In response to the June 28, 2006, Federal Register Notice (71 FR 36715) requesting additional proposals respecting the Class III and IV price formulas and their application, the National Milk Producers Federation (NMPF) proposes to establish new price formulas for Class I and Class II milk. NMPF’s proposal would address issues that were raised by, but excluded from the scope of, the proceedings under Docket No. AO-14-A74, et al.

NMPF’s proposed amendment would define a direct relationship between dairy product prices and Class I and II prices; would reestablish an appropriate relationship between the Class I and II prices and the Class III and IV prices; would update the Class I and II price formulas on established principles; and would allow for future amendments of Class III and IV formulas without undue impacts on Class I and II calculations.

NMPF is an association that represents the interests of more than 50,000 of America’s estimated 65,000 dairy farmers, and 33 cooperative associations that they own.

**Background.**

The issue of how to appropriately formulate Class I and Class II prices requires the Secretary’s immediate consideration. The Department is in the process of concluding the proceedings in Docket No. AO-14-A74 involving a proposal by a cheese manufacturer to increase "make allowances" for Class III and IV dairy products. This change was proposed to remedy an emergency situation faced by manufacturers of cheddar cheese,
dry whey, butter, and nonfat dry milk. However, as NMPF has attempted to point out numerous times during that proceeding, under the current pricing system, any changes to Class III and Class IV make allowances will also result in lower Class I and Class II prices for producers. This is a result that is unnecessary to provide economic relief for dairy product processors. Unless adjustments are made to the Federal order Class I and Class II prices dairy producers will be faced with unnecessary and unjustified economic hardships.

1. The Anticipated Decision will Impose an Undue Hardship upon Producers.

NMPF asserts that the same factors that have increased dairy product manufacturers’ costs have also raised the costs to producers and cooperative associations of supplying Class I and II milk. The potential reduction of Class I and II milk prices under Docket No. AO-14-A74 does not give proper consideration to these costs. By Federal order precedent, discussed below, these costs should be acknowledged and Class I and II prices raised accordingly. The incomplete results of the hearing under Docket No. AO-14-A74 therefore unduly deny producers well-justified offsetting compensation in the Class I and II price formulas.

---

1 As demonstrated by the hearing record in Docket No. AO-14-A74, the manufacturers of the four benchmark products (cheddar cheese, dry whey, nonfat dry milk, and butter) face higher costs than those upon which the current make allowances are based. At the same time, the margin between their average price and their minimum raw milk price are constrained by those make allowances. NMPF supported the proposed changes to the Class III and Class IV make allowances in that proceeding, but argued that Class I and Class II pricing should be held harmless from any changes, pending a full consideration of those prices. Unfortunately, both the “hold harmless” approach and the fuller consideration of Class I and II pricing were excluded from the scope of the hearing.
Fifty-two percent of milk pooled in the Federal orders in 2005 was Class I and II milk. U.S. dairy producers are now experiencing an extended period of low milk prices, high production costs, and exceptionally low farm returns. Large reductions in Class I and II revenues will stress farm income and, undoubtedly will be disastrous for many producers.

USDA marketing order officials testified that if the proposed make allowance changes were applied to the calculation of the prices producers receive for Class I and II milk, the negative impact on producer income would be nearly double that which would occur if the proposed changes were applied only in calculating the prices of Class III and Class IV milk. USDA program officials estimated the losses to producers from reduced Class I and Class II revenues to be potentially as high as $350 million over 5 years.

USDA senior staff economist Howard McDowell presented his analysis of the impact on direct producer income of the proposed make allowance changes under several scenarios. In the scenario with the smallest impact, he estimated that the negative impact to producer revenue from changes in the Class I and Class II prices would be $155 million over five years (2006 through 2010), or 40% of the projected impact from all classes. In his scenario with the largest impact, producers would lose $340 million in Class I and II income over five years, representing 36% of the total.

The table below presents NMPF’s estimates of the impact of changing the make allowances. It does not account for dynamic changes in the market over time, as Dr.

---

3 Docket No. AO-14-A74, et al., Exhibit 2, Table A-4, summing all impacts on Class I and II revenue.

4 Docket No. AO-14-A74, et al., Exhibit 2, Tables A2 and A4.
McDowell’s does. Nevertheless, it can be read as a short-run analysis that provides an estimate of the relative impacts of applying or not applying the Class III and IV make allowances to Class I and II.

* Combined using USDA methodology from 2003 final decision; offered at January 2006 hearing.
**Cornell weighted averages plus $0.0015 “marketing costs” added in 2003 final decision.
Note: All-milk impact based on 75% of FO Class price changes.
Sources: USDA/AMS; USDA/RBCS; CDFA; Mark Stephenson, Cornell University; NMPF

NMPF expects that a more complete consideration of the Class I and II price formulas will produce offsetting compensation in these formulas, and thereby avoid unnecessary and excessive reductions in producer income.

2. The Inadequacy of Current Class I and II Pricing is Contributing to Disorderly Marketing in Federal Order Markets.

The Class I and II price formulas were defined during order reform, based on specific cost considerations, which are discussed in more detail below. These have not been updated since the proposed rule was issued in 1998 despite substantial changes in these costs. As a result, the Class I and II prices are inadequate to ensure an ample and
wholesome supply of fresh fluid milk, as evidenced by rising Class I over-order premiums in milk surplus regions, and the growing difficulty of supplying deficit markets. This proposal would address these conditions, which will be exacerbated by a potential reduction in Class I and II prices under Docket No. AO-14-A74.

**NMPF Proposes New Class I and II Formulas.**

NMPF proposes new Class I and II formulas based directly upon dairy product prices. If these formulas were applied, Class I and Class II prices would move in concert with the Class III and IV prices, as they do now, but would not be artificially bound to the Class III and IV milk price formulas. Instead, NMPF’s proposed Class I and II formulas would better describe the appropriate relationship between Class I and II prices and the larger dairy market, consistent with Federal order precedent and principles.

The last time the relationship between Class I and II and Classes III and IV was fully considered was at the time of order reform, in 1996 through 1999. The January 2006 national hearing considered the changes in Class III and IV manufacturing costs, and applied these changes directly to the Class I and II price calculations without considering potentially offsetting changes in the costs of balancing and maintaining Grade A milk supplies for Class I and II use. Suppliers of Class I and II milk face additional costs which vary, sometimes exactly, with Class III and IV manufacturing costs; but while costs are subtracted from Class III and IV formulas, they have been added to Class I and II. A full consideration of these Class I and II costs is a necessary complement to the make allowances changes that are now in process.
1. **Class I Skim Milk Formula**

Expressed in its simplest form, the current Class I skim milk mover formula is equal to the higher of:

\[
\text{Nonfat dry milk price} \times 8.9 - \$1.25
\]

or

\[
\text{Cheese price} \times 10.0 + \text{Dry whey price} \times 6.1 - \text{Butter price} \times 3.9 - \$2.17.
\]

The butter-powder-based calculation incorporates the yield of nonfat dry milk per hundredweight of skim milk, minus a make allowance ($1.25/cwt.). The cheese-based calculation incorporates yields for cheese, whey, and whey butter, minus a make allowance ($2.17/cwt.).\(^5\)

NMPF proposes the following replacement for the Class I skim milk price mover, equal to the higher of:

\[
\text{NDM price} \times 8.9 - .52
\]

or

\[
\text{Cheese price} \times 10.0 + \text{Dry whey price} \times 6.1 - \text{Butter price} \times 3.9 - \$1.44
\]

NMPF’s proposed formula incorporates the same commodity values and yield factors as the current Class I formula, minus a Class I adjuster which combines product conversion costs and corresponding changes in the estimated per hundredweight costs of supplying Class I milk.

At the time of order reform, certain costs of supplying Class I milk were explicitly incorporated into the minimum Class I differential. NMPF does not propose to change the Class I differentials at this time, but maintains that any adjustment to minimum Class

\(^5\) The make allowances in the current Class III calculation are not meaningful with respect to skim milk alone. However, for milk with a certain butterfat test, the butterfat elements of the Class III formula cancel each other out, and only cheese and whey values remain.
I prices can be made through the Class I skim milk and butterfat movers. Class I supply costs were necessarily incorporated in the Class I differential only because the Class I mover directly incorporated the Class III and IV formulas by reference. If the Class I mover is based on the new formula NMPF proposes, it is equally appropriate to apply adjustments in the fixed element of the Class I price to the mover calculation.

The Class I skim milk price and Class II price are currently calculated using the Class III and IV price formulas by reference, adding differentials that are designed to reflect their relationship to Class III and IV values. This differentials are designed to compensate not processors, but rather the suppliers of Class I and II raw milk. In the Proposed Rule for Order Reform, USDA set the minimum Class I differential at $1.60 per hundredweight, based upon several enumerated costs, beginning with the costs of maintaining Grade A standards.

There are several requirements for producers to meet to convert to a Grade A dairy farm and then maintain it. A Grade A farm requires an approved water system (typically one of the greatest conversion expenses), specific facility construction and plumbing requirements, certain specifications on the appearance of the facilities, and specific equipment. After achieving Grade A status, producers must maintain the required equipment and facilities, and adhere to certain management practices. Often, this will require additional labor, resource, and utility expenses. It has been estimated that this value may be worth approximately $0.40 per hundredweight.

The “labor, resource, and utility expenses” of dairy farmers rise, of course, along with those of milk processors. Non-feed costs in the production of milk have risen by 27% between 1998 and 2004, according to USDA estimates. Based on the above, and applying the same 27% to the 40¢ cost of maintaining Grade A supplies, NMPF

---

6 See 7 CFR 1000.50.
7 Management expenses include costs of hot water and steam for sanitation, additional bedding material, more frequent cleaning, and purchase of additional supplies and services necessary to maintain Grade A status. All these costs rise as processors’ costs do.
8 63 FR 4908.
conservatively estimates the present costs of maintaining Grade A standards at 51¢ per hundredweight, an increase of 11¢ from the status quo. As USDA has stated:

Traditionally, the additional portion of the Class I differential reflects the marketing costs incurred in supplying the Class I market. These marketing costs include such things as seasonal and daily reserve balancing of milk supplies, transportation to more distant processing plants, shrinkage, administrative costs, and opportunity or ‘give-up’ charges at manufacturing milk plants that service the fluid Class I markets. This value has typically represented approximately $0.60 per hundredweight. \(^9\)

Most of these are the same costs associated with operation of plants producing such products as cheese, dry whey, butter, and nonfat dry milk powder. The operators of balancing plants often sacrifice plant profitability of their manufacturing operations in order to provide Class I and II balancing services. The costs of this balancing rises as energy costs and per-pound processing costs rise, and these costs should be offset in the Class I price. Shipping milk from distant sources imposes an even larger cost of balancing Class I markets; transportation costs also rise with higher energy prices, as has been acknowledged in a recent tentative partial decision on the transportation credits in the Southeast and Appalachian markets.\(^{10}\) The manufacturing costs estimated from the recent surveys tend to reflect costs of plants running near full capacity; processing costs of balancing plants are higher, and should be reflected in the Class I price. Very conservatively, though, the same percentage increase in the costs of butter and powder manufacture (the primary form of market balancing through manufacturing) that is applied to Class III and IV make allowances should also be applied to the 60¢ balancing cost. The data presented at the January hearing suggested a 22% increase the costs of converting milk into butter and powder. A 22% increase in the 60¢ balancing cost applied in the order reform decision would be 13¢ per hundredweight. In addition, shifts

\(^9\) 63 FR 4908.

\(^{10}\) See 71 FR 54118, et seq. Marketwide balancing assessments and credits may be ultimately be necessary to fully compensate balancing plants, as opposed to full-capacity manufacturers.
in milk production and manufacturing consolidation have lead to longer hauls to Class I plants. Based upon the record in the ongoing transportation credit proceeding and studies performed by the Seattle Milk Market Administrator’s office,\textsuperscript{11} we estimate at least an additional 10¢ per hundredweight increase in Class I assembly costs, for a total increase of 23¢ in this component of the original $1.60 Class I cost. This is a conservative estimate. NMPF anticipates that there will be additional data at hearing regarding increased costs.

The last element of the minimum Class I price, per the proposed rule, was the “additional competitive factor”, estimated at 60¢ per hundredweight based upon two price comparisons. The proposed rule reported that Grade A milk received an average premium above Class III in 1995 and 1996 of 86¢ in Minnesota and 89¢ in Wisconsin.\textsuperscript{12}

In 2004 and 2005, these average premiums were up to $1.33 in Minnesota and $1.53 in Wisconsin.\textsuperscript{13} In addition, the proposed rule considered the substantial over-order premiums paid for Class I milk in Chicago, Milwaukee, and Minneapolis in 1996, ranging from $1.19 to $1.79. By 2005, the Class I differential had been increased, per the order reform decision, but the over-order premiums were now $2.10 in Minneapolis and $2.72 in Chicago and Milwaukee. These growing premiums are indication of the inadequacy of the current minimum Class I prices to draw milk to the pool to meet Class I needs, and of their failure to meet the objectives of the Act. In both cases, the competitive costs associated with Class I milk have risen by an average of about 65%.

\textsuperscript{12} 63 FR 4908-4909.
\textsuperscript{13} USDA/NASS data, available at www.nass.usda.gov.
Applying this increase to the 60¢ “competitive factor” incorporated at order reform would produce a 39¢ increase in the minimum Class I price.

Altogether, these considerations conservatively justify at least a 73¢ increase in the Class I skim milk price mover.

2. **Class I Butterfat Formula**

   In its simplest form, the current Class I butterfat price mover is calculated as:

   \[(\text{Butter price} \times 1.2) - \$0.1380\]

   This incorporates the butter yield (1.2 lbs. butter per lb. of butterfat) minus the make allowance ($0.138/lb. bf).

   NMPF proposes the following replacement:

   \[(\text{Butter price} \times 1.2) - \$0.1307\]

   This would correspond exactly to the proposal for Class I skim milk, including a 0.73¢ increase in the price per pound associated with balancing costs.¹⁴

3. **Class II Skim Milk Formula**

   In its simplest form, the current Class II Skim Price is calculated as:

   \[(\text{Nonfat dry milk price} \times 8.9) - \$1.2474 + \$0.70\]

   \[= (\text{Nonfat dry milk price} \times 8.9) - \$0.5474\]

   This contains the nonfat dry milk yield (8.9 lbs./cwt.) and the 70¢ Class II differential minus make allowance ($1.2474/cwt.)

   NMPF proposes the following direct replacement for the Class II skim milk price:

   

¹⁴ We propose only this modest adjustment, although experience in California’s state program has shown the feasibility of a substantially larger premium on Class I butterfat, vis-à-vis manufacturing classes.
NMPF’s proposed formula is equal to the full value of nonfat dry milk (NFDM) derived from a hundredweight of skim milk, minus condensing costs, plus the cost of rehydrating powder, and is similar to the current calculation, except that it avoids the redundant application of the cost of drying condensed skim milk. In the current formulas, this drying cost is deducted from powder values to arrive at a Class IV value, and then added back through application of the 7₀¢ differential.

In the Order Reform Proposed Rule and in the Final Decision, the calculation of the Class II price was based on the Class IV calculation, plus 7₀¢.¹⁵ “The $0.70 differential represents the cost of converting concentrated milk to dry solids, plus rehydration.”¹⁶ “Only a small portion of the $0.70 is intended to represent the cost of rehydration. The majority of the $0.70, $0.57, represents the cost to dry condensed milk…. It should be noted that the cost to purchase or manufacture NFDM for use in Class II products would include not only the cost of milk at the Class IV price, but the cost of making NFDM.”¹⁷ The final decision notes:

Generally, the source of inputs alternative to product milk for the manufacture of Class II products is dry milk products and butterfat that otherwise would be used in butter. Basing the price of milk used to make Class II products on these alternative ingredients should help considerably to remedy a situation in which it is perceived that a separate product class for dry milk (Class III-A) has resulted in a competitive advantage over producer milk used to produce Class II products.¹⁸

In other words, the relationship between the nonfat dry milk price and the Class II price is the objective of the 7₀¢ Class II differential. This relationship depends upon make allowances established at that time; it is therefore out of date and inconsistent with

¹⁵ 63 FR 4882, 64 FR 16104.
¹⁶ 64 FR 16104.
¹⁷ 64 FR 16104. This indicates a rehydration cost of 1₃¢ per hundredweight.
¹⁸ 64 FR 16104.
any potential make allowances revisions. It is now appropriate to establish a direct relationship between the Class II skim milk price and the nonfat dry milk price, with only an allowance for condensing. 19

Much Class II skim milk is sold as skim condensed milk, which competes with nonfat dry milk as an ingredient. Substitution between Class II skim condensed and nonfat dry milk can help balance markets, but the margin should be such that otherwise uneconomic permanent year-round substitution of nonfat dry milk is not made for skim condensed. Therefore, this formula is equal to the value of an equivalent volume of nonfat dry milk, minus a condensing cost, plus the cost of rehydrating powder.

Condensing costs are currently estimated by the industry at 6¢ to 7¢ per pound of solids, or 54¢ to 63¢ per cwt. of skim milk.

4. **Class II Butterfat Formula**

In its simplest form, the current Class II butterfat price is calculated as:

\[
(\text{Butter price} \times 1.2) - 0.138 + 0.007
\]

19 If condensing and rehydration costs are equal to $0.5474, this would be equivalent to the current formula. Here is a derivation of the proposed formula. To avoid giving Class II manufacturors a year-round incentive to dry and rewet milk for Class II uses, the price of Class II skim condensed milk should be set less than or equal to the price of Class IV milk dried and rewet:

\[
\text{Class II skim} + \text{condensing cost} \leq \text{Class IV skim} + \text{condensing cost} + \text{drying cost} + \text{rewetting cost},
\]

where drying cost is the cost of drying condensed milk. The Class IV formula is:

\[
\text{Class IV} = \text{powder value} - \text{condensing cost} - \text{drying cost}
\]

So,

\[
\text{Cl. IV skim} + \text{condense} + \text{dry} + \text{rewet} = \text{powder} - \text{condense} - \text{dry} + \text{condense} + \text{dry} + \text{rewet} = \text{powder} + \text{rewet}
\]

From this and the first equation, we have:

\[
\text{Class II skim} + \text{condense} \leq \text{powder} + \text{rewet},
\]

or

\[
\text{Class II skim} \leq \text{powder} - \text{condense} + \text{rewet}.
\]
This incorporates the butter yield (1.2 lbs./lb. of bf) minus the make allowance ($0.138/lb. bf), plus the Class II differential ($0.007/lb. bf).

NMPF proposes the following replacement:

\[(\text{Butter price} \times 1.2) - 0.1147\]

This is equivalent to the proposed Class I butterfat mover, plus the minimum Class I differential of 1.6¢/lb. ($1.60 per cwt.) Class IV butterfat is used almost exclusively to produce butter. Since butter is generally not a viable substitute for cream in Class II applications, Class II butterfat is not constrained by competition with a manufactured substitute. As such it should be set equivalent to the minimum Class I butterfat price, excluding only the location component of the overall Class I butterfat price. Class I and II supplies are complementary, with much Class II butterfat use coming from the surplus butterfat at Class I bottling plants. The average 2005 butterfat tests for Class I use and Class II use were 1.97% and 7.42%, respectively. Combined, however, their average butterfat test was 3.34%, close to the Federal order standard of 3.5%.

**Proposed Class I and II Formulas Better Meet the Objectives of the Act.**

NMPF proposes that the Secretary establish new Class I and II milk price formulas. These would better meet the object of the Agricultural Marketing Agreement Act in several ways.

1. Class I and Class II are not Constrained by, and so are Only Incidentally Related to, Make Allowances for Class III and IV milk.
The manufacturers of cheddar cheese, dry whey, butter, and nonfat dry milk who receive Federal order milk are collectively constrained by the orders to operate within a margin between the average product prices that they must report to the National Agricultural Statistics Service, and the Federal order minimum prices for Class III and IV milk. The make allowance hearing was about establishing a margin wide enough to provide a reasonable opportunity to cover costs.

By contrast, the processors of Class I and Class II products are able to pass on increased costs to the market; higher product prices are not part of their minimum Class price calculation. The relationship between their price and the Class III and IV make allowances is incidental. If there are other reasons to dissociate their price calculations from these make allowances, there is no direct reason not to.  

2. The Costs of an Adequate Supply of Raw Class I and II milk Must Be Recognized in the Calculation of their Prices.

Producer and cooperative suppliers of raw milk for Class I and II use face substantial costs, as has been discussed above. These costs are analogous to those faced by dairy manufacturers and have had increases analogous to increases faced by manufacturers.

As manufacturing costs are subtracted in Class III and IV price calculations, Class I and II supply costs have been added in Class I and II price calculations. In order to maintain the proper relationship between product prices and the Class I and II milk prices, both of these sets of costs must be considered and applied. Strict application of new Class III and IV make allowances to the Class I and Class II prices, without

---

20 This is why the record in the make allowance proceeding provided no record and no justification for the direct application of new make allowances to Class I and II prices.
consideration of conditions specific to Class I and II milk, perverts the relationship among class prices.

Failure to address legitimate milk supply costs in establishing the Class I and II milk prices will undercut the ability of the pool to attract a stable supply of milk to these higher uses, and lead to increased de-pooling and more disorderly Class I and II milk markets.

Establishing these new Class I and II price formulas is clearly justified, and will as clearly further the objectives of the Act.

3. **Class I and II Formula Provisions Should not Incorporate Class III and IV Price Formulas by Reference**

   As discussed above, the incorporation of Class III and IV price formulas into the Class I and II price formulas can lead, and has led, to an overly broad application of Class III and IV formula changes to Class I and II prices without due consideration for the independent conditions that pertain to Class I and II milk supplies. Establishing independent provisions for Class I and II formulas will ensure that future changes in the Class I and II prices are based upon direct consideration of those changes as they apply to Classes I and II. This would avoid some unintended distortions in the relationships among Class prices that might lead to disorderly marketing conditions.

4. **Substantial Producer Interest has been Expressed in NMPF’s Proposal.**

   NMPF represents some 50,000 farmers through its 33 member cooperatives. As such, NMPF’s serves as the voice of the majority of American milk producers. NMPF
proffered testimony at the make allowance hearing\textsuperscript{21} in support of an alternative to the strict application Class III and IV make allowance changes to Class I and II prices, and its views were supported by many producer groups to the extent that they were allowed to express that support. The witness for Dairy Farmers of America, Inc., and Dairylea Cooperative, Inc., initially testified, over the objections of opposing parties, that those cooperative associations fully supported NMPF’s recommended modification.\textsuperscript{22} NMPF’s modification was also supported by the Association of Dairy Cooperatives in the Northeast (ADCNE)\textsuperscript{23} -- an association which represents Agri-Mark, Inc. (the original proponent), Dairylea Cooperative, Inc., Dairy Farmers of America, Inc., Land O’ Lakes, Inc., Maryland and Virginia Milk Producers Cooperative Association, Inc., O-AT-KA Milk Products Cooperative, Inc., St. Albans Cooperative Creamery, Inc. and Upstate Farms Cooperative, Inc.) The ADCNE witness testified, despite objections of opposing parties, that their position was to support that of NMPF in establishing independent Class I and II price provisions in the order language.\textsuperscript{24} Counsel for O-AT-KA Milk Products Cooperative also argued forcefully in favor of this position.\textsuperscript{25} Finally, the witness for Southeast Milk, Inc., attempted to testify in favor of independent Class I and II price provisions, but his testimony to that effect was also excluded by the ALJ.\textsuperscript{26}

\textsuperscript{21} Docket No. AO-14-A75, et al.
\textsuperscript{22} Their witness testified that they had compelled by the administrative law judge’s ruling excluding NMPF’s testimony to adopt a position in opposition to a change in the make allowances. (Tr. IV-271-278)
\textsuperscript{23} Tr. IV at 250-25.
\textsuperscript{24} Tr. IV-257-258. He stated that, “While it is urgent to adjust the Class III and IV make allowances, and prices, it is not necessary, and would be positively detrimental to allow the changes to impact Class I and Class II prices.”
\textsuperscript{25} Tr. IV-58-61.
\textsuperscript{26} Exhibit 61, p. 2; Tr. IV-72.
Conclusion

It now appears, as a result of the proceedings in Docket No. AO-14-A74, et al., that any resulting make allowance increase will be applied directly to the calculation of all four milk classes. Reductions in the Class I and II prices are neither a necessary nor a desirable consequence of make allowance changes intended to provide relief for manufacturers of benchmark Class III and Class IV products. NMPF urges the Secretary to convene a new hearing, on an expedited basis, and to issue an amended rule that would establish new Class I and II price formulas, in order to reestablish the proper price relationship among the four classes and with the larger dairy market, and to avoid losses that could be as much as $350 million for America’s dairy farmers.

NMPF proposes Class I and II formulas that would use the same product price sources used in the Class III and IV formulas. Class I and II prices will thereby remain complementary to the Class III and IV prices and appropriately reflect the overall dairy markets. In addition, independent formulas for Class I and II prices will assure that Class I and Class II revenue are not reduced by future changes in make allowances except where merited by the record.

America’s dairy producers will face substantial economic hardship if, as anticipated, the decision in the make allowance proceeding results in reduction in Class I and Class II prices. NMPF’s proposal would allow the Department to move forward in addressing both the current inadequate make allowances for Class III and IV, and in preventing unnecessary and unwarranted reduction in Class I and II prices.
Order Language to Effect NMPF’s Proposed Class I and II Price Formulas

§ 1000.50 Class prices, component prices, and advanced pricing factors.

Class prices per hundredweight of milk containing 3.5 percent butterfat, component prices, and advanced pricing factors shall be as follows. The prices and pricing factors described in paragraphs (a), (b), (c), (e), (f), and (q) of this section shall be based on a weighted average of the most recent 2 weekly prices announced by the National Agricultural Statistical Service (NASS) before the 24th day of the month. These prices shall be announced on or before the 23rd day of the month and shall apply to milk received during the following month. The prices described in paragraphs (g) through (p) of this section shall be based on a weighted average for the preceding month of weekly prices announced by NASS on or before the 5th day of the month and shall apply to milk received during the preceding month. The price described in paragraph (d) of this section shall be derived from the Class II skim milk price announced on or before the 23rd day of the month preceding the month to which it applies and the butterfat price announced on or before the 5th day of the month following the month to which it applies.

(a) Class I price. The Class I price per hundredweight, rounded to the nearest cent, shall be .965 times the Class I skim milk price plus 3.5 times the Class I butterfat price.

(b) Class I skim milk price. The Class I skim milk price per hundredweight shall be the adjusted Class I differential specified in §1000.52 plus the higher of the advanced pricing factors computed in paragraph (q)(1) or (2) of this section.

(c) Class I butterfat price. The Class I butterfat price per pound shall be the adjusted Class I differential specified in §1000.52 divided by 100, plus the advanced butterfat price computed in paragraph (q)(3) of this section.

(d) The Class II price per hundredweight, rounded to the nearest cent, shall be .965 times the Class II skim milk price plus 3.5 times the Class II butterfat price.

(e) Class II skim milk price. The Class II skim milk price per hundredweight shall be the advanced Class IV skim milk price computed in paragraph (q)(2) of this section plus 70 cents weighted average of the 2 most recent NASS U.S. average weekly survey nonfat dry milk prices announced before the 24th day of the month times 8.9, from which product is subtracted 54 cents.

(f) Class II nonfat solids price. The Class II nonfat solids price per pound, rounded to the nearest one-hundredth cent, shall be the Class II skim milk price divided by 9.

(g) Class II butterfat price. The Class II butterfat price per pound, rounded to the nearest one-hundredth cent, shall be the U.S. average NASS AA Butter survey price reported by the Department for the month, multiplied by 1.20, then subtracting from this product 11.47¢. shall be the butterfat price plus $0.007.

(h) Class III price. The Class III price per hundredweight, rounded to the nearest cent, shall be .965 times the Class III skim milk price plus 3.5 times the butterfat price.

(i) Class III skim milk price. The Class III skim milk price per hundredweight, rounded to the nearest cent, shall be the protein price per pound times 3.1 plus the other solids price per pound times 5.9.

(j) Class IV price. The Class IV price per hundredweight, rounded to the nearest cent, shall be .965 times the Class IV skim milk price plus 3.5 times the butterfat price.

(k) Class IV skim milk price. The Class IV skim milk price per hundredweight, rounded to the nearest cent, shall be the nonfat solids price per pound times 9.

(l) Butterfat price. The butterfat price per pound, rounded to the nearest one-hundredth cent, shall be the U.S. average NASS AA Butter survey price reported by the Department for the month less 11.5 cents, with the result multiplied by 1.20.

(m) Nonfat solids price. The nonfat solids price per pound, rounded to the nearest one-hundredth cent, shall be the U.S. average NASS nonfat dry milk survey price reported by the Department for the month less 14 cents and multiplying the result by .99.

(n) Protein price. The protein price per pound, rounded to the nearest one-hundredth cent, shall be computed as follows:

(1) Compute a weighted average of the amounts described in paragraphs (n)(1)(i) and (ii) of this section:
(i) The U.S. average NASS survey price for 40-lb. block cheese reported by the Department for the month; and

(ii) The U.S. average NASS survey price for 500-pound barrel cheddar cheese (38 percent moisture) reported by the Department for the month plus 3 cents;

(2) Subtract 16.5 cents from the price computed pursuant to paragraph (n)(1) of this section and multiply the result by 1.383;

(3) Add to the amount computed pursuant to paragraph (n)(2) of this section an amount computed as follows:

(i) Subtract 16.5 cents from the price computed pursuant to paragraph (n)(1) of this section and multiply the result by 1.572;

(ii) Subtract 0.9 times the butterfat price computed pursuant to paragraph (l) of this section from the amount computed pursuant to paragraph (n)(3)(i) of this section; and

(iii) Multiply the amount computed pursuant to paragraph (n)(3)(ii) of this section by 1.17.

(o) Other solids price. The other solids price per pound, rounded to the nearest one-hundredth cent, shall be the U.S. average NASS dry whey survey price reported by the Department for the month minus 15.9 cents, with the result multiplied by 1.03.

(p) Somatic cell adjustment. The somatic cell adjustment per hundredweight of milk shall be determined as follows:

(1) Multiply .0005 by the weighted average price computed pursuant to paragraph (n)(1) of this section and round to the 5th decimal place;

(2) Subtract the somatic cell count of the milk (reported in thousands) from 350; and

(3) Multiply the amount computed in paragraph (p)(1) of this section by the amount computed in paragraph (p)(2) of this section and round to the nearest full cent.

(q) Advanced pricing factors. For the purpose of computing the Class I skim milk price, the Class II skim milk price, the Class II nonfat solids price, and the Class I butterfat price for the following month, the following pricing factors shall be computed using the weighted average of the 2 most recent NASS U.S. average weekly survey prices announced before the 24th day of the month:

(1) An advanced Class III cheese skim milk price per hundredweight, rounded to the nearest cent, shall be computed as follows:

(i) Following the procedure set forth in paragraphs (n)(1) and (o) of this section, but using the weighted average of the 2 most recent NASS U.S. average weekly survey prices announced before the 24th day of the month, multiply the resulting cheese price times 10.0 compute a protein price and an other solids price;

(ii) Multiply the weighted average of the 2 most recent NASS U.S. average weekly survey dry whey prices announced before the 24th day of the month times 6.1 protein price computed in paragraph (q)(1)(i) of this section by 3.1;

(iii) Multiply the weighted average of the 2 most recent NASS U.S. average weekly survey butter prices announced before the 24th day of the month times 3.9 other solids price per pound computed in paragraph (q)(1)(i) of this section by 5.9; and

(iv) Add the amounts computed in paragraphs (q)(1)(i) and (ii) and (iii), subtract the amount in paragraph (q)(1)(iii), and subtract $1.44.

(2) An advanced Class IV butter-powder skim milk price per hundredweight, rounded to the nearest cent, shall be computed as follows:

(i) Following the procedure set forth in paragraph (m) of this section, but using Multiply the weighted average of the 2 most recent NASS U.S. average weekly survey prices for nonfat dry milk announced before the 24th day of the month times 8.9; and

(ii) From the amount computed in paragraph (q)(2)(i) subtract 52¢. Multiply the nonfat solids price computed in paragraph (q)(2)(ii) of this section by 9.

(3) An advanced butterfat price per pound, rounded to the nearest one-hundredth cent, shall be calculated by computing a weighted average of the 2 most recent U.S. average NASS AA Butter survey prices announced before the 24th day of the month, subtracting 11.5 cents from this average, and multiplying the result by 1.20, then subtracting 13.07¢.
