

Acidified Sodium Chlorite

Handling/Processing

Identification of Petitioned Substance

Chemical Name:	CAS Number:
Sodium chlorite	7758-19-2
Synonym:	Other Codes:
Chlorous acid, sodium salt	EINECS 231-836-6
	RTECS No. VZ 4800000
Other Names:	UN No. 1496
Acidified sodium chlorite (ASC)	
Sanova® SANOVA®	

Characterization of Petitioned Substance

Composition of the Substance:

The petitioned substance, acidified sodium chlorite (ASC) solution, is a binary composition that consists of sodium chlorite solution and citric acid.

Sodium chlorite solution is made with sodium chloride crystals or flakes and water, and available at various concentrations, such as SANOVA® Base (25%) and Sanova® Antimicrobial Food Additive Base (25%) containing 20-50% by weight of sodium chlorite (NaClO₂). While the chlorite ion (ClO₂⁻) is stable in aqueous solution, under acidic conditions—the acidifier can be any one of food-grade acids, chlorite forms chlorous acid (HClO₂) (see Figure 1). Chlorous acid is unstable and dissociates back to chlorite ion. Other compounds like chlorine dioxide (ClO₂) and chlorate also generated. Ultimately, chlorous acid degrades to chloride (Cl⁻).

Figure 1. Formation of Chlorous Acid

Properties of the Substance:

Chemical and physical properties (FSANZ, 2003)

Color	White Crystalline Solid (80% Technical Grade) ; Solutions: Colorless to light green
Density/Specific Gravity	2.468 Crystal 1.176 Bulk, Packed, 80% Technical Grade 1.21 (25% aqueous solution)
Dissociation Constants	pK _a of chlorous acid (HClO ₂) = 1.72 @ 25° C
Hydrolysis	Sodium chlorite reacts with hydrogen ions to form chlorous acid; pK _a of chlorous acid (HClO ₂) = 1.72 @ 25° C
Melting/Crystallization Points (liquids)	-8° C (25% Solution)
Melting Point or Range (solids)	180–200° C, Decomposes
Molecular Weight	91.45
Odor	Slight chlorine-like
Oxidation Stability (air)	Stable to air oxidation
Photolysis	80% Technical Grade is stable to photolysis; Photolysis sodium chlorite solutions produces chlorine dioxide

Physical State	White Crystalline Solid, slightly hygroscopic (80% Technical)
Solubility in Organic Solvents	Not soluble in non-polar solvents; Sparingly soluble in polar solvents
Solubility in Water	43.6% @ 25° C
Thermal Stability	Decomposes at 180 – 200° C
Vapor Pressure	21.085 mm Hg (25% solution @ 25° C)
Viscosity (liquids)	1.851 cps @25° C (25% solution)

33
34 ASC solution is typically not constituted for application until immediately just prior to the actual time of
35 use because of its unstable nature. Acidification of sodium chlorite results in partial conversion of chlorite
36 to an unstable material, chlorous acid. Gordon, et al. stated that 100% chlorous acid solution decomposed
37 to chloride and oxygen in one hour. Chlorous acid is the main active ingredient of ASC solution and is a
38 very strong oxidizing agent. A Material Safety Data Sheet (MSDS) for chlorous acid (CAS No.13898-47-0) is
39 not available; in addition, there is no USEPA registration number for chlorous acid.

40
41 **Specific Uses of the Substance:**

42
43 ASC solution is used as a processing aid in wash and/or rinse water, in accordance with the FDA
44 limitation for using on direct food contact and indirect food contact:

- 45 • Direct Food Contact (Secondary Direct Food Additive) – Poultry carcass, organs and parts; red
46 meat carcass, organs and parts, seafood (finfish and crustaceans), and fruits and vegetables (raw and
47 further processed); processed, comminuted or formed meat products; and
- 48 • Indirect Direct Food Contact – Hard surface food contact sanitization.

49
50 **Approved Legal Uses of the Substance:**

- 51
- 52 1. The U.S. Food and Drug Administration (FDA) approved
 - 53 • ASC solution as an antimicrobial agent (21 CFR §173.325) under the Specific Usage Additives
54 section of the Secondary Direct Food Additives Permitted in Food for Human Consumption. ASC
55 solution is produced by mixing an aqueous solution of sodium chlorite with any generally recognized
56 as safe (GRAS) acid, in accordance with current industry standards of good manufacturing practice, for
57 use in red meat, poultry, seafood, and raw agricultural commodities.
 - 58 • as a sanitizing solution (21 CFR §178.1010 (b) (46)), which is an aqueous solution of oxy-chloro
59 species generated by acidification of sodium chlorite, listed under the Substances Utilized to Control
60 the Growth of Microorganisms of Indirect Food Additives: Adjuvants, Production Aids, and Sanitizers.
61 In addition to use on food-processing equipment and utensils, this solution may be used on dairy-
62 processing equipment.
 - 63
64 2. The USDA Food Safety and Inspection Service (FSIS) identified the ASC, listed under Antimicrobials in
65 Table of Safe and Suitable Ingredients on Attachment 1 of FSIS Directive 7120.1, for use in red meat and
66 poultry products as processing aids.
 - 67
68 3. The U.S. Environmental Protection Agency (EPA) approved oxy-chloro species generated by
69 acidification of an aqueous solution of sodium chlorite, listed under 40 CFR §180.940 Tolerance exemptions
70 for active and inert ingredients, for use in antimicrobial formulations (Food-contact surface sanitizing
71 solutions). In addition, SANOVA® Base (25%) has the EPA Registration Number 1677-219.

72
73 **Action of the Substance:**

74
75 Chlorous acid exerts its antimicrobial activity by direct disruption of the cellular membrane and by
76 oxidation of cellular constituents of microorganisms. ASC solution is considered a broad-spectrum
77 oxidative antimicrobial, effective on pathogenic bacteria as well as viruses, fungi, yeast, molds, and some
78 protozoa. The level of chlorous acid, which forms in acidic aqueous solution, depends on the hydrogen ion
79 concentration (i.e. pH) of the mixed solution of sodium chlorite and acid. Sustained antimicrobial activity

80 deriving from chlorous acid is based on reservoirs of chlorite and hydrogen ions in the solution. As
 81 chlorous acid is consumed through oxidation, interaction with microorganisms and other organic matter,
 82 re-equilibration from reservoir ions produces additional chlorous acid.
 83

Status

United States:

88 1. The Food and Drug Administration (FDA) approved ASC solution as an antimicrobial agent (21 CFR
 89 §173.325), at specified levels of concentration (ppm) and pH, for treating on a variety of products, see Table
 90 1; and as a sanitizing solution (21 CFR §178.1010 (b) (46)), at a range 100-200 ppm of sodium chlorite, for
 91 applying on food-processing equipment and utensils.
 92

93 **Table 1. Summary of 21 CFR §173.325 Acidified Sodium Chlorite Solutions**
 94

Food Product	Application	ASC Solution	
		ppm	pH
Poultry intact carcasses and parts, meat, organs, or related parts or trim	Spray or Dip	500-1200	2.3-2.9
Poultry intact carcasses and parts	Pre-chiller or Chiller Solution	50-150	2.8-3.2
Red meat, red meat parts, and organs	Spray or Dip	500-1200	2.5-2.9
Processed, comminuted or formed meat food products	Spray or Dip	500-1200	2.5-2.9
Seafood ¹	Water or Ice (use to rinse, wash, thaw, transport, or store)	40-50	2.5-2.9
Finfish and Crustaceans ²	Spray or Dip Solution (in processing facilities)	1200	2.3-2.9
Raw Agricultural Commodities ³	Spray or Dip	500-1200	2.3-2.9
Processed Fruits and Vegetables ⁴	Spray or Dip	500-1200	2.3-2.9

95
 96 2. The USDA Food Safety and Inspection Service (FSIS) identified the ASC for use in red meat and
 97 poultry products as processing aids (FSIS Directive 7120.1, Attachment 1). For poultry products, the pH
 98 and concentration levels of the solutions have been referred to 21 CFR §173.325. For red meat products,
 99 ASC solution applied as a spray or dip has the pH 5.0 - 7.5, in addition, the concentrations of sodium
 100 chlorite and chlorine dioxide are not exceed 1200 and 30 ppm, respectively.
 101

102 3. The U.S. Environmental Protection Agency (EPA) approved oxy-chloro species (40 CFR §180.940)
 103 generated by acidification of an aqueous solution of sodium chlorite as a food-contact surface sanitizing
 104 solutions. The end-use concentration is not to exceed 200 ppm of chlorine dioxide.
 105

International:

- 108 1. The Canada Food Inspection Agency, Meat Hygiene Directive listed ASC as an approved microbial
 109 control agent, in a range of 500-1200 ppm at pH 2.5-2.9, for use on poultry. (May 2001)
- 110 2. The Food Standards Australia New Zealand (FSANZ) approved ASC as a food processing aid for
 111 antimicrobial use. (October 2003)
- 112 3. The European Food Safety Authority (EFSA) endorsed ASC to clean chicken carcasses. (January 2006)
- 113 4. Codex Committee on Food Additives recommended that they consider adding ASC to the inventory of
 114 processing aids (IPA). (April 2008)

¹ Any seafood is intended to be consumed raw shall be subjected to a potable water rinse prior to consumption.
² Treated seafood shall be cooked prior to consumption.
³ Treated product shall be followed by a potable water rinse, or by blanching, cooking, or canning.
⁴ Treated product shall be followed by a potable water rinse and a 24-hour holding period prior to consumption.

Evaluation Questions for Substances to be used in Organic Handling**Evaluation Question #1: Is the petitioned substance formulated or manufactured by a chemical process? (From 7 U.S.C. § 6502 (21).)**

In the petition, it states that ASC solutions are made on-site and on-demand by mixing a solution of sodium chlorite with natural citric acid. Sodium chlorite (25%) and citric acid (50%) solutions are stored separately in bulk on site. Both solutions are pumped by proportional pumps and a water dilution module to make the final use dilution product, which typically contains 0.1% sodium chlorite and 0.6% citric acid and 99.3% water.

Sodium chlorite is made by the reduction of chlorine dioxide, which is, in turn, from the reduction of sodium chlorate in the presence of sulfuric and hydrogen peroxide or sulfuric acid and sodium chloride. The resulting solution may be dried to a solid and the sodium chlorite content may be adjusted to about 80% by the addition of sodium chloride, sodium sulfate, or sodium carbonate. Sodium chlorite is marketed as a solid or an aqueous solution (such as 25% by weight).

The acid used to acidify sodium chlorite is natural citric acid, which is stated in the petition. However, there is no information in the petition regarding how the natural citric acid was manufactured.

Evaluation Question #2: Is the petitioned substance formulated or manufactured by a process that chemically changes the substance extracted from naturally occurring plant, animal, or mineral sources? (From 7 U.S.C. § 6502 (21).)

As mentioned above, ASC solution is formulated by mixing sodium chlorite solution with natural citric acid. However, the petitioner does not describe how the natural citric acid was made. Sodium chlorite solution and its precursor (sodium chlorite solid) are synthetic materials that are made by chemical processes, not extracted from naturally occurring plant, animal, or mineral sources.

ASC solution is produced by the addition of an acid (i.e. any GRAS acid in US/any food-grade acid in international community) to an aqueous solution of sodium chlorite. While the chlorite ion is stable in aqueous solution, under acidic conditions, chlorite forms a semi-stable intermediate, chlorous acid. Chlorous acid ultimately disintegrates to chloride.

Evaluation Question #3: Is the petitioned substance created by naturally occurring biological processes? (From 7 U.S.C. § 6502 (21).)

The petitioned substance is created by a chemical processes. Combination of sodium chlorite solution and acid results in partial conversion of chlorite to chlorous acid, which is the main active ingredient of ASC solution. Chlorous acid breaks down to form chlorate ion, chlorine dioxide, and chloride ion. The level of chlorous acid depends on the hydrogen ion concentration (i.e. pH) of the ASC solution. The hydrogen ion source for an ASC solution can be any food-grade, GRAS, acid. The quantity of GRAS acid required to achieve the appropriate pH (and level of chlorous acid) will depend upon the strength of the acid, the buffering capacity of the solution itself and, to a lesser extent, the alkalinity of the water used in the formulation. Weaker acid is needed in the approximate 0.20% to 1.20% concentration, while a stronger acid, such as phosphoric acid, is needed at approximate 0.04% to 0.10% concentration (FSANZ, 2003). Among the different applications, the highest concentration of chlorous acid is attained at a pH of 2.3 in 1200 ppm ASC solution. At a pH of 2.3, 2.9, and 3.2, approximately 31%, 10%, and 6% of chlorite (from sodium chlorite) are converted to chlorous acid, respectively (Rao, 2007).

Evaluation Question #4: Is there a natural source of the petitioned substance? (From 7 CFR § 205.600 (b) (1).)

169 There is no published literature to indicate that a natural source of ASC solution is available. ASC solution
170 is prepared just prior to use because of its unstable natural. Once sodium chlorite solution and acid are
171 mixed, the resulting solution is applied within one to two minutes (Rao, 2007).
172

173 **Evaluation Question #5: Is there an organic agricultural product that could be substituted for the**
174 **petitioned substance? (From 7 CFR § 205.600 (b) (1).)**
175

176 There is no information available to suggest that an organic agricultural commodity or product could be
177 substituted for the petitioned substance, ASC solution. However, on the NOP National List, there are some
178 synthetic substances allowed, as disinfectant and sanitizer for using on food contact surfaces, listed under
179 the 7 CFR §205.605 Nonagricultural (nonorganic) substances allowed, as ingredients in or on processed
180 products labeled as "organic" or "made with organic (specified ingredients or food group(s))".
181

182 For example, peracetic acid, listed under 7 CFR §205.605(b), can be substituted for the ASC. Peracetic acid
183 is a mixture of acetic acid and hydrogen peroxide. It is a very strong oxidizing agent and has a strong
184 pungent acetic acid odor. The primary mode of action is oxidation the same as ASC. In addition, peracetic
185 acid is considered environmentally safe. (For additional information, please see the NOP petitioned
186 substances database.)
187

188 **Evaluation Question #6: Are there adverse effects on the environment from the petitioned substance's**
189 **manufacture, use, or disposal? (From 7 CFR § 205.600 (b) (2).)**
190

191 ASC is manufactured by addition of acid (e.g. citric acid) to an aqueous solution of sodium chlorite. The
192 indoor uses of sodium chlorite will not result in exposure to the environment (RED, Case 4023). ASC
193 solution, once mixed, results in a chemical equilibrium containing chlorous acid, chlorite, and acid. During
194 the antimicrobial process upon contact of ASC with the food surface, chloride is ultimately produced.
195 Chloride is a normal constituent of all living organisms and waters; it is not expected to represent an
196 environmental impact at the expected concentrations (SCHER et al., 2008).
197

198 FDA Environmental Review Group (ERG) have examined uses of ASC in poultry processing, fruit and
199 vegetable processing, and for red meat and meat processing in Food Contact Notification 450, 644, 645, and
200 739. These reviews all indicate that the expected environmental concentrations of ASC will be lower than
201 the lowest toxicity endpoints currently available due to the chemical degradation of chlorous acid to
202 chloride (White, 2006).
203

204 **Evaluation Question #7: Does the petitioned substance have an adverse effect on human health as**
205 **defined by applicable Federal regulations? (From 7 CFR § 205.600 (b) (3).)**
206

207 ASC solution is prepared prior to use by combining citric acid with sodium chlorite solution. According to
208 the MSDSs submitted from the petitioner, citric acid is an irritant of the skin, eyes, and respiratory track;
209 sodium chlorite solution is corrosive to skin, eyes, and respiratory systems. Sodium chlorite solution may
210 cause burns to mouth, throat, and stomach, if it were swallowed.
211

212 Acidification of sodium chlorite results in conversion of chlorite to metastable chlorous acid, which can
213 subsequently form a mixture with chlorite, chlorine dioxide, and chloride. Chlorous acid, the main active
214 ingredient, is consumed by reacting with microorganisms and other organic matter found on the surface of
215 the treated food and ultimately generated chloride. Chlorite that does not form chlorous acid may remain
216 as chlorite ion in solution, or may react with water to produce chlorate. Chlorate is subsequently reduced
217 to chloride, which is the major residue component of ASC solutions and appears toxicologically inert.
218 Moreover, chloride occurs endogenously under normal physiological conditions in human body water
219 (Rao, 2007). Chlorine dioxide appears extremely volatile and would be expected to evaporate from the
220 food surface quickly. The toxicological impact of any chlorine dioxide generated in an ASC solution is
221 minimal to the overall effects and/or final measurable concentrations of chlorite, chlorate, or chloride
222 (FSANZ, 2003).
223

224 **Evaluation Question #8: Is the nutritional quality of the food maintained when the petitioned**
225 **substance is used? (From 7 CFR § 205.600 (b) (3).)**
226

227 ASC is applied onto the surfaces of the food at low levels. The predominant chemical residue from the
228 ASC solution is chloride. Chlorine dioxide can form in solution. However, chlorine dioxide is very volatile
229 and is lost by evaporation or reduction to chlorite by oxidation of organic matter (e.g. bacteria).
230 Consequently, it is not present as a residue of the treated food product. Moreover, if ASC is used
231 according to good manufacturing practice (GMP), no residues of any of the oxy-chlorine species (e.g.
232 chlorine dioxide, chlorite, and chlorate) should remain on the sprayed or dipped food product.
233

234 A number of studies (Rao, 2007) were performed and shown that no differences were identified in the
235 amino acid and fatty acid distribution of ASC-treated poultry carcasses in comparison to untreated
236 samples. The fatty acid profiles of ASC-treated red meat, seafood, and fish, also were comparable to
237 untreated controls. The report concluded that no evidence of either oxidized or chlorinated organic
238 residues, including lipids or amino acids and proteins, was found. In addition, a research conducted by
239 Ruiz-Crus et al. demonstrated that shredded carrots sanitized with ASC retained higher levels of sugars,
240 carotene, and antioxidant capacity.
241

242 **Evaluation Question #9: Is the petitioned substance to be used primarily as a preservative? (From 7**
243 **CFR § 205.600 (b) (4).)**
244

245 The petition request is to permit the use of ASC solution as a processing aid in organic handling. Its
246 intended uses are for (a) direct food contact (secondary direct food additive) — poultry carcass, organs and
247 parts; red meat carcass, organs and parts, seafood (finfish and crustaceans), and fruits and vegetables (raw
248 and further processed); processed, comminuted or formed meat product; and (b) indirect direct food
249 contact — hard surface food contact sanitization. There is no published information to suggest that the
250 petitioned substance is being used primarily as a preservative.
251

252 **Evaluation Question #10: Is the petitioned substance to be used primarily to recreate or improve**
253 **flavors, colors, textures, or nutritive values lost in processing (except when required by law, e.g.,**
254 **vitamin D in milk)? (From 7 CFR § 205.600 (b) (4).)**
255

256 There is no information to indicate that the petitioned substance is used to recreate or improve flavors,
257 colors, textures, or nutritive values lost in processing. The petition request is to permit the use of ASC
258 solution as a processing aid in wash and/or rinse water for direct food contact and indirect food contact.
259

260 **Evaluation Question #11: Is the petitioned substance generally recognized as safe (GRAS) when used**
261 **according to FDA's good manufacturing practices? (From 7 CFR § 205.600 (b) (5).)**
262

263 The ASC solution is not listed as generally recognized as safe (GRAS). However, both sodium chlorite and
264 citric acid, which are the components used in preparation of ASC solution, are approved by FDA as GRAS.
265 In addition, both sodium chlorite and citric acid are listed under indirect and direct food substances
266 affirmed as GRAS in 21 CFR §186.1750 and 21 CFR §184.1033, respectively.
267

268 **Evaluation Question #12: Does the petitioned substance contain residues of heavy metals or other**
269 **contaminants in excess of FDA tolerances? (From 7 CFR § 205.600 (b) (5).)47**
270

271 Since ASC is a mixture of sodium chlorite solution and citric acid, any impurities in the resulting ASC
272 solution are expected from both components. Currently there are no set purity criteria for ASC (Rao, 2007).
273

274 Sodium chlorite solution is commonly prepared by using technical-grade of sodium chlorite solid, which is
275 comprised of 80% sodium chlorite, with sodium chloride, sodium carbonate, sodium hydroxide, sodium
276 sulfate, and sodium chlorate making up the remainder of the compositions. In general, the manufacturing
277 process employed in the production of sodium chlorite does not include any specific purification steps.
278 Heavy metal, lead, may occur in the final product as a result of their occurrence in the starting material that

279 are obtained from natural sources. Lead must be limited by the specifications indicating maximum levels
280 of 5 mg/kg (Rao, 2007). In addition, the citric acid used to acidify sodium chloride solution must meet
281 FDA specifications of its identity and purity.

282
283 There is no other published information to suggest that other heavy metals or contaminants may or may
284 not be present in the petitioned substance.
