and 606 on this. And for 606, buck hull powder, black pepper extract, and dried orange pulp.

Regarding some statements that were made in public comment, there was a couple of notes of an impression within the industry that petitions to change the annotation were not being accepted by the Program. I would just like to note that we have a couple of substances on the list for this discussion at this meeting, as we have in the past, of petitions that are essentially
annotation changes. So there were two
specific, I believe two specific questions or
examples of where petitions had been rejected
and where this idea was coming from. I will
work with Bob or whoever-- the Chairman of the
Materials Committee will work with Bob in the
next year before the next meeting to find the
status of those and try to resolve any
questions that are there.

Items that are up for
consideration that are on our list are listed
here. On the next slide, these are the ones
that the Board has received but we did not
have time for dealing with them at this
meeting. Some of them are on the list for
this meeting for discussion items. There was
a number of public comment presented on a few
of them, at least, but they are not up as
action items on this meeting.

In addition to those, we have a
few petitions that at one point in time we've
received and they've been sent back or pulled
back by the petitioner. If you go to the next slide, please, Valerie, those are listed there.

Next slide, please. Sunset items. There are no Sunset items up for review consideration at this meeting.

Next slide. The material review process, the guidelines to either add or delete substances to the National List with the Federal Register notice as listed there.

Next slide, please. The material review process, material petition process, is designed for substantially one of three things: adding new listings to National List; changing annotations of existing listings already on the National List; and removing items currently on the National List. Annotation change essentially comes down to a situation of expanding use or restricting use, and they're generally included in the writing and when it's explained and described as either being add or delete petitions. But
they all fit within that same framework.

Next slide. The National Review process has a minimum time frame for the National Review of 145 days, and this is really an absolute minimum optimal time frame, and it does not include time for rule-making. It is conditional upon the completeness of the petition on the initial submission, the manpower within the specific reviewing committees and the Board overall, time frame relative to the NOSB public meetings, and completion and review of technical reviews.

Day 1 through 14, and this day is a starting day of when the Program initially receives the petition. The petition is received by the NOP and reviewed for completeness. Issues determined not to be complete-- the NOP contacts the petitioner for completing the petition. Upon determination of completeness by the NOP, the petition is forwarded to the NOSB Materials Chairperson.

Next slide. Day 14 through 45, the
Materials Chairperson forwards the petition to the chairperson of the designated NOSB committee: crops, livestock, or handling. The petition is re-evaluated for completeness and determined if it will be forwarded for an external technical review. And specific questions which the committee wishes addressed in the technical review are submitted to the NOP.

Sixty days prior to the meeting at the NOSB, the technical reviews are sent to the NOSB. The TAP and the technical reviews are posted on the NOP web site for review and public comment, and the committee recommendations are posted for public comment. Prior to the meeting, the public comment is accepted by the NOP and posted on the web site.

At the NOSB meeting, the committee recommendations are submitted. Further comments are accepted from the public and all public comment are taken into consideration,
and action is taken by the full NOSB Board regarding committee recommendations. As a final note, on the material review process, all communications between petitioners and the NOSB should go through the NOP.

Regarding the National List criteria, there are two references there for anyone who wants to look at it more detailed. And the general National List criteria number one: potential of such substance for detrimental chemical interactions with other materials used in organic farming systems; the toxicity and mode of action of the substance and its breakdown product of any contaminants and their persistence in areas of concentration in the environment; number three, the probability of environmental contamination during manufacture, use, misuse, or disposal of each substance; the effect of the substance on human health; number five, the effect of the substance on biological and chemical interactions in the agroecosystem,
including physiological effects of the substance on soil microorganisms, crops, and livestock; six, the alternatives to using the substance in terms of practices and other available materials; and, seven, its compatibility with the system of sustainable agriculture.

Regarding processing aids and adjuvants criteria is, number one, the substance cannot be produced from a natural source and there is no organic substitute; two, the substance manufacture, use, and disposal do not have adverse effects on the environment and are done in a manner compatible with organic handling; three, the nutritional quality of the food is maintained when the substance is used and the substance itself or its breakdown products do not have an adverse effect on human health, as defined by applicable federal regulations; four, the substance's primary use is not as a preservative or to create or improve flavors,
colors, textures, or nutritive value lost
during processing, except whether replacement
of nutrients is required by law; four, the
substance is listed as generally recognized as
safe by the FDA when used in accordance with
FDA's good management manufacturing practices
and contains no residues of heavy metals or
other contaminants in excess of tolerances set
by the FDA; and, six, the substance is
essential for the handling of organically-
produced agricultural products.

The criteria for 606, which are
agricultural and potentially commercially-
unavailable, the NOSB will consider: A) why
the substance should be permitted in the
production of handling an organic product; B)
the current industry information regarding
availability and history of the unavailability
of an organic form in the appropriate form,
quality, and quantity of the substance;
information that includes but is not limited
to regions of production, including factors
such as climate and the number of regions, the
number of suppliers and amounts produced;
number three, current and historical supplies
related to weather events, such as hurricanes,
floods, and droughts that temporarily halt
production or destroy crops or supplies; four,
trade-related issues such as evidence of
hoarding, war, trade barriers, or civil unrest
that may temporarily restrict supplies; and,
five, other issues that may present a
challenge to a consistent supply.

Sunset Review criteria. The
Sunset provision, no exception or prohibition
contained in the National List shall be valid
unless the National Organics Standard Board
has reviewed such exemption or prohibition as
provided in the section within five years of
such exemption or prohibition being adopted or
reviewed and the secretary has reviewed such
exemption and prohibition. So the Sunset
Review process needs to be done every five
years.
Sunset Review criteria. The exemptions, which really is what the National List listing is, were accepted because the evidence available showed substances were found not harmful to human health or the environment; the substances were necessary because of the unavailability of wholly non-synthetic alternatives; and the substances were consistent and compatible with organic practices. The Sunset includes the opportunity to revisit the continued need for the exemption. If a review finds that the initial conditions still exist, the regulation is renewed for an additional period of time. Sunset Review is to determine if conditions relevant to the exception of the exemption have changed. The Sunset Review process is not to add new substances to the National List. It is not to change an existing annotation and is not the time to re-interpret unchanged information and conditions. These issues are best dealt with
in the petition process.

A note on the Materials Working Group: the Materials Working Group is working to help NOSB resolve issues, questions, and confusion regarding the classification and definition of materials. The members are from across the industry and have been meeting in conference calls on a regular basis. At the Fall `08 meeting, we'll receive a follow-up report on questions of Ag/Non-Ag as originally addressed at the Spring `08 NOSB public meeting. We will hopefully be looking at the Spring `09 meeting a synthetic/non-synthetic report. And hopefully, everything being perfect, at the Fall `09 meeting we will allow for the NOSB action on the MWG recommendations.

Final note regarding public comment: a reminder that all public comment is handled now via the www.regulations.gov web site. You search that according to the appropriate Federal Register docket and the
government agency, which for us is the AMS.

As an effort to bring processing of public comment to an equal level of efficiency for all departments and agencies -- I need to change that. It's no longer a new process, but it is a continually evolving process, as we have all learned. And all public comment received by the NOP is made available to the NOSB members for review in advance of the respective votes, whenever possible.

And, finally, just to have them posted so they are available, the web site listings for the National Organic Program, the NOSB web page, and the regulations.gov. And that, Mr. Chairman, concludes the material presentation, unless there are any questions.

CHAIRPERSON DELGADO: Are there any questions for the Chair of the Materials Committee? Mr. Chairman, I do have a question on the list of materials that we have in the pipeline. I count to 19; is that a correct
number? Pipeline for 2009.

MR. GIACOMINI: We just had three
more materials added to that pipeline on
Friday, and it's whatever is on that list. I
have the same number that you do.

CHAIRPERSON DELGADO: Okay, good.

MR. GIACOMINI: But that could
certainly change at any point in time. I
could -- by next Monday, Rob may have added
three or four more to the list, so--

CHAIRPERSON DELGADO: Okay. Thank
you for that. One more chance to ask
questions. All right. Thank you, Mr.
Chairman. And we'll move now to the next
point on the agenda, and that is a well-
deserved break, 10 minutes long. It's
actually 15, but we'll call it 10, so we'll be
here by a quarter to the hour.

(Whereupon, the foregoing matter
went off the record at 10:24 a.m. and went
back on the record at 10:49 a.m.)

CHAIRPERSON DELGADO: Okay. We
are back in session. And at this point, I would like to ask Dr. Robinson to introduce our special guest.

DR. ROBINSON: Thank you, Mr. Chairman. As I mentioned before, our Deputy Administrator, Dan Shipman.

MR. SHIPMAN: Thanks, Barbara, and thank you Board members. I know it takes a lot of your personal time to come and do something like this. Over the years that I've spent at USDA, I've been involved with a lot of boards, and what I've heard about this particular one, you really end up spending an awful lot of time and energy, and it's a five-year term. Most of them that I've dealt with have been three-year terms max. So thank you very much for the time that you provide. What you do really helps run the Organic Program.

So I just thought I'd take a few minutes, Barbara and her staff were gracious enough to give me some notes, and I've thrown those out and I'll use my own. But I wanted
to tell you a little bit about my background. I grew up in Connecticut, so I'm not your typical USDA guy that's from the Midwest. I grew up in Connecticut, not on a farm, but I did go to University of Connecticut and ended up getting a degree in biology and natural resources, so some of my roommates and so forth at school considered me kind of a tree-hugger.

But I've been in kind of mainstream agriculture most of my career. I started with USDA in '76, row crops primarily: grains; sorghum, we talked a little bit about sorghum; corn and soybeans and so forth; got involved with a number of farm bills over the years, and biotechnology as it entered the market and some of the regulatory process there. But as I learned more and more -- I came to AMS just six months ago. When Ken Clayton, Dr. Clayton retired, they asked me if I'd put my hat in the ring, and I did and I accepted the position.
And the group of people at USDA or at AMS that I've had the pleasure to work with have just been outstanding. I really think that the staff there—what makes a good agency to serve the American agriculture and the public at large is the staff that's built there, and under Ken Clayton's leadership and all of the administrators that have been there and the deputies, like Barbara. I think they've built a really fabulous staff, and it's been a pleasure to work with them.

As I've worked with all of the different programs at AMS, I don't find any more interesting than the Organic Program. At staff meetings on Monday morning, Barbara always has something interesting to share. Sometimes, it's good news; most of the time it's challenges. But it's certainly an interesting program, and I really do enjoy listening and starting to get involved in it.

I just want to share a little bit of kind of the principles that guide me and
will guide me as I work with Barbara regarding
the organics or any standards. First of all,
I believe that when you establish standards--
government standards-- you have to do it in a
transparent, open process, and I will support
that; and they have to be clear standards and
rules that you operate by. Ambiguity within
the marketplace creates risk and uncertainty,
and that doesn't benefit anybody in a
marketing system. So setting clear standards
in a transparent way is certainly of interest
to me, and you will have my support as you
move forward in that.

And then educating people and
reaching out and making sure they understand
those standards and rules is vitally
important. Again, whether you're talking
about organic standards or you're talking
about ethanol standards or any other standard
that the government may get involved with,
people have to understand what those rules
are.
And then when you come to enforcement, my philosophy is that you have to hold people responsible for those standards, but you have to use all of your enforcement tools that are in your toolbox. It's just not a one-fit solution. And you have to develop an environment where people that are in that market, in that industry, want to adhere to those standards, that it's in their best interest to adhere to those standards.

So set the standards by listening to folks, trying to build a consensus, make sure they're clear, and do it in a transparent way. Educate, outreach to people so that they know what those standards are. And then enforce those standards, and do it in a way where you use all the tools and authorities that are at your access.

So I'm just going to end it there. If anyone has any questions, I'd be more than happy to try to answer them. I know you have a very busy schedule. I see Lenny back there.
I've run across his path a few times in my days over in the corn and soybeans and so forth. Good to see you, Len. Any questions? If not, I again welcome you, and we can get on with your meeting.

CHAIRPERSON DELGADO: Thank you.

MR. SHIPMAN: Okay. Thanks.

CHAIRPERSON DELGADO: I'm going to ask the Board members to see if they have any questions. Thank you very much for taking time away from your busy schedule, and I appreciate you coming.

MR. SHIPMAN: I forgot, almost.

The listening sessions on pasture--two more--Barbara asked me to mention that. And I guess you mentioned you wanted to say something about transition team and what can be expected. One quick comment: at 3:00 today we meet for the first time with the transition team that's coming into USDA. We'll see how that goes. We're going to be providing information as far as what we do, what some of
the big challenges are for the first 90 days of the new administration coming in. This is the first session that we will have with them in the marketing and regulatory area, but they are here. They've already hit the ground and they're starting to meet with folks. So you can start to anticipate getting some feedback as to what's occurring over the next few months. Thanks, and enjoy your meeting.

CHAIRPERSON DELGADO: Thank you.

MS. FRANCES: The restaurant in the hotel, if you would like to eat there for lunch, they have pre-ordering. If you would like to order off that menu you need to basically do that now.

CHAIRPERSON DELGADO: Thank you.

Any other comments? Moving on with the agenda, we're going to start our public comment session. And before we do that, let me do the traditional thing that we do at the start of public comment, which is essentially reading the ground rules. If you're
interested, we have those on page 29 of the procedures manual for our Board.

There are several points. I'll skip to the most important one, which is individuals providing public comment will refrain from any personal attacks or remarks that otherwise fall on the character of the individual. And we're very strict with that. Folks, what we're looking for is constructive ideas that will help us improve the quality of our recommendations. Also, I want to touch upon the mission of our Board, which is to provide effective and constructive advice.

So, as you realize, we have a number of people presenting today. I think the list is over 60 today. We want to listen to all of you. We encourage you to stick to the five-minute limit that we invoke per individual. We are not trying to turn anybody away, by all means; we're interested in your comments and your ideas. But we would like to ask that you are specific-- concrete in giving
1 us your input and your ideas on what is it 
2 that we can do to make our work better. 
3 So, on that note, our first 
4 speaker of the day is Dave Martinelli, and he 
5 is representing the Methionine Task Force. 
6 And, again, for the ground rules, our acting 
7 secretary will give the speaker a one-minute 
8 notice, and that will be the indication that 
9 you have one minute left for wrapping up 
10 comments. 
11 After Mr. Martinelli, we have Dave 
12 Bruce, if you can be ready to move on to the 
13 podium. 
14 MR. MARTINELLI: Actually, David 
15 Bruce, I've got a proxy from David Bruce. 
16 And, actually, David Will is presenting from 
17 the Methionine Task Force, too, so we're going 
18 to try to use 10 to 15 minutes between the two 
19 of us. 
20 CHAIRPERSON DELGADO: So you have 
21 a proxy -- 
22 MR. MARTINELLI: My five minutes,
one proxy, and David's five.

CHAIRPERSON DELGADO: All right.

MS. FRANCES: It's on the list, so it's all there.

MR. MARTINELLI: And for the record, I'm Dave Martinelli with Coleman Natural Foods, and I'm here with David Will, and we're presenting for Methionine Task Force. I'll let him do his own introduction when it's his time.

Basically, methionine is not an agenda item for the NOSB at this time, but at the last NOSB meeting we had committed to you all that we were going to be actively engaged on kind of a 24-month work plan involving research on alternatives, as well as conducting some more field trials. So today is just the first in a series of updates that you'll get from us on what we're actively engaged on.

And just to kind of get everybody up to speed, just a quick primer here,
methionine is a necessary nutrient in poultry production. The NOSB has approved the use of synthetic methionine until October 2010, and the Task Force is currently involved in a number of projects looking at alternatives and seeing if we can raise chickens without synthetic methionine.

There was a specific question that came up between the last Board meeting and this meeting from you all regarding, how much synthetic methionine do we add to the diet? The question was asked in the open session at the last meeting, but there wasn't a whole lot of science behind our answer. So we went out and worked with Dr. Robert Schwartz, who's a member of the Task Force. He's a long-time poultry nutritionist. He has his own company and consults for companies on the East and West Coast. And we also brought in specific nutritionists that work with some of the Task Force members: Dr. Paul Twining who works in California and Pennsylvania, and Dr. Richard
Arnold in Texas.

So just kind of to do a quick overview of methionine, it is required to meet, we add synthetic methionine to the diet to meet both the methionine and cystine requirements of the birds. Both methionine and cystine are sulfur-containing amino acids, and birds have a high demand for cystine as part of the feathering process that they go through. And we do not add cystine in synthetic form, but the birds are able to take in the methionine that we provide them and metabolically convert it into cystine. So the reason that that's important is when you look at the methionine needs for the birds, you really need to look at both the methionine and the cystine needs.

This chart indicates, we went through different classes of poultry: layers, broilers, turkey, duck, and geese. And this is just kind of a general percentage. They're very specific numbers, but we tried to take
specific age groups of the birds. I mean, these percentages change throughout the life cycle of the animals, obviously, so we tried to take a snapshot in time for each of the different species to show you what the birds' total demand is and then how much is being provided from the grains and how much synthetic is being added.

I think the real take-away here is that, at most, we're adding one-quarter of one percent synthetic methionine to the diet, so it's an exceedingly small amount. It's, at most, about five pounds per ton of feed, so it's a very small percentage of the overall feed.

We also try to break it out not only as percentage of the diet, but I think the real question was, if a bird has a demand for methionine/cystine, how much of that demand is met from the organic grains in the diet and how much is met from the synthetics? And, again, this is a gross generalization,
but approximately 70 percent or more of the birds' dietary needs are met from their base diet, from the grains in the diet; and we're adding the synthetic to meet approximately 30 percent or less of their total methionine and cystine needs.

So now to kind of segue way into the active research that we're doing, as you recall, our most promising area of research is around high methionine corn, and you all had a presentation from Dr. Walter Goldstein at the last meeting. I actually have copies of his latest communication to us where he goes into much more detail about all the work that he's been doing on trials. I just summarized it here. We completed seed stock trials in Hawaii this spring. I think that might have even been done at the last meeting. And then plantings occurred in the Midwest in the spring, and they're just harvesting the crop now in Wisconsin, Iowa; and we actually have some East Coast plantings in Pennsylvania that
one of our Task Force members is doing, as well.

We, unfortunately, just because of timing, don't have any data on yields or thiamine levels or protein levels in the corn. We're just literally collecting that data now, so probably in 30 to 60 days we'll be able to have a report on that. And then we'll be able to assess how much grain is available for feeding trials and then how much has to be re-used for seed stock.

We are working with Dr. Goldstein's group, the Michael Fields Agricultural Institute, on trying to do a winter planting, you know, either in the southern hemisphere-- Chile is what we did last year-- or in the States, either Florida or Hawaii. We're trying to get two planting cycles a year to try to accelerate the development the hybrids.

The other area we've made good progress I think is we funded a grant through
the University of Arkansas with Dr. Steve Ricke, who's the Director of the Center of Food Safety. He is working on trying to isolate bacteria that will naturally produce methionine, and he's modeled a three-phase trial that will take about 12 months to complete. End of January he will start phase one, and the Task Force has agreed to underwrite that program. He would really be the best person to give you the updates on that trial. I think it's premature to get him here now, but maybe at next spring's meeting or next fall's meeting he can come in and give you a full presentation on what they've determined at that point, at least in the trial work that he's doing.

The third thing that we were committed to looking at was this notion of insect meal or ento-protein. There was a presentation a couple of meetings ago by Neptune Industries at the agriculture session. I would characterize this as really not a
viable alternative, currently. We've had some
discussions with the folks at Neptune. They
are at the very beginning level of pilot
programs. I mean, they're talking about
having maybe 20 pounds per week of this
product available sometime in the next three
to six months. So it's really not even on--
at that volume, it's really not even a trial-
able scale because this is not 100-percent
methionine; it's another feed source that has
an elevated level of methionine, probably
similar to fish meal. We've not been able to
get any specific specs from the company yet.
As soon as we can get some specs, and as soon
as they get to more commercially-viable
volumes, then we can take another look at it.

With that, I'm going to turn it
over here to David Will to talk about some of
the work they've been doing in the field with
birds on diets without methionine.

MR. WILL: Good morning. Thank
you. My name is David Will. I'm with Chino
Valley Ranchers/MCM Poultry, and we are actually conducting with the Methionine Task Force the first commercial-scale layer trial down in Lakeview, California. We're currently at 27 weeks of age on the birds. They were hatched the second week of May of this year. They are sisters: a total of 22,000 birds divided into two houses, 11,000 each. One flock is being raised under our normal practices. The second, we are adding no additional methionine to the ration. They are high-lying brown pullets and now our egg layers. They are cage-free, and our intent and commitment of our company is to run this through the full cycle of their life, which includes to the age of 105 weeks of age.

In our control group, we currently have fed them a total of 10,383 total grams of feed, of which 1,885 was protein, 52.52 grams of that were methionine which included 22.52 grams of added methionine. And for their four-week average, they've consumed a little
over 24 pounds of feed. And to date, we've received an average of 9.9 eggs per hen. The major differences on the birds that we've added no methionine: they've consumed 10,292 total grams of feed, 2,211 grams of protein, or about 17 percent more in order to compensate for the methionine. They've received 37.8 total grams of methionine or about 30 percent less to date, zero percent added synthetic methionine. Their four-week average of feed consumption is over 28 pounds, and we've received a total of 8.8 eggs per hen to date.

Both flocks started at 11,000 birds. The control group has a mortality so far of 538 total layers. The no methionine is at 678. And except for the first week, the mortality has been very, very similar and close. It was the first week the methionine group had a slightly higher loss, which we attribute to just poor hatchlings.

The control group has a uniformity
of 1,741 grams or 85 percent of body weight to our target plan. The no methionine group is at 1,707 grams and is at 70 percent uniformity, meaning out of 100 birds 70 percent are at target of the weight and 30 percent are not within. At the end of the brood, both flocks were within I believe 17 grams of each other, and in the last couple of weeks the no methionine-added group has started to really dive.

The control group-- we're currently at 75.3 percent production with an average egg weight of 57.8 grams, which is just slightly above a large; and our case weight is about 46 pounds. To date, the no methionine group this last week was at 65.6 percent production, and the average egg weight was 56 grams, and the case weight was about a pound lighter at 45.

Some general observations. The feathering in both houses looks great, and we have a lot of feathers on the ground, which is
one of the first warning signs. We anticipate to see that changing. We've had no added signs of cannibalism whatsoever. And in the no-added-methionine group, feed consumption is about 20 percent higher, egg production is 15 percent lower, and case weights are 3 percent lower as well.

Our last general observation, we are starting to become concerned about ammonia. Because we're in Southern California and we've had a very mild fall so far, we've been using natural ventilation with no concern. As we start getting colder now, we're going to be buttoning up the houses a little bit to control the birds' heating, and we anticipate ammonia problems due to the extra protein in the feed and in their urine and bodily function output. So we will be monitoring that. To date, we've done none because we haven't seen any.

And our other major concern is that the age of the birds, that we are just
starting to get into peak production and major
case weight, and we've been warned by our
veterinarian and our nutritionist that the
feed consumption is one of the first signs
that we're going to start having some issues
coming up in the near future.

CHAIRPERSON DELGADO: Are there
any questions? Kevin?

MR. ENGELBERT: Could you
elaborate a little bit on your hatching and
why you felt there was a difference in the
mortality between them? And were the parent
birds being fed methionine? And could you
also elaborate on your cage-free system? Do
the birds have access to the outdoors, or are
they simply in a barn with an open area to
roam?

MR. WILL: First, it's just a
random luck of the draw. You get great
hatchlings and you get less-than-standard
hatchlings from the hatchery. We don't hatch
our own birds. They came from one of the
traditional hatcheries in Southern California. I'm sure the parent stock was a standard methionine-fed flock.

As far as the system, it is a cage-free house. These birds are not on an organic ration. We weren't willing to commit that sort of money because we weren't sure how much these birds were going to crash as the program goes on. So they are on an open-house, no restrictions with movement, open sides, with ventilation and access to the ground.

CHAIRPERSON DELGADO: Hugh?

MR. KARREMAN: Thank you for that update, you guys. We really appreciate that, and you know we're watching you, and it's really good to see that you're following through. That's really important. Just wondering on the study you did -- you had the data there, which is great -- are they significant differences? I mean, that's your raw differences. Are they significant, you
know --

MR. WILL: Individually, no.

Cumulatively, they're starting to become a bit of a difference, yes.

MR. KARREMAN: And you'll censor the data from the hatchlings that didn't make it into your final numbers?

MR. WILL: Probably not, because that's just part of the, you know, the randomness of poultry. So I don't think we'll take that into account. It would be more from the moment of housing, which they both basically went in. To date, their livability has been excellent in both houses, so I think we'll only look at that as the number. We just wanted to make that an awareness at the start that there was that minor issue.

But, mainly, we'll be looking at consumption, conversion, and health. Number one will be health of the birds driving us.

MR. KARREMAN: As you're going into the more critical time, according to your
nutritionist and vet, can you still add in methionine as needed for the welfare of the birds? Or is it like, "Oops, too late, they're done?"

MR. WILL: If we had to pull in, we could add methionine. We've actually had some experiences where we've seen some production in the Midwest that we didn't know or didn't have any control over where that was the problem, they were methionine deficient, and the birds had really majorly crashed. Our nutritionist stepped in, and we actually were able to salvage that production and keep those birds in excellent shape.

So we are watching it. Our intent is to go as far as we can, and our hope is that we get to the end of this and have 105 weeks of data to present to you. But again, bird health has to be our number one issue.

MR. KARREMAN: Thanks.

CHAIRPERSON DELGADO: Dan?

MR. GIACOMINI: A couple of
questions. Will it be okay for Valerie to send copies of these out to us? I'd like to do some crunching on some numbers on those, if possible.

MS. FRANCES: They'll be posted on the web site.

MR. GIACOMINI: Okay, fantastic. Dave, you referred to your requirement as a methionine/cystine requirement. Is that the way the industry wants us to look at what we've been looking at as a methionine number? I know sometimes we talk about methionine and sometimes it's methionine/cystine. Is that the preferred way the industry wants to look at it?

MR. MARTINELLI: That's the feedback we got from all the nutritionists. They all basically said you need to look at them together. So I would say, you know, we've not done in that past and shame on us. But I think, going forward, we should try to look at it as a total.
MR. GIACOMINI: Okay, all right. And, finally, Dave, in your trial, the box is only so big when you have that kind of an increase in protein. What was your drop in energy? Or did you have a drop in energy, or was it absorbed somewhere else in this trial?

MR. WILL: So far we haven't seen a drop.

MR. GIACOMINI: No, but in the energy density of the diet, when you see that kind of an -- you had to take that space that you took up with more protein from something. Was it energy, or was it something else?

MR. WILL: I'll have to get back to you on that specifically.

MR. GIACOMINI: Okay.

CHAIRPERSON DELGADO: Kevin?

MR. ENGELBERT: Mr. Will, did I understand you correctly to say that the feed ration is off, it's conventionally fed ration to both groups of birds?

MR. WILL: Correct. Both groups
are conventional feed.

MR. ENGELBERT: To get a trial for organically-fed birds, wouldn't you want to try to have organic feed, given that the nutritional content and availability, at least from my own experience, for organic feed is significantly higher than conventional feed. Seriously, it would have a real impact on the outcome.

MR. WILL: I'm not sure that that's something that we looked at further down with the difference in the organic versus the non-organic, because we balance our rations to a set level of proteins. So I think, if anything, it would be a little bit of adjustment within the ration. But our main concern was, this never having been done before, growing birds from start at this level of scale, we had no idea what we were walking into. And as a financial commitment of the company, we felt that this was one that we were comfortable with to start with.
MR. ENGELBERT: I would certainly be interested in even a smaller scale trial where organic feed was the basis for the ration and see what the differences were then.

MR. MARTINELLI: You know, I could add for the broiler trials that we've done we've used organic feed, because it's a much smaller quantity of birds and a much shorter feeding cycle. I mean, I can totally appreciate what Dave is going through at 105 weeks. The math gets much different. But I think the thing would be let's see how these birds do over the next critical phase, and if the results are promising then I think the next thing to follow it up with would be maybe an organic-based trial with smaller numbers or something.

CHAIRPERSON DELGADO: Kevin?

MR. ENGELBERT: And thank you for your efforts and report.

CHAIRPERSON DELGADO: Bea?

MS. JAMES: I'm trying to
understand, do your birds see sunlight at all?
Do they go outside?
